THE J. Mason Warren

WORKS

OF

AMBROSE PAREY,

Chyrurgeon to

HENRY II. FRANCIS II. CHARLES IX. and HENRY III.

Kings of France.

Wherein are Contained

An Introduction to CHIRURGERY in general:

A

Diſcourſe of ANIMALS, and of the Excellency of MAN.

THE

ANATOMY of MAN's BODY.

A

TREATISE of præternatural Tumors in general. Of their Cure in particular. Of Wounds in general. Of Wounds with their Cure in the particular parts of Man's Body. Of Wounds made by Gun-ſhot, and other deſtructive Engines. Of Contuſions and Gangrenes. Of Ulcers and Fiſtulaes. Of Bandage. Of Fractures and Diſlocations. Of almoſt all preternatural Affections, whoſe Cure is performed by manual Operation. Of the Gout. Of the French Pox, with all its Symptoms. Of the Small Pox and Meaſles. Of Worms and Leproſie. Of Poiſons, with the Cure of Wounds, made by the Biting of a mad Dog, and other Venomous Creatures. Of the Plague. Of artificial Supplying thoſe things which by Nature or Accident are wanting. Of Monſters and Prodigies. The way of making Reports, and Embalming Dead Bodies.

ILLUSTRATED

With Variety of Figures, and the Cuts of the moſt uſeful Inſtruments in Chirurgery.

RECOMMENDED

By the Univerſity of *Paris* to all Students in Phyſick and Chirurgery, particularly ſuch as Practiſed in Camps and the Sea.

To the Right Honourable

EDWARD

Lord *Herbert* of *Cherbury* and *Caſtle-Iſland*,

and one of His Majeſties moſt Honourable Council of War.

My Lord,

IT is not the far-fetcht Pedegree of Noble Anceſtors nor thoſe Honors your Lordſhip deſervedly poſſeſſes, that make me crave your Patronage to this my Labour; but it is that Heroick mind, enriched with the choice endowments of Nature and Art, and that earneſt affection wherewith your Honour entertains all Sciences, Arts, and Artiſts, with that exquiſite Judgement which ſees into the inner man, which embolden and incite me to ſue for your Honours aſſiſtance, in protecting the fame of him, who by your many favours is made yours. I know the ſeeming and ſelf-pleaſing Wiſdom of our Times, conſiſts much in cavilling and unjuſtly carping at all things that ſee light, and that there are many who earneſtly hunt after the Publick Fame of Learning and Judgement, by this eaſily trod, and deſpicable Path, which notwithſtanding they tread with as much Confidence as Folly; for that oft-times which they vainly and unjuſtly brand with Opprobry, out-lives their Fate, and flouriſhes when it is forgot that ever any ſuch as they had being.

I know your Lordſhips diſpoſition to be far diſſenting from theſe men, and that you rather endeavour to build up the Fame of your Learning and Judgment upon a ſtrong laid Foundation of your own, than Heroſtratus-*like, by pulling down any, howſoever fair built Fabrick of another. I heartily wiſh that your Honour could propagate this Good, and that all Detractors might be turned into Actors, and then I know it would much mitigate their rigour in cenſuring others, when as they themſelves were alſo expoſed to the ſame Hazard.*

I think it impertinent to acquaint your Honour with the Nature of the Work, my Pains in Tranſlating, or the Benefit that may enſue thereon, for that I know your Honour ignorant of nothing in this kind; neither doubt I of your favourable acceptance of the good Will of him, that thinks himſelf much honoured by being

Yours,

THOMAS JOHNSON.

TO

TO THE
READER.

I Have here for the Publick Good taken pains to ſubject my ſelf to Common Cenſure, the which I doubt not but to find as various as the Faces of the Cenſurers; but I expect no thanks, nor hunt after other praiſe, than that I have laboured for my Countries good, if that deſerve any. I fear not Calumniation (though ſure to hear of it) and therefore I will not Apologize, but inform thee of ſome things concerning the Author, his Work, and the Reaſon that induced me to the Tranſlation thereof, with ſome few things beſides. For the Author, who was principal Surgeon to two or three Kings of *France*, he was a man very well verſed in the Writings of the Ancient and Modern Phyſicians and Surgeons, as you may evidently find by ſundry places alledged in his Works. For his Experience or Practice (the chief help to attain the higheſt perfection in this Art) it was wonderful great, as you may collect by his Voyages recorded in the laſt part of his Work; as alſo by that which *James Guillemau* Surgeon to the *French* King, a man both learned and judicious in his Profeſſion, avers, ſpeaking of his own Education and Progreſs in the Art of Surgery. I ſo laid (* ſaid he) the firſt Foundation of this Art in the Hoſpital of *Paris*, being as it were, an ample Theatre of Wounds and Diſeaſes of all kinds, that for two whole Years, during which time I was there converſant, nothing was conſulted of, nothing performed, the Phyſicians and Surgeons being preſent, whereof I was not an Auditor or Actor. There flouriſhed at theſe Times, and yet doth, *Ambroſe Parey*, Principal Surgeon to the moſt Chriſtian King, the Author of this great Work, moſt renowned for the moſt gracious favour of Kings, Princes and Nobles towards him, for his Authority amongſt his equals, for his Chirurgical Operations amongſt all men. Therefore I earneſtly endeavoured to be received into his Family, as unto another *Machaon*, or *Podalirius*: Once admitted, I ſo by all dutifulneſs and due reſpect acquired his Favour, that he, unleſs I were preſent and aſſiſting, did nothing (ſuch is his natural gentleneſs and curteſie to all ſuch as are ſtudious of the Art) at home or abroad, in the Field, in the Tents, or laſtly in this famous City of *Paris*, about the Bodies of Dukes, Noblemen, or Citizens, in whoſe Cure, he by the ardent deſire of them all, had ſtill the prime place.

* In his Epiſtle prefixed before the Latin Edition of this Author.

Now for this Work, hear what this ſame man in the ſame place affirmeth further: I not content with theſe means, which may ſeem ſufficient, and too much, as deſirous to ſatisfie my long thirſt, determined to trie whether I could draw or borrow any thing from Strangers, which our men wanted, to the fuller knowledge of Surgery. To this purpoſe I travelled over *Germany*, and then for four years ſpace I followed the *Spaniſh* Army in the Low-Countries; whereas I did not onely carefully cure the wounded Souldiers, but alſo heedfully and curiouſly obſerved what way of curing the renowned *Italian*, *German*, and *Spaniſh* Surgeons obſerved, who together with me were imployed in the Hoſpital, for the healing of the wounded and ſick. I obſerved them all to take no other courſe than that which is here delivered by *Parey*. Such as did not underſtand *French*, got ſome pieces of this Work for large rewards turned into *Latin*, or ſuch Languages as they underſtood, which they kept charily, and made great ſtore of; and they eſteemed, and admired, and embraced this Work alone, above all other Works of Surgery, &c. Our Author alſo himſelf, not out of a vain-glorious oſtentation, but a mind conſcious of the truth of his aſſertion, affirms thus much of this Work. I have (ſaith he) ſo certainly touched the mark whereat I aimed, that Antiquity may ſeem to have nothing wherein it may exceed us, beſides the Glory of *Invention*; nor Poſterity any thing left, but a certain ſmall hope to add ſome things, as it is eaſie to add to former Inventions. Thus much concerning our Author, and the excellency of his Work.

Now come I to the Tranſlation, the which, as deſiring more a publick Good than private Praiſe, I have performed plainly and honeſtly, labouring to fit it to the capacity of the meaneſt Artiſt; for theſe are they to whom I chiefly commend this Work, and from whom I expect acceptation. I being by the earneſt perſuaſions of

ſome of this Profeſſion, chiefly and almoſt wholly perſuaded and incited to take this pains, who knowing the diſability of underſtanding this Author in Latin or French, in many of the weaker Members of the large Body of their Profeſſion, diſperſed over this Kingdom, and the reſt of his Majeſties Dominions, whoſe good and increaſe in knowledge may be wiſhed, that ſo they may be the better enabled to do good to ſuch as ſhall implore their aid in their Profeſſion.

There are ſome I know will blame me for Engliſhing this Work, as laying open the Myſteries of a worthy Art to the unworthy view of the Vulgar. To ſuch I could anſwer as * *Ariſtotle* did to *Alexander:* but for the preſent I will give them theſe reaſons which I think may ſatisfie any but the purpoſely malicious. The firſt is drawn from the *goodneſs* of the thing, as intended for thoſe that want ſuch Guides to direct them in their Art; for it is commonly granted, that *Bonum quo communius eo melius.* Secondly, it hath been the cuſtom of moſt Writers in all Ages and Countries thus to do: *Hippocrates*, *Galen*, and the other *Greeks*, writ in their Mother Tongue the Myſteries of their Art. Thus did *Celſus*, *Serenus*, and others in *Latin: Meſue*, *Avicen*, *Serapio*, and others, in *Arabick:* as alſo, to go no farther, our Author writ this Work in his Native *French*, and learned men have done the like in this, and all other Arts. And it is a great hinderance to us in theſe days, that we muſt be forced to learn to underſtand two or three Tongues before we can learn any Science, whereas the Ancients learned and taught theirs in their Mother Tongue: ſo that they ſpent a great deal leſs time about Words, and more upon the Study of that Art or Science they intended to learn and follow. Thirdly, I muſt tell you, that, *Ex libris nemo evaſit Artifex*, No man becomes a Workman by Books: ſo that unleſs they have had ſome inſight in the Art, and be in ſome ſort acquainted both with the terms of Art, as alſo with the knowledge and uſe of the Inſtruments thereto belonging, if by reading this, or any other Book of the like nature, they become Surgeons, I muſt needs liken them (as *Galen* doth another ſort of men *) to Pilots by Book onely: to whoſe care, I think none of us would commit his ſafety at Sea; nor any any if wiſe, will commit themſelves to theſe at Land or Sea either, unleſs wholly deſtitute of other.

Vid. Aul. Gel. l. 2. c. 4.

Gal. de Simp. l. 6.

The other things whereof I muſt give you notice, are theſe. The Figures in the Anatomy are not the ſame uſed by my Author (whoſe were according to thoſe of *Veſalius*) but according to thoſe of *Bauhine*, which were uſed in the Work of Dr. *Crook*; and theſe indeed are the better and more compleat. Alſo *pag.* 519. I thought it better to give the true Figure of the Helmet flowered *Aconite*, mentioned out of *Pliny*, than to reſerve the feigned Picture of *Matthiolus* which in our Author was increaſed with the further fiction of a Helmet. I have in ſome few places in the Margent, which you ſhall find marked with a Star, put ſhort annotations, for the better illuſtration of that which is obſcure, &c. I have alſo in the Text to the ſame purpoſe, here and there put two or three words, contained in theſe limit [ ] which I find here and there turned into a plain Parentheſis, eſpecially toward the latter end of the Book; but the matter is not great. Further I muſt acquaint you that the Apology and Voyages, being the laſt part of this Work, and not in the Latin, but French Editions, were tranſlated into Engliſh out of French by *George Baker*, a Surgeon of this City, ſince that time, as I hear, dead beyond the Seas.

This is all, Courteous Reader, that I have thought neceſſary to acquaint thee withal concerning this, which I would deſire thee to take with the ſame mind that it is preſented to thee, by him that wiſheth thee all happineſs,

Thomas Johnſon.

THE

THE AUTHORS EPISTLE DEDICATORY TO HENRY III.

The most Christian King of *France* and *Poland*.

EVen as (most Christian King) we see the members of Mans Body by a friendly consent are always busied, and stand ready to perform those Functions for which they are appointed by Nature for the preservation of the whole, of which they are parts; so it is convenient that We, which are as it were Citizens of this Earthly Common-wealth, should be diligent in the following of that Calling which (by Gods appointment) we have once taken upon us: and content with our present Estate, not carried away with Rashness and Envy, desire different and divers things whereof we have no knowledge. He which doth otherwise, perverts and defiles with hated confusion the order and beauty, on which this Universe consists. Wherefore when I considered with my self that I was a Member of this great Mundane Body, and that not altogether unprofitable; I endeavoured earnestly that all Men should be acquainted with my duty, and that it might be known how much I could profit every Man. For God is my witness, and all good men know that I have now laboured fifty years with all care and pains in the Illustration and Amplification of Chirurgery; and that I have so certainly touched the mark whereat I aimed, that Antiquity may seem to have nothing wherein it may exceed us, beside the Glory of Invention; *nor Posterity any thing left but a certain small hope to add some things, as it is easie to add to former Inventions. In performance whereof, I have been so prodigal of my self, my watchings, faculties, and means, that I spared neither time, labour, nor cost, whereby I might satisfie and accomplish my own Desires, this my great Work, and the Desires of the Studious. Neither may we doubt but their Studies would at length wax cold, if they onely furnished with the Theorick and Precepts in Schools, and that with much labour, should see no manual operation, nor manifest way of performing the Art. For which cause I seeking the praise and profit of the* French Nation, *even with the hinderance of my particular Estate, have endeavoured to illustrate and increase Chirurgery, hitherto obscure either by the infelicity of the former Ages, or the envy of the Professors; and not onely with Precepts and Rules, but being a lover of Carved Works, I beautified it with 300 Forms, or Graven Figures, and apt Delineations, in which whosoever shall attentively look, shall find five hundred Anatomical or Organical Figures belonging to the Art, (if they be reckoned particularly.) To every of these I have given their Names and shewed their Use, lest they should seem to have been put in vainly for Ostentation or Delight. But although there be few men of this Profession which can bring so much authority to their Writings either with Reason or Experience, as I can; notwithstanding I have not been so arrogant, but intending to publish my Work, I first communicated it with Men the most excellent in the Art of Physick, who gave me greater encouragement to perfect*

fect and publiſh it, that it might be in common uſe: profeſſing they wiſhed nothing more, than that it might be turned into Latin, by which means it ſhould be known to foreign Nations, that there is no kind of Learning which is not delivered with great dexterity of Wit in this Kingdom over which you rule. And thus much I dare boldly affirm, that there is ſcarce any, be he never ſo ſtately or ſupercilious, but that he may here find ſome thing which may delight him, and by which he may better his knowledge. Therefore I doubted not to conſecrate this Book unto your Majeſty, both as a Pattern and Treaſury of my Labours, as well in reſpect of my duty, who am Yours by Nature and Education, as that I might manifeſt to all, your Highneſſes exceeding bounty towards me, in placing me (having heretofore enjoyed the Office of Principal Chirurgeon under three Kings, your Majeſties Predeceſſors) in the ſame dignity, and that of your own accord. And moreover I did conjecture that it would fall out, as now it doth, that this my Work carried through the World by the Fame of your Majeſties Name, ſhould neither fear the face nor view of any, ſupported by the Favour and Majeſty of a moſt invincible Monarch and moſt Excellent and Renowned Prince. Neither did King Charles IX. *of happy Memory, incited by the relation of the moſt gracious Queen his Mother, refuſe to read it, being he underſtood it proceeded from him, who having happily paſſed all his time in private and publick imployments, and converſed with all men of all ſorts, was judged moſt worthy to obtain this favour, as to have the Front of this Work adorned and beautified with the ſplendour of his prefixed Name. I, encouraged by this hope, deſired that my requeſt ſhould paſs as by a certain continuation and ſucceſſion from a moſt Powerful, to a moſt Invincible King; and do wholly conſecrate theſe my Labours taken for my Countries good unto your Sacred Majeſty. God grant that your Majeſty may have happy ſucceſs of all your Enterpriſes abundantly added to* Neſtors *Years.*

Paris February 8.

Anno Dom. 1579.

Your Moſt Chriſtian Majeſties

Faithful Servant,

Ambroſe Parey.

THE

THE

PREFACE.

MOst Men derive the Original of Phyſick from Heaven; for thoſe who hold the beſt opinion of the Creation of the World, affirm, the Elements being created and ſeparated each from other, Man being not as yet made; incontinently by the divine Decree, all Herbs and Plants, with infinite variety of the Flowers endued with various Sents, Taſts, Colours, and Forms, grew and ſprung forth of the Bowels of the Earth, enriched with ſo many and great Virtues, that it may be thought a great offence to attribute to any other than the Deity, the benefit of ſo great a bleſſing ſo neceſſary for ſo many uſes. Neither could Mans capacity ever have attained to the knowledge of theſe things without the guidance of the Divine Power. For God the great Creator and Faſhioner of the World, when firſt he inſpired Adam by the breath of his mouth into a living and breathing Man, he taught him the Nature, the proper Operations, Faculties and Virtues of all things contained in the circuit of this Univerſe. So that if there be any who would aſcribe the glory of this invenuion to Man, he is condemned of ingratitude even by the judgment of Pliny. But this knowledge was not buried in oblivion with Adam: but by the ſame gift of God was given to thoſe whom he had choſen and ordained for Phyſick, to put their helping hands to others that ſtood in need thereof. Which opinion was not onely received in the common manner and by the tacite conſent of all Nations, but confirmed by Moſes in the Scripture. Which thing Jeſus the ſon of Sirach, the wiſeſt amongſt the Jews, hath confirmed, ſaying, Honour the Phyſitian with the honour due unto him, for the Moſt High hath created him becauſe of neceſſity: and of the Lord cometh the gift of Healing. The Lord hath created Medicins of the Earth, and he that is wiſe will not abhor them. Give place and honour to the Phyſician, for God hath created him; let him not go from thee, for thou haſt need of him. The Græcians who firſt ſeem more fully and with greater fame to have profeſſed the Art of Phyſick, do in a manner conſent with this opinion, in acknowledging Apollo to have been the Inventer thereof, neither did they it without a reaſonable cauſe. For whether by Apollo they may underſtand the Sun, who by its gentle and vital heat doth bring forth, temper, and cheriſh all things; or elſe ſome Heroes, who incited by an excellent and almoſt divine underſtanding, firſt taught and put in practice the Medicinal Vertues of Herbs; in which ſenſe Ovid brings him in ſpeaking thus:

Gen. 1.
Eccluſ. 38. 1.

Herbs are of mine invention, and through all
The World, they me the firſt Phyſician call.

The original of Phyſick ariſing from thoſe beginnings, ſhall always be celebrated as celeſtial, and was increaſed principally after this manner. After Apollo, Æſculapius his ſon inſtructed by his Father, reduced this Art being as yet rude and vulgar, into a little better and more exquiſit form, for which cauſe he was reputed worthy to be accounted as one of the Gods. At the ſame time flouriſhed Chiron the Centaure, who for that he excelled in knowledge of Plants, and taught Æſculapius (as many report) their Faculties, is thought by Pliny and ſome others to have been the Inventer of Phyſick. Æſculapius had two ſons, Podalirius and Machaon, who following their Fathers ſteps, and profeſſing Phyſick, did principally beautifie and practiſe that part thereof which is called Chirurgery, and for that cauſe were accounted the Inventers thereof. After thoſe Aſclepiades left this Art much enlarged, as hereditary to his Poſterity; by whoſe ſtudy and diligence, that part of the Art was invented and annexed, which by a more curious skill ſearcheth and cureth thoſe diſeaſes which lie hid within the body. Hippocrates the Coan the ſon of Heraclidas, born of the noble race of Aſclepiades, Prince of the Phyſicians that were before him, perfected Phyſick, and reduced it into an Art, and wrote divers Books thereof in Greek. Galen ſucceeded him ſix hundred years after, who was a Man moſt famous, not onely for his knowledge in Phyſick, but alſo in all other Sciences, who faithfully interpreting every thing that was obſcure and difficult en the Writings of Hippocrates, enlarged the Science with many Volumes. Thus therefore was the beginning, thus the increaſe and perfecting the Art of Phyſick, as much as can be hoped for from Mans Induſtry. Although indeed we cannot deny but that experience hath much

Plin. l. 7. c. 3

profited

profited this Art as it hath and doth many other. For as men perceived that some things were profitable, some unprofitable for this or that disease, they set it down, and so by diligent observation and marking of singularities, they established universal and certain Precepts, and so brought it into an Art. For so we find it recorded in ancient Histories, before the invention of Physick, that the Babylonians and Assyrians had a Custom amongst them to lay their sick and diseased persons in the Porches and Entries of their Houses, or to carry them into the Streets or Market-places, that such as passed by and saw them, might give them counsel to take those things to cure their Diseases, which they had formerly found profitable in themselves, or any other in the like affects, neither might any pass by a sick man in silence. Also Strabo writes that it was a custom in Greece that those which were sick should resort to Æsculapius his Temple in Epidaurus, that there as they slept, by their dreams they might be admonished by the god what means they should use to be cured; and when they were freed from their Diseases, they writ the manner of their Infirmities, and the means by which they were cured, in Tables and fastned them to the Pillars of the Temple, not onely for the glory of the god, but also for the profit of such as should afterwards be affected with the like Maladies. All which Tables (as Fame reports) Hippocrates transcribed, and so from those drew the Art of Physick. Beasts also have added much to his Art. For one Man was not onely instructed by another, but learned also much from brute Beasts; for they by the onely instinct of Nature have found out divers Herbs and Remedies, by which they freed and preserved themselves from Infirmities, which might presently be transferred to Mans use. Wherefore considering that such and so many have concurred to bring this Art to perfection, who hereafter dare call in question the Excellency thereof? chiefly if he respected the subject thereof, Mans Body, a thing more noble than all other Mundane things, and for which the rest were created. Which thing moved Herophilus in times past to call Physicians, The Hands of the gods. For as we by putting forth our hand, do help any man out of the Water and Mud into which he is fallen: even so we do sustain those that are thrown down from the top of Health to the gates of Death by violence of Diseases, with happy Medicins, and as it were by some special and divine gift deliver them out of the jaws of Death. Homer the Prince of Greek Poets affirms, That one Physician is far more worthy than many other Men. All Antiquity gave Physicians such honour, that they worshiped them with great veneration as gods, or the sons of their gods. For who is it which is not much delighted with the divine force of healthful Medicins, with which (we see by daily experience) Physicians, as armed with Mercuries Rod, do bring back those languishing souls which are even entering the gates of Death? Hence it cometh to pass that the divine Poets of ancient Times, as Orpheus, and Musæus, and Hesiod, and the most renowned Philosophers, Pythagoras, Plato, Aristotle, Theophrastus, Chrysippus, Cato Censorius, and Varro esteemed nothing more excellent than to excel in the knowledge of Medicins, and to testifie the same by written monuments to Posterity. For what can be more noble and worthy of a generous disposition than to attain to that by the benefit of Physick, that adorned with the ornaments of dignity thou maist have power over other men, and favoured of Princes, Kings, and Emperours, maist appoint and prescribe to them those things which are profitable to preserve health, and cure their diseases? But if thou look for benefit by Sciences, then know that the Professors hereof have beside sufficient gain, acquired much honour and many friends. Hippocrates coming to Abdera to cure Democritus of his Madness, not onely the men of the City, but also the women and children, and people of every Age, Sex and Rank, went forth to meet him, giving him with a common consent and loud voice, the title of a Tutelary Deity and Father of their Country. But the Athenians, for freeing their Country from the Plague, with triumphant pomp celebrated Plays to his honour, and bountifully set upon his head, as if he had been a King, a Crown of Gold weighing 1000 pieces of their golden Coin, and erected his Statue for a perpetual Monument of his Piety and Learning. Erasistratus the Nephew of Aristotle by his daughter, received, freely given him by Ptolomy King of Egypt, for the cure of his Son, 100 talents of gold. The Emperour Augustus honoured Antonius Musa with a golden Statue. Quintus Stertinius yearly received out of the Emperours Treasury 12500 pieces of gold. In the time of our Grandfathers, Petrus Aponensis called Conciliator, was so famous through all Italy for his knowledge in Physick, that he could scarce be intreated to come to any man of fashion that was sick, unless he gave him 50 Crowns for every day he was absent from home: but when he went to cure Heronius the Bishop of Rome, he received 400 Crowns for every day he was absent. Our French Chronicles relate in what credit and estimation James Cotterius the Physician was with Lewis XI. King of France; for they report he gave him Monethly out of his Treasury 10000 Crowns. Physick in times past hath been in such

In what esteem Physicians have formerly been.

ſuch Eſteem with many famous and noble Perſonages, that divers Kings and Princes delighted with the Study thereof, and deſirous to attain glory thereby, called ſundry Herbs after their own names. For ſo Gentian *took its name of* Gentius *King of* Illyria; *the Herb* Lyſimachia *of* Lyſimachus *the King of* Macedon, *the* Mithridatick *Herb or* Scordium *of* Mithridates *the King of* Pontus *and* Bithynia, Achillea *of* Achilles, Centory *of* Chiron *the Centaure*, Artemiſia *of* Artemiſia *the Queen of* Caria. Attalus *King of* Pergamus, Solomon *of* Judæa, Evax *of* Arabia, *and* Juba *the King of* Mauritania, *were not onely inflamed with a deſire of the knowledge of Plants; but either they have written Books of it, or for the great commodity of Poſterity, invented by their skill, many choice Antidotes compounded of divers Simples; neither the deſire of Learning this moſt noble Science is yet altogether extinct; as may appear by that* Indian *Plant* Tobacco, *called by ſome the Noble Herb,* Catharines *Herb, and* Medices *Herb, but commonly the* Queens *Herb, becauſe* Catharine Medices *the Mother of our King, by her ſingular ſtudy and induſtry made manifeſt the excellent vertue it hath in curing malign Ulcers and Wounds, which before was unknown to the* French. *For theſe worthy men underſtood that their glory, thus faſtened and ingraffed into the deep, and as it were ever-living Roots of Plants, would never decay; but ſhould be propagated to all Poſterity in many ſucceeding Ages, growing up with their ſprouting and budding Shouts, Stalks, Flowers, and Fruits. Neither did theſe famous men whileſt they adorned this part of Phyſick, ſuffer the other, which treats of the Diſſection of Mans Body, be buried in oblivion, and without their knowledge; as inſtructed with the Precepts and Learning of the Wiſeſt Men, how artificial and unimitable by mortal hand this Fabrick of our Body is. Neither is it probable that* Apis, Oſiris, *and* Ptolomy *Kings of* Egypt, Solomon, Alexander *the Great*, Mithridates, Attalus, *ſeeing they dedicated themſelves wholly to the contemplation of Natural things, neglected the uſe of Anatomy, and being men moſt deſirous to know themſelves, to have been ignorant of the ſtructure of their own Bodies, being the habitation of their Souls immortal, and made to the Image of God: ſeeing they obſerved with certain judgement the different lights of the Sun, Moon, and Stars; and paſſed over ſo many Lands, ſo many Seas, ſo many Regions, ſo far remote one from another, by ways ſo terrible by reaſon of cold, uncouthneſs, darkneſs, by rocks, by fire and ſword, with great labour, charge, and danger of life, onely that they might ſatisfie their minds thirſting after the knowledge of things; and to have left untouched a thing truly noble, admirable, and moſt worthy of knowledge, eaſie to be attained by any, and to be acquired without any danger of life or fortunes.*

Names given to Plants.

Seeing there be three parts of that Phyſick which at this time we profeſs; Chirurgery, *which by the uſe of the hand,* Diet *which with the convenient manner of feeding and ordering the body, and* Pharmacy *that by Medicins attempt to expel Diſeaſes, and preſerve Health; The prime Phyſicians do not without reaſon contend which of theſe may be accounted the chief. Certainly* Herophilus *had* Pharmacy *in ſuch eſteem, that he thought Medicins were firſt mixed and adminiſtred to the Sick by* Apollo *(whom Antiquity thought a great Deity.) And* Pliny *had ſo good an opinion of* Diet, *that he exclaims, The true Remedies and Antidotes againſt Diſeaſes, are put into the Pot and eaten every day by the poor People. Verily all learned men confeſs, that the manner of curing which which is performed by Diet, is much more facil and proſperous than that which is done by Medicins; as thoſe things which ſought with much labour and coſt are taken with much loathing, and taken are ſcarce retained, but retained they oft work with much labour and pain: Which things long ago moved* Aſclepiades *to exclude the uſe of Medicins as hurtful to the ſtomach. Yet if we will believe* Celſus, *neither of theſe parts merit the preheminence, but both of them give place to* Chirurgery. *For ſeeing that Fortune is very powerful in Diſeaſes, and the ſame Meats and Medicins are often good and often vain, truly it is hard to ſay, whether the health is recovered by the benefit of Diet and Pharmacy, or by the ſtrength of the body. Moreover in thoſe caſes in which we moſt prevail with Medicins, although the profit be moſt manifeſt, yet it is evident that health is often ſought in vain even by theſe things, and often recovered without them. As it may be perceived by ſome troubled with ſore Eyes, and others with Quartan Fevers, who having been long troubled by Phyſicians, are healed without them. But the effect of Chirurgery as it is very neceſſary, ſo it is the moſt evident amongſt all the parts of Phyſick. For who without Chirurgery can hope to cure Broken or Luxated parts, who Wounds and Ulcers, who the Falling of the Matrix, the Stone in the Bladder, a Member infeſted with a Gangrene or Sphacele? Beſides, this part alſo is the moſt antient; for* Podalirius *and* Machaon *following their General* Agamemnon *to the* Trojan *Wars, yielded no ſmall comfort to their Fellow-Souldiers. Whom notwithſtanding* Homer *affirms not to have given any help in the Peſtilence, nor in divers other Diſeaſes, but onely were accuſtomed*

Phyſick is divided into three parts.

to

The excellency of Chirurgery.

to heal Wounds by Inſtruments and Medicins. And if the difficulty of learning it argue the excellency of the Art, who can doubt but Chirurgery muſt be the moſt excellent, ſeeing that none ought to be accounted a Chirurgeon, or which can perform his duty without the knowledge of Diet *and* Pharmacy? *But both the other can perform their parts without Chirurgery, if we may believe* Galen. *But if we conſider the matter more nearly according to truth, we ſhall underſtand thoſe three parts have a certain common bond, and are very near of kindred, ſo that the one implores the aid of the other; neither can the Phyſician do any thing praiſe-worthy without the conſpiracy and joint conſent of theſe three; therefore in ancient times there was but one Performer and Uſer of all the three Parts. But the multitude of men daily increaſing, and on the contrary, Mans life decreaſing, ſo that it did not ſeem able to ſuffice for to learn and exerciſe all the three, the Workmen divided themſelves. Wherefore that which happens to any man either by lot, or counſel, that let him follow, maintain and onely uſe, as mindful how ſhort his life is, and how long the Art.*

A Table of the Books and Chapters.

Chap. 1 WHat Chirurgery is Page 1
2 Of Chirurgical Operations ib.
3 Of things Natural 2
4 Of Elements ib.
5 Of Temperaments 3
6 Of Humours 6
7 Of the Practice of the aforesaid rules of temperaments 11
8 Of the Faculties 13
9 Of the Actions 14
10 Of the Spirits 15
11 Of the Adjuncts of things Natural, 16
12 Of things Not Natural 17
13 Of the Air 18
14 Of Meat and Drink 19
15 Of Motion and Rest 21
16 Sleep and Watching 22
17 Repletion, Inanition or Emptiness 23
18 Of the perturbations or passions of the Mind 24
19 Of things against Nature, and first of the cause of a Disease 25
20 Of a Disease 26
21 Of a Symptom ib.
22 Of Indications ib.
23 Of certain wonderful and extravagant ways of curing Diseases 31
24 Of certain jugling and deceitful ways of curing 32

Book II. Of living Creatures, and of the Excellency of Man, from 34 to 49.

Book III. Treating of the Anatomy of Mans Body 50

Ch. 1 The Division or Partition of Mans Body 52
2 Of the containing parts of the Epigastrium, and the preparation to anatomical administration 56
3 Of the outmost skin or cuticle ib.
4 Of the true skin 57
5 Of the fleshy Panicle ib.
6 Of the Fat 58
7 Of the common coat of the Muscles 59
8 What a Muscle is, and the differences thereof ib.
9 Of the parts of a Muscle 61
10 A more particular inquisition into each part of a muscle 62
11 Of the Muscles of the Epigastrium, or lower belly 63
Of the white line, and Peritonæum, or rim of the belly 64
12 Of the Epiploon, Omentum, or Zirbus, i.e. the Kall 66
13 Of the Ventricle or Stomach 67
14 Of the Guts 68
15 Of the Mesentery 70
16 Of the Glandules in general, and of the Pancreas or Sweetbread 71
17 Of the Liver ib.
18 Of the Bladder of the Gall 72
19 Of the Spleen or Milt 73
20 Of the Vena Porta, and Gate-vein, and the distribution thereof ib.
21 Of the original of the Artery, and the division of the branch descending to the natural parts 74
22 Of the distribution of the Nerves to the natural parts 75
23 The manner of taking out the Guts 76
24 The orig. and distribution of the descendent hollow vein ib.
25 Of the Kidnies or Reins 77
26 Of the Spermatick Vessels 78
27 Of the Testicles or Stones ib.
28 Of the varicous bodies or parastats, and of the ejaculatory Vessels, and the glandulous or prostates 79
29 Of the Ureters 81
30 Of the Bladder 81
31 Of the Yard 82
32 Of the Spermatick Vessels and Testicles in women 83
33 Of the Womb 85
34 Of the coats containing the Infant in the Womb 87
35 Of the Navel 88

Book IV. Treating of the Vital Parts contained in the Chest.

Ch. 1 What the Thorax or the Chest is, into what parts it may be divided, and the nature of these parts pag. 89
2 Of the containing and contained parts of the Chest 90
3 Of the Brests or Dugs ib.
4 Of the Clavicles, or Collar-bones and Ribs 91
5 The anatomical administration of the Sternon 92
6 Of the Pleura, or coat investing of the Ribs ib.
7 Of the Mediastinum 93
8 Of the Diaphragma or Midriff ib.
9 Of the Lungs 94
Of the Pericardium, or purse of the Heart ib.
10 Of the Heart 95
11 Of the Orifices and Valves of the Heart 96
12 Of the distribution of the Vena Arteriosa, and the Arteria Venosa 97
13 Of the distribution of the hollow Vein 98
14 Of the distribution of the nerves or sinews of the 6 conj. 101
15 The division of the Arteries ib.
16 Of the Thumus 103
17 Of the Aspera Arteria or Weason ib.
18 Of the Gullet 105

Book V. Of the Animal parts contained in the head.

Ch. 1 A general description of the Head pag. 106
2 Of the musculous skin of the Head, (commonly called the Hairy Scalp) and of the Pericranium ib.
3 Of the Sutures 107
4 Of the Cranium or Skull 108
5 Of the Meninges, that is, the two membranes called Dura Mater and Pia Mater 109
6 Of the Brain ib.
7 Of the Ventricles and Mamill. Processes of the Brain 111
8 Of the seven conjugations of the Nerves of the Brain, so called, because they always shew the Nerve conjugated and doubled, that is, on each side one 113
9 Of the Rete Mirabile, or wonderful Net, and of the Wedg-bone 115
10 Of the holes of the inner basis of the skull 116
11 Of the perforations of the external basis of the Brain ib.
12 Of the Spinal Marrow or Pith of the Back 117

Book VI. Treating of the Muscles, and Bones, and the other extreme parts of the Body.

Ch. 1 Of the Bones of the Face pag. 118
2 Of the Teeth 119
3 Of the Broad Muscle 120
4 Of the Eye-lids and Eye-brows ib.
5 Of the Eyes 121
6 Of the Muscles, Coats, and Humours of the Eye ib.
7 Of the Nose 124
8 Of the Muscles of the Face ib.
9 Of the Muscles of the lower Jaw 125
10 Of the Ears and Parotides, or Kernels of the Ears 126
11 Of the Bone Hyoides, and the Muscles thereof 128
12 Of the Tongue ib.

13 *Of the Mouth* 129
14 *Of the Gargareon or* Uvula ib.
15 *Of the* Larinx *or Throttle* ib.
16 *Of the neck and parts thereof* 131
17 *Of the muſcles of the Neck* 133
18 *Of the muſcles of the Cheſt and Loins* 139
19 *Of the muſcles of the ſhoulder-blade* 140
20 *The deſcription of the hand taken in general* 141
21 *The deſcription of the ſubclavian vein, and firſt of the* Cephalica *or* Humeraria 142
22 *The deſcription of the axillary vein* 143
23 *The diſtribution of the axillary artery* ib.
24 *Of the Nerves of the Neck, Back, and Arm* 144
25 *The deſcription of the bone of the Arm, and the muſcles which move it* 145
26 *A deſcription of the bones of the Cubit, and the muſcles moving them* 147
27 *A deſcription of the bones of the wriſt, after-wriſt and fingers* 148
28 *Of the muſcles which ſeated in the cubit move the Wand, and with it the hand* 150
29 *Of the muſcles of the inſide of the hand* 151
30 *A deſcription of the leg taken in general* 152
31 *A deſcription of the crural Vein* ib.
32 *A deſcription of the crural Artery* 153
33 *Of the Nerves of the Loins, Holy-bone and Thigh* ib.
34 *Of the proper parts of the thigh* 154
35 *Of the muſcles moving the thigh* 156
36 *Of the bones of the leg or ſhank* 157
37 *Of the muſcles of the legs* ib.
38 *Of the bones of the foot* 158
39 *Of the muſcles moving the foot* 161
40 *Of the muſcles moving the toes of the feet* 162
41 *An Epitome or brief recital of the bones in mans body*, ib.
42 *An Epitome of the names and kinds of compoſure of the bones* 165

Book VII. Of Tumors againſt Nature in general.

Ch. 1. *What a Tumor againſt Nature, vulgarly called an Impoſtume is, and what be the differences thereof* 169
2 *Of the general cauſes of Tumors* ib.
3 *The ſigns of Impoſtumes or Tumors in general* 170
4 *Of the Prognoſticks in Impoſtumes* 171
5 *Of the general Cure of Tumors againſt Nature* ib.
6 *Of the four principal and general Tumors, and of other Impoſtumes, which may be reduced to them* 172
7 *Of a Phlegmon* ib.
8 *Of the cauſes and ſigns of a Phlegmon* 173
9 *Of the Cure of a true Phlegmon* ib.
10 *Of the Cure of an ulcerated Phlegmon* 175
11 *Of Fevers, and the cure of the Fevers which accompany a Phlegmon* 176
12 *Of an* Eryſipelas, *or Inflammation* 178
13 *Of the Cure of an* Eryſipelas 179
14 *Of the* Herpes, i.e. *Tetters or Ringworms, or ſuch like*, ib.
15 *Of Fevers which happen upon eryſipelous Tumors* 180
16 *Of an* Oedema *or cold phlegmatick Tumor* 181
17 *Of the cure of flatulent and wateriſh Tumors* 182
18 *Of the cure of a flatulent and wateriſh Tumor* 183
19 *Of an* Atheroma, Steatoma *and* Meliceris 184
20 *Of the cure of* Lupiæ, i.e. *Wens, or Ganglions* ib.
21 *Of a* Ganglion *more particularly ſo called* 185
22 *Of the* Strumæ *or* Scrophulæ, i.e. *the Kings-evil* 186
23 *Of the Fever which happens upon an œdematous tum.* 187
24 *Of* Scirrhus, *or an hard tumor proceeding of melanch.* 188
25 *Of the cure of a* Schirrus ib.
26 *Of a Cancer already generated* 189
27 *Of the cauſes, kinds and prognoſticks of a Cancer* ib.
28 *Of the cure of a Canc. beginning and not yet ulcerated*, 190
29 *Of the cure of an ulcerated Cancer* ib.
30 *Of the topick medicins to be applied to an ulcerated and not ulcerated Cancer* 191
31 *Of the Fever which happeneth in ſcirrhous Tumors* 192
32 *Of an* Aneuriſma, i.e. *the dilation or ſpringing of an Artery, Vein, or Sinew* 194

Book VIII. Of the particular Tumors againſt Nature.

Ch. 1. *Of an* Hydrocephalos, *or watery tumor which commonly affects the heads of Infants* 195
2 *Of a* Polypus, *being an eating diſeaſe in the Noſe* 196
3 *Of the* Parotides, i.e. *certain ſwellings about the Ears*, ib.
4 *Of the* Epulis, *or over-growing of the fleſh of the gums*, 197
5 *Of the* Ranula ib.
6 *Of the ſwellings of the gland or almonds of the throat*, 198
7 *Of the inflammation and relaxation in the* Uvula *or* Columella ib.
8 *Of the* Angina *or ſquinzy* 200
9 *Of the* Bronchocele, *or rupture of the throat* 201
10 *Of the Pluriſie* ib.
11 *Of the Dropſie* 202
12 *Of the cure of the dropſie* 203
13 *Of the tumor and relaxation of the Navil* 205
14 *Of the tumors of the groins and cods called* Herniæ, i. e. *Ruptures* ib.
15 *Of the cure of Ruptures* 206
16 *Of the golden ligature or the* Punctus Aureus, *as they call it* 208
17 *Of the cure of other kinds of Ruptures* 210
18 *Of the falling down of the fundament* 211
19 *Of the* Paronychiæ 212
20 *Of the ſwelling of the Knees* ib.
21 *Of the* Dracunculus 213

Book IX. Of Wounds in general.

1 *What a wound is, what the kinds and differences thereof are, and from whence they may be drawn or derived* 216
2 *Of the cauſes of wounds* ib.
3 *Of the ſigns of Wounds* 217
4 *Of prognoſticks to be made in wounds* ib.
5 *Of the cure of Wounds in general* 218
6 *Of Sutures* 219
7 *Of the flux of bloud which uſually happens in wounds* 220
8 *Of the pain which happens upon Wounds* 221
9 *Of Convulſion by reaſon of a Wound* ib.
10 *The Cure of a Convulſion* 222
11 *Of the cure of a Convulſion by ſympathy and pain* ib.
12 *Of the Palſie* 223
13 *Of the cure of the Palſie* ib.
14 *Of Swouning* 224
15 *Of* Delirium, i.e. *raving, talking idlely, or doting* 225

Book X. Of the green and bloudy Wounds of each part.

Ch. 1. *Of the kinds and differences of a broken skull* 225
2 *Of the cauſes and ſigns of a broken skull* 227
3 *Of the ſigns of a broken skull, which are manifeſt to our ſenſe* ib.
4 *Of a Fiſſure being the firſt kind of a broken skull* 228
5 *Of a Contuſion which is the ſecond part of a Fracture*, 230
6 *Of an effracture, depreſſion of the bone, being the third kind of a Fracture* 232
7 *Of a ſeat, being the fourth kind of a broken skull* 213
8 *Of a* Reſonitus *or Counterfiſſure, being the fifth kind of Fracture* 234
9 *Of the moving or concuſſion of the Brain* 235
10 *Of prognoſticks to be made in Fractures of the skull* 236
11 *Why when the Brain is hurt by a wound of the head there may follow a convulſion of the oppoſite part* 237
12 *A convulſ. of the deadly ſigns in wounds of the head*, 238
13 *Of ſalutary ſigns in wounds of the head* 239
14 *Of the general cure of a broken skull, and of the ſymptoms uſually happening thereupon* ib.

15 *Of the particular cure of wounds of the Head, and of the musculous skin* 241
16 *Of the particular cure of a fracture or broken skull* 243
17 *Why we use trepanning in the fractures of the skull* 244
18 *A description of Trepans* 245
19 *Of the places of the skull whereto you may not apply a Trepan* 247
20 *Of the corruption and* Caries, *or rottenness of the bones of the Head* 248
21 *Of the discommodities which happen to the* Crassa Meninx *by fractures of the skull* 250
22 *Of the cure of the Brain, being shaken or moved* 251
23 *Of the Wounds of the Face* 252
24 *Of the Wounds of the Eys* 253
25 *Of the Wounds of the Cheeks* 255
26 *Of the Wounds of the Nose* 256
27 *Of the Wounds of the Tongue* 257
28 *Of the Wounds of the Ears* ib.
29 *Of the Wounds of the Neck and Throat* ib.
30 *Of the Wounds of the Chest* 259
31 *Of the Cure of the Wounds of the Chest* ib.
32 *Of differences, causes, signs, and cure of an Hect. Fever,* 262
33 *Of the Wounds of the* Epigastrium, *and of the whole lower belly* 264
34 *Of the cure of wounds of the lower belly* 265
35 *Of the Wounds of the Groins, Yard, and Testicles* 266
36 *Of the Wounds of the Thigh and Legs* ib.
37 *Of the Wounds of the Nerves and nervous parts* ib.
38 *Of the cure of the wounds of the nervous parts* 267
39 *Of the wounds of the joints* 268
40 *Of the Wounds of the Ligaments* 269

Book XI. Of Wounds made by Gun-shot, other Fiery Engines, and of all sorts of Weapons. The Preface.

The first discourse wherein wounds made by Gun-shot are freed from being burnt, or cauterized according to Vigo's *method* 272
Another discourse of these things, which King Charles IX. *returning from the Expedition, and taking of* Rouen, *inquired of me concerning wounds made by Gun-shot* 273
Ch. 1. *A division of wounds drawn from the variety of the wounded parts, and the bullets which wound* 278
2 *Of the signs of wounds made by Gun-shot* ib.
3 *How these wounds must be ordered at the first dressing,* ib.
4 *A description of fit Instruments to draw forth bullets, and other strange bodies* 279
5 *What dressing must first be used, after the strange bodies are pluckt or drawn out of the wound* 281
6 *How you shall order it at the second dressing* 282
7 *By what means strange bodies left in at the first dressing, may be drawn forth* 283
8 *Of Indications to be observed in this kind of wounds* ib.
9 *What remains for the Surg. to do in this kind of wo.* 284
10 *Of Bullets which remain in the body for a long time after the wound is healed up* 285
11 *How to correct the constitutions of the air, so that the noble parts may be strengthened, and the whole body beside* ib.
12 *Certain memorable Histories* 286
13 *An Apology concerning Wounds made by Gun-shot* 287
14 *Another Apology against those who have laboured with new reasons, to prove that wounds made by Gun-shot are poisoned* 290
15 *How wounds made by Arrows differ from those made by Gunshot* 291
16 *Of the diversity of Arrows and Darts* ib.
17 *Of the difference of the wounded parts* ib.
18 *Of drawing forth Arrows* ib.
19 *How arrows broken in a wound may be drawn forth,* 292
20 *What to be done when an arrow is left fastned or sticking in a bone* 293
21 *Of poisonous wounds* ib.

Book XII. Of Contusions and Gangrenes.

Ch. 1. *Of a Contusion* pag. 293
2 *Of the general Cure of great and enormous Contusions,* 294
3 *How we must handle Contusions when they are joined with a wound* ib.
4 *Of those Contusions which are without a wound* 295
5 *By what means the contused part may be freed from the fear and imminent danger of a Gangrene* ib.
6 *Of that strange kind of Symptome which happens upon Contusions of the Ribs* 296
7 *A Discourse of* Mummia, *or Mummy* ib.
8 *Of Combustions and their differences* 297
9 *Of hot and attractive Medicins to be applied to Burns,* ib.
10 *Of a Gangrene and Mortification* 299
11 *Of the general and particular causes of a Gangrene* ib.
12 *Of the antecedent causes of a Gangrene* ib.
13 *Of the signs of a Gangrene* 300
14 *Of the Prognosticks in Gangrenes* 301
15 *Of the general Cure of a Gangrene* ib.
16 *Of the particular cure of a Gangrene* ib.
17 *The signs of a perfect* Necrosis, *or Mortification* 302
18 *Where amputation must be made* ib.
19 *How the Section or Amputation must be performed* 303
20 *How to stanch the bleeding when the member is taken off* 304
21 *How after the bloud is stanched, you must dress the wounded member* ib.
22 *How you must stop the bleeding, if any of the bound up vessels chance to get loose* ib.
23 *How to perform the residue of the Cure of the amputated member* 305
24 *What just occasion moved the Author to devise this new form of remedy, to stanch the bloud after the amputation of a member, and to forsake the common way used almost by all Chirurgeons; which is by application of actual cauteries* ib.
25 *The practice of the former precepts is declared together with a memorable History of a certain Souldier, whose arm was taken off at the elbow* 306

Book XIII. Of Ulcers, Fistulaes, and Hæmorrhoids.

Ch. 1. *Of the nature causes, and differences of Ulcers* 307
2 *Of the signs of Ulcers* 309
3 *Of the Prognosticks of Ulcers* ib.
4 *Of the general cure of Ulcers* 310
5 *Of a distempered Ulcer* 311
6 *Of an Ulcer of pain* ib.
7 *Of Ulcers, with overgrowing or proudness of flesh* 512
8 *Of an Ulcer putrid and breeding worms* ib.
9 *Of a sordid Ulcer* ib.
10 *Of a virulent and malign Ulcer, which is termed* Cacoethes, *and of a Chironian Ulcer* 313
11 *An advertisement to the young Chirurgeon touching the distance of times wherein malign Ulcers are to be dressed,* 314
12 *How to bind up Ulcers* ib.
13 *Of the cure of particular Ulcers, and first of those of the Eyes* ib.
14 *Of the* Ozæna *and Ulcers of the Nose* 315
15 *Of the Ulcers of the mouth* ib.
16 *Of the Ulcers of the Ears* 316
17 *Of the Ulcers of the Wind-pipe, Weazon, Stomach, and Guts* 317
18 *Of the Ulcers of the Kidnies and Bladder* ib.
19 *Of the Ulcers of the Womb* 318
20 *Of the Varices and their Cure by cutting* 319
21 *Of Fistulaes* ib.
22 *Of the cure of Fistulaes* 320
23 *Of the Fistulaes in the Fundament* 321
24 *Of Hæmorrhoids* ib.

A Table of the Books and Chapters.

Book XIV. Of Bandages or Ligatures.

Ch. 1 *Of the differences of Bandages* pag. 322
2 *Sheweth the Indications and general Precepts of fitting of Bandages and Ligatures.* 323
3 *Of the 3 kinds of Bondages neceſſary in Fractures* 324
4 *Of the binding up of Fract. aſſociated with a wound* 325
5 *Certain common Precepts of the binding up of Fractures and Luxations* ib.
6 *Of the Uſes for which Ligatures ſerve* ib.
7 *Of Bolſters or Compreſſes* 326
8 *Of the Uſe of Splints, Junks, and Caſes* ib.

Book XV. Of Fractures.

Ch. 1 *What a Fracture is, and the differences thereof* 327
2 *Of the ſigns of a Fracture.* ib.
3 *Prognoſticks to be made in Fractures* 328
4 *The general cure of broken and diſlocated Bones* 329
5 *By what means you may perform the third Intention in curing Fractures and diſlocations, which is the hindering and correction of Accidents and Symptoms* 330
6 *Of the Fracture of the Noſe* 331
7 *Of the fracture of the lower Jaw* ib.
8 *Of the fracture of the Clavicle or Collar-bone* 332
9 *Of the fracture of the ſhoulder-blade* ib.
10 *Of the fracture and depreſſion of the* Sternon, *or Breſt-bone* 333
11 *Of the fracture of the Ribs* ib.
12 *Of certain preternatural affects which enſue upon broken Ribs* 334
13 *Of the fracture of the* Vertebræ *or Rack-bones of the Back, and their Proceſſes* 335
14 *Of the fracture of the Holy-bone* ib.
15 *Of the fracture of the Rump* ib.
16 *Of the fracture of the Hip, or* Os Ileum 336
17 *Of a fracture of the ſhoulder or arm-bone* ib.
18 *Of the fracture of the Cubit, or Ell and Wand* ib.
19 *Of the fracture of a Hand* 337
20 *Of the fracture of a Thigh* ib.
21 *Of the fracture of the Thigh nigh to the joint, or the upper or lower head of the bone* 339
22 *Of the fract. of the* Patella, *or whirl-bone of the knee* 340
23 *Of a broken Leg* ib.
24 *Of ſomething to be obſerved in Ligation, when a Fracture is aſſociated with a wound* 341
25 *What was uſed to the Authors leg after firſt dreſſing* 342
26 *What may be the cauſe of the convulſive twitchings of broken members* 343
27 *Certain documents concerning the parts whereon the Patient muſt neceſſarily reſt whileſt he lies in his bed* ib.
28 *By what means we may know the* Callus *is breeding* 344
29 *Of thoſe things that may hinder the generation of a* Callus, *and how to correct the fault thereof, if it be ill-formed* 345
30 *Of Fomentations which be uſed in broken bones* 346
31 *Of the fractures of the bones in the Feet* ib.

Book XVI. Of Diſlocations or Luxations.

Ch. 1 *Of the kinds and manners of Diſlocations* 346
2 *Of the differences of Diſlocations* 347
3 *Of the cauſes of Diſlocations* ib.
4 *The ſigns of Diſlocations* ib.
5 *Of Prognoſticks to be made upon Luxations* 348
6 *Of the general cure of Diſlocations* 349
7 *The deſcription of certain Engins ſerving for the reſtoring of Diſlocations* ib.
8 *Of the diſlocation of the Jaw-bone* 351
9 *How to ſet the Jaw diſlocated forwards on both ſides* ib.
10 *Of reſtoring the Jaw diſloc. forwards but on one ſide* ib.
11 *Of the luxation of the Collar-bone* 352
12 *Of the luxation of the Spine, or Back-bone* ib.
13 *Of the diſlocation of the Head* 353
14 *Of the diſloc. of the* Vertebræ *or rack-bones of the neck* ib.
15 *Of the diſlocated* Vertebræ *of the Back* ib.
16 *How to reſtore the Spine outwardly diſlocated* 354
17 *A more particular inquiry of the diſlocation of the* Vertebræ, *proceeding from an internal cauſe* ib.
18 *Prognoſticks of the diſlocated* Vertebræ *of the back* 355
19 *Of the diſlocation of the Rump* ib.
20 *Of the luxation of the Ribs* ib.
21 *Of a diſlocated ſhoulder* 356
22 *Of the firſt manner of ſetting a ſhoulder, which is with ones Fiſt* ib.
23 *Of the ſecond manner of reſtoring a ſhoulder, that is, with the Heel, when as the Patient by reaſon of pain can neither ſit nor ſtand* 357
24 *Of the third manner of reſtoring a ſhoulder* 358
25 *Of the fourth manner of reſtoring a diſlocated ſhoulder* ib.
26 *Of the fifth manner of putting the ſhoulder into joint, which is performed by a Ladder* 359
27 *The ſixth manner of reſtoring a ſhoulder luxated into the arm-pit* 360
28 *How to reſtore a ſhoulder diſlocated forwards* 361
29 *Of the ſhoulder luxated outwardly* 362
30 *Of the ſhoulder diſlocated upwards* ib.
31 *Of the diſlocation of the Elbow* 363
32 *How to reſtore the Elbow, diſlocated outwardly* ib.
33 *Of the diſlocation of the Elbow to the inſide, and of a compleat and uncompleat luxation* 364
34 *Of the diſlocation of the* Styliformis *or Bodkin-like proceſs of the Cubit or Ell* 365
35 *Of the diſlocation of the Wriſt* ib.
36 *Of the diſlocated bones of the Wriſt* ib.
37 *Of the diſlocated bones of the after-wriſt* ib.
38 *Of the diſlocated Finger* 366
39 *Of a diſlocated Thigh or Hip* ib.
40 *Prognoſticks belonging to a diſlocated Hip* ib.
41 *Of the ſigns of the Hip diſloc. outwardly or inwardly* 367
42 *Of the Thigh-bone diſlocated forwards* 368
43 *Of the Thigh-bone diſlocated backwards* ib.
44 *Of reſtoring the Thigh-bone diſlocated inwards* 369
45 *Of reſtoring the Thigh diſlocated outwardly* 370
46 *Of reſtoring the Thigh diſlocated forwards* ib.
47 *Of reſtoring the Thigh diſlocated backwards* ib.
48 *Of the diſlocation of the whirl-bone of the knee* 371
49 *Of the diſlocated Knee* ib.
50 *Of a Knee diſlocated forwards* ib.
51 *Of the ſeparation of the greater and leſſer focil* 372
52 *Of the Leg-bone or greater focil diſlocated, and divided from the paſtern-bone* ib.
53 *Of the diſlocation of the Heel* ib.
54 *Of the Symptoms which follow upon the contuſion of the Heel* ib.
55 *Of the diſlocated Paſtern, or Ankle-bone* 373
56 *Of the diſlocation of the Inſtep and back of the foot* ib.
57 *Of the diſlocation of the Toes* ib.
58 *Of the Symptoms and accidents which may befal a broken or diſlocated member* ib.

Book XVII. Of divers other preternatural affects whoſe cure is commonly performed by Surgery.

Ch. 1 *Of an* Alopecia, *or the falling away of the hairs of the Head.* pag. 374
2 *Of the* Tinea *or Scald-head* 375
3 *Of the* Vertigo, *or giddineſs* 376
4 *Of the* Hemicrania *or Meagrim* ib.
5 *Of certain affects of the Eyes, and firſt of ſtaying up the upper Eye-lid when it is too lax* 377
6 *Of* Lagopthalmus, *or the Hare-eye* ib.
7 *Of the* Chalazion *or Hail-ſtone, and the* Hordeolum *or Barley-corn of the Eye-lids* 378

8 *Of the* Hydatis, *or fatneſs of the Eye-lids* ib.
9 *Of the Eye-lids faſtned or glewed together* ib.
10 *Of the itching of the Eye-lids* 379
11 *Of* Lippitudo, *or blear-eyes* ib.
12 *Of the* Opthalmia, *or inflammation of the Eyes* ib.
13 *Of the* Proptoſis, *that is, the falling or the ſtarting forth of the Eye, and of the* Pthiſis *and* Camoſis *of the ſame* 380
14 *Of the* Ungula *or* Web 381
15 *Of the* Ægilops, Fiſtula lacrymoſa, *or weeping Fiſtula of the Eye* 382
16 *Of the* Staphyloma, *or Grape-like ſwelling* ib.
17 *Of the* Hypopion, i.e. *the ſuppurate or putrid Eye* 383
18 *Of the* Mydriaſis, *or dilation of the pupil of the Eye* ib.
19 *Of a Cataract* ib.
20 *Of the Phyſical cure of a beginning Cataract* 384
21 *By what ſigns ripe and curable Cataracts may be diſcovered from unripe and uncurable ones* ib.
22 *Of the couching a Cataract* 385
23 *Of the ſtopping of the paſſage of the Ears, and of the falling of things thereinto* 386
24 *Of getting little bones and ſuch like things out of the Jaws and Throat* ib.
25 *Of the Tooth-ach* ib.
26 *Of other affects of the Teeth* 387
27 *Of drawing of Teeth* 388
28 *Of cleanſing of Teeth* 389
29 *Of the impediment and contraction of the Tongue* 390
30 *Of ſuperfluous Fingers, and ſuch as ſtick together* ib.
31 *Of too ſhort a prepuce, and of ſuch as have been circumciſed* 391
32 *Of* Phimoſis *and* Paraphimoſis, *that is ſo great a conſtriction of the Prepuce about the Glans or Nut, that it cannot be bared or uncovered at pleaſure* ib.
33 *Of thoſe whoſe Glans is not rightly perforated, and of the too ſhort or too ſtrait ligament, bridle, or cord of the Yard* ib.
34 *Of the Cauſes of the Stone* 392
35 *Of the ſigns of the Stone in the Kidnies and Bladder* ib.
36 *Prognoſticks in the Stone* 393
37 *What cure is to be uſed when we fear the Stone* 394
38 *What is to be done when the Stone falleth out of the Kidney into the Ureter* 395
39 *What muſt be done, the Stone being fallen into the neck of the bladder* 396
40 *What courſe muſt be taken, if the Stone ſticking in the* Ureter, *or Urinary paſſage, cannot be gotten out by the forementioned Art* 397
41 *What manner of Section is to be made, when a Stone is in a Boys bladder* 397
42 *How to cut Men for the taking out of the Stone in the bladder* 398
43 *What cure muſt be uſed to the wound when the Stone is taken forth* 402
44 *How to lay the Patient after the Stone is taken away* 403
45 *How to cure the wound made by the inciſion* ib.
46 *What cure is to be uſed to Ulcers, when as the Urin flows through them long after the Stone is drawn out* ib.
47 *How to take Stones out of Womens bladders* 404
48 *Of the ſuppreſſion of the Urin by internal cauſes* 405
49 *A digreſſion concerning the purging of ſuch as are unprofitable in the whole body by the Urin* ib.
50 *By what external cauſes the Urin is ſuppreſt, and prognoſticks concerning the ſuppreſſion thereof* 406
51 *Of bloudy Urin* ib.
52 *Of the ſigns of the ulcerated Kidnies* ib.
53 *Of the ſigns of the ulcerated Bladder* 407
54 *Prognoſticks of the ulcerated Reins and Bladder* ib.
55 *What cure muſt be uſed in the ſuppreſſion of the Urin* ib.
56 *Of the* Diabete, *or inability to hold the Urin* 408
57 *Of the Strangury* ib.
58 *Of the Colick* 409
59 *Of Phlebotomy, or Blood-letting* 411
60 *How to open a Vein or draw bloud from thence* 412
61 *Of Cupping-glaſſes or* Ventoſes ib.
62 *Of Leeches, and their Uſe* 414

Book XVIII. Of the Gout.

Ch. 1 *Of the deſcription of the Gout* 414
2 *Of the occult Cauſes of the Gout* ib.
3 *Of the manifeſt Cauſes of the Gout* 416
4 *Out of what part the matter of the Gout may flow down upon the joints* ib.
5 *The ſigns of the Arthritick humour flowing from the brain* 417
6 *The ſigns of a gouty humour proceeding from the Liver* ib.
7 *By what ſigns we may underſtand this or that humour to accompany the Gout in malignity* ib.
8 *Prognoſticks in the Gout* ib.
9 *The general method of preventing and curing the Gout,* 418
10 *Of Vomiting* 419
11 *The other general remedies for the Gout* 420
12 *What Diet is convenient for ſuch as have the Gout* 421
13 *How to ſtrengthen the joints* ib.
14 *Of the palliative cure of the Gout, and the material Cauſes thereof* 422
15 *Of local Medicins that may be uſed to a cold Gout* 423
16 *Of local Medicins to be applied to a hot or ſanguine Gout* 424
17 *Of local Medicins for a cholerick Gout* 425
18 *What remedies muſt be uſed in pains of the joints proceeding of a diſtemper onely, without matter* 426
19 *What is to be done after the fit of the Gout is over* 427
20 *Of the* Tophi, *or knots which grow at the joints of ſuch as are troubled with the Gout* ib.
21 *Of the flatulencies contained in the joints, and counterfeiting true Gouts, and of remedies to be uſed thereto* 428
22 *Of the* Iſchias, *Hip-gout, or* Sciatica ib.
23 *The Cure of the* Sciatica 429
24 *Of the flatulent Convulſion, or convulſive Contraction, which is commonly called by the* French *Gout-Cramp, and by the* Engliſh *the Cramp* 430

Book XIX.

Ch. 1 *Of the* Lues Venerea, *and thoſe ſymptoms which happen by the means thereof* 430
2 *Of the Cauſes of the* Lues Venerea 431
3 *In what humour the malignity of the* Lues Venerea *reſides* 432
4 *Of the ſigns of the* Lues Venerea ib.
5 *Of Prognoſticks* 433
6 *How many, and by what means there are to oppugn this diſeaſe* ib.
7 *How to make choice of the wood* Guaiacum ib.
8 *Of the preparation of the decoction of* Guaiacum 434
9 *Of the ſecond manner of curing the* Lues Venerea, *which is performed by friction or unction* 435
10 *Of the choice preparation and mixing of* Hydrargyrum, ib.
11 *How to uſe the Unction* 436
12 *What cautions to be uſed in rubbing or anointing the Patient* ib.
13 *Of the third manner of Cure, which is performed by Cerates and Emplaſters, as ſubſtitutes of Unctions* 436
14 *Of the fourth manner of curing the* Lues Venerea 437
15 *Of the cure of the ſymptoms, or ſymptomatick affects of the* Lues Venerea, *and firſt of the Ulcers of the Yard* ib.
16 *How a Gonorrhœa differeth from a virulent ſtrangury,* 440
17 *Of the cauſes and difference of the ſcalding or ſharpneſs of the Urin* ib.
18 *Prognoſticks in a virulent Strangury* 441
19 *The chief heads of curing a Gonorrhœa* ib.
20 *The general cure both of the ſcalding of the water, and the virulent Strangury* ib.
21 *Of the proper Cure of a virulent Strangury* 442

22 *Of Caruncles, or fleshy excrescences which sometimes happen to grow in the* Urethra *by the heat or scalding of the Urin* 443
23 *What of the Remedies shall be used to Caruncles occasioned by the* Lues Venerea 444
24 *Of Venereal* Buboes, *or swellings in the groins,* 445
25 *Of the* exostosis, *bunches, or knots growing upon the bones, by reason of the* Lues Venerea 446
26 *Why the bones become rotten, and by what means it may be perceived* ib.
27 *Of actual and potential cauteries* 447
28 *Of the Vulnerary potion* 450
29 *Of Tetters, Ring-worms, or Chops, occasioned by the* Lues Venerea ib.
30 *Of curing the* Lues Venerea *in Infants and little children* 451

Book XX. Of the Small Pox and Meazles; as also of Worms and the Leprosie, *from pag.* 45 . *to pag.* 463.

Book XXI. Of Poisons and of the biting and stinging of a mad Dog, and the bitings and stingings of other venomous Creatures, *from pag.* 463. *to pag.* 490.

Book XXII. Of the Plague.

Ch. 1. *The description of the Plague* Pag. 490
2 *Of the Divine causes of an extraordinary Plague* ib.
3 *Of the Natural causes of the Plague* 491
4 *Of the preparation of humours to putrefaction, and admission of pestiferous impressions* 492
5 *What signs in the Air and Earth prognost. a Plague* ib.
6 *By using what cautions in Air and Diet, one may prevent the Plague* 493
7 *Of the cordial remedies by which we may preserve our bodies in fear of the Plague, and cure those already infected therewith* 494
8 *Of local Medicins to be applied outwardly* 496
9 *Of other things to be observed for prevention, in fear of the Plague* 497
10 *Of the office of Magistrates in time of the Plague* 498
11 *What caution must be used in choosing Physicians, Apothecaries, and Surgeons, who may have care of such as are taken with the Plague* 499
12 *How such as undertake the cure of the Plague ought to arm themselves* ib.
13 *Of the signs of such as are infected with the Plague* 500
14 *What signs in the Plague are mortal* ib.
15 *Signs of the Plague coming by contagion of the Air without any fault of the humours* 501
16 *Signs of the Plague drawn into the body by the fault and putrefaction of humours* ib.
17 *Of the Prognostication that is to be instituted in the Plague* 502
18 *How a pestilent Fever comes to be bred in us* 503
19 *Into what place the Patient ought to betake himself so soon as he finds himself infected* ib.
20 *What Diet ought to be observed, and first of the choice of meat,* 504
21 *What drink the Patient infected ought to use* 506
22 *Of Antidotes to be used in the Plague* 507
23 *Of Epithems to be used for the strengthening of the principal parts* 508
24 *Whether Purging and Bloud-letting be necessary in the beginning of Pestilent Diseases* ib.
25 *Of purging Medicins in a pestilent Disease* 510
26 *Of many Symptoms which happen together with the Plague, and first of the pain of the Head* 511
27 *Of the heat of the Kidnies* 512
28 *Of the eruptions and spots, which commonly are called by the name of Purples or Tokens* ib.
29 *Of the Cure of Eruptions and Spots* 513
30 *Of a pestilent* Bubo *or Plague-sore* 513
31 *Of the Cure of* Buboes *or Plague-sores* 514
32 *Of the nature, causes, and signs of a pestilent carbuncle* 516
33 *What prognosticks may be made in pestilent* Buboes *or Carbuncles* ib.
34 *Of the cure of a pestilent Carbuncle* 518
35 *Of the itching and inflammation happening in pestilent Ulcers, and how to cicatrize them* ib.
36 *Of sundry kinds of evacuations, and first of Sweating and Vomiting* 519
37 *Of Spitting, Salivation, Sneezing, Belching, Hicketting, and making Water* 520
38 *Of the Menstrual and Hæmorrhoidal Purgation* ib.
39 *Of procuring evacuation by stool, or a flux of the belly* 521
40 *Of stopping the flux of the belly* 522
41 *Of evacuation by insensible transpiration* 523
42 *How to cure Infants and Children taken with the Plague* ib.

Book XXIII. Of the means and manner to repair or supply the defects of Mans Body.

Ch. 1. *How the loss of the natural or true Eye may be covered, hidden, or shadowed* 524
2 *By what means a part of the nose that is cut off, may be restored; or how instead of the nose that is cut off, another counterfeit nose may be fastned or placed on* 525
3 *Of the placing of Teeth artificially made, instead of those that are lost or wanting* 526
4 *Of filling the hollowness of the palat* 527
5 *How to help such as cannot speak by reason of the loss of some part of the Tongue* ib.
6 *Of covering and repairing certain defects or defaults in the Face* 528
7 *Of the defects of the Ears* ib.
8 *Of amending the deformity of such as are crook-backt* ib.
9 *How to relieve such as have their Urin flow from them against their wills; and such as want their Yard* 529
10 *By what means the perished function or action of a thumb or finger may be corrected and amended* 530
11 *Of the helping those that are* Vari *or* Valgi, *crook-legg'd, or crook-footed inwards, or outwards* 531
12 *By what means arms, legs, and hands may be made by Art, and placed in the stead of natural arms, legs, or hands, that are cut off and lost* 532
13 *Of amending or helping lameness or halting* 533

Book XXIV. Of the Generation of Man.

Ch. 1. *Why the generative parts are endued with great pleasure* pag. 534.
2 *Of what quality the seed is, whereof the male, and whereof the female is engendered* 535
3 *What is the cause why females of all brute Brests, being great with young, do neither desire nor admit the males, until they have brought forth their young* 536
4 *What things ought to be observed, as necessary unto Generation in the time of copulation* ib.
5 *By what signs it may be known, whether the Woman have conceived or not* 537
6 *That the Womb so soon as it hath received the seed, is presently contracted or drawn together* ib.
7 *Of the generation of the Navel* 540
8 *Of the Umbilical vessels, or the vessels belonging to the Navel* ib.
9 *Of the ebullition or swelling of the seed in the Womb, and of the concretion of the bubbles or bladders, or the three principal entrails* 541
10 *Of the third bubble or bladder, wherein the head and the brain is formed* ib.
11 *Of the Life or Soul* 542

12 *Of*

12 *Of the natural excrements in general, and ſpecially of thoſe that the Child or Infant being in the Womb excludeth* 543
13 *With what travel the Child is brought into the World, and of the cauſe of this travail* 544
14 *Of the ſituation of the Infant in the Womb* ib.
15 *Which is the legitimate and natural, and which the illegitimate or unnatural time of child-birth* 545
16 *Signs of the birth at hand* 546
17 *What is to be done preſently after the Child is born* 547
18 *How to pull away the Secundine or after-birth* 548
19 *What things muſt be given to the Infant by the mouth, before he be permitted to ſuck the Teat or Dug* 550
20 *That Mothers ought to give ſuck to their own children,* ib.
21 *Of the choice of Nurſes* ib.
22 *What Diet the Nurſe ought to uſe, and in what ſituation ſhe ought to place the Infant in the Cradle* 552
23 *How to make Pap for Children* 553
24 *Of the weaning of Children* 554
25 *By what Signs it may be known whether the Child in the womb be dead or alive* ib.
26 *Of the Chirurgical extractions of the Child from the womb either dead or alive* 555
27 *What muſt be done unto the Woman in travail, preſently after her deliverance* 557
28 *What care muſt be uſed to the Dugs and Teats of thoſe that are brought to bed* 558
29 *What the cauſes of difficult and painful travail in child-birth are* 559
30 *The cauſe of abortion or untimely birth* ib.
31 *How to preſerve the Infant in the womb when the mother is dead* 560
32 *Of ſuperfœtation* 561
33 *Of the Tumor called* Mola, *or a Mole growing in the womb of Women* 562
34 *How to diſcern true conception from a falſe conception, or* Mola ib.
35 *What cure muſt be uſed to the* Mola 564
36 *Of Tumors or ſwellings happening to the* Pancreas *or Sweet-bread, and the whole Meſentery* 565
37 *Of the cauſe of barrenneſs in Women* 566
38 *Of the barrenneſs or unfruitfulneſs of Women* 567
39 *The ſigns of a diſtempered womb* ib.
40 *Of the falling down, or perverſion, or turning of the womb* 568
41 *The cure of the falling down of the womb* 569
42 *Of the tunicle or membrane called* Hymen 570
43 *A memorable hiſtory of the membrane called* Hymen, 571
44 *Of the ſtrangulation of the womb* 572
45 *The ſigns of imminent ſtrangulation of the womb* 573
46 *How to know whether the Woman be dead in the ſtrangulation of the womb, or not* ib.
47 *How to know whether the ſtrangulation of the womb comes of the ſuppreſſion of the Flowers, or the corruption of the Seed* ib.
48 *Of the cure of the ſtrangulation of the womb* 574
49 *Of womens monethly Flux or Courſes* 575
50 *The cauſes of Womens monethly Flux or Courſes* 576
51 *The cauſes of the ſuppreſſion of the Courſes or menſtrual Flux* 377
52 *What accidents follow the ſuppreſſion or ſtopping of the monethly Flux and Flowers* ib.
53 *Of provoking the Flowers or Courſes* ib.
54 *Of the ſigns of the approaching of the menſtr. Flux* 578
55 *Accidents follow immoderate fluxes of the Flowers or Courſes* 579
56 *Of ſtopping the immoderate flowing of the Flowers and Courſes* ib.
57 *Of local Medicins to be uſed againſt the immoderate flowing of the Courſes* ib.
58 *Of womens Fluxes, or the Whites* 580
59 *Of the cauſes of the Whites* 580
60 *The cure of the Whites* ib.
61 *Of the* Hæmorrhoides *and Warts of the Neck of the womb* 581
62 *Of the cure of the Warts that are in the Neck of the womb* 582
63 *Of Chaps, and thoſe wrinkled and hard Excreſcences, which the* Greeks *call* Condylomata 583
64 *Of the itching of the womb* ib.
65 *Of the relaxation of the great Gut, or inteſtine, which happeneth to women* ib.
66 *Of the relaxation of the Navel in Children* 584
67 *Of the pain that Children have in breeding of Teeth* ib.

Book XXV. Of Monſters and Prodigies; from pag. 585, to pag. 628.

Book XXVI. Of the Faculties of Simple Medicins, as alſo of their Compoſition and Uſe.

Ch. 1. *What a Medicin is, and how it differeth from nouriſhment* pag. 629
2 *The differences of Medicins in their matter and ſubſtance* ib.
3 *The difference of Simples in their qualities and effects,* 630
4 *Of the ſecond Faculties of Medicins* 631
5 *Of the third Faculties of Medicins* ib.
6 *Of the fourth Faculty of Medicins* 632
7 *Of Taſtes* ib.
8 *Of the preparation of Medicins* 634
9 *Of repelling or repercuſſive Medicins* ib.
10 *Of attractive Medicins* 635
11 *Of reſolving Medicins* 636
12 *Of Suppuratives* ib.
13 *Of mollifying things* 637
14 *Of deterſives, or mundificatives* 638
15 *Of Sarcoticks* ib.
16 *Of Epuloticks, or skinning Medicins* 639
17 *Of Agglutinatives* ib.
18 *Of Pyroticks, or Cauſtick Medicins* 640
19 *Of Anodynes, or ſuch as mitigate or aſſwage pain* ib.
20 *Of the Compoſition and Uſe of Medicins* 641
21 *Of the Weights and Meaſures, and the notes of both of them* ib.
22 *Of Clyſters* 642
23 *Of Suppoſitories, Nodules, and Peſſaries* 644
24 *Of Oils* 645
25 *Of Liniments* ib.
26 *Of Ointments* ib.
27 *Of Cerats and Emplaſters* 647
28 *Of Cataplaſms and Pultiſes* 649
29 *Of Fomentations* 650
30 *Of Embrocations* ib.
31 *Of Epithemes* 651
32 *Of Potential Cauteries* ib.
33 *Of Veſicatories* 652
34 *Of* Collyria 653
35 *Of Errhines, and Sternutatories* ib.
36 *Of Apophlegmatiſms, or Maſticatories* 654
37 *Of Gargariſms* ib.
38 *Of Dentifrices* 655
39 *Of Bags or Quilts* ib.
40 *Of Fumigations* 656
41 *Of a Particular, or Half-bath* ib.
42 *Of Baths* 657
43 *Of Stoves or Hot-houſes* 659
44 *Of* Fuci, i.e. *Waſhes and ſuch things for the ſmoothing and beautifying of the skin* 660
45 *Of the* gutta roſacea, *or a fiery Face* 661
46 *To black or colour the Hair* 662
47 *Of* Pſilothra, *or Depilatories, and alſo of ſweet waters,* ib.

Of

Book XXVII. Of Distillation.

Ch. 1. *What Distillation is, and how many kinds thereof there be* 663
2 *Of the matter and form of Fornaces* 664
3 *Of Vessels fit for Distillation* ib.
4 *What things are to be considered in Distillation* ib.
5 *Of what fashion the Vessels for the distilling of Waters ought to be* 665
6 *How the Materials must be prepared before Distillation* 667
7 *Of the Art of Distilling of Waters* ib.
8 *How to distil* Aqua Vitæ, *or the Spirits of Wine* 668
9 *Of the manner of rectifying, that is, how to increase the strength of Waters that have been once distilled* 669
10 *Of Distillation by Filtring* ib.
11 *What, and how many ways there are to make Oils* 670
12 *Of extracting of oils of Vegetables by Distillation* ib.
13 *Another manner how to draw the essence and spirits of Herbs, Flowers, Seeds, and Spices, as also of Rhubarb, Agarick, Turbith, Hermodactyls, and other Purgers* 671
14 *How to extract oil out of Gums, condensed Juices, and Rosins, as also out of some Woods* 672
15 *Of Extracting of Oils out of the harder sorts of Gums, as Myrrh, Mastich, Frankincense, and the like* 673
16 *The making of oil of Vitriol* ib.
17 *A Table or Catalogue of Medicins and Instruments serving for the Cure of Diseases* 674

Book XXVIII. How to make Reports, and to Embalm the Dead.

Book XXIX. A Treatise concerning divers Voyages.

A Table of the Contents of the Three Tracts.

Tr. 1. *Reckons up the branches or propagations of the* Vena porta, *or the Gate-vein, and explains an Aphorism of* Hippocrates, *that makes very much to the purpose* pag. 1
2 *Treats of the superiour, or ascendent Trunk of the* Vena cava *or Hollow vein, and the branches which it scatters through the head* 4
3 *Shews how the axillary vein is distributed through the arm* 8
4 *Explains the lower, or descendent Trunk of the hollow vein* 9
5 *Reckons up the propagations and branches of the outer Iliacal branch disseminated through the* crus, *or great foot, that reaches from the lower part of the buttock to the end of the toes* 12

AN

AN *INTRODUCTION* or *Compendious Way* TO CHIRURGERY.

Book I.

CHAP. I.

What Chirurgery is.

CHIRURGERY is an Art, which teacheth the way by reaſon, how by the operation of the hand we may cure, prevent and mitigate Diſeaſes, which accidentally happen unto us. Others have thought good to deſcribe it otherwiſe; as, That it is that part of Phyſic which undertaketh the cure of Diſeaſes by the ſole induſtry of the Hand: as by cutting, burning, ſawing off, uniting fractures, reſtoring diſlocations, and performing other works, of which we ſhall hereafter treat. Chirurgery alſo is thus defined by the Author of the *Medicinal Definitions*; The quick motion of an intrepid hand joined with experience; or, An artificial action by the hand uſed in Phyſic, for ſome convenient intent. Yet none muſt think to attain to any perfection in this Art, without the help of the other two parts of Phyſic; I ſay, of Diet and Pharmacy, and the diverſe applications of proper Medicines, reſpecting the condition of the Cauſes, Diſeaſes, Symptoms, and the like Circumſtances, which comprehended under the names of things natural, not natural and beſide nature, (as they commonly call them) we intend to deſcribe in their proper place. But if any reply, that there be many which do the works of Chirurgery, without any knowledge of ſuch like things, who notwithſtanding have cured deſperate Diſeaſes with happy ſucceſs: Let them take this for an anſwer, That ſuch things happen rather by chance, than by the induſtry of the Art; and that they are not provident that commit themſelves to ſuch. Becauſe that for ſome one happy chance, a thouſand dangerous errors happen afterwards, as *Galen* (in divers places of his Method) ſpeaks againſt the Empirics. Wherefore ſeeing we have ſet down Chirurgery to be, A diligent Operation of the hands, ſtrengthned by the aſſiſtance of Diet and Pharmacy, we will now ſhew what, and of what nature the operations of it are.

The Definition of Chirurgery.

What neceſſary for a Chirurgeon.

CHAP. II.

Of Chirurgical Operations.

FIve things are proper to the duty of a Chirurgeon; To take away that which is ſuperfluous; to reſtore to their places ſuch things as are diſplaced; to ſeparate thoſe things which are joined together; to join thoſe that are ſeparated; and to ſupply the defects of nature. Thou ſhalt far more eaſily and happily attain to the knowledg of theſe things by long uſe and much exerciſe, than by much reading of Books, or daily hearing of Teachers. For ſpeech, how perſpicuous and elegant ſoever it be, cannot ſo lively expreſs any thing, as that which is ſubjected to the faithful eyes and hands.

The nature of a Chirurgeon. Experience more neceſſary for a Chirurgeon than Art.

We have examples of taking away that which abounds, in the Amputation or cutting off a finger, if any have ſix on one hand, or any other monſtrous member that may grow out; in the lopping off a putrefied part inwardly corrupted; in the extraction of a dead child, the ſecondine, mole or ſuch like bodies out of a womans womb: In taking down of all Tumors, as Wens, Warts, Polypus, Cancers and fleſhy excreſcences of the like nature; in the pulling forth of bullets, of pieces of mail, of darts, arrows, ſhells, ſplinters, and of all kind of weapons in what part of the body ſoever they be. And he taketh away that which redounds, which plucks away the hairs of the eye-lids which trouble the eye by their turning in towards it: who cuts away the web, poſſeſſing all the **Adnata*, and the part of the **Cornea*: who letteth forth ſuppurated matter: who taketh out ſtones in what part ſoever of the body they grow; who pulls out a rotten or otherwiſe hurtful tooth; or cuts a nail that runs into the fleſh; who cuts away part of the *Uvula*, or hairs that grow on the eye-lids: who taketh off a Cataract; who cuts the navil or foreskin of a child newly born; or the skinny caruncles of womens privities.

Examples of taking away that which is ſuperfluous.

*Two tunicles of the eyes.

Examples of placing thoſe things which are out of their natural ſite, are manifeſt in reſtoring diſlocated bones; in re-placing of the guts and gall fallen into the cods, or out of the navil or belly by a wound; or of the falling down of the womb, fundament or great gut, or the eye hanging out of its circle or proper place.

Examples of re-placing.

But we may take examples of disjoining thoſe things which are continued; from the fingers growing together, either by ſome chance, as burning; or by the imbecillity of the forming faculty; by the disjunction of the membrane called *Hymen*, or any other troubling the neck of the womb; by diſſection

Example of ſeparating things joined together.

ction of the ligament of the tongue, which hinders children from ſucking and ſpeaking, and of that which hinders the *Glans* from being uncovered of the foreskin; by the diviſion of a various vein, or of a half-cut nerve or tendon, cauſing Convulſion, by the diviſion of the membrane ſtopping the auditory paſſage, the noſe, mouth or fundament, or the ſtubborn ſticking together of the hairs of the eye-lids. Refer to this place all the works done by Cauſtics, the Saw, Trepan, Lancet, Cupping-glaſſes, Inciſion-knife, Leeches, either for evacuation, derivation or revulſion ſake.

Examples of uniting things disjoined.

The Chirurgeon draws together things ſeparated, which healeth wounds by ſtitching them, by bolſtring, binding, giving reſt to, and fit placing the part: which repairs fractures, reſtoring luxated parts: who by binding the veſſel, ſtayeth the violent effuſion of blood: who cicatriceth cloven lips, commonly called Hare-lips: who reduceth to equality the cavities of Ulcers and Fiſtula's.

Examples of ſupplying defects.

But he repairs thoſe things which are defective either from the infancy or afterwards by accident, as much as Art and Nature will ſuffer; who ſets on an ear, an eye, a noſe, one or more teeth; who fills the hollowneſs of the palat eaten by the Pox, with a thin plate of gold or ſilver, or ſuch like; who ſupplies the defect of the tongue in part cut off, by ſome new addition: who faſtens to a hand, an arm, or leg with fit ligaments, workman-like: who fits a doublet bombaſted, or made with iron plates to make the body ſtreight; who fills a ſhoo too big with cork, or faſtens a ſtockin or ſock to a lame mans girdle to help his gate. We will treat more fully of all theſe in our following Work. But in performing thoſe things with the hands, we cannot but cauſe pain: (for who can without pain cut off an arm or leg, or divide and tear aſunder the neck of the bladder, reſtore bones put out of their places, open ulcers, bind up wounds, and apply cauteries, and do ſuch like?) notwithſtanding the matter often comes to that paſs, that unleſs we uſe a judicious hand, we muſt either die, or lead the remnant of our lives in perpetual miſery. Who therefore can juſtly abhor a Chirurgeon for this, or accuſe him of cruelty? or deſire they may be ſerved as in antient times the *Romans* ſerved *Archagatus*, who at the firſt made him free of the City; but preſently after, becauſe he did ſomewhat too cruelly burn, cut, and perform the other works of a good Chirurgeon, they drew him from his houſe into *Campus Martius*, and there ſtoned him to death, as we read it recorded by *Sextus Cheronæus*, *Plutarch*'s nephew by his daughter. Truly, it was an inhumane kind of ingratitude, ſo cruelly to murder a man intent to the works of ſo neceſſary an Art. But the Senate could not approve the act; wherefore to expiate the crime as well as then they could, they made his Statue in Gold, placed it in *Æſculapius* his Temple, and dedicated it to his perpetual memory. For my part, I very well like that ſaying of *Celſus*: A Chirurgeon muſt have a ſtrong, ſtable and intrepid hand, and a mind reſolute and mercileſs; ſo that to heal him he taketh in hand, he be not moved to make more haſte than the thing requires; or to cut leſs than is needful; but which doth all things as if he were nothing affected with their cries; not giving heed to the judgment of the vain common people, who ſpeak ill of Chirurgeons becauſe of their ignorance.

Archagatus the Chirurgeon.

In Præf. l. 7. The properties of a good Chirurgeon.

CHAP. III.
Of things Natural.

THat the Chirurgeon may rightly and according to Art perform the foreſaid works, he muſt ſet before his eyes certain Indications of working: Otherwiſe, he is like to become an Empiric, whom no Art, no certain reaſon, but only a blind temerity of fortune moves to boldneſs and action. Theſe Indications of actions are drawn from things (as they call them) natural, not-natural and beſide-nature, and their adjuncts, as it is ſingularly delivered of the Antients, being men of an excellent underſtanding. Wherefore we will proſecute according to that order, all the ſpeculations of this Art of ours. Firſt therefore, things Natural are ſo termed, becauſe they conſtitute and contein the nature of mans body, which wholly depends of the mixture and temperament of the four firſt bodies, as it is ſhewed by *Hippocrates* in his Book *de Nat. humana:* wherefore the conſideration thereof belongs to that part of Phyſic, which is named *Phyſiologia*; as the examination of things not natural to *Diætetice* or Diet, becauſe by the uſe of ſuch things it endevors to retein and keep health: but *Therapeutice*, or the part which cures the Diſeaſes, and all the affects beſide nature, challenges the contemplation of thoſe things which are not agreeable to nature. But the things which are called Natural, may be reduced to ſeven heads: beſide which there comes into their fellowſhip, thoſe which we term, Annexed.

From whence we muſt draw Indications.

What things are called natural.

To what part of Phyſic things not natural pertain.

To what, things beſides nature.

The ſeven principal heads of things Natural; are	*Elements*	To theſe are annexed, as ſomewhat near;	*Age*
	Temperaments		*Sex*
	Humors		*Colour*
	Parts or Members		*Compoſure*
	Faculties		*Time or ſeaſon*
	Actions		*Region*
	Spirits		*Vocation of life*

CHAP. IV.
Of Elements.

AN Element (by the definition which is commonly received among Phyſicians) is the leaſt and moſt ſimple portion of that thing which it compoſeth: or, that my ſpeech may be the more plain. The four firſt and ſimple bodies are called Elements; Fire, Air, Water and Earth; which accommodate and ſubject themſelves as matter to the promiſcuous generation of all things which the Heavens engirt, whether you underſtand things perfectly or unperfectly mixed. Such Elements are only to be conceived in your mind, being it is not granted to any external ſenſe to handle them in their pure and abſolute nature. Which was the cauſe that *Hippocrates* expreſſed them not by the names

What an Element is.

Elements are underſtood by reaſon, not by ſenſe.

names of ſubſtances, but of proper qualities, ſaying, Hot, Cold, Moiſt, Dry, becauſe ſome one of theſe qualities is inherent in every Element, as his proper and eſſential form, not only according to the exceſs of latitude, but alſo of the active faculty; to which is adjoined another ſimple quality, and by that reaſon principal, but which notwithſtanding attains not to the higheſt degree of his kind, as you may underſtand by *Galen* in his firſt Book of Elements. So, for Example ſake, in the Air we obſerve two qualities, Heat, and Moiſture, both principal, and not remitted by the commixture of any contrary quality, for otherwiſe they were not ſimple. Therefore thou maiſt ſay, what hinders that the principal effects of heat ſhew not themſelves as well in the Air, as in the Fire? Becauſe, as we ſaid before, although the Air have as great a heat according to his nature, extent, and degree, no otherwiſe than Fire hath, yet it is not ſo great in its active quality. The reaſon is becauſe that the calfactory force in the Air is hindered, and dulled by ſociety of his companion and adjoyned quality, that is, Humidity which abateth the force of heat, as, on the contrary, drineſs quickneth it. The Elements therefore are endued with qualities.

Why *Hipp.* expreſſed the Elements by theſe names of Qualities.

Two principal qualities are in each Element.

Why the Air heats not ſo vehemently, as the Fire.

Names of the ſubſtances	*Fire*	is	*Hot and dry*	Names of the qualities.
	Air		*Moiſt and hot*	
	Water		*Cold and moiſt*	
	Earth		*Cold and dry.*	

Theſe four Elements in the compoſition of natural bodies retain the qualities they formerly had, but that by their mixture and meeting together of contraries, they are ſomewhat tempered and abated. But the Elements are ſo mutually mixed one with another, and all with all, that no ſimple part may be found; no more than in a maſs of the Emplaiſter *Diacalcitheos* you can ſhew any *Axungia* oil, or Litharge by it ſelf; all things are ſo confuſed and united by the power of heat, mixing the ſmalleſt particulars with the ſmalleſt, and the whole with the whole, in all parts. You may know and perceive this concretion of the four Elementary ſubſtances in one compound body, by the power of mixture, in their diſſolution by burning a pile or heap of green wood: For the flame expreſſes the Fire; the ſmoak, the Air; the moiſture that ſweats out at the ends, the Water; and the aſhes, the Earth: You may eaſily perceive by this example ſo familiar and obvious to the ſenſes, what diſſolution is, which is ſucceeded by the decay of the compound body; on the contrary, you may know that the coagmentation, or uniting and joyning into one of the firſt mixed bodies is ſuch, that there is no part ſincere or without mixture. For if the heat which is predominant in the fire, ſhould remain in the mixture in its perfect vigor, it would conſume the reſt by its pernicious neighbourhood; the like may be ſaid of Coldneſs, Moiſture, and Drineſs; although of theſe qualities, two have the title of Active, that is, Heat and Coldneſs, becauſe they are the more powerful; the other two Paſſive, becauſe they may ſeem more dull and ſlow, being compared to the former. The temperaments of all ſublunary bodies ariſe from the commixture of theſe ſubſtances and elementary qualities, which hath been the principal cauſe that moved me to treat of the Elements. But I leave the force and effects of the Elementary qualities to ſome higher contemplation, content to have noted this, that of theſe firſt qualities, (ſo called, becauſe they are primarily and naturally in the four firſt bodies) others ariſe and proceed, which are therefore called the ſecond qualities: as of many, theſe, Heavineſs, Lightneſs, variouſly diſtributed by the four Elements, as the Heat, or Coldneſs, Moiſtneſs or Drineſs have more power over them. For of the Elements, two are called light, becauſe they naturally affect to move upwards: the other two heavy, by reaſon they are carryed downward by their own weight. So we think the fire the lighteſt, becauſe it holds the higheſt place of this lower world; the Air, which is next to it in ſite, we account light; for the water which lies next to the Air, we judg heavy; and the earth the center of the reſt we judg to be the heavieſt of them all. Hereupon it is, that light bodies, and the light parts in bodies, have moſt of the lighter Elements; as on the contrary heavy bodies have more of the heavier. This is a brief deſcription of the Elements of this frail world, which are only to be diſcerned by the underſtanding, to which I think good to adjoin another deſcription of other Elements, as it were ariſing or flowing from the commixture of the firſt: For beſides theſe, there are ſaid to be Elements of generation, and Elements of mans body. Which as they are more corporal, ſo alſo are they more manifeſt to the ſenſe. By which reaſon *Hippocrates* being moved, in his Book *de Natura humana*, after he had deſcribed the Nature of Hot, Cold, Moiſt, and Dry, he comes to take notice of theſe by the order of compoſition. Wherefore the Elements of our generation, as alſo of all creatures which have blood, are ſeed and menſtruous blood. But the Elements of our bodies, are the ſolid and ſimilar parts, ariſing from thoſe Elements of generation. Of this kind are bones, membranes, ligaments, veins, arteries, and many others manifeſt to the eyes, which we will deſcribe at large in our Treatiſe of Anatomy.

How the Elements may be underſtood to be mixed in compound bodies.

Why of the firſt qualities two are active and two paſſive.

Why the firſt qualities are ſo called.

What the ſecond qualities are.

What Elements light, what heavy.

What the Elements of generation are.

What the Elements of mixt bodies.

CHAP. V.

Of Temperaments.

A Temperament is defined, a proportionable mixture of hot, cold, moiſt, and dry; or, It is a concord of the firſt diſagreeing faculties. That harmony ſprings from the mixture of the four firſt bodies of the world. This whether Temperament or Concord is given to Plants and brute Beaſts for the beginning of their life, and ſo conſequently for their life and form. But as Plants are inferiour in order and dignity to beaſts, ſo their *life is more baſe and infirm, for they have only a growing faculty, by which they may draw an Alimentary juyce from the earth, as from their Mothers breaſts, to preſerve them and their life, by which they may grow to a certain bigneſs; and laſtly, by which they may bring forth their like for the perpetual continuance of their kind. But

What a Temperament is.

* *Anima.*

What the life performs in Plants.

* *Anima*, What in beasts. Mans soul comes from above.

the * life of beasts, have to the three former, the gift of sense annexed: by benefit whereof, as by a certain inward knowledg they shun those things that are hurtful, and follow those which profit them; and by the power of their will, they move themselves whither they please. But the soul of man far more perfect and noble than the rest, ariseth not from that earthly mixture and temper of the Elements, but acknowledgeth and hath a far more divine off-spring; as we shall teach hereafter.

The manifold division of a Temperament.

They divide a Temperament at the first division, into two kinds; as, one a temperate, another an untemperate. The untemperate is of two sorts: The one wholly vicious, which hath altogether exceeded the bounds of mediocrity: The other, which hath somwhat strayed from the mediocrity of temper, but notwithstanding is yet contained within the limits of health: as that which brings no such evident harm to the actions, but that it somwhat hinders them, so that they cannot so well and perfectly perform their duties. But the vicious Temperament doth three manner of ways corrupt the functions, either by weakning, depraving, or abolishing them. For so, *Stupor*, or astonishment, diminisheth and floweth the quickness of motion; Convulsion depraves it; the Palsie abolisheth it, and taketh it away.

A Temperament, *ad Pondus.*

Ad pondus, vel ad justitiam.

The temperate Temperament is also divided into two kinds; which is either to equality of weight or justice. It is called a Temperature to weight which ariseth from the equal force of exactly concurring qualities, and, as placed in a perfect ballance, draws down neither to this nor that part. They think the example of this Temperament to appear in the inner skin of the fingers ends of a man tempered to Justice. For seeing the most exquisite touch resides there, they ought to be free from all excess of contrariety; for otherwise being corrupted by too much heat or cold, moisture or driness, they could give no certain judgment of the tangible qualities. For which thing Nature hath excellently provided in the fabrick and coagmentation of the parts, of which the skin consists. For it is composed of hot and moist flesh, and therefore soft, and of a tendon and nerve cold and dry, and therefore hard; which are not only equally fitted and conjoyned, but wholly confused and mixed together, by which it comes, that removed from all extreams of opposition, it is placed in the midst, as a rule to judg of all the excesses that happen to the touch. So it was fit, the eye, which was to be the instrument of sight, should be tinctured with no certain colour, that it might be the less deceived in the judgment of colours. So it was convenient the Hearing should not be troubled with any distinct sound, whereby it might more certainly judg of equal and unequal sounds, not distinguished by a ratable proportion; neither was it fit the tongue should have any certain taste, lest the access of that taste should deceive it in knowing and judging of so many different tastes. The temperature tempered to justice, is that, which although it is a little absent from the exact and severe parility of mixed qualities, yet hath that equality which doth fully and abundantly suffice for to perform all the functions fitly and perfectly, which nature doth require; wherefore we can judg no otherwise of it than by the integrity of the Actions. For hence it took its name; for as distributive Justice equally gives to every one rewards, or punishment according to their deserts; so Nature, having regard to all the parts of the body, gives them all that temper which may suffice to perform those duties, for which they are ordained. Let us for an example consider a Bone; no man doubts, but that, like as the other similar parts of the body, proceeds from the mixture of the four Elements: but nevertheless nature weighing the use of it, and ordaining it to support the rest of the body, would have more of the terrene and dry Element infused into it, that it might be the stronger and firmer to sustain weight. But a Ligament, seeing it was made for other uses, hath less of that earthly driness than the bone, but more than the flesh, altogether fitted to its nature. So it hath seemed good to nature to endue all the parts of the body, not only with an equal portion, but also proportion of Elements and qualities; we call that a Temperament to justice: and we say, that it is in Plants, brute Beasts, and all natural bodies, which enjoy that temper and mediocrity, which may be agreeable to their nature. Hereupon by comparison arise eight kinds of intemperate tempers: As

A Temperament *ad justitiam.*

The Temperament of a bone.

The kinds of untemperate tempers.

Four simples { *Hot* / *Cold* } temperate in { *Driness* and *Moisture.* } Four Compounds { *Hot* and *Moist* / *Hot* and *Dry* }
Four simples { *Moist* / *Dry* } temperate in { *Heat* and *Cold.* } Four Compounds { *Cold* and *Moist* / *Cold* and *Dry.* }

But these Temperaments are either of the whole Body, or of some part thereof;

And that either { Principal, as { the *Brain* / the *Heart* / the *Liver* / the *Stones.* } Or / Of the rest of the parts composed of other which have no principality in the body. }

Again, such Temperaments are either healthful, which suffice perfectly to perform their actions; or unhealthful, which manifestly hurt them, the signs whereof may be read described by *Galen.* And you must observe that when we say the body, or any part of it, is hot; we understand more hot than is fit for one of that kind which is tempered to justice; as when we say a man hath a hot liver, we mean his liver is hotter, than a man justly tempered should have; for all other tempers, whether of the whole body, or any of the parts thereof, are to be referred to this; and in the cure of diseases we must look upon it, as the mark, and labour to preserve it by the use of convenient things, as much as lies in our power. Wherefore, because it is very necessary to know the distinction of Temperaments, I have thought good in this place, briefly to handle the Temperaments of the parts of the Body, Ages, Seasons of the year, Humors, and Medicins. Therefore the temperaments of the parts of our body are of this nature, not only by the judgment of the touch of a mans hand, which is justly tempered, (who is often deceived by flowing heat, which spread from the heart into all the body, imparts a certain kind of heat, to all the parts) but also by the rule of their reason, composure, and substance, as

Lib. 2. *de Temper. & in Arte medica.*

What the temperaments of mans body are.

A Bone is the moſt dry and cold.
A Griſle leſs than it.
A Ligament leſs than a Griſle.

A Tendon is ſo much drier and colder than the membrane, by how much it, in the ſame temper, exceeds a Vein and Artery. Then follow the harder Veins: for the ſofter are in a middle temper of dryneſs and moiſture, like as the Skin; although all, both ſoft and hard are of a cold temper. Wherefore all theſe parts of their own nature are cold and without blood: although the Veins and Arteries wax hot, by reaſon of the heat of the blood they contain, which notwithſtanding alſo borroweth that heat from the heart, as a part moſt hot, and ſofter than the skin; the Liver next followeth the heart, in the order of the hotter parts, which is far ſofter than the skin it ſelf: for if, according to *Galens* opinion, the heart is ſomewhat leſs hard than the skin, and that is far harder than the liver, as appears by touching them, it muſt neceſſarily follow that the liver much exceeds the skin in ſoftneſs; I underſtand the skin, ſimple and ſeparated from the fleſh lying under it, to which it firmly cleaves. The fleſh is more moiſt and hot than the skin, by reaſon of the blood diſperſed in it. The ſpinal marrow is colder and moiſter than the skin; but the brain ſo much exceeds it in moiſture, as it is exceeded by the fat. The lungs are not ſo moiſt as the fat? and the ſpleen, and kidneys are of the like nature, and nevertheleſs they are all moiſter than the skin. *Ad finem, lib. de Temper.*

According to the diverſities of ages, the temperaments both of the whole body, and all its parts, undergo great mutations; for the bones are far harder in old men than in children, becauſe our life is, as it were, a certain progreſs to drineſs; which when it comes to the height, conſequently cauſeth death. Wherefore in this place we muſt ſpeak of the Temperaments of Ages, when firſt we ſhall have defined what an age is. Therefore an Age is defined, A ſpace of life in which the conſtitution of the body of its ſelf and own accord, undergoeth manifeſt changes. The whole courſe of life hath four ſuch Ages. The firſt is Childhood, which extends from the birth to the eighteenth year of age, and hath a hot and moiſt temper, becauſe it is next to the hot and moiſt beginnings of life, ſeed, and blood. Youth followeth this, which is prolonged from the eighteenth to the twenty fifth year, and is temperate, and in the midſt of all exceſſes. Mans eſtate ſucceedeth Youth, which they deny to extend beyond the thirty fifth year of age; in its proper temper it is hot and dry; whereby it cometh to paſs that then the heat is felt more acid and biting, which in Childhood ſeemeth mild; becauſe the progreſs of the life to drineſs, hath much waſted the native humidity. The temperaments of ages. What an age is.

Then ſucceeds Old-age, ever divided into two parts; the firſt whereof extends from the thirty fifth, to the forty ninth year; thoſe of this age are called Old-men, *(but we commonly call them middle ag'd men.)* The latter is, as it were divided by *Galen* into three * degrees; the firſt whereof are thoſe, who having their ſtrength ſound and firm, undergo civil affairs and buſineſſes: which things thoſe which are in the ſecond degree of Old-age cannot do, becauſe of the debility of their now decaying ſtrength: but thoſe which are in the laſt degree, are afflicted with moſt extream weakneſs and miſery, and are as much deprived of their ſenſes and underſtanding, as of the ſtrength of their bodies; whereof aroſe this Proverb, *Old men, twice Children.* Thoſe Old men of the firſt rank are pleaſant and curteous; and thoſe we ſay, are beginning to grow Old, or in their green Old-age; thoſe of the ſecond ſort delight in nothing but the boord and bed; but old decrepit men of the laſt order, think of nothing elſe, than their graves and monuments. Their firm and ſolid parts are of a cold and dry temperature, by reaſon of the decay of the radical moiſture, which the inbred heat cauſeth in the continuance of ſo many years. Which thing may happen in a ſhort ſpace, by the vehement flame of the ſame natural heat, turned by feavers into a fiery heat. But if any to prove Old men moiſt, will object, That they cough oft, and ſpit much, I will anſwer him, as an old Doctor once ſaid; That a pitcher filled with water, may pour forth much moiſture; yet no man will deny but that ſuch a veſſel of its own terrene nature and matter is moſt dry; ſo old men may plainly be affirmed to be moiſt, by reaſon of their defect of heat, and abundance of excrements. But this deſcription of ages is not to be taken ſo ſtrictly as always to be meaſured by the ſpaces and diſtances of years; for there are many which by their own miſdemeanour ſeem elder at forty, than others do at fifty. Old-age divided into two parts. * Three degrees of the ſecond part of Old-age. Old men have their ſolid parts dry.

Laſtly, the famous Philoſopher *Pythagoras* divided mans life into four ages, and by a certain proportion compared the whole courſe thereof to the four ſeaſons of the year; as Childhood to the Spring, in which all things grow and ſprout out, by reaſon of plenty and abundance of moiſture. And Youth to the Summer, becauſe of the vigor and ſtrength which men enjoy at that age. And mans eſtate, or conſtant age, to Autumn; for that then after all the dangers of the fore-paſſed life, the gifts of diſcretion and wit acquire a ſeaſonableneſs or ripeneſs, like as the fruits of the earth enjoy at that ſeaſon. And laſtly, he compares Old-age to the ſterile and fruitleſs Winter, which can eaſe and conſolate its tedioufneſs by no other means, than the uſe of fruits gathered and ſtored up before, which then are of a cold and troubleſome condition. But for extreme Old-age, which extends to eighty or a hundred years, it is ſo cold and dry, that thoſe which arrive at that decrepit age are troubleſome, harſh, touchy, froward, crabby, and often complaining, until at the length, deprived of all their ſenſes, tongue, feet, and underſtanding, they doting return again to childiſhneſs, as from the ſtaff to the ſtart. And thus much of the Temperaments of ages. A compariſon of the four ages to the four ſeaſons of the year.

But now in like manner we will explain the Temperatures of the ſeaſons of the year, which are four; the Spring, Summer, Autumn, Winter. The Spring continues almoſt from the twelfth or thirteenth day of *March* to the midſt of *May*; *Hippocrates* ſeemeth to make it hot and moiſt; which opinion ſeemeth not to have ſprung from the thing it ſelf, but from an inveterate error of the ancient Philoſophers, who would fit the Temperaments of the four ſeaſons of the year, as anſwering in proportion to the temperatures of the four ages. For if the matter come to a juſt trial, all men will ſay, the Spring is temperate, as that which is in the midſt of the exceſs of heat, cold moiſture, and drineſs: not only by compariſon, becauſe it is hotter than Winter, and colder than Summer; but becauſe it hath that quality of its own proper nature. Wherefore it is ſaid of *Hippocrates*, The Spring is moſt *Aphor. 9. ſect. 3.* The temperatures of the ſeaſons of the year. How the ſpring is temperate.

wholesom, and least deadly; if so be that it keep its native temper, from which if it decline, or succeed a former untemperate season, as Autumn or Winter, it will give occasion to many diseases described by *Hippocrates*; not that it breeds them but because it brings them to sight, which before lay hid in the body. Summer is comprehended in the space of almost four months; it is of a hot and dry temper, a breeder of such diseases as proceed from choler, because that humour at this time is heaped up in many bodies by adustion of blood bred in the Spring; but all such diseases do speedily run their course. The beginning of Autumn, is from the time the Sun enters into Libra, and endures the like space of time as the Spring. But when it is dry, it hath great inequality of heat and cold, for the mornings and evenings being very cold, the noondays on the contrary are exceeding hot. Wherefore many diseases are in Autumn, and them long and deadly, especially if they incline towards Winter; because all daily and sudain changes to heat and cold are dangerous. The Winter possesses the remnant of the year, and is cold and moist, it increases natural heat, stirs up the appetite, and augments Phlegm. It increases heat by *Antiperistasis*, or contrariety of the encompassing air, which being then cold, prohibits the breathing out of heat: whereby it happens that the heat being driven in and hindered from dissipation, is strengthened by co-uniting its forces. But it augments Phlegm, for that men are more greedy, the Appetite being increased by the strengthened heat: from whence proceeds much crudity, and a large store of diseases, especially Chronic or Long, which spread and increase rather in this Winter-season than in any other part of the year. To this discourse of the temper of the seasons of the years, is to be revoked the variety of tempers which happens every day; which certainly is not to be neglected, that there may be place of election, especially if nothing urge. For hither belongs that saying of *Hippocrates*; When in the same day it is one while hot, another cold, Autumnal diseases are to be expected. Therefore an Indication taken from hence is of great consequence to the judgment of diseases; for if it agree with the disease, the disease is made more contumacious, and difficult to cure. Whereupon the Patient and Physician will have much trouble; but if on the contrary it reclaim and dissent, the health of the Patient is sooner to be expected. Neither is it a thing of less consequence to know the customs and habits of the Places and Countrys in which we live; as also the inclination of the Heavens, and temperature of the Air. But let us leave these things to be considered by Natural Philosophers, that we may deliver our judgment of the temperaments of *Humours*. Blood, as that which answers to the Air in proportion, is of a hot and moist nature, or rather temperate, as *Galen* testifies; for, saith he, it is certain and sure, that the Blood is neither hot nor moist, but temperate, as in its first composure none of the four first qualities exceeds other by any manifest excess, as he repeats it upon the 39th Sentence. Phlegm, as that which is of a waterish nature, is cold and moist; no otherwise than Choler being of a fiery temper, is hot and dry. But Melancholy assimilated to earth, is cold and dry. This which we have spoken in general of Phlegm and Melancholy, is not always true in every kind of the said Humours. For salt Phlegm is of a hot and dry temperature; as also all kinds of Melancholy which have arose or sprung by adustion from the native and alimentary, as we will teach in the following Chapter. Now the temperaments of Medicines have not the same form of judgment, as those things which we have before spoken of; as, not from the Elementary quality, which conquering in the contention and mixture, obtains the dominion; but plainly from the effects, which taken or applied, they imprint in a temperate body. For so we pronounce those things, hot, cold, moist, or dry, which produce the effects of Heat, Coldness, Moisture, or Driness. But we will defer the larger explication of these things to that place, where we have peculiarly appointed to treat of Medicines; where we will not simply enquire whether they be hot or cold, but what degree of heat and cold, or the like other quality: In which same place we will touch the temperature and all the nature of Tastes, because the certainest judgment of Medicines is drawn from their tastes. Hitherto of Temperaments; now we must speak of Humors, whose use in Physical speculation is no less than that of Temperaments.

CHAP. VI.

Of Humors.

The knowledg of the Humor is necessary. Lib. *De natura Humana.*

TO know the nature of *Humors*, is a thing not only necessary for Physicians, but also for Chirurgeons, because there is no disease with matter which arise not from some one, or the mixture of more *Humors*. Which thing *Hippocrates* understanding, writ, every Creature to be either sick or well according to the condition of the *Humors* in the body. And certainly all putrid feavers proceed from the putrefaction of *Humors*. Neither do any acknowledg any other original or distinction of the differences of Abscesses or Tumors: neither do ulcerated, broken, or otherwise wounded members hope for the restauration of continuity, from other than from the sweet falling down of Humors to the wounded part. Which is the cause that often in the cure of these affects, the Physitians are necessarily busied in tempering the blood, that is, bringing to a mediocrity the four Humors composing the mass of blood, if they at any time offend in quantity, or quality. For whether if any thing abound or digress from the wonted temper in any excess of heat, cold, viscosity, grosness, thinness, or any such like quality, none of the accustomed functions will be well performed. For which cause those chief helps to preserve and restore health have been divinely invented; *Phlebotomy*, or blood-letting, which amends the quantity of too much blood; and Purging, which corrects and draws away the vicious quality. But now let us begin to speak of the Humors, taking our beginning from the Definition.

The helps of Health.

What an Humor is.

An *Humor* is called (by Physicians) what thing soever is liquid and flowing in the body of living Creatures endued with Blood: and that is either natural, or against nature. The natural is so called because it is fit to defend, preserve, and sustain the life of a Creature. Quite different is the nature and reason of that which is against nature. Again, the former is either Alimentary or Excremen-

The manifold division of Humors.

mentitious: The Alimentary which is fit to nouriſh the body, is that Humor which is contained in the veins and arteries of a man which is temperate and perfectly well; and which is underſtood by the general name of blood, which is let out at the opening of a vein. For Blood otherwiſe taken, is an Humor of a certain kind, diſtinguiſhed by heat and warmneſs from the other Humors comprehended together with it, in the whole maſs of the blood. Which thing, that it may the better be underſtood, I have thought good in this place to declare the generation of Blood by the efficient and material cauſes. All things which we eat or drink, are the materials of Blood; which things drawn into the bottom of the Ventricle by its attractive force, and there detained, are turned by the force of concoction implanted in it, into a ſubſtance like to Almond-butter. Which thing, although it appear one and like it ſelf, yet it conſiſts of parts of a different nature, which not only the variety of meats, but one and the ſame meat yields of it ſelf. We term this *Chylus*, (when it is perfectly concocted in the ſtomach.) But the * Gate-vein receives it driven from thence into the ſmall Guts, and ſucked in by the Meſeraic-veins, and now having gotten a little rudiment of change in the way, carries it to the Liver, where by the Blood-making faculty, which is proper and natural to this part, it acquires the abſolute and perfect form of Blood. But with that Blood, at one and the ſame time and action all the Humors are made, whether alimentary or excrementitious. Therefore the Blood, that it may perform its Office, that is, the faculty of nutrition, muſt neceſſarily be purged and cleanſed from the too excrementitious Humors: of which the bladder of Gall draws one, which we call yellow Choler; and the Spleen the other, which we term Melancholy. Theſe two Humors are natural but not alimentary or nouriſhing, but of another uſe in the body, as afterwards we will ſhew more at large. The Blood freed from theſe two kinds of Excrements, is ſent by the veins and arteries into all parts of the body for their nouriſhment. Which although then it ſeem to be of one ſimple nature, yet notwithſtanding it is truly ſuch, that four different and unlike ſubſtances may be obſerved in it, as, Blood, properly ſo named; Phlegm, Choler, and Melancholy, not only diſtinct in colour, but alſo in taſte, effects, and qualities. For, as *Galen* notes in his Book *de Natura humana*, Melancholy is acid or ſowr, Choler bitter, Blood ſweet, Phlegm unſavoury. But you may know the variety of their effects, both by the different temper of the nouriſhed parts, as alſo by the various condition of the diſeaſes ſpringing from thence. For therefore ſuch ſubſtances ought to be tempered and mixed amongſt themſelves in a certain proportion; which remaining, health remains; but violated, diſeaſes follow. For all acknowledg, that an *Oedema* is cauſed by Phlegmatic; a *Scirrhus*, by Melancholic; an *Eryſipelas*, by Choleric; and a *Phlegmone*, by pure and laudable blood. *Galen* teaches by a familiar example of new wine preſently taken from the Preſs, that theſe four ſubſtances are contained in that one maſs and mixture of the blood. In which every one obſerves four diſtinct Eſſences; for the flower of the wine working up, ſwims at the top, the dregs fall down to the bottom, but the crude and watery moiſture, mixed together with the ſweet and vinous liquor, is every where diffuſed through the body of the wine: the flower of the wine, repreſents Choler, which bubbling up on the ſuperficies of blood, as it concretes and grows cold, ſhineth with a golden colour; the dregs, Melancholy, which by reaſon of its heavineſs ever ſinketh downward, as it were, the mud of the blood; the crude and watery portion, Phlegm: for as that crude humour, except it be rebellious in quantity, or ſtubborn by its quality, there is hope it may be changed into Wine, by the natural heat of the Wine; ſo Phlegm, which is blood half concocted, may by the force of native heat be changed into good and laudable blood. Which is the cauſe that nature decreed or ordained no peculiar place, as to the other two humors, whereby it might be ſevered from the blood: But the true and perfect liquor of the wine repreſents the pure blood, which is the more laudable and perfect portion of both humors of the confuſed maſs. It may eaſily appear by the following Scheme, of what kind they all are, and alſo what the diſtinction of theſe four Humors may be.

The material and efficient cauſes of blood.

	Nature.	Conſiſtence.	Colour.	Taſte.	Uſe.
Blood is	*Of Nature airy, hot and moiſt, or rather temperate.*	*Of indifferent conſiſtence, neither too thick nor too thin.*	*Of Colour, red roſie or crimſon.*	*Of Taſte ſweet.*	*Of ſuch uſe, that it chiefly ſerves for the nouriſhment of the fleſhy parts, and carryed by the veſſels imparts heat to the whole body.*
Phlegm is	*Of Nature watery, cold and moiſt.*	*Of Conſiſtence, liquid.*	*Of Colour, white.*	*Of Taſte, ſweet, or rather unſavory; for we commend that water which is unſavory.*	*Fit to nouriſh the brain, and all the other cold and moiſt parts, to temper the heat of the blood, and by its ſlipperineſs to help the motion of the joynts.*
Choler is	*Of Nature fiery, hot and dry.*	*Of Conſiſtence, thin.*	*Of Colour, yellow or pale.*	*Of Taſte, bitter.*	*It provoketh the expulſive faculty of the Guts attenuates the Phlegm cleaving to them, but the Alimentary is fit to nouriſh the parts of like temper with it.*
Melancholy is	*Of Nature earthly, cold, and dry.*	*Of Conſiſtence, groſs and muddy.*	*Of Colour, blackiſh.*	*Of Taſte, acide, ſour or biting.*	*Stirs up the Appetite, nouriſhes the Spleen, and all the parts of like temper to it, as the bones.*

Blood

Blood hath its neareſt matter from the better portion of the *Chylus:* and being begun to be laboured in the veins, at length gets form and perfection in the Liver; but it hath its remote matter from meats of good digeſtion and quality, ſeaſonably eaten after moderate exerciſe; but for that, one age is better than another, and one time of the year more convenient than another. For blood is made more copiouſly in the Spring, becauſe that ſeaſon of the year comes neareſt to the temper of the blood, by reaſon of which the blood is rather to be thought temperate, than hot or moiſt; for that *Galen* makes the Spring temperate, and beſides, at that time blood-letting is performed with the beſt ſucceſs: Youth is an age very fit for the generation of blood; or, by *Galens* opinion, rather that part of life that continues from the 25, to the 35. year of our age. Thoſe in whom this Humor hath the dominion, are beautified with a freſh and roſie colour, gentle, and wel-natured, pleaſant, merry, and facetious. The generation of Phlegm is not by the imbecillity of heat, as ſome of the Ancients thought; who were perſuaded that Choler was cauſed by a raging, Blood by a moderate, and Phlegm and Melancholy by a remiſs heat. But that opinion is full of manifeſt error: for if it be true, that the *Chylus* is laboured and made into blood in the ſame part, and by the ſame fire, that is, the Liver; from whence in the ſame moment of time ſhould proceed that ſtrong and weak heat, ſeeing the whole maſs of blood, different in its four eſſential parts, is perfected and made at the ſame time, and by the ſame equal temper of the ſame part, action, and blood-making faculty; therefore from whence have we this variety of Humors? From hence; for that thoſe meats by which we are nouriſhed, enjoy the like condition that our bodies do, from the four Elements, and the four firſt Qualities: for it is certain, and we may often obſerve, In what kind ſoever they be united or joyned together, they retain a certain hot portion imitating the fire; another cold, the water; another dry, the earth; and laſtly, another moiſt like to the air. Neither can you name any kind of nouriſhment, how cold ſoever it be, not Lettuce it ſelf, in which there is not ſome fiery force of heat. Therefore it is no marvail, if one and the ſame heat working upon the ſame matter of *Chylus*, varying with ſo great diſſimilitude of ſubſtances, do by its power produce ſo unlike humors, as from the hot, Choler; from the cold, Phlegm; and of the others, ſuch as their affinity of temper will permit.

Lib. 1. *de temp.*

One and the ſame Heat is the efficient cauſe of all humors at the ſame time.

The heat of the Sun alone doth melt wax and harden clay.

There is no cauſe that any one ſhould think that variety of humors to be cauſed in us, rather by the diverſity of the active heat, than wax and a flint placed at the ſame time, and in the ſame ſituation of climat and ſoil, this to melt by the heat of the Sun, and that ſcarce to wax warm. Therefore that diverſity of effects is not to be attributed to the force of the efficient cauſe, that is, of Heat, which is one, and of one kind in all of us; but rather to the material cauſe, ſeeing it is compoſed of the conflux, or meeting together of various ſubſtances, gives the heat leave to work, as it were out of its ſtore, which may make and produce from the hotter part thereof Choler; and of the colder and more rebellious, Phlegm. Yet I will not deny, but that more Phlegm, or Choler may be bred in one and the ſame body, according to the quicker, or ſlower provocation of the heat; yet nevertheleſs it is not conſequent, that the Original of Choler ſhould be from a more acid, and of Phlegm from a more dull heat in the ſame man. Every one of us naturally have a ſimple heat, and of one kind, which is the worker of divers operations, not of it ſelf, ſeeing it is always the ſame, and like it ſelf, but by the different fitneſs, pliableneſs, or reſiſtance of the matter on which it works. Wherefore Phlegm is generated in the ſame moment of time, in the fire of the ſame part, by the efficiency of the ſame heat, with the reſt of the blood, of the more cold, liquid, crude, and watery portion of the *Chylus*. Whereby it comes to paſs, that it ſhews an expreſs figure of a certain rude or unperfect blood, for which occaſion nature hath made it no peculiar receptacle, but would have it to run friendly with the blood in the ſame paſſages of the veins, that any neceſſity hapning by famin, or indigency, and in defect of better nouriſhment, it may by a perfecter elaboration quickly aſſume the form of blood. Cold and rude nouriſhment make this humor to abound principally in Winter, and in thoſe which incline to old age, by reaſon of the ſimilitude which Phlegm hath with that ſeaſon and age. It makes a man drowſie, dull, fat, ſwollen up, and haſtneth gray hairs. Choler is as it were, a certain heat and fury of humours, which generated in the Liver, together with the blood, is carryed by the veins and arteries through the whole body. That of it which abounds, is ſent, partly into the guts, and partly into the bladder of the gall, or is conſumed by tranſpiration, or ſweats; It is ſomewhat probable that the arterial blood is made more thin, hot, quick, and pallid, than the blood of the Veins, by the commixture of this Alimentary Choler. This Humor is chiefly bred and expel'd in youth, and acid and bitter meats give matter to it: but great labors of body and mind give the occaſion. It maketh a man nimble, quick, ready for all performance, lean, and quick to anger, and alſo to concoct meat. The Melancholic humor, or Melancholy, being the groſſer portion of the blood, is partly ſent from the Liver to the Spleen to nouriſh it, and partly carried by the veſſels into the reſt of the body, and ſpent in the nouriſhment of the parts endued with an earthly drineſs; it is made of meats of groſs juyce, and by the perturbations of the mind, turned to fear and ſadneſs. It is augmented in Autumn, and in the firſt and crude Old-age; it makes men ſad, harſh, conſtant, froward, envious and fearful. All men ought to think, that ſuch Humors are wont to move at ſet hours of the day, as by a certain peculiar motion or tide, Therefore the blood flows from the ninth hour of the night, to the third hour of the day; then Choler to the ninth of the day; then Melancholy to the third of the night; the reſt of the night that remains, is under the dominion of Phlegm. Manifeſt examples hereof appear in the French-Pox. From the elaborate and abſolute maſs of the blood, (as we ſaid before) two kind of Humors, as excrements of the ſecond concoction, are commonly and naturally ſeparated, the one more groſs, the other more thin. This is called either abſolutely Choler, or with an adjunct, yellow Choler. That is called Melancholy, which drawn by the Spleen in a thinner portion, and elaborate by the heat of the Arteries, which in that part are both many and large, becomes nouriſhment to the part; the remnant thereof is carried by the veiny Veſſel into the orifice of the ventricle, whereby it may not cauſe but whet the appetite, and by its aſtriction ſtrengthen the actions thereof. But yellow Choler drawn into the bladder of the gall, remains there ſo long, till being troubleſome; either in quantity

The diverſe condition of the matter alone, is the cauſe of variety.

The effect of Phlegm.

The effects of Choler.

The effects of Melancholy.

What motions are in each quarter of the body.

The Melancholy Humor doth not cauſe but whet the appetite.

quantity or quality, it is excluded into the guts, whereby it may caſt forth the excrements reſiding in them; the expulſive faculty being provoked by its acrimony, and by its bitterneſs kills the worms that are bred there. The ſame Humor is accuſtomed to die the urine of a yellow colour. There is another ſerous Humor, which is not fit to nouriſh but profitable for many other things, which is not an excrement of the ſecond, but of the firſt concoction. Therefore nature would that mixed with the *Chylus*, it ſhould come to the Liver, and not be voided with the excrements, whereby it might allay the groſneſs of the blood, and ſerve it for a vehicle; for otherwiſe the blood could ſcarce paſs through the capillary veins of the Liver, and paſſing the ſimous and gibbous parts thereof, come to the hollow vein. Part of this ſerous humor, ſeparated together with the blood which ſerves for the nouriſhment of the Reins, and ſtraight carried into the bladder, is turned into that urine which we daily make; the other part thereof, carried through all the body together with the blood, performing the like duty of tranſportation, is excluded by ſweats into which it degenerates. Beſides the forenamed, the *Arabians* have mentioned four other humors, which they term Alimentary and ſecondary, as being the next matter of nouriſhment, as thoſe four the blood contains, the remote. They have given no name to the firſt kind, but imagin it to be that humor, which hangs ready to fall like to little drops in the utmoſt orifices of the veins. They call the ſecond kind, * Dew; being that humor, which, entred already into the ſubſtance of the part, doth moiſten it. The third they call by a barbarous name, *Cambium*, which, already put to the part to be nouriſhed, is there faſtned. The fourth named *Gluten*, or Glew, is only the proper and ſubſtance-making humidity of the ſimilar parts, not their ſubſtance. The diſtinction of the degrees of nutrition recited by *Galen* in his books of Natural faculties, anſwer in proportion to this diſtinction of humors. The firſt is, that the blood flow to the part that requires nouriſhment; then that being there arrived, it may be agglutinated; then laſtly, that having loſt its former form of nouriſhment, it may be aſſimilated.

A ſerous or wheyiſh humor.

Secundary Humors.

* *Ros.*

Thoſe humors are againſt nature, which being corrupted, infect the body and the parts in which they are contained by the contagion of their corruption, retaining the names and titles of the humors, from whoſe perfection and nature they have revolted, they all grow hot by putrefaction, although they were formerly by their own nature cold. And they are corrupted, either in the veins only, or within and without the veins; In the veins Blood and Melancholy; but, both without and within the veins, Choler and Phlegm. When blood is corrupted in its thinner portion, it turns into Choler, when in its thicker, into Melancholy; for the Blood becomes faulty two manner of ways, either by the corruption of its proper ſubſtance by putrefaction, or by admixtion of another ſubſtance by infection. The Melancholy humor which is corrupted in the veins, is of three ſorts: The firſt is of a Melancholy juice putrefying, and by the force of a ſtrange heat, turned as it were, into aſhes, by which it becomes aduſt, acid and biting. The other ariſeth from that Choler which reſembles the yolks of eggs, which by aduſtion becomes leek-coloured, then æruginous, or of a blewiſh green, then red, and laſtly black, which is the very worſt kind of Melancholy, hot, malign, eating, and exulcerating, and which is never ſeen or voided with ſafety. The third comes from Phlegm putrefying in the veins, which firſt degenerates into ſalt Phlegm, but ſtraight by the ſtrength of extraneous heat degenerates into Melancholy.

Humors againſt nature.

Into what Humors the blood when it corrupts, doth degenerate.

The Melancholy Humor corrupted, is of three kinds.

- *Phlegm not natural is bred, either*
  - In the Veins, and is either
    - Acid and very crude, as which hath had none or very little impreſſion of heat, but that which it firſt had in the ſtomach.
    - Salt, which is bred by the ſweet, putrefying and aduſt, or mixture of aduſt and ſalt particles.
  - Or without the Veins, and is of four ſorts; either
    - Wateriſh, as is that thin moiſture which diſtils from the brain by the noſtrils.
    - Mucous, as when that wateriſh is thickned into filth by the help of ſome accidental or ſmall heat.
    - Glaſſie, or * Albuminous, reſembling molten glaſs, or rather the white of an egg, and is moſt cold.
    - *Gypſea*, or Plaiſter-like, which is concrete into the hardneſs and form of chalk, as you may ſee in the joints of the fingers in a knotty gout, or in inveterate diſtillations upon the Lungs.

* *Albuminea.*

- *Choler not natural is bred, either*
  - In the Veins, as the * Vitelline (like in conſiſtence to the yolk of a raw egg) which the acrimony of ſtrange heat breeds of yellow Choler, which ſame, in diſeaſes altogether deadly, degenerates into green, æruginous, and laſtly into a blue, or colour like that which is died by woad.
  - Or in the capacity of the upper belly, as the ventricle, and this is of five kinds.
    - The firſt is called *Porracea*, or leek-coloured, reſembling the juice of a leek in greenneſs.
    - The ſecond *æruginoſa*, or æruginous, like in colour to verdigreaſe.
    - The third bluiſh, or woad-coloured, like the colour died by woad.
    - The fourth red, differing in this from blood, whoſe colour it imitates, that it never cometh into knots, or clods like blood.
    - The fifth very red, generated by the exceſs of the former, which cauſeth burning feavers.

* *Vitellina.*

The kinds of ſuch Choler, are often caſt forth by vomit in diſeaſes, the ſtrength of the diſeaſe being paſt; being troubleſom to the parts through which they are evacuated, by their bitterneſs, acrimony, and biting.

The

The ſigns of a Sanguine Perſon.

I Think it manifeſt, becauſe the matter and generation of fleſh is principally from blood, that a man of a fleſhy, denſe, and ſolid habit of body, and full of a ſweet and vaporous juice, is of a Sanguine complexion. And the ſame party hath a flouriſhing and roſie colour in his face, tempered with an equal mixture of white and red; of white, by reaſon of the skin lying utmoſt; of red, becauſe of the blood ſpread underneath the skin: for always ſuch as the humor is, ſuch is the colour in the face. In manners he is curious, gentle, eaſie to be ſpoken to, not altogether eſtranged from the love of women, of a lovely countenance and ſmooth forehead, ſeldom angry, but taking all things in good part; for as the inclination of humors is, ſo alſo is the diſpoſition of manners. But blood is thought the mildeſt of all humors; but the ſtrong heat of the inward parts maketh him to eat and drink freely. Their dreams are pleaſant, they are troubled with diſeaſes ariſing from blood, as frequent Phlegmons and many ſanguine puſtles breaking through the skin, much bleeding, and menſtruous fluxes. Wherefore they can well endure blood-letting, and delight in the moderate uſe of cold and dry things; and laſtly, are offended by hot and moiſt things. They have great and ſtrong Pulſe, and much urine in quantity, but mild of quality, and of an indifferent colour and ſubſtance.

Such as the humor is, ſuch is the colour. The manners and diſeaſes of Sanguine perſons.

The ſigns of a Choleric Perſon.

Choleric are not commonly fat. The manners and diſeaſes of Choleric perſons.

CHoleric men are of a pale or yellowiſh color, of a lean, ſlender and rough habit of body, with fair veins and large Arteries, and a ſtrong and quick pulſe: their skin being touched, feels hot, dry, hard, rough and harſh, with a pricking and acid exhalation which breaths forth of their whole body. They caſt forth much choler by ſtool, vomit, and urine. They are of a quick and nimble wit, ſtout, hardy and ſharp vindicators of received injuries, liberal even to prodigality, and ſomewhat too deſirous of glory. Their ſleep is light, and from which they are quickly waked: their dreams are fiery, burning, quick, and full of fury; they are delighted with meats and drinks which are ſomewhat more cold and moiſt, and are ſubject to Tertian and burning feavers, the Phrenſie, Jaundiſe, Inflammations, and other Choleric puſtles, the Lask, Bloody flux, and bitterneſs of the mouth.

The ſigns of a Phlegmatic Perſon.

The manners and diſeaſes of Phlegmatic perſons.

THoſe in whom Phlegm hath the dominion, are of a whitiſh coloured face, and ſometimes livid and ſwollen, with their body fat, ſoft, and cold to touch.

They are moleſted with Phlegmatic diſeaſes, as Oedematous tumours, the Dropſie, Quotidian feavers, falling away of the hairs, and Catarrhs falling down upon the Lungs, and the *Aſpera Arteria*, or Weaſon: they are of a ſlow capacity, dull, ſlothful, drowſie; they do dream of rains, ſnows, floods, ſwiming, and ſuch like, that they often imagine themſelves overwhelmed with waters; they vomit up much watery and Phlegmatick matter, or otherwiſe ſpit and evacuate it, and have a ſoft and moiſt tongue.

And they are troubled with a dog-like hunger, if at any time it ſhould happen that their inſipid Phlegm become acid; and they are ſlow of digeſtion, by reaſon of which they have great ſtore of cold and Phlegmatic humors; which if they be carried down into the windings of the Colic-gut, they cauſe murmuring and noiſe, and ſometimes the Colic.

From whence noiſe or rumbling in the belly proceeds.

For much wind is eaſily cauſed of ſuch like Phlegmatic excrements wrought upon by a ſmall and weak heat, ſuch as Phlegmatic perſons have, which by its natural lightneſs is diverſly carried through the turnings of the guts, and diſtends and ſwells them up, and whiles it ſtrives for paſſage out, it cauſeth murmurings and noiſes in the belly, like wind breaking through narrow paſſages.

Signs of a Melancholic Perſon.

Diſeaſes familiar to Melancholy perſons.

THe face of Melancholy perſons is ſwart, their countenance cloudy and often cruel, their aſpect is ſad and froward; frequent Scirrhus or hard ſwellings, tumors of the Spleen, Hæmorrhoids, *Varices* (or ſwollen Veins) Quartan feavers, whether continual or intermitting; Quintan, Sextan, and Septiman feavers: and to conclude, all ſuch wandering feavers or agues ſet upon them. But when it happens, the Melancholy humor is ſharpened, either by aduſtion, or commixture of Choler, then Tetters, the black Morphew, the Cancer ſimple and ulcerated, the Leprous and filthy ſcab, ſending forth certain ſcaly and branlike excreſcences, (being vulgarly called St. *Manis* his evil;) and the Leproſie it ſelf invades them; They have ſmall veins and arteries, becauſe coldneſs hath dominion over them; whoſe property is to ſtraiten, as the quality of heat is to dilate. But if at any time their veins ſeem big, that largeneſs is not by reaſon of the laudable blood contained in them, but from much windineſs; by occaſion whereof it is ſomewhat difficult to let them blood; not only, becauſe that when the vein is opened, the blood flows ſlowly forth, by reaſon of the cold ſlowneſs of the humors; but much the rather, for that the vein doth not receive the impreſſion of the Lancet, ſliding this way and that way, by reaſon of the windineſs contained in it, and becauſe that the harſh drineſs of the upper skin, reſiſts the edge of the inſtrument. Their bodies ſeem cold and hard to the touch, and they are troubled with terrible dreams, for they are obſerved to ſeem to ſee in the night Devils, Serpents, dark dens and caves, ſepulchres, dead corpſes, and many other ſuch things full of horror, by reaſon of a black vapor, diverſly moving and diſturbing the brain, which alſo we ſee happens to thoſe who * fear the water, by reaſon of the biting of a mad Dog. You ſhall find them froward, fraudulent, parſimonious, and covetous even to baſeneſs, ſlow ſpeakers, fearful, ſad, complainers, careful, ingenious, lovers of ſolitarineſs, man-haters, obſtinate maintainers of opinions once conceived, ſlow to anger, but angred not to be pacified. But when Melancholy hath exceeded natures and its own bounds, then by reaſon of putrefaction and inflammation all things appear full of extreme fury and madneſs, ſo that they often caſt themſelves headlong down from ſome high place, or are otherwiſe guilty of their own death, with fear of which notwithſtanding they are terrified.

From, or by what their Veins are ſwollen.

Their dreams.

* *Hydrophobi.*

Their manners.

But

But we muſt note, that changes of the native Temperament, do often happen in the courſe of a mans life, ſo that he which a while agone was Sanguine, may now be Choleric, Melancholic, or Phlegmatic; not truly, by the changing of the blood into ſuch Humors, but by the mutation of Diet, and the courſe or vocation of life. For none of a Sanguine complexion, but will prove Choleric, if he eat hot and dry meats, (as all like things are cheriſht and preſerved by the uſe of their like, and contraries are deſtroy'd by their contraries) and weary his body by violent exerciſes and continual labors; and if there be a ſuppreſſion of Choleric excrements, which before did freely flow either by Nature or Art. But whoſoever feeds upon Meats generating groſs blood, as Beef, Veniſon, Hare, old Cheeſe, and all ſalt Meats, he without all doubt ſliding from his nature will fall into a Melancholy temper; eſpecially, if to that manner of Diet, he ſhall have a vocation full of cares, turmoils, miſeries, ſtrong and much ſtudy, careful thoughts and fears; and alſo if he ſit much, wanting exerciſe, for ſo the inward heat, as it were defrauded of its nouriſhment, faints and grows dull, whereupon groſs and droſſie humors abound in the body. To this alſo the cold and dry condition of the place in which we live, doth conduce, and the ſuppreſſion of the Melancholy humor accuſtomed to be evacuated by the Hemorrhoids, courſes and ſtools.

From whence the change of the native temper.

How one may become Choleric.

How Melancholic.

But he acquires a Phlegmatic temper, whoſoever uſeth cold and moiſt nouriſhment, much feeding, who before the former meat is gone out of the belly, ſhall ſtuff his paunch with more, who preſently after meat runs into violent exerciſes, who inhabit cold and moiſt places, who lead their life at eaſe in all idleneſs; and laſtly, who ſuffer a ſuppreſſion of the Plegmatic humor accuſtomably evacuated by vomit, cough or blowing the noſe, or any other way, either by Nature or Art. Certainly it is very convenient to know theſe things, that we may diſcern if any at the preſent be Phlegmatic, Melancholic, or of any other temper; whether he be ſuch by nature or neceſſity. Having declared thoſe things which concern the nature of Temperaments, and deferred the deſcription of the parts of the Body to our Anatomy, we will begin to ſpeak of the Faculties governing this our life, when firſt we ſhall have ſhewn, by a practical demonſtration of examples, the uſe and certainty of the aforeſaid Rules of Temperaments.

How Phlegmatic.

CHAP. VII.

Of the Practice of the aforeſaid Rules of Temperaments.

THat we may draw the Theoric of the Temperaments into practice, it hath ſeemed good for avoiding of confuſion which might make this our Introduction ſeem obſcure, if we would proſecute the differences of the Tempers of all men of all Nations, to take thoſe limits which Nature hath placed in the world; as South, North, Eaſt and Weſt, and, as it were, the Center of thoſe bounds, that the deſcribed variety of Tempers, in colour, habit, manners, ſtudies, actions, and form of life of men that inhabit thoſe Regions ſituated ſo far diſtant one from another, may be as a ſure rule, by which we may certainly judge of every mans temperature in particular, as he ſhall appear to be nearer or further off from this or that Region. Thoſe which inhabit the South, as the *Africans*, *Æthiopians*, *Arabians* and *Egyptians*, are for the moſt part deformed, lean, dusky-colored, and pale, with black eyes and great lips, curled hair, and a ſmall and ſhrill voice. Thoſe which inhabit the Northern parts, as the *Scythians*, *Moſcovites*, *Polonians*, and *Germans* have their faces of color white, mixt with a convenient quantity of blood, their skin ſoft and delicate, their hair long, hanging down and ſpreading abroad, and of a yellowiſh or reddiſh colour; of ſtature they are commonly tall, and of a well-proportioned, fat and compact habit of body, their eyes grey, their voice ſtrong, loud and big. But thoſe who are ſituated between theſe two former, as the *Italians* and *French*, have their faces ſomewhat ſwart, are well-favoured, nimble, ſtrong, hairy, ſlender, well in fleſh, with their eyes reſembling the color of Goats-eye, and often hollow-eyed, having a clear, ſhrill and pleaſing voice.

Four bounds or regions of the world.

The forces of temperatures in particular.

The temperature of the Southern people.

Of the Northern.

The Southern people prevail in wit, the Northern in ſtrength.

The Southern people learn'd and religious.

The Northern famous Warriers and Artificers.

The Southern people are exceeded ſo much by the Northern in ſtrength and ability of body, as they ſurpaſs them in wit and faculties of the mind. Hence is it you may read in Hiſtories, that the *Scythians*, *Goths* and *Vandals* vexed *Afric* and *Spain* with infinite incurſions, and moſt large and famous Empires have been founded from the North to South; but few or none from the South to the North. Therefore the Northern people thinking all right and law to conſiſt in Arms, did by Duel only determin all cauſes and controverſies ariſing amongſt the Inhabitants, as we may gather by the antient Laws and Cuſtoms of the *Lombards*, *Engliſh*, *Burgundians*, *Danes* and *Germans*; and we may ſee in *Saxo* the Grammarian, that ſuch a Law was once made by *Fronto* King of *Denmark*. The which Cuſtom at this day is every where in force amongſt the *Moſcovites*. But the Southern people have always much abhorred that faſhion, and have thought it more agreeable to Beaſts than Men. Wherefore we never heard of any ſuch thing uſed by the *Aſſyrians*, *Egyptians*, *Perſians* or *Jews*: But moved by the goodneſs of their wit, they erected Kingdoms and Empires by the only help of Learning and hidden Sciences. For ſeeing by nature they are Melancholic, by reaſon of the drineſs of their temperature, they willingly addict themſelves to ſolitarineſs and contemplation, being endued with a ſingular ſharpneſs of wit. Wherefore the *Ethiopians*, *Egyptians*, *Africans*, *Jews*, *Phœnicians*, *Perſians*, *Aſſyrians*, and *Indians*, have invented many curious Sciences, revealed the myſteries and ſecrets of Nature, digeſted the Mathematics into order, obſerved the motions of the Heavens, and firſt brought in the worſhip and religious ſacrifices of the gods: Even ſo far that the *Arabians* who live only by ſtealth, and have only a Wagon for their Houſe, do boaſt that they have many things diligently and accurately obſerved in Aſtrology by their Anceſtors, which every day made more accurate and copious, they as by an hereditary right, commend to poſterity, as it is recorded by *Leo* the *African*. But the Northern people, as the *Germans*, by reaſon of the abundance of humors and blood, by which the mind is as it were oppreſt, apply themſelves to works obvious to the ſenſes, and which may be done by the hand. For, their minds oppreſt with the earthly maſs of their bodies, are eaſily drawn

drawn from heaven and the contemplation of celeſtial things, to theſe inferior things, as to find out Mines by digging, to buy and caſt metals, to draw and hammer out works of Iron, Steel and Braſs. In which things they have proved ſo excellent, that the glory of the Invention of Guns and Printing belongs to them.

The endowments of ſuch as inhabit between them.

The people who inhabit the middle regions between theſe are neither naturally fit for the more abſtruſe Sciences, as the Southern people are; nor for Mechanic works, as the Northern; but intermeddle with civil affairs, commerce and Merchandizing. But are endued with ſuch ſtrength of body as may ſuffice to avoid and delude the crafts and arts of the Southern Inhabitants; and with ſuch wiſdom as may be ſufficient to reſtrain the fury and violence of the Northern. How true this is, any one may underſtand by the example of the *Carthaginians* and *Africans*, who when they had held *Italy* for ſome years by their ſubtle counſels, crafty ſleights and devices; yet could not eſcape, but at length their arts being eluded, and they ſpoil'd of all their fortunes, were brought in ſubjection to the *Romans*.

The Northern know how to overcome, but not how to uſe the victory.

The *Goths*, *Hunns* and other Northern People have ſpoiled and over-run the *Roman* Empire by many incurſions and inroads, but deſtitute of counſel and providence, they could not keep thoſe things which they had gotten by Arms and Valour.

The abundance of Counſellors and Lawyers from *France* and *Italy*.

Therefore the Opinion of all Hiſtorians is agreeing in this, that good Laws, the form of governing a Common-wealth, all politic Ordinances, the Arts of diſputing and ſpeaking have had their beginnings from the *Greeks*, *Romans* and *French*. And from hence in times paſt and at this day a greater number of Writers, Lawyers and Counſellors of State have ſprung up than in all the whole world beſides. Therefore that we may attribute their gifts to each Region, we affirm that the Southern People are born and fit for the ſtudies of Learning, the Northern for Wars, and thoſe between both for Empire and Rule. The *Italian* is naturally wiſe, the *Spaniard* grave and conſtant, the *French* quick and diligent; for you would ſay he runs when he goes, being compared to the ſlow pace of the *Spaniard*, which is the cauſe that *Spaniards* are delighted with *French* Servants for their quick agility in diſpatching buſineſs.

The manners of the Eaſtern people.

The Eaſtern people are ſpecially endued with a good, firm and well-temper'd wit, not keeping their counſels ſecret and hid. For haſte is of the nature of the Sun, and that part of the day which is next to the riſing of the Sun is counted the right ſide and ſtronger; and verily in all things living, the right ſide is always the more ſtrong and vigorous. But the Weſtern people are more tender and effeminate, and more cloſe in their carriage and mind, not eaſily making any one partaker of their ſecrets. For the Weſt is as it were ſubject to the Moon, becauſe at the change it always inclines to the Weſt, whereby it happens that it is reputed as nocturnal, ſiniſter and oppoſite to the Eaſt; and the Weſt is

The Eaſtwind healthful.

leſs temperate and wholſom. Therefore of the Winds none is more wholſom than the Eaſt-wind, which blows from the Weſt with a moſt freſh and healthful gale; yet it ſeldom blows, but only at Sun-ſet.

The Northern people great eaters and drinkers.

The Northern people are good eaters, but much better drinkers, witty when they are a little moiſtned with Wine, and talkers of things both to be ſpoken and concealed, not very conſtant in their promiſes and agreements, but principal keepers and preſervers of ſhame-fac'dneſs and chaſtity, far different from the Inhabitants of the South, who are wonderful ſparing, ſober, ſecret and ſubtle,

Who are to be counted barbarous.

and much addicted to all ſorts of wicked Luſt. *Ariſtotle* in his *Problems* ſaith, that thoſe Nations are barbarous and cruel, both which are burnt with immoderate heat, and which are oppreſt with exceſſive cold, becauſe a ſoft temper of the Heavens ſoftens the manners and the mind. Wherefore

The Northern and Southern have each their cruelties.

both as well the Northern as *Scythians* and *Germans*; and the Southern, as *Africans*, are cruel; but theſe have this of a certain natural ſtoutneſs and ſoldier-like boldneſs, and rather of anger than a wilful deſire of revenge; becauſe they cannot reſtrain by the power of reaſon the firſt violent motions of their anger by reaſon of the heat of their blood. But thoſe of a certain inbred and inhumane pravity of manners wilfully and willingly premeditating they perform the works of cruelty, becauſe they are of a ſad and melancholy nature. You may have an example of the Northern cruelty from the *Tranſylvanians* againſt their ſeditious Captain *George*, whom they gave to be torn in pieces alive and devoured by his Souldiers, (being kept faſting for three days before for that purpoſe) who was then unbowelled, and roſted, and ſo by them eaten up. The cruelty of *Hannibal* the Captain of the *Carthaginians* may ſuffice for an inſtance of the Southern cruelty. He left the Roman Captives wearied with burdens and the length of the way, with the ſoles of their feet cut off; But thoſe he brought into his Tents, joyning brethren and kinſmen together he cauſed to fight, neither was ſatisfied with blood before he brought all the victors to one man. Alſo we may ſee the cruel nature of the Southern *Americans*, who dip their children in the blood of their ſlain enemies, then ſuck their blood, and banquet with their broken and ſqueaſed Limbs.

Val. Max. l.9. c. 2.

The diſeaſes of the Southern people.

And as the Inhabitants of the South are free from divers Plethoric Diſeaſes, which are cauſed by abundance of blood (to which the Northern people are ſubject) as Feavers, Defluxions, Tumors, Madneſs with laughter, which cauſeth thoſe which have it to leap and dance, (the people commonly term it *S. Vitus his evil*) which admits of no remedy but Muſic: ſo they are often moleſted with the Frenſie, invading with madneſs and fury; by the heat whereof they are often ſo raviſht and carried beſide themſelves, that they foretel things to come; they are terrified with horrible dreams, and in their fits they ſpeak in ſtrange and forein tongues; but they are ſo ſubject to the ſcurf and all kind of ſcabs and to the Leproſie as their homebred diſeaſe, that no houſes are ſo frequently met withal by ſuch as travel through either of the *Mauritania's*, as Hoſpitals provided for the Lodging of Lepers.

Mountainers.

Thoſe who inhabit rough and mountainous places, are more brutiſh, tough and able to endure labour. but ſuch as dwell in Plains, eſpecially if they be mooriſh or fenniſh, are of a tender body, and ſweat much with a little labour; the truth of which is confirmed by the *Hollanders* and *Friſelanders*. But if the Plain be ſuch as is ſcorched by the heat of the Sun, and blown upon by much contrariety of winds, it breeds men who are turbulent, not to be tamed, deſirous of ſedition and novelty, ſtubborn, impatient of ſervitude, as may be perceived by the ſole example of the Inhabitants of *Narbon*, a Province of *France*. Thoſe who dwell in poor and barren places are commonly more witty and diligent

and

and moſt patient of labors; the truth of which the famous wits of the *Athenians*, *Ligurians* and *Romans*, and the plain country of the *Bœotians* in *Greece*, of the *Campanians* in *Italy*, and of the reſt of the Inhabiters adjoining to the *Ligurian* Sea, approves.

CHAP. VIII.
Of the Faculties.

A Faculty is a certain power and efficient cauſe, proceeding from the temperament of the part, and the performer of ſome actions of the body. There are three principal Faculties governing mans body, as long as it enjoys its integrity; the Animal, Vital and Natural. The Animal is ſeated in the proper temperament of the Brain, from whence it is diſtributed by the Nerves into all parts of the body which have ſenſe and motion. This is of three kinds; for one is Moving, another Senſitive, the third Principal. The Senſitive conſiſts in five external Senſes; Sight, Hearing, Taſte, Smell and Touch. The Moving principally remains in the Muſcles and Nerves, as the fit inſtruments of voluntary motion. The Principal comprehends the Reaſoning Faculty, the Memory and Fantaſie. *Galen* would have the common or inward Senſe to be comprehended within the compaſs of the Fantaſie, although *Ariſtotle* diſtinguiſh between them.

What a Faculty is.
3 Faculties.

The Vital abides in the heart, from whence heat and life is diſtributed by the Arteries to the whole body; this is principally hindred in the diſeaſes of the Breaſt; as the Principal is, when any diſeaſe aſſails the Brain; the prime Action of the vital faculty is Pulſation, and that continued agitation of the Heart and Arteries, which is of threefold uſe to the body: for by the dilatation of the Heart and Arteries, the Vital Spirit is cheriſhed by the benefit of the Air which is drawn in; by the contraction thereof, the vapors of it are purged and ſent forth, and the native heat of the whole body is tempered by them both.

The triple uſe of the Pulſe.

The laſt is the Natural Faculty which hath choſen its principal ſeat in the Liver, it ſpreads or carries the nouriſhment over the whole body; but it is diſtinguiſht into three other faculties; The Generative, which ſerves for the generation and forming of the Iſſue in the womb; the Growing or Increaſing faculty, which flouriſheth from the time the Iſſue is formed, until the perfect growth of the ſolid parts into their full dimenſions of length, heighth and breadth. The nouriſhing faculty, which as ſervant to both the other, repairs and repays the continual efflux and waſte of the threefold ſubſtance; for Nutrition is nothing elſe but a repleniſhing or repairing whatſoever is waſted or emptied. This nouriſhing faculty endures from that time the Infant is formed in the womb until the end of life. It is a matter of great conſequence in Phyſic, to know the four other faculties, which as Servants attend upon the nouriſhing faculty; which are the Attractive, Retentive, Digeſtive and Expulſive faculty. The Attractive draws that Juice which is fit to nouriſh the body; that, I ſay, which by application may be aſſimilated to the part. This is that faculty, which in ſuch as are hungry, draws down the meat ſcarce chewed, and the drink ſcarce taſted, into the gnawing and empty ſtomach. The Retentive faculty is that which retains the nouriſhment once attracted, until it be fully laboured and perfectly concocted; and by that means it yields no ſmall aſſiſtance to the Digeſtive faculty. For the natural heat cannot perform the office of concoction, unleſs the meat be embraced by the part, and make ſome ſtay therein. For otherwiſe the meat, carried into the ſtomach, never acquires the form of *Chylus*, unleſs it ſtay detained in the wrinkles thereof as in a rough paſſage, until the time of *Chylification*. The Digeſtive faculty aſſimilates the nouriſhment, being attracted and detained, into the ſubſtance of that part whoſe faculty it is, by the force of the inbred heat and proper diſpoſition or temper of the part. So the ſtomach plainly changes all things which are eat and drunk into *Chylus*, and the Liver turns the *Chylus* into blood. But the Bones and Nerves convert the red and liquid blood, which is brought down unto them by the capillary or ſmall veins, into a white and ſolid ſubſtance. Such concoction is far more laborious in a Bone and Nerve, than in the Muſculous fleſh. For the blood being not much different from its nature, by a light change and concretion turns into fleſh. But this Concoction will never ſatisfie the deſire of nature and the parts, unleſs the nouriſhment, purged from its excrements, put away the filth and droſs, which muſt never enter into the ſubſtance of the part. Wherefore there do not only two ſorts of excrements remain of the firſt and ſecond Concoction, the one thick, the other thin, as we have ſaid before; but alſo from the third Concoction which is performed in every part. The one of which we conceive only by reaſon, being that which vaniſheth into Air by inſenſible tranſpiration. The other is known ſometimes by ſweats, ſometimes by a thick fatty ſubſtance ſtaining the ſhirt; ſometimes by the generation of hairs and nails, whoſe matter is from fuliginous and earthly excrements of the third Concoction. Wherefore the fourth faculty was neceſſary which might yield no ſmall help to nouriſhment; it is called the Expulſive, appointed to expel thoſe ſuperfluous excrements which by no action of heat can obtain the form of the part. Such faculties ſerving for nutrition are in ſome parts twofold; as ſome common, the benefit of which redounds to the whole body, as in the ventricle, liver and veins; Others only attending the ſervice of thoſe parts in which they remain, and in ſome parts all theſe four, as well common as proper, are abiding and reſiding as in thoſe parts we now mentioned; ſome, with the four proper have only two common, asthe Gall, Spleen, Kidneys and Bladder. Others are content only with the proper, as the ſimilar and muſculous parts, who if they want any of theſe four faculties, their health is decayed either by want of nouriſhment, an ulcer, or otherwiſe. The like unnatural affects happen by the deficiency of juſt and laudable nouriſhment. But if it happen thoſe faculties do rightly perform their duty, the nouriſhment is changed into the proper part, and is truly aſſimilated as by theſe degrees. Firſt, it muſt flow to the part, then be joined to it, then agglutinated, and laſtly, as we have ſaid, aſſimilated. Now we muſt ſpeak of the Actions which ariſe from the faculties.

The natural Faculty is threefold.

What Nutrition is.

Four other Faculties attend upon the nouriſhing Faculty.

The neceſſity of the retentive Faculty.

Two excrements of every concoction.

The work of the expulſive Faculty.

By what degrees the nouriſhment is aſſimilated.

CHAP. IX.

Of the Actions.

What an Action is.

AN Action or Function is an active motion proceeding from a faculty; for as the faculty depends on the Temperament, ſo the Action on the faculty, and the Act or Work depends upon the Action by a certain order of conſequence. But although that the Words, Action and Act or work are often confounded; yet there is this difference between them, as that the Action ſignifies the motion uſed in the performance of any thing; but the Act or work, the thing already done and performed: For example, Nutrition and the Generating of fleſh are natural Actions; but the parts nouriſhed, and a hollow ulcer filled with fleſh are the works of that motion, or action. Wherefore the Act ariſeth from the Action, as the Action ariſeth from the Faculty, the integrity or perfection of the inſtruments concurring in both. For as, if the Faculty be either defective, or hurt, no Action will be well performed: ſo unleſs the inſtruments keep their native and due conformity (which is their perfect health, the operator of the Action proper to the inſtrument) none of thoſe things, which ought to be, will be well performed. Therefore for the performance of blameleſs and perfect actions, it is fit a due conformity of the inſtrument concur with the faculty. But Actions are two-fold: for they are either Natural, or Voluntary. They are termed Natural, becauſe they are performed not by our will, but by their own accord, and againſt our will: As are, that continual motion of the Heart, the beating of the Arteries, the expulſion of the Excrements, and ſuch other like, which are done in us by the Law of Nature whether we will or no. Theſe Action flow either from the Liver and Veins, or from the Heart and Arteries. Wherefore we may comprehend them under the names of Natural and Vital Actions. For we muſt attribute his Action to each faculty, leſt we ſeem to conſtitute an idle faculty and no way profitable for uſe. The unvoluntary vital Actions, are the dilatation and contraction of the Heart and Arteries, the which we comprehend under the ſole name of the Pulſe: by that they draw in, and by this they expel or drive forth. The unvoluntary vital actions be,

An Action and an Act are different.

Natural Actions.

Generation, Growth, and Nutrition, } which proceed from the { Generative, Growing, and Nouriſhing } Faculty.

What Generation is.

Generation is nothing elſe than a certain producing or acquiring of matter, and an introducing of a ſubſtantial form into that matter: this is performed by the aſſiſtance of two faculties; of the altering, which doth diverſly prepare and diſpoſe the ſeed and menſtruous blood to put on the form of a Bone, Nerve, Spleen, Fleſh, and ſuch like: of the Forming faculty, which adorns with figure, ſite, and compoſition, the matter ordered by ſo various a preparation.

What Growth is.

Growth is an inlarging of the ſolid parts into all the dimenſions, the priſtine and ancient form remaining ſafe and ſound in figure and ſolidity. For the perfection of every growth is judged only by the ſolid parts; for if the body ſwell into a maſs of fleſh, or fat, it ſhall not therefore be ſaid to be grown: but then only when the ſolid parts do in like manner increaſe, eſpecially the bones, becauſe the growth of the whole body follows their increaſe, even although at the ſame time it wax lean and pine away.

What Nutrition is.

Nutrition is a perfect aſſimilation of that nouriſhment which is digeſted, into the nature of the part which digeſts. It is performed by the aſſiſtance of four ſubſidiary or helping actions, Attractive, Retentive, Digeſtive and Expulſive.

Action voluntary.

The voluntary actions which we willingly perform, are ſo called, becauſe we can at our pleaſure hinder, ſtir up, ſlow or quicken them. They are three in general, the ſenſative, moving and principal Action. The ſenſitive * Soul comprehends all things in five ſenſes, in Sight, Hearing, Smell, Taſte, and Touch. Three things muſt neceſſarily concur to the performance of them, the Organ, the *Medium* or Mean and the Object. The principal Organ or Inſtrument is the Animal Spirit diffuſed by the Nerves into each ſeveral part of the body, by which ſuch actions are performed. Wherefore for the preſent we will uſe the parts themſelves for their Organs. The Mean is a Body, which carries the Object to the Inſtrument. The Object is a certain external quality, which hath power by a fit *Medium* or Mean to ſtir up and alter the Organ. This will be more manifeſt by relating the particular functions of the Senſes by the neceſſary concurring of theſe three.

* *Anima ſentiens.*

How Sight is performed.

Sight is an action of the ſeeing faculty, which is done by the Eye, fitly compoſed of its coats and humors, and ſo conſequently the Organical body of this Action. The Object is a viſible quality brought to the Eye. But ſuch an Object is two-fold; for either it is abſolutely viſible of itſelf, and by its own nature, as the Sun, the Fire, the Moon and Stars; or deſires, as it were, the help of another that it may be actually ſuch; for ſo by the coming of the light colours, which were viſible in power only, being brought to the Eye, they do ſeem and appear ſuch as they actually are. But ſuch Objects cannot arrive at the Eye, but through a clear and illuminate *Medium*, as the Air, Water, Glaſs, and all ſorts of Cryſtal.

How Hearing.

The Hearing hath for its Organ the Ear and Auditory paſſage, which goes to the ſtony-bone furniſhed with a Membrane inveſting it, an Auditory Nerve, and a certain inward ſpirit there contained. The Object is every ſound ariſing from the ſmitten or broken Air, and the Colliſion of two bodies meeting together. The *Medium* is the encompaſſing Air which carries the ſound to the Ear.

How Smelling.

Smelling (according to *Galen*'s opinion) is performed in the mamillary proceſſes produced from the proper ſubſtance of the brain, and ſeated in the upper part of the noſe: although others had rather ſmelling ſhould be made in the very foremoſt ventricles of the brain. This Action is weak in man, in compariſon of other Creatures: the Object thereof is every ſmell, or fumid exhalation breathing out of bodies. The *Medium* by which the Object is carried to the noſes of Men, Beaſts and Birds,

How the Taſt.

is the Air; but to Fiſhes the Water itſelf. The Action of Taſte, is performed by the Tongue, being

being tempered well and according to nature, and furniſhed with a Nerve ſpread over its upper part from the third and fourth Conjugation of the Brain. The Object is * Taſte, of whoſe nature and kinds we will treat more at large in our Antidotary. The *Medium* by the which the Object is ſo carried to the Organ, that it may affect it, is either external or internal: The external is that ſpattle which doth, as it were, anoint and ſupple the tongue; the internal is the ſpongy fleſh of the tongue it ſelf, which affected with the quality of the Object, doth preſently ſo poſſeſs the nerve that is planted in it, that the kind and quality thereof, by the force of the ſpirit, may be carried into the common ſenſe. All parts endued with a nerve, enjoy the ſenſe of touching, which is chiefly done, when a tractable quality doth penetrate even to the true and nervous skin, which lieth under the Cuticle, or ſcarf-skin; we have formerly noted, that it is moſt exquiſite in the skin which inveſts the ends of the fingers. The Object is every tractable quality, whether it be of the firſt rank of qualities, as Heat, Cold, Moiſture, Dryneſs; or of the ſecond, as Roughneſs, Smoothneſs, Heavineſs, Lightneſs, Hardneſs, Softneſs, Rarity, Denſity, Friability, Unctuoſity, Groſſneſs, Thinneſs. The *Medium* by whoſe procurement the inſtrument is affected, is either the skin or the fleſh interwoven with many Nerves.

* *Sapor.*

How touching.

The next Action, is that Motion which by a peculiar name we call Voluntary; this is performed and accompliſhed by a Muſcle, being the proper Inſtrument of voluntary Motion. Furthermore, every motion of a member poſſeſſing a Muſcle, is made either by bending and contraction, or by extenſion: Although generally there be ſo many differences of voluntary motion, as there are kinds of ſite in place; therefore Motion is ſaid to be made upward, downward, to the right hand, to the left, forward and backward: Hither are referred the many kinds of motions, which the infinite variety of Muſcles produce in the body. Into this rank of voluntary Actions, comes Reſpiration, or breathing, becauſe it is done by the help of the Muſcles, although it be chiefly to temper the heat of the Heart. For we can make it more quick or ſlow as we pleaſe, which are the conditions of a voluntary Motion.

Of motion.

How Reſpiration may be a voluntary motion.

Laſtly, that we may have ſomewhat in which we may ſafely reſt and defend our ſelves againſt the many queſtions which are commonly moved concerning this thing, we muſt hold, that Reſpiration is undergone and performed by the Animal faculty, but chiefly inſtituted for the Vital.

The principal Action and prime amongſt the Voluntary, is abſolutely divided into three, Imagination, Reaſoning and Memory.

The third principal Action.

Imagination is a certain expreſſing and apprehenſion, which diſcerns and diſtinguiſheth between the forms and ſhapes of things ſenſible, or which are known by the ſenſes.

Reaſoning is a certain judicial eſtimation of conceived or apprehended forms or figures, by a mutual collating or comparing them together.

Memory is the ſure ſtorer of all things, and as it were the Treaſury which the mind often unfolds and opens, the other faculties of the mind being idle and not imployed. But becauſe all the forementioned Actions, whether they be Natural, or Animal and Voluntary, are done and performed by the help and aſſiſtance of the Spirits; therefore now we muſt ſpeak of the Spirits.

CHAP. X.

Of the Spirits.

THe Spirit is a ſubtil and airy ſubſtance, raiſed from the purer blood, that it might be a vehicle for the faculties (by whoſe power the whole body is governed) to all the parts, and the prime inſtrument for the performance of their Office. For they, being deſtitute of its ſweet approach, do preſently ceaſe from action, and as dead, do reſt from their accuſtomed labours. From hence it is, that making a variety of Spirits according to the number of the faculties, they have divided them into three; as one Animal, another Vital, another Natural.

What a Spirit is.

Spirits threefold.

The Animal hath taken his ſeat in the Brain; for there it is prepared and made, that, from thence conveyed by the Nerves, it may impart the power of ſenſe and motion to all the reſt of the members. An Argument hereof is, that in the great cold of Winter, whether by the intercepting them in their way, or by the concretion, or, as it were, freezing of thoſe ſpirits, the joynts grow ſtiff, the hands numb, and all the other parts are dull, deſtitute of their accuſtomed agility of motion, and quickneſs of ſenſe. It is called Animal, not becauſe it is the * Life, but the chief and prime inſtrument thereof: Wherefore it hath a more ſubtil and airy ſubſtance; and enjoys divers names, according to the various condition of the Senſories, or ſeats of the ſenſes, into which it enters; for that which cauſeth the ſight, is named the Viſive: You may ſee this by night, rubbing your eyes, as ſparkling like fire. That which is conveyed to the Auditory paſſage, is called the Auditive or Hearing; that which is carried to the inſtruments of Touching, is termed the Tactive; and ſo of the reſt.

The Animal Spirit.

Why ſo called * *Anima.*

This Animal ſpirit is made and laboured in the windings and foldings of the Veins and Arteries of the brain, of an exquiſite ſubtil portion of the Vital brought thither by the *Carotidæ Arteriæ*, or ſleepy Arteries; and ſometimes alſo of the pure air, or ſweet vapour drawn by the Noſe in breathing. Hence it is, that with Ligatures we ſtop the paſſage of this ſpirit, from the parts we intend to cut off. An Humour which obſtructs or ſtops it paſſage, doth the like in Apoplexies and Palſies, whereby it happens that the members ſituate under that place do languiſh and ſeem dead, ſometimes deſtitute of motion, ſometimes wanting both ſenſe and motion.

How it is made.

The Vital ſpirit is next to it in dignity and excellency, which hath its chief Manſion in the left ventricle of the Heart, from whence, through the Channels of the Arteries, it flows into the whole body, to nouriſh the heat which reſides fixed in the ſubſtance of each part, which would periſh in

The Vital Spirit.

ſhort time, unleſs it ſhould be refreſhed with heat flowing thither together with the ſpirit. And becauſe it is the moſt ſubtil next to the Animal, Nature (leſt it ſhould vaniſh away) would have it contained in the nervous coat of an Artery, which is five times more thick than the coat of the Veins, as *Galen*, out of *Herophilus*, hath recorded.

What the matter of it is.

It is furniſhed with matter from the ſubtil exhalation of the blood, and that air which we draw in breathing. Wherefore, as it doth eaſily and quickly periſh by immoderate diſſipations of the ſpirituous ſubſtance, and great evacuations; ſo it is eaſily corrupted by the putrefaction of Humors, or breathing in of peſtilent air and filthy vapours; which thing is the cauſe of the ſo ſudden death of thoſe which are infected with the Plague. This Spirit is often hindred from entring into ſome part, by reaſon of obſtruction, fullneſs, or great inflammations; whereby it follows, that in a ſhort ſpace, by reaſon of the decay of the fixed and inbred heat, the parts do eaſily fall into a Gangrene, and become mortified.

There is ſome doubt of the Natural Spirit.

The Natural ſpirit (if ſuch there be any) hath its ſtation in the Liver and Veins. It is more groſs and dull than the other, and inferiour to them in the dignity of the Action, and the excellency of the uſe. The uſe thereof is to help the concoction both of the whole body, as alſo of each ſeveral part, and to carry blood and heat to them.

Fixed Spirits.

Beſides thoſe already mentioned, there are other Spirits fixed and implanted in the ſimilar and prime parts of the body, which alſo are natural, and Natives of the ſame place in which they are ſeated and placed. And becauſe they are alſo of an airy and fiery nature, they are ſo joyned, or rather united to the Native heat, that they can no more be ſeparated from it than flame from heat; wherefore they with theſe that flow to them, are the principal Inſtruments of the Actions which are performed in each ſeveral part: And theſe fixed Spirits have their nouriſhment and maintenance from the radical and firſt-bred moiſture, which is of an airy and oily ſubſtance, and is, as it were, the foundation of theſe Spirits, and the inbred heat. Therefore without this moiſture, no man can live a moment. But alſo the chief Inſtruments of life are theſe Spirits, together with the Native heat. Wherefore this radical Moiſture being diſſipated and waſted (which is the ſeat, fodder and nouriſhment of the Spirits and heat) how can they any longer ſubſiſt and remain? Therefore the conſumption of the natural heat, followeth the decay of this ſweet and ſubſtance-making moiſture, and conſequently death, which happens by the diſſipating and reſolving of natural heat.

The radical moiſture.

Natural death.

But ſince then theſe kinds of Spirits, with the natural heat, is contained in the ſubſtance of each ſimilar part of our body (for otherwiſe it could not perſiſt) it muſt neceſſarily follow, that there be as many kinds of fixed Spirits, as of ſimilar parts. For becauſe each part hath its proper temper and increaſe, it hath alſo its proper Spirit, and alſo its own proper fixed and implanted heat, which here hath its abode, as well as its Original. Wherefore the Spirit and heat which is ſeated in the bone, is different from that which is impact into the ſubſtance of a Nerve, Vein, or ſuch other ſimilar part; becauſe the temper of theſe parts is different, as alſo the mixture of the Elements from which they firſt aroſe and ſprung up. Neither is this contemplation of Spirits of ſmall account, for in theſe conſiſt all the force and efficacy of our Nature.

The uſe and neceſſity of the Spirits.

Theſe being by any chance diſſipated or waſted, we languiſh; neither is health to be hoped for, the flower of life withering and decaying by little and little. Which thing ought to make us more diligent, to defend them againſt the continual efflux of the threefold ſubſtance. For if they be decayed, there is left no proper indication of curing the diſeaſe; ſo that we are often conſtrained, all other care laid aſide, to betake our ſelves to the reſtoring and repairing the decayed powers. Which is done by meats of good juyce, eaſie to be concocted and diſtributed; good Wines, and fragrant ſmells.

What the remedy for the diſſipation of the Spirits.

But ſometimes theſe Spirits are not diſſipated, but driven in and returned to their fountains, and ſo both oppreſs and are oppreſt; whereupon it happens we are often forced to dilate, and ſpread them abroad by binding and rubbing the parts. Hitherto we have ſpoke of thoſe things which are called Natural, becauſe we naturally conſiſt of them; it remains that we now ſay ſomewhat of their Adjuncts and Aſſociates by familiarity of Condition.

What the remedy for oppreſſion of the Spirit is.

The Adjuncts and Aſſociates to things natural; are,

- *Age:* Of which, by reaſon of the ſimilitude of the Argument, we were conſtrained to ſpeak, when we handled the Temperatures.
- *Sex.*
- *Colour:* Of which we have already ſpoken.
- The Conformation of the *Inſtrumental* parts.
- *Time:* whoſe force we have alſo conſidered.
- *Region.*
- Order of *Diet*, and condition of *Life*.

CHAP. XI.

Of the Adjuncts of things Natural.

What ſex is.

SEX is no other thing than the diſtinction of Male and Female; in which this is moſt obſervable, that for the parts of the body, and the ſite of theſe parts, there is little difference between them; but the Female is colder than the Male. Wherefore their ſpermatical parts are more cold, ſoft, and moiſt; and all their natural actions leſs vigorous and more depraved.

The nature of women.

Of Eunuchs.

The Nature of Eunuchs is to be referred to that of women, as who may ſeem to have degenerated into a womaniſh nature, by deficiency of heat; their ſmooth body, and ſoft and ſhrill voyce do very much aſſimilate women. Notwithſtanding you muſt conſider, that there be ſome manly Women, which

which their manly voice, and chin covered with a little hairineſs, do argue; and on the contrary, theſe are ſome womanizing or womaniſh men, which therefore we term dainty and effeminate.

Of Hermaphrodites.

The Hermaphrodite is of a double nature, and in the middle of both Sexes, ſeems to participate of both Male and Female.

Colour the bewrayer of the Temperament.

The Colour which is predominant in the habit and ſuperficies of the body, and lies next under the skin, ſhews the Temperament of what kind ſoever it be; for, as *Galen* notes in *Comment. ad Aphor.* 2. *Sect.* 1. Such a colour appears in us, as the contained Humor hath. Wherefore if a Roſie hew colour the cheeks, it is a ſign the body abounds with blood, and that is carried abroad by the plenty of Spirits. But if the skin be died with a yellow colour, it argues Choler is predominant; if with a whitiſh and pallid hew, Phlegm; with a ſable and duskie, Melancholy. So the colour of the Excrements which are according to nature, is not of the leaſt conſideration. For thus, if an Ulcer being broken ſend forth white matter, it argues the ſoundneſs of the part from whence it flows; but if ſanious or bloody, green, blackiſh, or divers colours, it ſhews the weakneſs of the ſolid part, which could not aſſimilate by concoction the colour of the excrementitious humor. The like reaſon is of unnatural Tumors: For, as the colour, ſo the dominion of the Humor cauſing or accompanying the Swelling commonly is.

The perfection of the organical parts, conſiſts in four things.

The conformity and integrity of the Organical parts is conſidered by their figure, greatneſs, number, ſituation, and mutual connexion. We conſider the figure, when we ſay, almoſt all the external parts of the body are naturally round, not only for ſhew, but for neceſſity, that being ſmooth, and no way cornered, they ſhould be leſs obnoxious to external injuries. We ſpeak of Greatneſs, when we ſay, ſome are large and thick, ſome lank and lean. But we conſider their Number, when we obſerve ſome parts to abound, ſome to want, or nothing to be defective or wanting. We inſinuate Site and Connexion, when we ſearch, whether every thing be in its proper place, and whether they be decently fitted, and well joyned together.

We have handled the varieties of the four Seaſons of the Year, when we treated of Temperaments. But the conſideration of Region (becauſe it hath the ſame judgment that the Air) ſhall be referred to that diſquiſition or enquiry which we intend to make of the Air, amongſt the things Not-natural.

Diet.

The manner of life, and order of Diet, are to be diligently obſerved by us, becauſe they have great power either to alter, or preſerve the Temperament. But becauſe they are of almoſt infinite variety, therefore they ſcarce ſeem poſſible to fall into Art, which may proſecute all the differences of Diet and Vocations of life. Wherefore if the Calling of Life be laborious, as that of Husbandmen, Mariners, and other ſuch Trades, it ſtrengthens and dries the parts of the body. Although though thoſe which labour about Waters, are moſt commonly troubled with cold and moiſt diſeaſes, although they almoſt kill themſelves with labour.

Again, thoſe which deal with Metals, as all ſorts of Smiths, and thoſe which caſt and work braſs, are more troubled with hot diſeaſes, as Feavers. But if their Calling be ſuch, as they ſit much, and work all the day long ſitting at home, as Shoo-makers; it makes the body tender, the fleſh effeminate, and cauſeth great quantity of excrements. A life as well idle and negligent in body, as quiet in mind, in all riotouſneſs and exceſſes of Diet, doth the ſame. For from hence the body is made ſubject to the Stone, Gravel and Gout.

The commodities of an indifferent Diet.

That Calling of life which is performed with moderate labour, clothing and diet, ſeems very fit and convenient to preſerve the natural temper of the body. The ingenious Chirurgion may frame more of himſelf that may more particularly conduce to the examination of theſe things. Therefore the things natural, and thoſe which are near or neighbouring to them being thus briefly declared; the Order ſeems to require, that we make enquiry of things Not-natural.

CHAP. XII.

Of things Not-natural.

Why they are called things Not-natural.

THe things which we muſt now treat of, have by the later Phyſitians been termed Not-natural; becauſe they are not of the number of thoſe which enter into the conſtitution or compoſure of mans body; as, the Elements, Humors, and all ſuch things which we formerly comprehended under the name of Natural: Although they be ſuch as are neceſſary to preſerve and defend the body already made and compoſed. Wherefore they were called by *Galen* Preſervers; becauſe by the due uſe of them the body is preſerved in health. Alſo, they may be called Doubtful, and Neuters; for that rightly and fitly uſed, they keep the body healthful, but inconſiderately, they they cauſe diſeaſes. Whereby it comes to paſs, that they may be thought to pertain to that part of Phyſick which is of preſerving health; not becauſe ſome of theſe things ſhould be abſolutely and of their own nature wholſom, and others unwholſom; but only by this, that they are, or prove ſo by their convenient, or prepoſterous uſe. Therefore we conſider the uſe of ſuch like things from four conditions, Quantity, Quality, Occaſion, and Manner of uſing: If thou ſhalt obſerve theſe, thou ſhalt attain and effect this, That thoſe things which of themſelves are, as it were, doubtful, ſhall bring certain and undoubted health. For theſe four Circumſtances do ſo far extend, that in them, as in the perfection of Art, the Rules which may be preſcribed to preſerve health, are contained. But *Galen* in another place, hath in four words comprehended theſe things Not-natural; as, things Taken, Applied, Expelled, and to be Done. Things Taken, are thoſe which are put into the body, either by the mouth, or any other way; as the Air, Meat and Drink. Things applied, are thoſe which muſt touch the body, as the Air now mentioned, affecting the body with a diverſe touch of its qualities of heat, cold, moiſture or drineſs. Expelled, are what

Galen. 1. ad Glauconem.

Lib. de Sanitat. tuenda.

things ſoever being unprofitable, are generated in the body, and require to be expelled. To be Done, are labour, reſt, ſleep, watching, and the like. We may more diſtinctly, and by expreſſion of proper Names, revoke all theſe things to ſix:

Which are
- *Air.*
- *Meat* and *Drink.*
- *Labour* and *Reſt.*
- *Sleep* and *Watching.*
- *Repletion* and *Inanition*; or things to be expell'd, or retained and kept.
- *Perturbations* of the Mind.

CHAP. XIII.

Of the Air.

How neceſſary for life the Air is.

AIR is ſo neceſſary to life, that we cannot live a moment without it; if ſo be that breathing, and much more tranſpiration, be not to be ſeparated from life. Wherefore it much conduceth to know, what Air is wholſom, what unwholſom, and which by contrariety of qualities fights for the Patient againſt the Diſeaſe; or on the contrary, by a ſimilitude of qualities ſhall nouriſh the Diſeaſe, that if it may ſeem to burthen the Patient by increaſing or adding to the Diſeaſe, we may correct it by Art. So in curing the wounds of the head, eſpecially in Winter, we labour by all the means we may to make the Air warm. For cold is hurtful to the Brain, Bones, and the wounds of theſe parts; and heat is comfortable and friendly. But alſo the Air being drawn into the body by breathing when it is hotter than ordinary, doth with a new warmth over-heat the heart, lungs, and ſpirits, and weaken the ſtrength by the diſſipation of the Spirits too much attenuated; ſo being too cold, in like manner the ſtrength of the faculties faints and grows dull, either by ſuppreſſion of the vapors, or by the inſpiſſation or thickning of the Spirits.

What Air is hurtful.

Therefore to conclude, That air is to be eſteemed healthful, which is clear, ſubtil and pure, and free and open on every ſide, and which is far remote from all Carion-like ſmells of dead Carkaſſes, or the ſtench of any putrefying thing whatſoever: The which is far diſtant from ſtanding Pools, and Fens, and Caves, ſending forth ſtrong and ill vapors; neither too cloudy nor moiſt by the nearneſs of ſome River.

Such an Air, I ſay, if it have a vernal temper, is good againſt all diſeaſes, That Air which is contrary to this, is altogether unhealthful; as that which is putrid, ſhut up, and preſt by the ſtraitneſs of neighbouring Mountains, infected with ſome noiſom vapor. And becauſe I cannot proſecute all the conditions of Airs, fit for the expelling of all diſeaſes, as which are almoſt infinite; it ſhall ſuffice here to have ſet down, what we muſt underſtand by this word *Air.*

Three things are underſtood by the name of the Air.

Phyſicians commonly uſe to underſtand three things by the name of *Air:* The preſent ſtate of the Air, the Region in which we live, and the ſeaſon of the Year. We ſpoke of this laſt, when we treated of Temperaments. Wherefore we will now ſpeak of the two former. The preſent ſtate of the Air, one while for ſome ſmall time, is like the Spring, that is temperate; otherwhiles like the Summer, that is hot and dry; otherwhiles like the Winter, that is cold and moiſt; and ſometimes like the Autumn, which is unequal; and this laſt conſtitution of the Air is the cauſe of many diſeaſes. When upon the ſame day, it is one while hot, another cold, we muſt expect Autumnal diſeaſes. Theſe tempers and varieties of conſtitutions of the Air, are chiefly and principally ſtirred up by the Winds; as which being diffuſed over all the Air, ſhew no ſmall force by their ſudden change. Wherefore we will briefly touch their natures: That which blows from the Eaſt, is the Eaſt-wind, and is of a hot and dry nature, and therefore healthful, But the Weſtern wind is cold and moiſt, and therefore ſickly. The South-wind is hot and moiſt, the Author of putrefaction and putrid diſeaſes. The North-wind is cold and dry, therefore healthy: Wherefore it is thought, if it happen to blow in the Dog-days, that it makes the whole year healthful, and purges and takes away the ſeeds of putrefaction, if any chance to be in the Air. But this deſcription of the four Winds, is then only thought to be true, if we conſider the Winds in their own proper nature, which they borrow from thoſe Regions from which they firſt proceed. For, otherwiſe they affect the Air quite contrary, according to the diſpoſitions of the places over which they came; as, Snowy places, Sea, Lakes, Rivers, Woods, or ſandy Plains, from whence they may borrow new qualities, with which they may afterwards poſſeſs the Air, and ſo conſequently our bodies.

Aphor. 4. *ſect.* 2. The force of the Winds.

How the winds acquire other faculties, than they naturally have.

Hence it is we have noted the Weſtern-wind unwholſome, and breeding diſeaſes, by reaſon of the proper condition of the Region from whence it came; and ſuch that is cold and moiſt: The *Gaſcoins* find it truly to their ſo great harm, that it ſeldoms blows with them, but it brings ſome manifeſt and great harm, either to their bodies, or fruits of the earth. And yet the *Greeks* and *Latins* are wont to commend it for healthfulneſs, more than the reſt. But alſo the riſing and ſetting of ſome more eminent Stars, do often cauſe ſuch cold winds, that the whole Air is cooled, or infected with ſome other malign quality. For vapors and exhalations are often raiſed by the force of the Stars, from whence Winds, Clouds, Storms, Whirlwinds, Lightnings, Thunders, Hail, Snow, Rain, Earthquakes, Inundations, and violent raging of the Sea, have their original. The exact contemplation of which things, although it be proper to Aſtronomers, Coſmographers and Geographers, yet *Hippocrates* could not omit it, but that he muſt ſpeak ſomething in his Book *de Aere & Aquis*; where he touches, by the way, the deſcription of the neighbouring Regions, and ſuch as he knew.

The Weſtwind of it ſelf unwholſome.

What force Stars have upon the Air.

From this force of the Air, either hurtful, or helping in diſeaſes, came that famous obſervation of *Guido* of *Caulias*, That wounds of the head are more difficult to cure at *Paris*, than at *Avignon*, and

and the plain contrary of wounds of the legs; for the air of *Paris*, compared to that of *Avignon*, is cold and moiſt, wherefore hurtful and offenſive to the wounds of the head. On the contrary, the ſame Air, becauſe it obſcures the ſpirits, incraſſates the blood, condenſates the humors, and makes them leſs fit for defluxions, makes the wounds of the legs more eaſie to be healed, by reaſon it hinders the courſe of humors, by whoſe defluxion the cure is hindred. But it is manifeſt, that hot and dry places make a greater diſſipation of the natural heat, from whence the weakneſs of the powers; by which ſame reaſon the Inhabitants of ſuch places do not ſo well endure blood-letting; but more eaſily ſuffer purgation, though vehement, by reaſon of the contumacy of the humor, cauſed by drineſs. To conclude, the Air changes the Conſtitutions of our bodies, either by its qualities, as if it be hotter, colder, moiſter or drier; or by its matter, as if it be groſſer, or more ſubtil than is fit, or corrupted by exhalations from the earth, or by a ſudden and unaccuſtomed alteration, which any man may prove, who makes a ſudden change out of a quiet air into a ſtormy, and troubled with many winds. But becauſe, next to the Air, nothing is ſo neceſſary to nouriſh mans body, as Meat and Drink, I will now begin to ſpeak of them both.

How the air of *Paris* comes to be ill for wounds of the head, and good for thoſe of the legs.

By what means the air changes our bodies.

CHAP. XIV.

Of Meat and Drink.

THat this our Treatiſe of Meat and Drink may be more brief and plain, I have thought good to part it into theſe heads, as to conſider the goodneſs and illneſs of both of them, their quantity, quality, cuſtom, delight, order, time; and to accommodate them all to the ages and ſeaſons of the year. We judge of the goodneſs and pravity of meats and drinks, from the condition of the good or vicious humours or juyce which they beget in us. For evil juyce cauſeth many diſeaſes. As on the contrary, good juyce drives away all diſeaſes from the body, except the fault happen from ſome other occaſion, as from quantity, or too much exceſs. Wherefore it is principally neceſſary, that thoſe who will preſerve their preſent health, and hinder the acceſs of diſeaſes, feed upon things of good nouriſhment and digeſtion; as, are good wine, the yolks of eggs, good milk, wheaten bread well baked, the fleſh of Capons, Partridge, Thruſhes, Larks, Veal, Mutton, Kid, and ſuch like other, which you may find mentioned in the Books which *Galen* writ, *de Alimentorum facultatibus*; where alſo he examines thoſe which are of evil juyce by their manifeſt qualities; as Acrimony, Bitterneſs, Saltneſs, Acidity, Harſhneſs, and ſuch like.

The goodneſs of nouriſhments.

But unleſs we uſe a convenient quantity and meaſure in our meats, howſoever laudable they be, we ſhall never reap theſe fruits of health we hoped for. For they yield matter of diſeaſes, by the only exceſs of their quantity; but we may by this know the force of quantity on both parts, becauſe often the poiſonous quality of meats of ill nouriſhment doth not hurt, by reaſon they were not taken into the body into a great quantity. That meaſure of quantity is chiefly to be regarded in diſeaſes; for as *Hippocrates* ſaith, If any give meat to one ſick of a Feaver, he gives ſtrength to the well, and increaſes the diſeaſe to the ſick, eſpecially if he do not uſe a mean. Wherefore it is a thing of no ſmall conſequence, to know what diſeaſes require a ſlender, and what a large diet; of which thing there is a large relation made in *Sect.* 1. of the Aphoriſms of *Hippocrates*; where he teacheth, the ſick muſt feed more largely in the beginning of long diſeaſes, whereby they may be enabled to endure the length of the diſeaſe, and laſt to the ſtate thereof. But in ſharp and violent diſeaſes, which preſently come to their height, we muſt uſe a ſlender diet; but moſt ſlender, when the diſeaſe is in the height: And beſides, all our conſultations in this kind, muſt be referred to the ſtrength of the Patients. But thoſe who enjoy their perfect health, muſt uſe a quantity of meat, agreeable to their evacuation and tranſpiration; for men, by reaſon of the ſtrength of their heat, and the more copious diſſipation of the triple ſubſtance, have greater appetite than women; altogether by the ſame reaſon, that young people, and ſuch as grow, need more frequent and plentiful nouriſhment than old men; and alſo amongſt young men of the like age, ſome do rightly require more copious nouriſhment than otherſome, that is, according to the quantity of their evacuations and cuſtom. Certainly for Gluttony, it is ſuch as may be extended to all; but we all ſhould take ſo much meat and drink, that our powers may be refreſhed, and not oppreſſed; for by the decree of *Hippocrates*, theſe be the two compendiary ways of preſerving health; not to be over-filled with meat, and to be quick to work: And thus much of the quantity of meats. Neither muſt thoſe who are ſound or ſick, have leſs regard to the qualities of their meats; and thoſe are either the firſt, as heating, cooling, moiſtening, drying; or the ſecond, attenuating, incraſſating, obſtructing, opening, or ſome other-like, working according to the condition of their nature. The manner of our diet is not only to be framed according to theſe, but alſo to be varied; for the preſent ſtate of ſuch as be in health, requires to be preſerved by the uſe of like things. As hot and moiſt nouriſhments is to be preſcribed to children, as to thoſe which are hot and moiſt; and cold and dry to old men, as to thoſe who are cold and dry, if ſo be that vulgar ſaying be true, that, *Health delights in the uſe of like things*. Yet becauſe Old-age, how green and new begun howſoever it be, is of it ſelf, as it were, a diſeaſe, it ſeems to be more convenient, both to truth, and for health, that old people ſhould eat meats contrary to their nature, that is, hot and moiſt; that ſo we may defer, as much as we can, the cauſes of death, cold and drineſs, which haſten the deſtruction of that age. For we muſt reſiſt diſeaſes by the uſe of their contraries, as thoſe things which are contrary to nature. For otherwiſe, as much meat as you give to the ſick, you add ſo much ſtrength to the diſeaſe. And the ſame is the cauſe why *Hippocrates* ſaid, that a moiſt diet is convenient for all ſuch as are ſick of Feavers, becauſe a Feaver is a dry diſtemperature. Therefore we muſt diligently pry into the nature of the diſeaſe, that knowing it, we may endeavour to abate its fury by the uſe of contraries.

Their quantity.

The quantity of meats muſt be eſteemed according to the nature of the diſeaſe, and ſtrength of the Patient.

The qualities of meat.

Old-age a diſeaſe.

Aphor. 16. *Sect.* 1.

But

The force of Cuſtom.

But if Cuſtom (as they ſay) be another nature, the Phyſician muſt have a great care of it, both in ſound and ſick. For this ſometimes by little and little, and inſenſibly, changes our natural temperament, and inſtead thereof gives us a borrowed temper. Wherefore if any would preſently or ſuddenly change a Cuſtom, which is ſometimes ill, into a better, truly he will bring more harm than good; becauſe all ſudden changes (according to the opinion of *Hippocrates*) are dangerous. Wherefore if neceſſity require that we ſhould withdraw any thing from our Cuſtom, we muſt do it by little and little, that ſo nature may by degrees be accuſtomed to contraries without violence, or the diſturbance of its uſual government. For that meat and drink which is ſomewhat worſe, but more pleaſant and familiar by cuſtom, is to be preferred (in *Hippocrates* opinion) before better, but leſs pleaſant and accuſtomed. Hence is it, that Countrey-men do very well digeſt Beef and Bacon, which commonly they uſe; but will turn into nidorulent vapors, Patridg, Capons, and other meat of good nouriſhment, ſooner than change them into good and laudable *Chylus*. The cauſe of which thing is not only to be attributed unto the property of their ſtronger, and as it were, burning heat, but much more to Cuſtom; which by a certain kind of familiarity, cauſeth that means of hard digeſtion, are eaſily turned into laudable blood. For the force of Cuſtom is ſo great, that accuſtomed meats are more acceptable; whereby it comes to paſs, that while the ſtomach delights in them, it more ſtraitly embraces them, and happily digeſts them, without any trouble of loathing, vomiting, or heavineſs. All the contrary, meet and happen in the uſe of meats, which are unpleaſant to the taſte and ſtomach. For the ventricle abhorring thoſe things, makes manifeſt how it is troubled by its acid and nidorulent belchings, loathing, nauſeouſneſs, vomit, heavineſs, pain of the head, and trouble of the whole body.

Aphor. 91. *ſect.* 2.

Aphor. 38. *ſect.* 2.

Accuſtomed meats are more grateful, and ſo, by that means, more nouriſhing.

Wherefore we muſt diligently enquire, what meats the Patient chiefly delighted in, that by offering them, his appetite languiſhing by reaſon of ſome great evacuation, vomit, or the like, may be ſtirred up. For it will be better and more readily reſtored by things acceptable, though they be ſomewhat worſe, as we noted a little before out of *Hippocrates*. By which words he plainly taught, that it is the part of a good and prudent Phyſician to ſubſcribe to, and pleaſe, the palat of his Patient.

The order of eating our meats.

But ſeeing that Order is moſt beautiful in all things, it is truly very neceſſary in eating our meat: for how laudable ſoever the meats be in their quantity and quality, howſoever familiar by uſe, and grateful by cuſtom; yet unleſs they be eaten in due order, they will either trouble or moleſt the ſtomach, or be ill, or ſlowly and difficultly concocted; wherefore we muſt diligently obſerve, what meats muſt be eaten at the firſt, and what at the ſecond courſe; for thoſe meats which be hard to concoct, are not to be eaten before thoſe which are eaſie of digeſtion; neither dry and aſtringent things, before moiſtening and looſing.

We muſt begin our meals with moiſt or liquid meat.

But on the contrary, all ſlippery, fat and liquid things, and which are quickly changed, ought to go before, that ſo the belly may be moiſtned; and then aſtringent things muſt follow, that the ſtomach, by their help, being ſhut and drawn together, may more ſtraitly comprehend the meat on every ſide, and better perform the Chylification by its proper heat united and joyned together.

For this cauſe *Hippocrates*, *Lib. de Victu in acutis*, commands thoſe things to be always eaten in the morning, which are fit to looſen the belly, and in the evening ſuch as nouriſh the body. Yet notwithſtanding drink ought not to precede or go before meat, but on the contrary, meat muſt precede drink, by the order preſcribed by him.

The time of eating.

Neither ought we in our eating to have leſs care of the time, than we have of the order; for the time of eating of ſuch as are healthful, ought to be certain and fixt; for at the accuſtomed hour, and when hunger preſſes, any ſound man, and which is at his own diſpoſure may eat, but exerciſe and accuſtomed labours ought to go before; for it is fit, according to the Precept of *Hippocrates*, that labour precede meat, whereby the excrements of the third concoction may be evacuated, the native heat increaſed, and the ſolid parts confirmed and ſtrengthened, which are three commodities of exerciſe very neceſſary to the convenient taking of meat. But in ſick perſons we can ſcarce attend and give heed to theſe circumſtances of time, and accuſtomed hour of feeding; for, that indication of giving meat to the ſick, is the beſt of all, which is drawn from the motion of the diſeaſe, and the declining of the fit: For if you give meat in Feavers, ſpecially the fit then taking the Patient, you nouriſh not him, but the Diſeaſe. For the meat then eaten, is corrupted in the ſtomach, and yields fit matter for the diſeaſe: For meat (as we noted before out of *Hippocrates*) is ſtrength to the ſound, and a diſeaſe to the ſick, unleſs it be eaten at convenient time, and diligent care to be had of the ſtrength of the Patient, and greatneſs of the diſeaſe.

The profit of labour before meat.

We muſt not give meat in a fit of a Feaver.

Variety of meats.

But neither is it convenient that the meat ſhould be ſimple, and of one kind, but of many ſorts, and of divers diſhes dreſſed after different forms, leſt nature by the continual and hateful feeding upon the ſame meat, may at length loath it, and ſo neither ſtraitly contain it, nor well digeſt it; or the ſtomach accuſtomed to one meat, taking any loathing thereat, may abhor all other; and as there is no deſire of that we do not know, ſo the dejected appetite cannot be delighted and ſtirred up with the pleaſure of any meat which can be offered. For we muſt not credit thoſe ſuperſtitious or too nice Phyſicians, who think the digeſtion is hindred by the much variety of meats.

Why variety of meats is good.

The matter is far otherwiſe, for by the pleaſure of what things ſoever the ſtomach allured doth require, it embraces them more ſtraitly, and concocts them more perfectly. And our nature is deſirous of variety.

Moreover, ſeeing our body is compoſed of a ſolid, moiſt, and airy ſubſtance; and it may happen, that by ſo many labours, which we are compelled to undergo and ſuſtain in this life, one of theſe may ſuffer a greater diſſipation and loſs than another; therefore the ſtomach is neceſſarily compelled to ſeek more variety, leſt any thing ſhould be wanting to repair that which is waſted. But alſo the age and ſeaſon of the year, yield Indications of feeding; for ſome things are convenient for a young man, ſome for an old; ſome in Summer, ſome in Winter. Wherefore we ought to know what befits each age and ſeaſon. Children need hot, moiſt, and much nouriſhment, which may not only

Indications of feeding, taken from the age.

ſuffice

ſuffice to nouriſh, but increaſe the body. Wherefore they worſt endure faſting, and of them eſpecially thoſe who are the moſt lively and ſpiritful. With old men it is otherwiſe; for becauſe their heat is ſmall, they need little nouriſhment, and are extinguiſhed by much. Wherefore old men eaſily endure to faſt; they ought to be nouriſhed with hot and moiſt meats, by which their ſolid parts now growing cold and dry, may be heated and moiſtned, as by the ſweet nouriſhment of ſuch like meats. Middle ag'd men delight in the moderate uſe of contraries, to temper the exceſs of their too acrid heat. Young people as temperate, are to be preſerved by the uſe of like things.

The manner of Diet in Winter muſt be hot, and inclining to drineſs. Wherefore, then, we may more plentifully uſe roſt-meats, ſtrong wines, and ſpices; becauſe in the Winter-ſeaſon we are troubled with the cold and moiſt air, and at the ſame time, have much heat inwardly; for the inner parts, according to *Hippocrates*, are naturally moſt hot in the Winter, and the Spring, but fearveriſh in Summer; ſo the heat of Summer is to be tempered by the uſe of cold and moiſt things, and much drink. In the temperate Spring, all things muſt be moderate; but in Autumn, by little and little, we muſt paſs from our Summer to our Winter diet. Indication from the time of the year.

CHAP. XV.

Of Motion and reſt.

HEre Phyſicians admoniſh us, that by the name of Motion, we muſt underſtand all ſorts of Exerciſes, as walking, leaping, running, riding, playing at Tennis, carrying a burthen, and the like. Friction or rubbing is of this kind, which in times paſt was in great uſe and eſteem, neitheir at this day is it altogether neglected by the Phciyſians. They mention many kinds of it, but they may be all reduced to three; as, one gentle, another hard, a third indifferent; and that of the whole body, or only of ſome part thereof. That Friction is called hard, which is made by the rough, or ſtrong preſſure of the hands, ſpunges, or a coarſe and new linnen cloth: It draws together, condenſates, binds and hardens the fleſh, yet if it be often and long uſed, at length it rariſies, diſſolves, attenuates, and diminiſhes the fleſh, and any other ſubſtance of the body; and alſo it cauſeth revulſion, and draws the defluxion of humors from one part to another. The gentle Friction, which is performed by the light rubbing of the hand, and ſuch like, doth the contrary; as, ſoftens, relaxes, and makes the skin ſmooth and unwrinckled; yet unleſs it be long continued, it doth none of theſe worthy to be ſpoken of. The indifferent kinds, conſiſting in the mean betwixt the other two, increaſeth the fleſh, ſwells or puffs up the habit of the body, becauſe it retains the blood and ſpirits which it draws, and ſuffers them not to be diſſipated. What Motion ſignifies. Three kinds of Frictions. Hard. Gentle. Indifferent.

The benefit of Exerciſe is great, for it increaſes natural heat, whereby better digeſtion follows, and by that means nouriſhment, and the expulſion of the excrements; and laſtly, a quicker motion of the ſpirits, to perform their office in the body, all the ways and paſſages being cleanſed. Beſides, it ſtrengthens the reſpiration, and the other actions of the body, confirms the habit, and all the limbs of the body, by the mutual attrition of the one with the other; whereby it comes to paſs they are not ſo quickly wearied with labour. Hence we ſee, that Country-people are not to be tired with labour. The uſe of exerciſes.

If any will reap theſe benefits by Exerciſe, it is neceſſary that he take opportunity to begin his exerciſe, and that he ſeaſonably deſiſt from it, not exerciſing himſelf violently, and without diſcretion; but at certain times according to reaſon. What the fitteſt time for exerciſe.

Wherefore the beſt time for exerciſe will be before meat (that the appetite may be increaſed by augmenting the natural heat) all the excrements being evacuated, leſt Nature being hungry and empty, do draw and infuſe the ill humors contained in the guts and other parts of the body, into the whole habit, the Liver, and other noble parts. Neither is it fit preſently, after meat, to run into exerciſe, leſt the crude humours and meats not well concocted, be carried into the veins. The meaſure and bounds of exerciſe muſt be, when the body appears more full, the face looks red, ſweat begins to break forth, we breath more ſtrongly and quick, and begin to grow weary; if any continue exerciſe longer, ſtiffneſs and wearineſs aſſails his joynts, and the body flowing with ſweat ſuffers a loſs of the ſpirituous and humid ſubſtance, which is not eaſily repaired; by which it becomes more cold and lean, even to deformity.

The quality of exerciſe which we require, is in the midſt of exerciſe; ſo that the exerciſe muſt be neither too ſlow and idle, neither too ſtrong nor too weak, neither too haſty nor remiſs, but which may move all the members alike. Such exerciſe is very fit for ſound bodies. But if they be diſtempered, that ſort of exerciſe is to be made choice of, which by the quality of its exceſs, may correct the diſtemper of the body, and reduce it to a certain mediocrity. Wherefore ſuch men as are ſtuffed with cold, groſs, and viſcous humors, ſhall hold that kind of exerciſe moſt fit for them, which is more laborious, vehement, ſtronger, and long continued. Yet ſo, that they do not enter into it before the firſt and ſecond concoction, which they may know by the yellowneſs of their urin. But let ſuch as abound with thin and cholerick humors, chuſe gentle exerciſes, and ſuch as are free from contention, not expecting the finiſhing of the ſecond concoction, for the more acrid heat of the ſolid parts delights in ſuch half-concocted juices, which otherwiſe it would ſo burn up all the glutinous ſubſtance thereof being waſted, that they could not be adjoyned or faſtned to the parts. For the repeating or renewing of exerciſe, the body ſhould be ſo often exerciſed, as there is a deſire to eat. For exerciſe ſtirs up and revives the heat which lies buried and hid in the body; for digeſtion cannot be well performed by a ſluggiſh heat, neither have we any benefit by the meat we eat, unleſs we uſe exerciſe before. The quality of exerciſe. For whom ſtrong exerciſes are convenient.

The laſt part of exerciſe begun and performed according to Reaſon, is named, *The ridering of the body*, which is performed by an indifferent rubbing and drying of members; that ſo the ſweat breaking *Anoregnia.*

ing

ing forth, the filth of the body, and ſuch excrements lying under the skin, may be allured and drawn out; and alſo that the members may be freed from ſtiffneſs and wearineſs. At this time it is commonly uſed by ſuch as play at Tennis.

What diſcommodities proceed from Idleneſs.

But, as many and great Commodities ariſe from exerciſe conveniently begun and performed, ſo great harm proceeds from Idleneſs; for groſs and vicious juyces heaped up in the body, commonly produce crudities, obſtructions, ſtones both in the reins and bladder, the Gout, Apoplexy, and a thouſand other diſeaſes.

CHAP. XVI.

Of Sleep and Watching.

THat this our ſpeech of Sleep and Watching, which we now intend, may be more plain, we will briefly declare, what commodity or diſcommodity they bring; what time and what hour is convenient for both; what the manner of lying muſt be, and the choice thereof; what the dreams in ſleeping; and what, pains or heavineſs and chearfulneſs after ſleep may portend.

What ſleep is.

Sleep is nothing elſe than the reſt of the whole body, and the ceſſation of the Animal faculty from ſenſe and motion. Sleep is cauſed, when the ſubſtance of the brain is poſſeſſed, and after ſome ſort overcome and dulled by a certain vaporous, ſweet, and delightſome humidity; or when the ſpirits, almoſt exhauſt by performance of ſome labour, cannot any longer ſuſtain the weight of the body, but cauſe reſt by a neceſſary conſequence; by which means, nature may produce other, from the meat by concoction turned into blood.

The uſe of ſleep.

Sleep fitly taken, much helps the digeſtion of the parts, becauſe in the time of reſt, the heat being the worker of all concoction, is carried back to them, together with the ſpirits. Neither doth ſleep only give eaſe to the wearied members, but alſo leſſens our cares, and makes us to forget our labours.

Fit time for ſleep, and the nature of the night.

The night is a fit time to ſleep and to take our reſt in, as inviting ſleep by its moiſture, ſilence, and darkneſs. For the heat and ſpirits, in the thick obſcurity of night, are driven in and retained in the center of the body; as on the contrary by the daily, and as it were, friendly and familiar light of the Sun, they are allured and drawn forth into the ſuperficies, and outward part of the body; from whence they leave ſleeping, and begin to wake.

Sleep on the day-time.

Beſides alſo, which makes not a little to that opportunity and benefit which we look for from ſleep, the night ſeaſon ſuffices for the work of juſt and perfect concoction. Which is one reaſon, amongſt many, that ſleep in the day time may be hurtful. For we are wakened from our ſleep by the heat and ſpirits, called forth to the skin either by the light, or noiſe on the day time, before that the concoction which was begun be finiſhed. But, that ſleep cannot but be light which comes without neceſſity of ſleeping. Wherefore the concoction being attempted, but not perfected, the ſtomach is filled with crudities, diſtended with acid or ſour belchings, and the brain troubled with groſs vapors and excrementitious humidities. From whence proceed pain and heavineſs of the head, and ſtore of cold diſeaſes. But although ſleep on the night time be wholſome, yet it is fit that it be reſtrained within the limits of an indifferent time, For that which exceeds, hinders the evacuation of excrements both upwards and downwards: But in the mean time the heat, which is never idle, draws from them ſome portion or vapour, into the veins, principal parts and habit of the body, to become matter for ſome diſeaſe. We muſt meaſure this time, not by the ſpace of hours, but by the finiſhing the work of concoction, which is performed in ſome ſooner than in other ſome. Yet that which is longeſt is perfected and done in ſeven or eight hours. The ventricle ſubſiding and falling into its ſelf and its proper coats, and the urine tinctured yellow, gives perfect judgment thereof. For on the contrary, the extenſion of the ſtomach, acid belching, pain of the head, and heavineſs of the whole body, ſhew that the concoction is unperfect.

There ought to be a moderation of our nights ſleep.

How to be known.

What the form and ſite of our body ought to be while we ſleep.

In ſleeping we muſt have ſpecial care of our lying down; for firſt we muſt lie on our right ſide, that ſo the meat may fall into the bottom of our ſtomach, which being fleſhy, and leſs membranous, is the hotter, and more powerful to aſſimilate. Then a little after we muſt turn upon our left ſide, that ſo the Liver with its Lobes, as with hands, may on every ſide embrace the ventricle, and as a fire put under a kettle, haſten the concoction. Laſtly, towards morning it will not be unprofitable to turn again upon our right ſide, that by this ſituation the mouth of the ſtomach being opened, the vapours which ariſe from the elixation of the *Chylus* have freer paſſage.

The harm of lying on our backs.

Upon our bellies.

Lying upon the back is wholly to be avoided; for from hence the Reins are inflamed, the Stone is bred, Palſies, Convulſion, and all the diſeaſes which have their original from the defluxion into the ſpinal marrow, and to the Nerves taking beginning from thence. To lie upon the belly is not unprofitable for ſuch as have uſed to lie ſo, if they be not troubled with defluxions into the eyes; for ſo the humor will more eaſily flow into the part affected. But thus the work of concoction is not a little furthered, becauſe by that form of lying, not only the inward heat is contained and gathered about the Ventricle, but the encompaſſing warmneſs of the ſoft feathers of the bed aids and aſſiſts it.

The conſideration of dreams.

Neither are the Dreams which we have in our ſleep to be neglected, for by the diligent conſideration of theſe, the affections and ſuperfluous Humors which have chief power in the body are marvellouſly known. For thoſe who have raging choler running up and down their bodies while they ſleep, all things to them appear bright, ſhining, fiery, burning, full of noiſe and contention. Thoſe who abound with Phlegm, dream of floods, ſnows, ſhowers, and inundations and falling from high places. Thoſe who are Melancholy, dream of gapings and gulphs in the earth, thick and obſcure darkneſs, ſmoaks, caves, and all black and diſmal things. But thoſe whoſe bodies abound in blood, dream of marriages, dances, embraces of women, feaſts, jeſts, laughter, of orchards and gardens; and to conclude, of all things pleaſant and ſplendent.

Alſo

Alſo we muſt obſerve how the Patient doth after ſleep, whether more lively and chearful, or more heavy: for, by the opinion of *Hippocrates*,

Cum labor a ſomno eſt, lethalem collige morbum:
Sin profit ſomnus, nihil hinc lethale timendum eſt. *Aphor. 1. ſect. 2.*

Pain ſleep enſuing, an ill diſeaſe doth ſhow;
But if ſleep profit bring, no harm from thence will flow.

And as ſleep, ſo watching, if it exceed meaſure, is hurtful; for it hurts the temperature of the brain, weakens the ſenſes, waſtes the ſpirits, breeds crudities, heavineſs of the head, falling away of the fleſh, and leanneſs over all the body; and, to conclude, it makes Ulcers more dry, and ſo conſequently rebellious, difficult to heal and malign. There are many other things may be ſpoken of ſleep and watching, but theſe may ſuffice a Chirurgeon.

CHAP. XVII.

Of Repletion, and Inanition or Emptineſs.

THere are to be ſhort, two ſorts of Repletion, or of all exceſs; one is of a ſimple quality, without any defluxion, or ſociety of any humor, as appears in diſtempers without matter: The other is of quantity and maſs, the body being diſtended with two much meat, or too great quantity of humors; from whence proceed an infinite number of diſeaſes. They call the Repletion of meats, Satiety or Fulneſs; and it is of two kinds: The one which is called * Repletion or Fulneſs to the veſſels; the other Repletion to the ſtrength. *The kinds of Repletions, or rather of Exceſſes.* * *Repletio ad vaſa, ad vires*

We judge of Satiety to the veſſels, by the diſtention and ſwelling of the veins, and entrals, as the ſtomach. We call Satiety to the ſtrength, when the body is loaded with more meats than it can well bear. But alſo there is a double Repletion of humors. For either it is of ſome one humor, or of all the humors; they call this by a peculiar name, *Plethora*. For *Galen* defines *Plethora* to be an equal exceſs of all the humors. For if at any time he define a *Plethora* to be an exceſs of blood only; then verily by the name of blood, he underſtands an equal comprehenſion of the four humors as it is taught in Phyſick Schools, *Gal. Meth. 13. cap. 6.*

The Repletion which is cauſed by ſome one humor, is termed by *Galen* in the place before-mentioned, *Cacochymia* (that is, an evil juice) whether the Repletion proceed of a Cholerick, Melancholick, Phlegmatick, or ſerous Humor. *What Cacochymia is.*

Now Inanition or Evacuation, is no other thing than the expulſion or effuſion of humors which are troubleſome, either in quantity or quality. Of Evacuation, ſome are univerſal, which expel ſuperfluous humors from the whole body; ſuch are Purging, Vomiting, Tranſpiration, Sweats, Phlebotomy. Some particular, which are performed only to evacuate ſome part, as the Brain, by the noſe, palat, eyes, ears; the Lungs, by the weazon; the Stomach, by vomit and ſtool; the guts, by ſtool; the Liver and the Spleen, by urine and ordure. Theſe Evacuations are ſometimes performed by nature, freeing it ſelf of that which is troubleſome to it; otherwhiles by the Art of the Phyſician in imitation of nature. *The kinds of Evacuation.*

And again, one of theſe is good and requiſite, when only the humor which is hurtful either in quantity or quality, is evacuated: The other not requiſite, or immoderate, when the profitable Humors, together with the unprofitable, are expelled.

But what Evacuations ſoever theſe be, they are performed and done, either by the ſcratching and rubbing of the skin, as when a Cholerick, Salt or Serous Humor, or ſome windineſs lying between the skin and the fleſh, cauſe itching. For by ſcratching the skin, it gets paſſage out, which is manifeſt by the efflux of a ſerous matter burning, or cauſing ſcabs and ulcers, if the humor be ſomewhat groſs; but inſenſible and not ſo manifeſt, if it be windineſs, the skin by that rubbing being rarified, and the groſs flatulency attenuated. Wherefore they do ill who hinder their Patients from ſcratching, unleſs they ſcratch ſo cruelly and hard, that there may be danger (by reaſon of the great heat and pain thereby cauſed) of ſome defluxion or falling down of humors into the part. *The commodities of moderate ſcratching.*

Or theſe Evacuations are performed by much matter evacuated from an opened Bile, or running Ulcer, a Fiſtula, or ſuch like ſores. Or by ſweats which are very good and healthful, eſpecially in ſharp diſeaſes, if they proceed from the whole body, and happen on the critical days. By Vomit, which often violently draws theſe humors from the whole body, even from the utmoſt joynts, which purging Medicines could not evacuate, as we may ſee in the Palſie, and Sciatica, or Hip-gout. By ſpitting, as in all who are ſuppurated either in the ſides or lungs. By Salivation, or a Phlegmatick flux by the mouth, as in thoſe who are troubled with the French-pox. By ſneezing and blowing the noſe; for by theſe, the brain oppreſt with moiſture, disburtheneth it ſelf, whether it be done without, or with the help of ſternutatories and errhines; wherefore children, and ſuch as have ſomewhat moiſt brains, purge themſelves often this way. By hicket and belching; for by theſe the windineſs contained in the ſtomach, is often expelled. By urine, for by this not only Feavers, but which is more admired, the French-pox hath often been terminated and cured. *The force of Vomits.* *Salivation.* *The whole body is alſo purged by urine.*

For there have been ſome troubled with the Pox, in whom a flux of the vicious and venenate humor could not by Unctions of Quick-ſilver be procured, either from the mouth or belly; yet have been wonderfully freed by abundance of Urine, both from danger of death and their diſeaſe. By bleeding; for nature hath often found a way for grievous diſeaſes, eſpecially in young bodies, by bleeding at the noſe, and by their courſes in women. By a flux, or lask, purgations, ſweats, inſenſible

sible Evacuation and Transpiration; for so tumors, the matter being brought to suppuration, do sometimes vanish away and are dissolved, both of their own accord, as also by dissolving or discussing Medicines. We do the same by Exercise, Diet, Hot-houses, long sleep, walking, and shedding of tears. By sucking, as with Cupping-glasses, and Horse-leeches, in wounds made by venemous bitings.

We must observe three things in every Evacuation.

In all such kinds of Evacuations, we must consider three things, the quantity, quality and manner of Evacuation. As for an example, When an *Empiema* is opened, the matter which runs out, ought to be answerable in proportion to the purulent matter, which was contained in the capacity of the breasts; otherwise, unless all the matter be emptied, there may happen a relapse; the matter should be white, soft, equal, and nothing stinking: Lastly, you must let it forth, not all together, and one time, but by little and little, and at several times; otherwise, not a little quantity of the spirits and heat doth flow together with the unprofitable matter, and so consequently a dissolution of all the powers.

CHAP. XVIII.

Of the Perturbations or Passions of the Mind.

Why the Passions of the mind are called Accidents. Their force.

THe Perturbations are commonly called the Accidents of the Mind, because as bodily accidents from the body, so may these, be present and absent from the Mind, without the corruption of the subject. The knowledge of these must not be lightly passed over by the Chirurgeon; for they stir up great troubles in the bodies, and yield occasion of many and great diseases; of which things, joy, hope, and love, may give an apparent testimony. For by these motions the heat and spirits are sometimes gently, sometimes violently diffused over all the body, for the enjoying of the present, or hoped for good. For then the heart is dilated, as to embrace the thing beloved, and the face is died with a rosie and lively colour. For it is likely, that the faculty it self is stirred by the object, by whose power the heart it self is moved.

From whence they have their force.

For it is first necessary, before we be moved by any Passions, that the Senses in their proper seats, in which they are seldom deceived, apprehend the objects; and straight, as Messengers, carry them to the common sense, which sends their conceived forms to all the faculties. And then, that each faculty, as a Judge, may afresh examine the whole matter, how it is, and conceive in the presented objects some shew of good, or ill, to be desired or shunned. For, What man that was well in his wits, did ever fall into laughter, unless he formerly knew, or saw somewhat said or done, which might yield occasion of laughter? Therefore Joy proceeds from the heart, for the thing causing Mirth or Joy, being conceived, the faculty moves the heart, which shaken and moved by the faculty which hath dominion over it, is dilated and opened, as ready to embrace the exhilarating object. But in the mean time by the force of that dilatation, it sends forth much heat, and spirits together with the blood into all the Body. A great part of which coming to the face, dilates it, the fore-head is smooth and plain, the eyes look bright, the cheeks become red, as dyed with Vermilion, the lips and mouth are drawn together, and made plain and smooth; some have their cheeks dented with two little pits (which from the effects are called laughing cheeks) because of the contraction or curling, which the muscles suffer by reason of their fulness of blood and spirits; all which, to be brief, is nothing but to laugh.

The reason of Joy.

The effects of Joy.

Joy recreates and quickens all the faculties, stirs up the spirits, helps concoction, makes the body to be better liking, and fattens it, the heat, blood and spirits flowing thither, and the nourishing dew or moisture, watering and refreshing all the members; from whence it is, that of all the Passions of the mind, this only is profitable, so that it exceed not measure; for immoderate and unaccustomed joy carries so violently the blood and spirits from the heart, into the habit of the body, that sudden and unlook'd for death ensues, by a speedy decay of the strength, the lasting fountain of the vital humour being exhausted. Which thing principally happens to those who are less hearty, as women and old men.

Anger.

Anger causeth the same effusion of heat in us, but far speedier than Joy; therefore the spirits and humors are so enflamed by it, that it oftens causes putrid Feavers, especially if the body abound with any ill humour.

Sorrow.

Sorrow, or Grief, dries the body by a quite contrary way to that of Anger, because by this the heart is so straitned, the heat being almost extinct, that the accustomed generation of spirits cannot be performed; and if any be generated, they cannot freely pass into the members with the blood; wherefore the vital faculty is weakned, the lively colour of the face withers and decays, and the body wastes away with a lingering Consumption.

Fear.

Fear in like sort draws in and calls back the spirits, and not by little and little, as in Sorrow, but suddenly and violently; hereupon the face grows suddenly pale, the extreme parts cold, all the body trembles or shakes, the belly in some is loosed, the voice, as it were, stays in the jaws, the heart beats with a violent pulsation, because it is almost oppress by the heat, strangled by the plenty of blood, and spirits abundantly rushing thither: The hair also stands upright, because the heat and blood are retired to the inner parts, and the utmost parts are more cold and dry than a stone; by reason whereof the utmost skin and the pores, in which the roots of the hairs are fastned, are drawn together.

Hippocr. lib. 4. de Morb.

Shame.

Shame is a certain affection mixed, as it were, of Anger and Fear; therefore, if in that conflict of, as it were, contending Passions, Fear prevail over Anger, the face waxeth pale (the blood flying back to the heart;) and these or these Symptomes rise, according to the vehemency of the contracted and abated heat, But if on the contrary, Anger get the dominion over Fear, the blood runs violently to the face, the eyes look red, and sometimes they even fome at the mouth.

Shamefastness.

There is another kind of Shame, which the *Latins* call *Verecundia* (we, Shamefastness) in which there

there is a certain flux and reflux of the heat and bloud, first recoiling to the heart, then presently rebounding from thence again. But that motion is so gentle, that the heart thereby suffers no oppression, nor defect of spirits; wherefore no accidents worthy to be spoken of, arise from hence: this affect is familiar to young Maids and Boys, who if they blush for a fault committed unawares or through carelesness, it is thought an argument of a vertuous and good disposition.

An Agony.

But an agony, which is a mixt passion of a strong fear and vehement anger, involves the heart in the danger of both motions; wherefore by this passion the vital faculty is brought into very great danger. To these six Passions of the Mind all other may be revoked, as Hatred and Discord, to Anger; Mirth and Boasting to Joy: Terrours, Frights, and Swoundings, to Fear; Envy, Despair, and Mourning, to Sorrow.

By these it is evident how much the Passions of the mind can prevail, to alter and overthrow the state of the body; and that by no other means, than that by the compression and dilatation of the heart, they diffuse and contract the spirits, bloud, and heat; from whence happens the dissipation or oppression of the spirits.

Why the first signs of Passions of the mind appear in the face.

The signs of these Symptoms quickly shew themselves in the face; the heart, by reason of the thinness of the skin in that part, as it were painting forth the notes of its affections. And certainly the face is a part so fit to disclose all the affections of the inward parts, that by it you may manifestly know an Old man from a Young, a Woman from a Man, a temperate person from an untemperate, an *Ethiopian* from an *Indian*, a *Frenchman* from a *Spaniard*, a Sad man from a Merry, a Sound from a Sick, a Living from a Dead. Wherefore many affirm that the manners, and those things which we keep secret and hid in our hearts, may be understood by the Face and Countenance.

The use of Passions of the mind.

Now we have declared what commodity and discommodity may redound to the man from these fore-mentioned Passions, and have shewed that anger is profitable to none, unless by chance to some dull by reason of idleness, or oppress with some cold, clammy and phlegmatick humour; and Fear convenient for none, unless peradventure for such as are brought into manifest and extream danger of their life by some extraordinary sweat, immoderate bleeding, or the like unbridled evacuation: Wherefore it behoves a wise Chirurgeon to have a care, lest he inconsiderately put any Patient committed to his charge into any of these Passions, unless there be some necessity thereof, by reason of any of the fore-mentioned occasions.

CHAP. XIX.

Of things against Nature, and first of the Cause of a Disease.

What things against Nature are.

HAving treated of things Natural and not Natural, now it remains we speak of things (which are called) against Nature, because they are such as are apt to weaken and corrupt the state of our body. And they be three in number; The Cause of a Disease, a Disease, and a Symptom. The Cause of a Disease is an affect against Nature, which causes the Disease. Which is divided into Internal and External. The External, Original, or Primitive, comes from some other place, and outwardly, into the body: such be meats of ill nourishment, and such weapons as hostilely wound the body.

What, and how many the causes of diseases be.

The Primitive cause.

The Internal have their essence and seat in the body, and are subdivided into Antecedent and Conjunct. That is called an antecedent cause, which as yet doth not actually make a Disease, but goes near to cause one; so Humours copiously flowing, or ready to flow into any part, are the antecedent cause of Diseases. The Conjunct is that which actually causes the Disease, and is so immediately joined in affinity to the Disease, that the Disease being present it is present, and being absent it is absent.

Internal antecedent.

Internal conjunct.

Again, of all such Causes, some are born together with us, as the over-great quantity and malign quality of both the seeds, and the menstruous bloud from diseased Parents, are causes of many Diseases, and specially of those which are called Hereditary.

Other happen to us after we be born, by our diet and manner of life, a stroke, fall, or such other like. Those which be bred with us, cannot be wholly avoided or amended, but some of the other may be avoided, as a stroke and fall; some not, as those which necessarily enter into our body, as Air, Meat, Drink, and the like.

The congenit, or inevitable cause of death.

But if any will reckon up amongst the internal, inherent, and inevitable Causes, the daily, nay hourly dissipation of radical moisture, which the natural heat continually preys upon; I do not gainsay it, no more then that division of Causes celebrated and received of Philosophers, divided into Material, Formal, Efficient, and Final; for such a curious contemplation belongs not to a Chirurgeon, whom I onely intend plainly to instruct. Wherefore that we have written may suffice him.

CHAP. XX.
Of a Diſeaſe.

What a Diſeaſe is, and how various.

A Diſeaſe is an affect againſt Nature; principally, and by it ſelf hurting and depraving the action of the part in which it reſides. The Diviſion of a Diſeaſe is threefold; Diſtemperature, Ill Conformation, and the Solution of Continuity.

A Diſtemperature.

Diſtemperature is a Diſeaſe of the ſimilar parts diſſenting, and changed from their proper and native temper. That digreſſion from the native temper, happens two ways; either by a ſimple diſtemperature from the exceſs of one quality; and this is fourfold, Hot, Cold, Moiſt, and Dry: or by a compound diſtemperature, by the exceſs of two qualities, which alſo is fourfold, Hot and Moiſt, Hot and Dry; Cold and Moiſt, Cold and Dry. Again, every Diſtemper is the fault of one ſimple and ſingle quality, as an Inflammation; or hath ſome vicious humours joined with it, as a Phlegmon. Again, a Diſtemperature is either equal, as in a *Sphacele*; or unequal, as in a *Phlegmon*, beginning or increaſing.

Ill Conformation.

Ill Conformity is a fault of the organical parts, whoſe compoſure is thereby depraved. This hath four kinds; the firſt is, when the figure of the part is faulty, either by nature or accident, or ſome cavity aboliſhed; as if a part which Nature would have hollow for ſome certain uſe, do grow or cloſe up. Or laſtly, if they be rough, or ſmooth, otherwiſe then they ſhould, as if that part which ſhould be rough, be ſmooth, or the contrary. Another is in the magnitude of the part increaſed or diminiſhed contrary to Nature. The third is in the number of the parts increaſed or diminiſhed; as if a hand have but four, or elſe ſix fingers. The fourth is in the ſite and mutual connexion of the parts; as if the parts which ſhould be naturally united and continued, be pluckt aſunder, as happens in Luxations; or the contrary.

Solution of Continuity.

The third general kind of Diſeaſe, is the ſolution of continuity, a Diſeaſe common both to the ſimilar and organical parts, acquiring diverſity of names, according to the variety of the parts in which it reſides.

CHAP. XXI.
Of a Symptom.

What a Symptom is.

We do not in this place take the word Symptom in the moſt general acceptation, for every change or accident which happens to man beſides his own nature; but more reſervedly and ſpecially, onely for that change which the Diſeaſe brings, and which follows the Diſeaſe as a ſhadow doth the body.

Three kinds thereof.

There be three kinds of a Symptom properly taken. The firſt is, when the action is hurt; I ſay hurt, becauſe it is either aboliſhed, weakned, or depraved, ſo blindneſs is a deprivation or aboliſhing of the action of Seeing; dulneſs of ſight, is a diminution or weakning thereof; and a ſuffuſion, ſuch as happens at the beginning of a Cataract, and when they think Flies, Hairs, and ſuch like bodies fly to and fro before their eyes, is a depravation of the ſight.

The ſecond is a ſimple affect of the body, and a full fault of the habit thereof being changed, happening by the mutation of ſome qualities: ſuch is the changing of the native colour into a red by a Phlegmon, and into a livid and black by a Gangrene; ſuch is the filthy ſtench the Noſe affected with a *Polypus* ſends forth; the bitter taſte, in ſuch as have the Jaundice; and the rough and rugged skin in them which are Leprous.

The third is the fault of the overmuch retention of Excrements which ſhould be expelled, and expulſion of ſuch as ſhould be retained; for the evacuation of a humor profitable both in quantity and quality, is againſt nature, as bleeding in a body not full of ill humours, nor Plethorick; and alſo the retention of things hurtful in ſubſtance, quantity, and quality, as the Courſes in Women, the Urine, and the Stone in the Bladder.

CHAP. XXII.
Of Indications.

What Indication is.

The knowledge and exerciſe of Indications befits that Chirurgeon, whom no blind raſhneſs of Fortune but Reaſon, no Chance but Counſel, directs in the undertaking and performing the works of his Art. For an Indication is a certain ſafe and ſhort way, which leads the Phyſician, as by the hand, to the attainment of his purpoſed end, of preſerving the ſound, or curing the ſick.

See *Method.* Cap. 7. *Lib. de opt.* ſecta cap. 11.

For *Galen* doth define an Indication to be a certain inſinuation of what is to be done, or a quick and judicious apprehenſion of that which may profit or hurt. And as Faulconers, Mariners, Plowmen, Souldiers, and all manner of Artizans, have their peculiar terms and words, which are neither known, nor uſed by the vulgar; ſo this word Indication is proper and peculiar to Phyſicians and Chirurgeons, as a term of Art not vulgar; by conſideration of which, as by ſome ſign or ſecret token they are admoniſhed what is to be done to reſtore health, or repel an imminent danger.

The kinds of Indications.

There are three prime and principal kinds of Indications, every of which is ſubdivided into many other. The firſt is from things Natural. The ſecond from thoſe things which are termed Not Natural. The third from thoſe things which are contrary to Nature. Things natural ſhew they muſt be preſerved by their like, and in the compaſs of theſe are contained all the Indications which are drawn from the nature of the Patient, that is, from his ſtrength, temper, age, ſex, habit, cuſtom, diet.

Things

Things not Natural may be doubted as uncertain; for one while they indicate the ſame things with things natural; that is, they co-indicate with the ſtrength, temper, and the reſt; otherwhiles they conſent with things againſt Nature, that is, they co-indicate with the Diſeaſe. Wherefore *Galen* when he ſaith that Indications are drawn from three things; the Diſeaſe, the nature of the Patient, and the encompaſſing Air; by propoſing the familiar example of the Air, he would have us to underſtand the other things not Natural, becauſe we may ſhun or embrace them more or leſs as we will our ſelves; but we muſt whether we will or no endnre the preſent ſtate of the Air. Therefore the Air indicates ſomething to us, or rather co-indicates; for if it nouriſh the Diſeaſe, as conſpiring with it, it will indicate the ſame that the diſeaſe, that is, that it muſt be preſerved in the ſame ſtate. *Lib.9.Method. cap.9.*

Things contrary to Nature indicate they muſt be taken away by their contraries; therefore that we may more accurately and fully handle all the Indications drawn from things Natural, we muſt note, that ſome of theſe are concerning the ſtrength of the Patient; by care to preſerve which, we are often compelled for a time to forſake the cure of the proper Diſeaſe: for ſo, a great ſhaking happening at the beginning of an Ague or Fever, we are often forced to give ſuſtenance to the Patient, to ſtrengthen the Powers ſhaken by the vehemency of the ſhakings, which thing notwithſtanding lengthens both the general and particular fits of the Ague. Other pertain to the temper, other reſpect the habit, if the Patient be ſlender, if fat, if well fleſhed, if of a rare, or denſe conſtitution of body. Other reſpect the condition of the part affected in ſubſtance, conſiſtence ſoftneſs, hardneſs, quick or dull ſenſe, form, figure, magnitude, ſite, connexion, principality, ſervice, function or uſe. From all theſe, as from notes, the skilful Chirurgeon will draw Indications according to the time and part affected: for the ſame things are not fit for ſore eyes, which were convenient for the ears; neither doth the phlegmon in the jaws and throat admit the ſame form of cure, as it doth in other parts of the body. For none can there outwardly apply repercuſſives, without preſent danger of ſuffocation. So there is no uſe of repercuſſives in defluxions of thoſe parts which in ſite are near the principal, Neither muſt thou cure a wounded Nerve and Muſcle, after one manner. The temperature of a part, as Moiſture always indicates its preſervation, although the diſeaſe be moiſt, and give indication of drying, as an ulcer. The principality of a part always inſinuates an Indication of aſtringent things, although the diſeaſe require diſſolving, as an obſtruction of the Liver; for otherwiſe, unleſs you mix aſtringent things with diſſolving, you will ſo diſſolve the ſtrength of the part, that hereafter it cannot ſuffice for ſanguification. If the texture of a part be rare, it ſhews it is leſs apt or prone to obſtruction; if denſe, it is more obnoxious to that Diſeaſe, hence it is that the Liver is oftner obſtructed then the Spleen. If the part be ſituate more deep or remote, it indicates the medicines muſt be more vigorous and liquid, that they may ſend their force ſo far. The ſenſibleneſs, or quick ſenſe of the part, gives indication of milder Medicins, then peradventure the ſigns or notes of a great Diſeaſe require. For the Phyſician which applies things equally ſharp to the horny tunicle of the eye being ulcerated, and to the leg, muſt needs be counted either cruel or ignorant. Each Sex and Age hath its Indications, for ſome Diſeaſes are curable in youth, which we muſt not hope to cure in old age; for hoarſneſs and great diſtillations in very old men, admit no digeſtion, as *Hippocrates* ſaith; *Aphor.40. li.2.*

Indications drawn from things natural

What the conditions of the parts affected do indicate.

Indications from the Ages.

Nunquam decrepitus Bronchum coquit, atque Coryzam.
The feeble Sire, for Age that hardly goes,
Ne'r well digeſts the hurtful Rheum or poſe.

Moreover, according to his decree, the Diſeaſes of the Reins, and whatſoever pains moleſt the bladder, are difficultly healed in old men; and alſo reaſon perſuades that a Quartan admits no cure in Winter, and ſcarce a Quotidian; and Ulcers in like manner, are more hard to heal in Winter; that hence we may underſtand certain Indications to be drawn from time; and to increaſe the credit of the variety and certainty of Indications, ſome certain time, and ſeaſons in thoſe times command us to make choice of Medicins; for, as *Hippocrates* teſtifies; *Aphor.6. ſect.6.* *Aphor.5. ſect.4.*

Ad Canis ardorem, facilis purgatio non eſt.
In Dog-days heat it is not good,
By purging for to cleanſe the bloud,

Neither ſhalt thou ſo well preſcribe a ſlender diet in Winter, as in the Spring, for the air hath its Indications. For experience teaches us, that wounds of the head are far more difficultly and hardly cured, at *Rome*, *Naples*, and *Rochel* in *Xantoigne*. But the times of diſeaſes yield the principal Indications; for ſome Medicins are onely to be uſed at the beginning and end of Diſeaſes others at the increaſe and vigour of the Diſeaſe. We muſt not contemn thoſe Indications which are drawn from the vocation of Life, and manner of Diet; for you muſt otherwiſe deal with the painful Husbandman (when he is your Patient) which leads his life ſparingly and hardly, than with the Citizen, who lives daintily and idlely. To this manner of life and diet may be referred a certain ſecret and occult property, by which many are not onely ready to vomit at eating of ſome meats, but tremble over all their bodies when they hear them but ſpoken of. I knew a prime Nobleman of the *French* Nobility, who was ſo perplext at the ſerving in of an Eel to the Table, at the midſt of dinner and amongſt his friends, that he fell into a ſwound, all his powers failing him. *Galen* in his Book *De Conſuetudine* tells, that *Aerius* the *Peripatetick* died ſuddenly, becauſe compelled by the advice of thoſe Phyſicians he uſed, he drank a great draught of cold Water in the intolerable heat of a Fever. For no reaſon, ſaith *Galen*, than that becauſe he knowing he had naturally a cold ſtomach from his childhood, perpetually abſtained from cold Water.

From our diet.

Hatred ariſing from ſecret properties.

Indications taken from things againſt nature.

For as much as belongs to Indications taken from things againſt nature; the length and depth of

of a wound or ulcer indicates one way; the figure cornered, round equal and ſmooth, unequal and rough, with a hollowneſs ſtreight or winding, indicate otherwiſe; the ſite right, left, upper, lower in another manner, and otherwiſe the force and violence of antecedent and conjunct cauſes. For oftentimes the condition of the cauſe indicates contrary to the Diſeaſe, as when abundance of cold and groſs humours cauſe and nouriſh a Fever. So alſo a Symptom often indicates contrary to the Diſeaſe: in which contradiction, that indication muſt be moſt eſteemed which doth moſt urge; as for example ſake, If ſwounding happen in a Fever, the feveriſh burning ſhall not hinder us from giving Wine to the Patient,

Wherefore theſe Indications are the principalleſt and moſt noble, which lead us, as by the hand, to do theſe things which pertain to the cure, prevention and mitigating of Diſeaſes. But if any object, that ſo curious a ſearch of ſo many Indications is to no purpoſe; becauſe there are many Chirurgeons, which ſetting onely one before their eyes, which is drawn from the eſſence of the Diſeaſe, have the report and fame of skilful Chirurgeons, in the opinion of the vulgar; but let him know that it doth not therefore follow, that this Indication is ſufficient for the cure of all Diſeaſes; for we do not always follow that which the eſſence of the Diſeaſe doth indicate to be done. But chiefly, then where none of the fore-recited Indications doth reſiſt or gain-ſay. You may underſtand this by the example of a *Plethora*, which by the Indication drawn from the eſſence of the thing, requires Phlebotomy; yet who is it that will draw bloud from a child of three moneths old? Beſides, ſuch an Indication is not artificial but common to the Chirurgeon with the common people. For who is it that is ignorant, that contraries are the remedies of contraries? and that broken bones muſt be united by joyning them together? But how it muſt be performed and done, this is of Art and peculiar to a Chirurgeon, and not known to the Vulgar. Which the Indications drawn from thoſe Fountains we pointed at before, abundantly teach; which, as by certain limits of circumſtances, encompaſs the Indication which is taken from the eſſence of the Diſeaſe, leſt any ſhould think we truſt to that only. For there is ſome great and principal matter in it, but not all. For ſo the meaneſt of the common people is not ignorant that the ſolution of continuity is to be cured by repairing that which is loſt. But in what parts we may hope for reſtitution of the loſt ſubſtance, and in which not, is the part of a skilful Chirurgeon to know and pronounce. Wherefore he will not vainly beſtow his labour to cure the nervous part of the *Diaphragma* or Midriff being wounded, or the Heart, or ſmall Guts, Lungs, Liver, Stomach, Brair, or Bladder; and that I may ſpeak in a word, Empericks are not much more skilful then the common people, although they do ſo much extol themſelves above others by the name of experience. For although experience be another inſtrument to find out things with reaſon, yet without reaſon it will never teach what the ſubſtance of the part in which the diſeaſe lies, may be; or what the action, uſe, ſite, connexion, from whence ſpecial and proper Indications are drawn; with which the Chirurgeon being provided and inſtructed, ſhall not onely know by what means to find out a remedy, but alſo, leſt he may ſeem to mock any with vain promiſes, he ſhall diſcern what Diſeaſes are uncurable, and therefore not to meddled withall.

We do not always follow the Indication which is from the Diſeaſe.

In what parts we cannot hope for reſtoring of ſolution of continuity.

Experience without reaſon is like a blind man without a Guide.

But implicit or intricate Diſeaſes require each to be cured in their ſeveral order, except ſome one of them be deſperate, or ſo urge and preſs that the Phyſician think it neceſſary after a preposterous order to begin with it, although often he be forced to make ſome one of theſe Diſeaſes incurable, or give occaſion of cauſing ſome new one: into which ſtraits we are neceſſarily compelled to fall, when (for example) we determine to pull, or take away ſome extraneous body; for the performance whereof we are compelled to enlarge the wound. So we are forced by neceſſity to open the neck of the bladder, (that ſo we may draw forth the ſtone therein contained) with a wound which often degenerates into an uncurable Fiſtula. For that Diſeaſe which threatens danger of preſent death is of ſuch moment, that to ſhun that it may be counted a ſmall matter, and commodious for the ſick, to bring in other Diſeaſes, though incurable. For if a convulſion happen by pricking a Nerve, which we cannot heal by any remedies, then by cutting the Nerve aſunder we end the convulſion, but deprive the part into which that Nerve did go, of the uſe of ſome voluntary motion. So if in any great joint there happen a Luxation with a wound, becauſe there is danger of convulſion by trying to reſtore and ſet right the luxated part, we are forced for ſhunning thereof, to attend the wound only, and in the mean time to let alone the Luxation. Otherwiſe, in implicit Diſeaſes, if there be nothing which may urge, or call us from the ordinary cure, we muſt obſerve this order, that beginning with that affect, which hinders the cure of the principal Diſeaſe, we proſecute the reſt in the ſame and their proper order, untill all the Diſeaſes being overcome, we ſhall reſtore the part affected to its integrity. Therefore let us take for an example, an Ulcer in the Leg, a *Varix*, (or big-ſwollen Vein) and a Phlegmonous tumor round about it; and laſtly, a body wholly plethorick and filled with ill humours; Order and Reaſon require this, that uſing the advice of ſome learned Phyſician we preſcribe a convenient diet, and by what means we may bring him to an equality by purging and blood-letting, and then we will ſcarifie in divers places the part where it is moſt ſwollen, then preſently apply Leeches, that ſo we may free it from the burden of the conjunct matter; then uſe Cauteries to help the corruption of the bone, and in the mean time change the circular figure of the ulcer into an oval, or triangular; then at the length we will undertake the cutting of the *Varix*, and cure the ulcer which remains according to Art, and ſo at the length cicatrize it. In all this whole time the Patient ſhall neither walk, nor ſtand, nor ſit, but lie quietly, having his Leg orderly and decently rouled up. But if (as it often happens) the temper of the hurt part be different from the temper of the whole body, the manner of curing muſt be ſo tempered, that we increaſe the doſis of hot or cold medicins, according to the ratable proportion of the Indications requiring this or that, therefore imagine the part ulcerated to be ſuch, as that it is two degrees drier then the juſt temper; but the whole body to exceed the ſame temper in one degree of humidity: Reaſon and Art will require, that the medicin applied to the ulcer be drier by one degree then that which the part would otherwiſe require if it were temperate.

Indications in implicit Diſeaſes.

An example of Indications in implicit Diſeaſes.

What we muſt do when the temper of the part is different from the temper of the whole body.

But

But on the contrary let us ſuppoſe thus; the whole body to be one degree more moiſt than the temper requires, and the ulcerated part to be one degree drier: truly in this caſe the Medicin that is applied to the Ulcer by reaſon of the part it ſelf, ſhall not be increaſed in drineſs, but wholly compoſed and tempered to the Indication of the Ulcer, becauſe the force of the moiſture exceeding in the like degree, doth counterpoiſe the ſuperfluous degree of drineſs. But it is more eaſie by an artificial conjecture to determine of all ſuch things, than by any rules or precepts.

An artificial conjecture is of much force in Indications.

To theſe ſo many and various Indications, I think good to add two other; the one from ſimilitude, the other of a certain crafty device; and as the later Phyſicians term it, a certain ſubtle ſtratagem. We draw Indication from Similitude, in Diſeaſes which newly ſpring up and ariſe, as which cannot be cured by Indications drawn from their contraries, as long as their Eſſence is unknown and hid, wherefore they think it neceſſary to cure them by a way and Art like thoſe Diſeaſes with which they ſeem to have an agreeing ſimilitude of Symptoms and Accidents; our Anceſtors did the ſame in curing the *French-Pox*, at the firſt beginning thereof, as long as they aſſimilated the Cure to that of the *Leproſie*, by reaſon of that affinity, which both the Diſeaſes ſeem to have. But we follow crafty devices and ſubtle counſels, when the Eſſence of the Diſeaſe we meet with, is wholly ſecret and hid, either becauſe it is altogether of a hidden and ſecret nature, and which cannot be unfolded by manifeſt qualities, or elſe reſides in a ſubject which is not ſufficiently known to us, nor of a Phyſical contemplation, as the Mind. For then, we being deſtitute of Indications taken from the nature of the thing, are compelled to turn our cogitations to impoſtures and crafty counſels; and, they ſay, this Art and Craft is of chief uſe in Melancholy affects and fictions, which are often more monſtrous and deformed than the *Chimera* ſo much mentioned in the Fables of the Ancients; to which purpoſe, I will not think much to recite two Examples. A certain man troubled with a Melancholick Diſeaſe, I know not by what errour of Opinion, had ſtrongly perſuaded himſelf that he was without a head; the Phyſicians omitted nothing, by which they might hope to take this mad opinion out of his mind. But when they had in vain tried all Medicines, at length they deviſed this crafty, but profitable device: They faſtned and put upon his head a moſt heavy helmet, that ſo by the pain and trouble of his head nodding and drawn down by that weight, he might be admoniſhed of his errour.

Indication from ſimilitude.

Indication of a ſubtle device.

It is reported, another moleſted by the obſcurity and darkneſs of the ſame Diſeaſe, did verily believe, that he had horns upon his head; neither could he be drawn or diverted from that abſurd and monſtrous opinion, until that binding up his eyes, they miſerably bruiſed and ſcratched his forehead with the bony roughneſs of the lower parts of an Oxes horns, that ſo he begun to believe by the painful drawing of the bloud that ran down his face, that thoſe bloudy horns were forcibly plucked from him. Ingenious Chirurgeons in imitation of theſe examples may in like caſes do the like. For that caſe requires a man of a quick apprehenſion and advice, who may give manifeſt proof of his diligence and skill by medicinal ſtratagems, as who forthwith can politickly deviſe ſtratagems of divers ſorts.

A Phyſician ſhould be of a quick apprehenſion.

But now coming to the end of this our tract of Indications, we muſt chiefly and principally obſerve; That of Indications ſome are Indicative, which abſolutely and of themſelves command this to be done; other co-indicative, which indicate the ſame with the Indicative, and jointly ſhew it to be done, but in ſome ſort ſecondarily and not primitively. Some are repugnant, which of themſelves and their own nature perſuade quite contrary to that the indicative primitively did perſuade us; other correpugnant, which give their voice after the ſame form and manner with the repugnant againſt the indicative, as the co-indicative conſent to and maintain them. Let this ſerve for an example of them all:

Indications
Indicative.
Coindicative.
Repugnant.
Correpugnant.

A *Plethora*, or plenitude of humours, of its own nature, requires and indicates bloud-letting, the Spring time perſuades and co-indicates the ſame; but to this counſel is quite oppoſite and repugnant a weak faculty; and childhood is correpugnant.

Wherefore theſe four muſt be diligently weighed and conſidered when we deliberate what is to be done, and we muſt rather follow that which the indicative or repugnant ſhew and declare, as what the Diſeaſes and ſtrength of the Patient require, than that which the coindicative or correpugnant ſhall perſuade, becauſe they have a weaker and but ſecondary power of indicating, and not eſſential and primitive. But becauſe the kinds of Indications are ſo many and diverſe, therefore that the knowledge of them may be more perſpicuous and leſs confuſed, I have thought good to deſcribe and diſtinguiſh them by this following Scheme.

A TABLE of INDICATIONS.

An Indication is a certain plain and compendious way which leads the Chirurgeon to a certain determinate and proposed end for the cure of the present Diseases: of which there are three kinds.

- *The first, is drawn from things Natural which indicate their preservation by their like; of this kind are many other which are drawn either*
  - *From the strength and faculties of the Patient,* — *For whose preservation, oftentimes the proper cure of the disease must be neglected; for where these fail, it is impossible the Chirurgeon should perform what he desires and expects.*
  - *From the temperament; as if the Patient shall be* — *Sanguine, Cholerick, Flegmatick, Melancholick,* — *Of preservation of which the Chirurgeon must have care, and if they swerve from equality, to reduce them to that which formerly they naturally were.*
  - *From the habit of the body, as the Patient shall be* — *Dainty and delicate. Slender and weak. Low of stature. Rare or else dense and compact.*
  - *From the native condition of the hurt or affected part; in which we consider, either*
    - *The Substance thereof, as for as much as it is similar, we consider whether it be hot, cold, moist, dry; or as it is organical, and then whether it be a principal and noble part, or a subordinate and ignoble part.*
    - *Or the sense, whether quick or dull, by reason whereof the eye cannot endure such sharp and acid medicines, as simple flesh can.*
    - *Or the form, figure, magnitude, number, site, connexion, action, use.*
  - *From the Age; for each Age yields his peculiar Indications: hence you may observe most diseases to be incurable in old men, which are easily cured in young; others which in Youth admit of no cure, unless by the change of age and the ensuing temperament.*
  - *From Sex; for medicines work upon Women far more easily then upon Men.*
  - *From the time of the year; for some Meats and Medicines are fit in Winter, some in Summer.*
  - *From the Region; for as there are diversities of situations and habits of places, so also there are motions of humours, and manners of diseases: hence it is that wounds on the head at* Paris, *and sore shins at* Avignon *are more difficult to be cured.*
  - *From the times of Diseases, for some things in the beginning, others in the increase, state, and declining of the Disease, are more convenient.*
  - *From the manner of Diet; for this, as the proper temper, must be preserved. Wherefore such must be fed otherwise who live daintily then those who lead their lives sparingly and hardly. Hereunto add certain peculiar natures, which by a certain hidden property are offended at this, or that kind of meat; for there are some which not onely cannot concoct Ptoisan, Apples, Soles, Partridge, Water, and such like, but can scarce behold them without nauseousness.*
- *The second is drawn from things not Natural, which one while indicate their preservation by their like, another while their change by their contrary; for so*
  - *If the Air have as it were conspired with the Disease by a certain similitude of qualities to the destruction of the Patient, it must be corrected by its contraries according to Art.*
  - *But if by the disagreement of qualities it resist the disease, it must be kept in the same temper.*
- *The third from things contrary to Nature, which shew, they must be taken away by the use of their contraries, as*
  - *The Disease, the Indication being drawn from these,* — *The greatness, The complication or commixtion with other; so* — *In implicit, or mixed diseases we may draw Indications from these three heads.*
    - *From that which is most urgent,*
    - *From the cause*
    - *And*
    - *From that, without which the disease cannot be taken away.*

    such are — *Bitterness of pain, a defluxion into a part, a Varix, or big swollen Vein, a distemperature, if they be joined with a disease.*
  - *Cause of the Disease* / *Symptom* — *Which two often indicate and require medicines contrary to the Disease.*

CHAP.

CHAP. XXIII.

Of certain wonderful and extravagant ways of curing Diſeaſes.

AS Monſters happen ſometimes in Nature, ſo alſo in Diſeaſes, and in the events and cures of Diſeaſes. I underſtand by Monſters certain marvellous ſucceſſes in Diſeaſes, or certain ways of curing them, which ſwerve from Art, and happen beſides Reaſon, Nature, and common uſe. Monſtrous Diſeaſes.

Alexander ab Alexandro and *Peter Gilius* tell, that in *Apulia* a place in *Italy*, they have a certain kind of Spider very frequent, the Natives call it *Tarantula*, *Petrus Rhodius* calls it *Phalangium*. The Inhabitants find theſe Spiders in the firſt heat of Summer ſo venenate and deadly, that whomſoever they touch with their virulent biting, he preſently, without he have ſpeedy remedy, deprived of all ſenſe and motion falls down; or certainly, if he eſcape the danger of death, he leads the remnant of his life in madneſs. Experience hath found a remedy by Muſick for this ſo ſpeedy and deadly Diſeaſe: Wherefore, as ſoon as they can, they fetch Fidlers and Pipers of divers kinds, who by playing and piping may make Muſick; at the hearing whereof he which was fallen down by reaſon of the venemous bite, riſes chearfully, and dances ſo long to their meaſures and tunes, until by the painful and continued ſhaking and agitation of the whole body, all the malignity is diſſipated by tranſpiration and ſweats. The wonderful force of the bite of a certain Spider. Muſick the remedy thereof.

Alexander adds, That it happened once in his ſight, that the Muſicians, their wind and hands failing them, ceaſed playing, and then the Dancer preſently fell down as if he had been dead; but by and by the Muſick beginning anew, he roſe up again and continued his dancing till the perfect diſſipation of the venom. And that it hath happened beſides, that one not perfectly healed, certain reliques of the Diſeaſe yet remaining, when a long time after he heard by chance a noiſe of Muſicians, he preſently fell a leaping and dancing, neither could he be made to leave before he was perfectly cured.

Some affirm according to the opinion of *Aſclepiades*, that ſuch as are frantick are much helped with a ſweet and muſical harmony. *Theophraſtus* and *Aulus Gellius* ſay, that the pain of the Gout and Sciatica are taken away by Muſick. And the ſacred Scripture teſtifies, that *David* was wont by the ſweet ſound of the Harp to refreſh and eaſe King *Saul* when he was miſerably tormented by his evil ſpirit. *Herodotus* in *Clio* tells, That *Cræſus* the King of *Lydia* had a Son which of a long time could not ſpeak, and when he came to mans eſtate was accounted dumb: but when an enemy with his drawn Sword invaded his Father (overcome in a great fight, and the City being taken in which he was) not knowing that he was the King, the young man opened his mouth endeavouring to cry out, and with that ſtriving and forcing of the ſpirit, he broke the bonds and hindrances of his tongue, and ſpoke plainly and articulately, crying out to the Enemy that he ſhould not kill King *Cræſus*. So both the Enemy with-held his ſword, and the King had his life, and his Son had his ſpeech always after. *Plutarch* in his Book, *Of the Benefit to be received from our Enemies*, tells, That a *Theſſalian* called *Proteus*, had a certain inveterate and incurable Ulcer, in a certain part of his body, which could not be healed, before he received a wound in a conflict in the ſame place, and by that means the cure being begun afreſh, the Wound and Ulcer were both healed. Muſick gives eaſe to pain. A ſtrong perturbation of the mind helps by moving the ſpirits.

Quintus Fabius Maximus, as *Livy* writes, was long and very ſick of a quartan Ague, neither could have wiſhed ſucceſs from Medicins adminiſtred according to Art, until skirmiſhing with the *Allobroges*, he ſhaked off his old feveriſh heat, by a new heat and ardent deſire of fighting. It was credibly reported to me of late by a Gentleman of the Lord of *Lanſack*'s Chamber, that there was a French Gentleman in *Polonia*, who was grievouſly tormented with a quartan Fever, who on a time walking on the Bank of the River *Wexel*, to take away the irkſomneſs of his fit, was thruſt in jeſt into the River by a friend of his that met him by chance, by which (although he could ſwim, as he alſo knew that thruſt him in) he conceived ſo great fear, that the Quartan never troubled him after. King *Henry* the Second commanded me to go from the Camp at *Amiens* to the City *Dorlan*, that I might cure thoſe that were hurt in the conflict with the *Spaniards*: the Captain S. *Arbin*, although at that time he had a fit of a Quartan Ague, yet would he be preſent at the fight, in which he being ſhot through the ſide of the neck with a Bullet, he was ſtrucken with ſuch a terrour of death, that the heat of the Fever was aſſwaged by the cold fear, and he after lived free from his Ague. Chance ſometime exceeds Art.

Franciſcus Valeriola the famous Phyſician of *Arles* tells, That *John Berlam* his fellow-Citizen troubled with a Palſie of one ſide of his Body for many years, his houſe taking fire, and the flame coming near the Bed in which he lay, he ſtrucken with a great fear, ſuddenly raiſed himſelf with all the force he had, and preſently recovering the ſtrength of his body, leaps out at the window from the top of the houſe, and was preſently cured of his Diſeaſe; Senſe and Motion being reſtored to the part, ſo that afterward he went upright without any ſenſe of pain, who lay unmovable for many years before. He tells the like in the ſame place of his Couſin *John Sobiratius*; he was a long time lame at *Avignon*, by reaſon that the Nerves of his Hams were ſhrunk and drawn up, ſo that he could not go; being moved with a vehement and ſudden paſſion of anger againſt one of his Servants whom he endeavoured to beat, he ſo ſtirred his body, that forthwith the Nerves of his Hams being diſtended, and his Knees made pliant, he began to go and ſtand upright without any ſenſe of pain, when he had been crooked about the ſpace of ſix years before, and all his life time after he remained ſound. *Obſerv. lib. 2.*

Galen tells, he was once fetched to ſtanch the bleeding for one who had an Artery cut near his Ancle, and that by his means he was cured without any danger of an *Aneuriſma* (*i.e.*) a relaxation of a veinous veſſel; and beſides, by that accidental wound he was freed from a moſt grievous pain of his hip, with which he was tormented four years before: but although this eaſing of the pain of the Sciatica happened according to reaſon, by the evacuation of the conjunct matter, by the Artery of the Ancle *Cap. ult. lib. de cur. rat. per. ſanguinis miſſ.* *Galen* by a dream cures the Sciatica.

Ancle of the ſame ſide being opened; yet becauſe it was not cut for this purpoſe, but happened only by chance, I judged it was not much diſſenting from this argument.

Pliny writes that there was one named *Phalereus*, which caſting up bloud at his mouth, and at the length, medicines nothing availing, being weary of his life, went unarmed in the front of the Battel againſt the Enemy, and there receiving a wound in his Breſt, ſhed a great quantity of bloud, which gave an end to his ſpitting of bloud; the wound being healed, and the vein which could not contain the bloud being condenſate.

At *Paris*, *Anno* 1572. in *July*, a certain Gentleman being of a modeſt and courteous carriage, fell into a continual Fever, and by that means became Frantick, moved with the violence of which, he caſt himſelf headlong out of a window two ſtories high, and fell firſt upon the ſhoulder of *Valterra* the Duke of *Alenzons* Phyſician, and then upon the pavement; with which fall he cruelly bruiſed his ribs and hip, but was reſtored to his former judgment and reaſon. There were preſent with the Patient beſides *Valterra*, witneſſes of this accident, theſe Phyſicians, *Alexis*, *Magnus*, *Duretus*, and *Martenus*. The ſame happened in the like Diſeaſe, and by the like chance, to a certain *Gaſcoyn*, lying at the houſe of *Agrippa* in the Paved Street.

Othomannus Doctor of Phyſick of *Monpelier*, and the King's Profeſſor, told me that a certain Carpenter at *Broquer* a Village in *Switzerland*, being frantick, caſt himſelf headlong out of an high window into a River, and being taken out of the Water was preſently reſtored to his underſtanding.

The cauſe of the laſt recited Cures.

But if we may convert Caſualties into Counſel and Art, I would not caſt the Patients headlong out of a window, but would rather caſt them ſuddenly, and thinking of no ſuch thing, into a great Ciſtern filled with cold Water, with their heads foremoſt, neither would I take them out until they had drunk a good quantity of Water, that by that ſudden fall and ſtrong fear, the matter cauſing the Frenzy might be carried from above downwards, from the noble parts to the ignoble; the poſſibility of which is manifeſt by the fore-cited Examples, as alſo by the example of ſuch as bit by a mad Dog, fearing the Water, are often ducked into it to cure them.

CHAP. XXIV.

Of certain jugling and deceitful ways of Curing.

HEre I determine to treat of thoſe Impoſtors, who taking upon them the perſon of a Chirurgeon, do by any means, either right or wrong, put themſelves upon the works of the Art; but they principally boaſt themſelves amongſt the ignorant common ſort, of ſetting bones which are out of joint and broken, affirming, as falſly as impudently, that they have knowledge of thoſe things from their Anceſtors, as by a certain hereditary right; which is a moſt ridiculous fiction: for our minds when we are born, is as a ſmooth Table, upon which nothing is painted. Otherwiſe what need we take ſuch labour and pains to acquire and exerciſe Sciences? God hath endued all brute Beaſts with an inbred knowledge of certain things neceſſary for to preſerve their life, more than Man.

Sciences are not hereditary.

But on the contrary, he hath enriched him with a Wit furniſhed with incredible celerity and judgment, by whoſe diligent and laborious fatigation, he ſubjects all things to his knowledge. For it is no more likely that any man ſhould have skill in Chirurgery, becauſe his Father was a Chirurgeon, than that one who never endured ſweat, duſt, nor Sun in the Field, ſhould know how to ride and govern a great Horſe, and know how to carry away the credit in tilting, onely becauſe he was got by a Gentleman, and one famous in the Art of War.

A moſt impudent ſort of Impoſtors.

There is another ſort of Impoſtors, far more pernicious and leſs ſufferable, boldly and inſolently promiſing to reſtore to their proper unity and ſeat, bones which are broken and out of joint, by the onely murmuring of ſome conceited charms, ſo that they may but have the Patients name and his girdle. In which thing I cannot ſufficiently admire the idleneſs of our Countreymen ſo eaſily crediting ſo great and pernicious an errour; not obſerving the inviolable Law of the ancient Phyſicians, and principally of Divine *Hippocrates*, by which it is determined, that three things are neceſſary to the ſetting of Bones diſlocated and out of joint; to draw the bones aſunder, to hold the bone receiving firmly immovable with a ſtrong and ſteddy hand; to put the bone to be received into the cavity of the receiving. For which purpoſe the diligence of the Ancients hath invented ſo many Engines, Gloſſocomies and Bands, leſt that the hand ſhould not be ſufficient for that laborious Work. What therefore is the madneſs of ſuch Impoſtors to undertake to do that by words which can ſcarce be done by the ſtrong hands of ſo many Servants, and by many artificial Engins?

Three things neceſſary for the cure of a Luxation.

Of late years another kind of Impoſture hath ſprung up in *Germany*: they beat into fine powder a ſtone which in their mother-tongue they call *Bembruch*, and give it in drink to any who have a bone broken or diſlocated, and affirm that it is ſufficient to cure them. Through the ſame *Germany* there wander other Impoſtors, who bid to bring to them the Weapon with which any is hurt; they lay it up in a ſecret place and free from noiſe, and put and apply medicines to it, as if they had the Patient to dreſs, and in the mean time they ſuffer him to go about his buſineſs, and impudently affirm that the wound heals by little and little, by reaſon of the Medicin applied to the Weapon.

But it is not likely that a thing inanimate, which is deſtitute of all manner of ſenſe, ſhould feel the effect of any Medicin; and leſs probable by much, that the wounded party ſhould receive any benefit from thence. Neither if any ſhould let me ſee the truth of ſuch juggling by the events themſelves and my own eyes, would I therefore believe that it was done Naturally, and by Reaſon, but rather by Charms and Magick.

In the laſt aſſault of the Caſtle of *Heſdin*, the Lord of *Martigues* the Elder, was ſhot through the Breſt

Breſt with a Musket bullet. I had him in cure together with the Phyſicians and Chirurgeons of the Emperour *Charles* V. and *Emanuel Philibert* the Duke of *Savoy*, who becauſe he entirely loved the wounded Priſoner, cauſed an Aſſembly of Phyſicians and Chirurgeons to conſult of the beſt means for his cure. They were all of one opinion, that the wound was deadly and incurable, becauſe it paſſed through the midſt of his Lungs, and beſides had caſt forth a great quantity of knotted bloud into the hollowneſs of his Breſt.

There was found at that time a certain *Spaniard*, a notable Knave, and one of thoſe Impoſtors, who would pawn his life that he would make him ſound; wherefore this Honourable Perſonage being in this deſperate caſe, was committed unto his care. Firſt of all, he bid they ſhould give him the Patients ſhirt, which he tore into ſhreds and pieces, which preſently framing into a Croſs, he laid upon the wounds, whiſpering ſome conceived or coined words, with a low murmur. For all other things he wiſhed the Patient to reſt content, and to uſe what diet he pleaſed, for he would do that for him, which truly he did. For he eat nothing but a few Prunes, and drunk nothing but ſmall Beer, yet for all this the wounded Prince died within two days; the *Spaniard* ſlipt away, and ſo ſcaped hanging. And whileſt I opened the body in the ſight of the Phyſicians and Chirurgeons to embalm him, the ſigns and accidents of the wound did evidently and plainly appear to be as we had pronounced before.

What wounds may be cured onely by lint, or by tents and Water.

And there be alſo other jugling Companions of this Tribe, who promiſe to cure all wounds with Lint, or Tents, either dry or macerated in Oil or Water, and bound to the wound, having murmured over ſome charm or other, who have had ſometimes good ſucceſs, as I can witneſs. But the wounds upon which trial was made were ſimple ones, which onely required union, or cloſing for to perfect the cure. So verily the bones of Beaſts when they be broke, grow together by the onely benefit of Nature. But when the affect ſhall be compound by diverſity of Symptoms, as a wound with an ulcer, inflammation, contuſion and fracture of a bone, you muſt hope for no other from Tents, or Lints, nor Charms, than death. Therefore the common ſort, who commit themſelves to theſe Impoſtors to be cured, do not only injure themſelves, but alſo hurt the Common-wealth, and the common profit of the Citizens; for whoſe good and Juſtice ſake a prudent Magiſtrate ought to deprive Impoſtors of all freedom in a free and Chriſtian Commonweal.

Witches, Conjurers, Diviners, Soothſayers, Magicians, and ſuch like, boaſt of curing many Diſeaſes; but if they do or perform any thing in this kind, they do it all by ſleights, ſubtilties, and forbidden Arts, as Charms, Conjurations, Witcheries, Characters, Knots, Magical Ligatures, Rings, Images, Poyſons, Laces tied acroſs, and other damnable tricks, with which they pollute, pervert, and defame the prime and ſacred Art of Phyſick, and that with the danger of mens lives. Who certainly are to be baniſhed by the Laws of our Countrey, eſpecially ſeeing it is decreed in *Moſes* Law, *Let none be found among you that uſeth witchcraft*, or a regarder of Times, or a marker of the flying of Fowls, or a Sorcerer, or a Charmer, or that conſulteth with Spirits, or a Soothſayer, or that asketh counſel at the dead; for all that do ſuch things are abomination to the Lord, and becauſe of theſe abominations the Lord thy God doth caſt them out before thee. But the miracles of our Lord Jeſus Chriſt the Son of God, and of his Saints and Apoſtles in curing Diſeaſes beyond Nature and all Art, are of another kind, which we ought to believe ſo firmly and conſtantly, that it ſhould be counted an impiety for a Chriſtian to doubt of them. All holy Writings are full of theſe; as to give ſight to the blind, hearing to the deaf, power to go to thoſe ſick of the Palſie, to drive forth Devils, to cure the Leproſie, to give fruitfulneſs to Women, to raiſe the Dead, and perform by the Holy Ghoſt other Miracles which exceed the condition and Law of Nature; whom here we earneſtly intreat to free and protect us from unclean Devils, and the Spirits of Diabolical deceit, and to give us the mind that we may will and be able always to aſpire to Heaven, and faſten the hope, ſafety, and anchor of all our Fortunes in God alone. *Amen.* *Deut.* 18.

The End of the Firſt Book.

BOOK

BOOK II.

Of Living Creatures, and of the Excellency of Man.

The difference of brute Beasts

BEfore I come to speak of the Anatomy of Mans Body, I have thought fit to say a little of the Nature of brute Beasts. There is between Beasts a great deal of difference by Nature; for of these some are hardy and bold, others fearful; some wild and savage, others tame; some walking in herds, others wandring alone; some covered and defended with shels and scales, as the Crocodile, the Tortois, and many kinds of Fish; others have stings and prickles.

The Horse hath his hard and strong hoofs, his Crest (as being a generous Beast) beset with a thick and harsh Mane. The defence of the magnanimous Lion are his Teeth, his crooked Paws and Tail. Bulls are formidable by their Horns. The Boar by his Tusks standing out, as it were natural Hunting-spears. The Hare being a timorous Creature, is naked and unarmed; but in recompence thereof Nature hath made her nimble and swift of foot. For what the more noble and couragious Beasts have in Arms, is supplied in the fearful by nimbleness and celerity. Infinite are the other endowments of brute Beasts, and such as can hardly be imagined or described. For, if we diligently search into their Nature, we shall observe the impressions and shadows of many Vertues, as of Magnanimity, Prudence, Fortitude, Clemency, and Docility: for they entirely love one another, follow those things that are good, shun those that are hurtful, and gather and lay up in store those things that are necessary for Life and Food. Lastly, They give undoubted presages of the Weather and Air. They have taught men many things, and are of a most exquisit and quick sense; of rare Art in Vocal Musick, prudent and careful for their young, and faithful Lovers of their Native Soil. They are religiously observant of the Rights of Friendship and Chastity. They have their Weapons whereby they are prepared both to invade and to defend themselves being invaded. They submit themselves to the Discipline of Man, practise and imitate his Speech, and mutually prattle and chant one to another. They have a kind of Weal-publick amongst themselves, and know how to preserve their present welfare, and to depel the contrary, being in this their own Counsellors, and not tutored by Man. Yea, Man is beholden to them for the knowledge of many wholsom things. The consideration of which bred so great a doubt amongst the ancient Philosophers, that it was a question amongst them, Whether Beasts had use of Reason, or no? Therefore also the wise *Solomon* sends us for examples of parsimony and diligence unto the Ant or Pismire; and *Esaias* in exprobration of the People of *Israel* for their ingratitude and rebellion against God, sends them to the Ox and Ass; for they do not onely know, but reverence their Masters.

Some shadow of Vertue in Beasts.

Lib.8. Cap.27. But from whence is the knowledge of these Medicins wherewith the Art of Physick is so richly adorned, but from brute Beasts? as *Pliny* affirmeth. The infallible vertue of the Herb *Dictamnus*, in drawing Darts out of the flesh, was taught us by the Hart, who wounded with the Huntsman's Darts or Arrows, by means hereof draws out the Weapons which remain sticking in her. Which is likewise practised by the Goats of *Candy*, as *Aristotle* writeth. The wonderful effect which *Celandine* hath upon the sight, was learnt by the practice of Swallows, who have been observed with it to have besmeared, and so strengthened the eyes of their young. Serpents rub their eye-lids with Fennel, and are thought by that means to quicken and restore the decaying sight of their eyes. The Tortois doth defend and strengthen her self against the biting of Vipers, by eating of Savory. Bears, by eating of Pismires, expel that Poison that they have contracted by their use of Mandrakes. And for correction of that drowsiness and sloth which grows upon them by their long sleep in their Dens, they eat the herb of *Aron* (i.) Cuckopint. But the Art they use in the inticing and catching of Pismires is very pretty: they go softly to the holes or hills of the Pismires, and there lay themselves all their length upon the ground, as if they were dead, hanging out their Tongue wet with their foam, which they draw not again into their mouth before they feel them full of Pismires, which are enticed by the sweetness of the foam: And having taken this as a purging Medicine, they expel by the guts those ill humors wherewith they were offended. We see that Dogs give themselves a Vomit by eating a kind of Grass, which is from thence called Dog-grass. Swine, when they find themselves sick, will hunt after Smalt, or River-Lobsters. Stockdoves, Blackbirds, and Partridges, purge themselves by Bay-leaves. Pigeons, Turtles, and all sorts of Pullen disburden themselves of gross humours by taking of Pellitory of the Wall. The Bird *Ibis* (being not much unlike the Stork) taught us the use of Clysters. For when he finds himself oppressed with a burden of hurtful humours, he fills his Bill with Salt Water, and so pnrgeth himself by that part by which the Belly is best discharged. The invention of the way of removing the Cataract of the eye we must yield unto the Goat, who by striking by chance against the thorny bushes, pulls off the Cataract which hinders the sight, and covers the ball of the eye, and so recovers his sight. The benefit of Phlebotomy we owe unto the *Hippopotamus* or River-horse, being a kind of Horse, and the Inhabitant of the River *Nilus*; who being a great devourer, when he finds himself surcharged with a great deal of bloud, doth by rubbing his thigh against the sharp Sands on the Bank side, open a Vein, whereby the superfluous bloud is discharged, which he stoppeth likewise when it is fit, by rowling himself in the thick mud. The Tortois having chanced to eat any of the flesh of a Serpent, doth make Origanum and Marjoram her Antidote. The Ancients found help from brute Beasts, even against the dreadful and non-sparing force of Lightning; for they were of opinion that the Wings of an Eagle were never struck with Lightning, and therefore they put about their heads little wreaths of these Feathers

The craftiness of Bears.

The Bird *Ibis* the first Inventer or Shewer of Clysters.

The invention of removing a Cataract.

The invention of phlebotomy.

A preservative against Thunder.

Feathers. They were perſuaded the ſame thing of the Seal, or Sea-Calf, and therefore were wont to encompaſs their bodies with his Skin, as a moſt certain ſafeguard againſt Lightning. It were a thing too long and laborious to ſpeak of all thoſe other muniments of life and health (obſerved here and there by *Ariſtotle* and *Pliny*) which we have learnt of brute Beaſts. I will therefore end this Chapter, after that I have firſt added this; That we are beholden to Beaſts not onely for the skill of curing Diſeaſes, and of preſervation of Health, but for our Food, our Rayment, and the Ornament and Beautifying of our Bodies.

Of the Faculty of brute Beaſts in Preſaging.

THe firſt knowledge and skill of Prognoſtication, and obſervation of Weather by the Air, was firſt delivered unto us from Beaſts of the Land and Water, and from Fowl. For we ſee in daily obſervation, that it is a ſign of change of Weather when Lambs and Rams do but at one another with their Horns, and playing wantonly do kick, and keep up their heels. The ſame is thought to be preſaged when the Ox licks himſelf againſt the hair, and on the ſudden fills the Air with his lowing, and ſmells to the ground, and when he feeds more greedily than he uſed to do. But if the Piſmires in great multitudes fetch their prey ſo haſtily, that they run and tumble one upon another in their narrow paths, it is thought a ſign of rain; As is alſo the buſie working of Moles, and the Cats rubbing and ſtroking of her head and neck, and above her ears with the bottom of her feet. Alſo when Fiſhes play and leap a little above the Water, it is taken for a ſign of rain. But if the Dolphins do the ſame in the Sea, and in great companies, it is thought to preſage a ſudden ſtorm and tempeſt. Whereby the Mariners fore-warned, uſe all care poſſible for the ſafety of themſelves and their Ships, and, if they can, caſt Anchor. And it is ſufficiently known what the louder croaking of Frogs than ordinary portends.

What the butting of Rams ſignifies.

Preſages of Rain.

The ſign at Sea of a ſtorm at hand.

But the faculty of Birds in this kind of preſaging, is wonderful. If Cranes flie through the Air without noiſe, it is a ſign of fair Weather; and of the contrary if they make a great noiſe and fly ſtraglingly. As alſo if Sea-Fowl fly far from the Sea, and light on the Land. The cry or ſcriech-ing of Owls portends a change of the preſent Weather, whether foul or fair. *Plutarch* ſaith, that the loud cawing of the Crow betokens Winds and Showrs, as alſo when he flaps his ſide with his wings. Geeſe and Ducks, when they dive much, and order, and prune, and pick their Feathers with their Beaks, and cry to one another, fore-tell rain; and in like manner Swallows, when they fly ſo low about the Water that they wet themſelves and their wings. And the Wren, when he is obſerved to ſing more ſweetly than uſual, and to hop up and down. And the Cock when he chants, or rather crows preſently after the ſetting of the Sun. And Gnats and Fleas, when they bite more then ordinary. If the Heron ſoar aloft into the Air, it betokeneth fair Weather; if on the contrary he fly cloſe by the Water, rain. If Pigeons come late home to the Dove-houſe, it is a ſign of rain. If Bats fly in the Evening, they fore-ſhew wet Weather. And laſtly the Crocodile lays her Eggs in that place which muſt be the bounds of the overflowing of the River *Nilus*; and therefore he that firſt meets with theſe Eggs, tells the reſt of the Countrey People, and ſhews how high the flood will riſe, and what inundation it will make upon their Grounds: A thing moſt worthy of admiration, that in this Monſter there ſhould be that ſtrong faculty of preſaging.

The Crocodile by laying her eggs ſhews the bounds of the River *Nilus*.

Of the Induſtry of Fiſhes.

MAny Sea-fiſhes, when they feel a tempeſt coming, do gravel or baleſt themſelves, to the end they may not be toſſed up and down at the pleaſure of the waves. Others, when the fury of the Sea is at the height, hide themſelves in the holes of Rocks. But in that they ſwim againſt the ſtream, they do it for this cauſe and reaſon, that the force of the ſtream and the flood may not take from them, and ſtrike off their ſcales, and that their gills may not fill with water which would hinder their ſwimming, and intercept their reſpiration. As by the ſame advice Cranes fly againſt the Wind; whereas if they ſhould fly down the Wind their Feathers would be diſplaced and broken, and they would not be able to fly.

How Fiſhes provide for their ſafety againſt a ſtorm.

How they ſwim againſt the ſtream.

Of the Induſtry of Birds in the building of their Neſts.

THe induſtry of Birds in the building of their Neſts is ſuch, that it doth far exceed the Art and Skill of all Maſons and Architects, from whence it is become a Proverb, *That men know, and can do all things but make Birds Neſts.* They are built within with Wool and Feathers, and ſuch kind of ſoft things, which are as a kind of a Pallet for the young ones. Swallows build their Neſts in a round form, that they may be the more firm, and leſs ſubject to be hurt by any things that ſhall ſtrike againſt them, and likewiſe more capacious. They chuſe their matter out of Dirt and Chaff, (interlacing it with many Straws) as it were, their Plaſter or Lime. Thoſe that build in Trees do make choice of the ſoundeſt Boughs, as if they meant to have them as a ſure foundation for the building which they ſhould erect thereon. The Cock and the Hen do by turns ſit over their Eggs, and likewiſe fetch their meat, interchanging each others labour; neither do they ever forſake their young, before they are able to get their own living. I had at my houſe a great number of Sparrows Neſts in earthen Pots; and when the young ones begun to wax pretty big, and to be covered with Feathers, I made the whole Neſt be taken down and ſet upon the ground, that I and my friends might delight our ſelves in beholding the care of the old ones in the feeding of their young; for they feed them every one in order, skipping none, neither will they (to the wrong of the reſt) give one two parts, although he gape, and be importunate for it; dividing moſt juſtly to every one his own ſhare, according to the exact rule of diſtribution. And oftentimes for experiment, I would make trial with a ſtrange Sparrow of the ſame age, laid near, or put among the reſt of the young ones, whether the old ones would feed the ſtranger, as if it were legitimate. But this as a ſtranger and a Baſtard they would ſuffer to ſtarve, ſkipping it when it gaped after the meat. And in like manner Lambs and young Kids do in the Fields, in the midſt of a great Flock, run every one to his own Dam; who being moſt certainly able to diſtinguiſh between the Legitimate and a Baſtard, will not ſuffer her ſelf to be ſuckt, but by her own young.

Of what things Birds build their Neſts.

In what ſhape.

With what care Sparrows feed their young.

Of

Of the Industry of Spiders.

How the Spiders weave.

THe Spider spins her Web with wonderful Artifice, hanging and fastening it to every tack, or stay that is nigh, drawing of his thread, and running upwards and downwards, and every way. And although the diligence of the Chamber-maid beats down and mars this pendulous and new-begun work, yet her seat and her hold the Spider keeps still; neither doth she, nor will she desist from the work she hath begun, but in a very short time weaves a great deal more unto the ruines of her former work, than can be unweaved again with much labour. So that from hence all Cloth and Linnen Weavers, all Embroiderers and workers with the Needle (you will easily think) have learnt their Arts, if either you observe the exactness of the weaving, the fineness of the thread, or the continuation and indissoluble knitting together of the whole Web; for, being abrupt, and troubled with no ends of threds at all, it resembles a thin membrane, anointed with a kind of glew, whereby when the prey is entangled, the Spider runs presently in, and as it were draws her nets and infolds, and takes the captive after the manner of Huntsmen. If this were not daily seen with our eyes, it would be thought fabulous.

How they catch their prey.

Of Bees.

Bees chuse themselves a King.

I Cannot pass in silence the great industry of Bees: For having established a kind of Weal-publick, they make election of a King, who is such a one, as in procerity of body, and excellency of feature exceedeth all the rest. He is remarkable by his short wings, his streight legs, his grave gate; and in stead of a Diadem or Regal Crown, either he hath no sting, or else doth not use it, which is the Artillery of the rest. He never goeth unattended out of the Hive, but alway, environed with a Princely Retinue, the rest of his Train following after, neither goes he at any time abroad, but upon urgent affairs which concerns the whole State. His progress is fore-warned by the voice and sound of Trumpets, and as it were with singing, and they all draw nigh. Every one gets as near to his person as he can, and when he is weary with flying, they all bear him up with their own bodies.

Their pitching their tents. Their obsequies for their dead King.

On what place soever he alighteth, there they forthwith pitch their Tents. If he chance to die, they go not abroad to feed, but stand all mourning round about the corpse; then carry him out of the Hive, and (as it were follow his Hearse and bury him: and lastly, having with solemnity performed all the several rites and obsequies, they chuse themselves another King, for without a King they cannot live. He then taketh care of all things, having his eye every where, whilest that the rest intend the performance of the work. And supervising all, giveth them encouragement, and chastiseth negligence. For their time of going forth for food, they chuse a clear and fair day; for they have a natural faculty of presaging of the Weather. They are such observers of Justice and equity, that never, either with their sting, or by any other way, do they molest any Creature, neither do they exercise and prepare their Spears against any, but for the safeguard of themselves and their Hives.

Their justice.

Of the Care of Bees.

THey manage and order their affairs in this manner; in the day-time they appoint before their Gates a Station of Watchmen and Guarders. In the night they rest from their labours, so long, till that one (who is appointed to this charge) by one or two hums, as by the sound of a Trumpet, rouzeth all the rest. Then come they together to observe what is the state of the Weather, which if they foresee will be fair, then abroad go they into the Fields and Pastures. Some therefore bring into the Hive little fascicles of Flowers on their thighs; others water in their mouth, and others a dewy moisture gathered on their bodies. These are met by others, who receive their burdens, which they dispose in their due and proper places. Those that are sent out into the Fields for food, are the youngest and the smallest: and therefore if the wind chance to rise any thing high, they expect until it cease, and that the force and violence thereof be over. But if it continue violent, then do they ballast themselves with a little stone, flying close by the ground to prevent their being driven to and fro by the wind. They are exceeding diligent in all their business, and do punish the sloth of the Lazy oftentimes with death. Some of them are the Builders, others polish the Building, and the rest bring in their Materials.

Their watch.

Their divers imployments.

The building in their arched Hives is with wonderful artifice, being made with two doors, one to come in, and the other to go out at. They have all things alike, lest that the inequality, either of their food or labour, should give occasion of dissension. Their care is, that their houses may shew both state and handsomness. Idle Drones, born for nothing but to eat, and consume the fruits of their labours, they chase from their Hives. Those that chance to lose their stings are utterly disabled, and in a short time their guts come out that way, and they die. They bring to the Owners wonderful increase of Wax and Honey.

They punish Sloth with banishment.

Aristomachus a diligent observer of Bees.

Aristomachus the Philosopher doth boast, that for fifty eight years together, he had with great care been a nourisher of Bees, onely that he might better attain to the knowledge of their state and condition.

Of Pismires and Ants.

NEither truly is the industry, diligence, and experience of the Pismire less worthy of admiration than that of the Bees. Insomuch as that *Solomon* bids the sluggard to take an example of diligence from the Pismire. Truly, if experience did not witness it, it would seem incredible, that so small a Creature should be able to store up such abundance of Corn, to dispose and manage her affairs in that good order that we see she doth. *Pliny* saith, that they have among them the form of a well-governed and well-ordered Common-weal. For how pretty a sight is it to see them when they seize upon a grain they have a mind to carry away, how they set to it, and lift it with head and shoulders, And how, lest the Corn which they carry to their Store-house, should put forth and grow, they bite it at one end. If it be so big that they cannot carry it into their little hole, they divide it in the middle. If it be dampish, they lay it out to dry in the Sun and open Air. When the Moon is at the full they follow their work in the night; when she doth not shine, they take their rest, whereby they shew themselves to have some knowledge of heavenly things. *Pliny* affirmeth

Lib. 11. *&* 30.

Wonderful care.

firmeth that they have their ſet Fairs and Markets, whither they come in great companies, and where they uſe to eſtabliſh Leagues of Amity and Friendſhip one with another. And when one marks them well, would he not think that they were in conference one with another, and that they did diſcourſe among themſelves of their buſineſs? Do we not ſee that the often trampling of their little feet doth wear a path even upon hard flint ſtones?

From whence we may note, what in all kind of things is the affect of the aſſiduity. They ſay alſo that they perform the rites of burial one unto another, after the manner of men. What words ſhall I uſe (ſaith *Plutarch*) to expreſs ſufficiently the diligence and induſtry of the Piſmires? There is not among all the great things in Nature, a ſight of greater wonder than theſe: For in the Piſmires are ſeen the marks of all Vertues. Their great meetings argue that they maintain a kind of Friendſhip. There is nothing but may be attained by diligence.

Their alacrity in the undergoing of their labours, ſeem to ſhew their fortitude and magnanimity; and laſtly, they are eminent examples of Temperance, Providence, and Juſtice. Their mutual Charity appeareth in this, that if one of them that is not loaden meets another (in one of their narrow paths) that is, he will give him the way, that he may the better go on in his intended journey. They ſay, that the firſt entrance into their hole is not ſtreight, but full of many diverticles and crooked paths, which in the end will bring you to three little Cells; in one of which they have their Conventicles, in the other they lay up their Proviſions; and in the third they bury the carkaſſes of their dead. This doth *Plutarch* ſpeak concerning Piſmires. The forms of all Vertues expreſt in Piſmires.

Of Silk-Worms.

WIth the Induſtry of theſe Creatures I ſhall not unfitly join that of the Silk-Worm, of whoſe pains and care, both in the making of their Neſts, and the ſpinning of their thred and bottoms (wherewith Kings are ſo magnificently adorned) Philoſophers have written very ſtrange things.

And who can chuſe but wonder at thoſe great endowments of Skill and Knowledge, and that exceeding induſtry (the Mother of ſo much Wealth) in the little Body of ſo ſmall a Creature? The providence therefore of God doth not onely appear in this, that he hath adorned each Creature with a peculiar and proper endowment, but in this eſpecially, that on the leaſt Creatures of all, he hath beſtowed the greater portion of Skill, Induſtry, and Ingenuity, to ſupply their defect of bodily ſtrength. Diligence the Mother of Wealth.

Of the love of Beaſts one towards another, and to their Young.

PLutarch writeth, That all kind of Creatures bear a ſingular love, and have a kind of care of thoſe that are generated of them, and the induſtry of Partridges this way is much commended; for during the time that their young ones are weak and unable to fly, they teach them to lie upon their backs, and to hide themſelves among the clods on the ground, that ſo being almoſt of the ſame colour, they may not be diſcerned by the Falconer. But if notwithſtanding they ſee any body coming, and that he is near them, they do with a hundred dodges and ſtoopings of themſelves, as if they were weary with flying, entice him away from their young to follow after them, and when they have their purpoſe, they then, as if they had recovered ſome freſh ſtrength, fly quite away: Who can but wonder at this, both affection and ſubtilty? The induſtry of Partridges in preſerving their Young.

In *Florida*, part of the *Weſt-Indies*, they have a Beaſt, which for the variety and deformity of it I cannot paſs over in ſilence; the Natives call it *Succarath*, the Cannibals *Su*. It keeps for the moſt part about the Rivers, and the Sea-ſhore, and lives by prey. When he perceiveth that he is purſued by the Huntſman, he gets his young ones upon his Back, and with his Tail, which is very long and broad, he covereth them, and ſo flying, provideth both for his own and their ſafety; neither can he be taken by any other way but by Pits, which thoſe ſavage men uſe to dig in the places near which he is to run, into which at unawares he tumbles headlong.

This Picture of him here, I drew out of *Thevets* Coſmography.

How Hares provide for themſelves and their Young, for fear of Hunters.

Neither are thoſe things leſs wonderful that are reported of Hares, for when they would go to their ſeat, they ſever their young, and commit them to the truſt of divers places, it may be two acres aſunder one from another, leſt peradventure a Huntſman, a Dog, or any Man ſhould chance to come that way, and they might be in danger to be loſt at once. And then after they have traced up and down, hither and thither, and every way, that the Dogs may not trace them, nor the Huntſman prick them, they take a leap or two, and leap into their forms.

Nor inferior to this is the craft of the Hedg-hog; for when the Fox purſueth him, and is now at his heels, he rowls himſelf up in his prickles like a Cheſnut in the outward ſhell, ſo that every part being rounded and encompaſſed with theſe ſharp and dangerous pricks, he cannot be hurt; and ſo ſaves himſelf by this trick. For his young he provides in this manner:

The care of the Hedg-hog to provide for her Young.

In the time of Vintage he goes to the Vines, and with his feet he ſtrikes off the Boughs and the Grapes, and then rowling his body makes them ſtick upon his prickles, and ſo doth (as it were) take his burden upon his back, and then returns to his hole; you would think that the Grapes did move of themſelves; the prey he divides between himſelf and his young.

Of the affection of Birds, and of Dogs towards their Maſters.

The Piety of Storks.

THe young Stork provides for the old, which is diſabled by age; and if any one of their equals come to any miſchance that he is not able to flie, they will give him their aſſiſtance, and bear him on their backs and wings. And therefore this affection and piety towards the old one, and (as it were) brotherly love towards their equals, is commended in the Stork.

The Hen in any kind of danger gathers her Chickens under her wings, and (as it were) with that guard, defends them as well as ſhe can. For their ſake ſhe expoſeth her ſelf to the cruelty of the fierceſt Beaſts; and will flie in the eyes of a Dog, a Wolf, or a Bear, that by chance offers to meddle with her Chickens.

The fidelity of Dogs.

But who is there that doth not admire the fidelity and love of Dogs towards their Maſters, whereby they recompence them for their keeping? A Dog will never forſake his Maſter, no, if he be never ſo hardly uſed. For there is no man can find a ſtick hard enough to drive that Dog clean away from him which hath once taken a love to him. There is no kind of Creature that doth more certainly and readily remember his Maſter; he will know the voice of all the houſhold, and of thoſe which frequent the houſe. There cannot be a truſtier Keeper (as *Cicero* himſelf ſaith) than a Dog is; I ſpeak not of their faculty of ſmelling, whereby they follow their Maſters by the foot, and find them; neither do I ſpeak of thoſe infinite examples of the fidelity of Dogs, which were too long to rehearſe.

Doves free from adultery.

Pigeons, as well the Cock as the Hen, although they are all very venereous, yet they know no adultery; yea, and the Hen will bear with the frowardneſs of the Cock, neither will ſhe ever leave him, but reconciling him unto her by her officious diligence, bring him to his wonted dalliance and kiſſes; neither is the love of either of them leſs towards their Young.

Turtles never couple twice.

There is the like mutual bond of love between Turtles; for if one of them die, the ſurviver never ſolicits Hymen more, neither will he ever chuſe other ſeat than a dry withered Bough.

Of the Lamprey.

LEſt that the heat of affection may ſeem to lie quenched under the Waters, let us by one example, (it were an infinite thing to ſpeak of all) ſee in what kind of mutual love the Creatures of the Water come ſhort of thoſe of the Land. The Lamprey of all the Creatures of this kind doth worthily bear the praiſe for its piety towards thoſe of whom it was generated, its affection towards thoſe that are generated of her; for firſt ſhe breeds Eggs within her, which in a ſhort time after are ſpawned. But ſhe doth not as ſoon as her young ones are formed and procreated, bring them ſtraight-way forth into the light after the manner of other Fiſhes that bring forth their Young alive, but nouriſheth two within her, as if ſhe brought forth twice, and had a ſecond brood. Theſe ſhe doth not put forth before they are of ſome bigneſs, then ſhe teacheth them to ſwim and to play in the Water, but ſuffers them not to go far from her; and anon gapes and receives them by her mouth into her bowels again, ſuffering them to inhabit there, and to feed in her belly ſo long as ſhe thinks fit.

The Savage or Brute Beaſts may be made tame.

Coſmograph. Tom. 2. lib. 19. cap. 7.

THevet reporteth, that the Emperour of the *Turks* hath at *Caire* (it was once called *Memphis*) and at *Conſtantinople*, many ſavage Beaſts kept for his delight, as Lions, Tigers, Leopards, Antilopes, Camels, Elephants, Porcupines, and many other of this kind. Theſe they uſe to lead about the City to ſhew. The Maſters of them are girt with a Girdle hung about with little Bells, that by the noiſe of theſe Bells the people may be fore-warned to keep themſelves from being hurt by theſe Beaſts. But in hope of reward, and of gifts, they ſhew them to Ambaſſadors of ſtrange Nations, before whom they make theſe Beaſts do a thouſand very delightful tricks, and in the interim they play their Countrey Tunes and Muſick upon their Pipes and other Inſtruments, and make many ſports in hope of gain.

That Fiſhes alſo may be tamed.

BUt it is far more wonderful that the Creatures of the Water ſhould be made tame, and be taught by the Art of Man. Among which the chiefeſt are held to be the Eel. The ſame things alſo are reported of the Lamprey. For, we have it recorded, that *Marcus Craſſus* had a Lamprey in his Fiſh-pool that was ſo tame and ſo well taught, that he could command her at his pleaſure. Therefore as a domeſtical and tame Beaſt he gave her a name, by which, when he called her, ſhe would come. And when this Lamprey died, he mourned for her in black, as if ſhe had been his daughter. Which when his Colleague *Cneus Domitius* objected to him by way of reproach, he replying told him, That he had buried three Wives, and had mourned for none of all them three.

Of

Of the ſtrength, piety, docility, clemency, chaſtity, and gratitude of Elephants.

AMong the Beaſts of the Field, there is none more vaſt, more ſtrong, or more to be feared than the Elephant. His ſtrength is ſufficiently ſhewn by thoſe towred Caſtles of armed men which he carries, and fiercely ruſheth with into the Battail. The *Roman* Souldiers, being otherwiſe of undaunted ſpirits, yet in that battail which they fought againſt *Pyrrhus*, being terrified with the vaſt-

neſs and immanity of theſe Bodies, which they had never before ſeen, preſently turned their backs and fled; which notwithſtanding, it is a wonderful thing what Stories Natural Philoſophers tell of the Vertues of the Elephant.

Lib.8.cap.1. *Pliny* writeth, that an Elephant cometh very near to the underſtanding that Men have, and that he hath a rude kind of knowledge of Language; that his facility and obſequiouſneſs is wonderful; that his memory in the performance of his wonted duties, is no leſs wonderful. And for

The Religion of the Elephant. Religion (*Plutarch* ſaith) that they pray unto the Gods, and ſprinkle and purge themſelves with ſalt water; and that with great reverence they worſhip the Sun at his riſing, lifting their trunks up towards Heaven for want of hands. *Pliny* addeth, that they do with the like reverence worſhip the Moon and the Stars. For it is related in the Hiſtory of the *Arabians*, that at a New Moon the Elephants go by Troops down unto the Rivers, and there waſh themſelves with water; and being thus purged, kneel down and worſhip the Moon, and then return to the Woods; the eldeſt going firſt, and the other following after according to their age. *Plutarch* reporteth, that it hapned once, that among the Elephants which were taught at *Rome*, againſt the Panegyrick Shows, there was one that was ſomething dull, and not ſo docile as the reſt, which made him be deſpiſed by his fellows, and often beaten by his Maſter: But that this Elephant, that he might ſupply by diligence what he wanted in wit, was often-times obſerved in the night, by the light of the Moon, to be practiſing and conning what he learnt of his Maſter in the day time. For they were wont to be taught to make Letters, and alſo to preſent Garlands to the Spectators, and other ſuch like tricks. But they can never be brought to go aboard a Ship, to be carried over the Sea into any ſtrange Land, unleſs their Maſter give them his word to aſſure them that they ſhall return again to their own native ſoil. They never hurt any one that doth not firſt provoke them. They never gender but in private, out of ſight; an argument of their modeſty.

Plin.lib.8. c.5.

Of the Lion, the Ichneumon, and thoſe other Beaſts which are not eaſily terrified.

The providence of the Lion in his going. THe Lion when he goes, hath his claws always clutched, and (as it were) put up in their ſheaths, not onely becauſe he would leave no mark in his feet, whereby he may be traced and ſo taken, but becauſe by continual walking he ſhould wear off, and blunt the points of his Claws. Bulls when they fight, charge one another with their horns, and like valiant Souldiers provoke and animate one another to the Battail.

The Ichneumon ſeems to imitate the moſt valiant Souldier in his preparation and acceſs to battail; for he bedawbs himſelf with mud, and doth (as it were) buckle and make tite his Armour, eſpecially when he is to encounter with the Crocodile; who although he be a vaſt Beaſt, is put to flight by this little Creature. And this truly hath been obſerved to be by the ſingular Providence of Nature, that the moſt vaſt Creatures are terrified by the leaſt things, and ſuch from whence there can ariſe no danger; ſo they ſay, the Elephant doth ſtartle at the grunting of a Hog, and the Lion at the crowing of a Cock; although it be reported of the Lion, that no fear can make him turn his face. Theſe kind of fears, terrors, and affrightments, ariſing upon light and moſt ridiculous occaſions, we find as well in the ancient as modern Hiſtories of our Times, to have diſperſed and put to flight mighty Legions of Souldiers, and moſt potent Armies.

The greateſt are terrified by the leaſt.

Of Cocks.

Cocks are Kingly and martial Birds. COcks are Kingly Birds, and therefore Nature hath adorned them with a Comb, as with a Princely Diadem; and whereſoever they come, their magnanimity and courage makes them Kings. They fight with their Beaks and their Spurs, and with their martial voice they fright the Lion, who is otherwiſe the King of Beaſts.

Of Conies.

Conies have taught us undermining. COnies have taught us the Art of undermining the Earth, whereby the moſt lofty Cities and Structures reaching to the very Skies, are by taking away their foundation levelled with the ground.

Marcus Varro writes, that in *Spain* there was a Town, and that no mean one, which ſtanding on a ſandy ground, was ſo undermined by a company of Conies, that all the Houſes tumbling and falling down to the ground, the Inhabitants were fain to depart and ſeek new dwellings.

Of Wolves.

The deceits and ambuſhes of Wolves. MEn have learnt the Arts of waging War from the Wolves, for they come out by Troops, and lie in ambuſh near the Towns which they have appointed, and then one of them runs unto the Town and provokes the Dogs. And making, as if he run away, incites the Dogs to follow him, until he hath gotten them unto the place where their ambuſh lieth, which on a ſudden appeareth and ruſheth out upon them. And ſo they kill and eat all, or as many of the Dogs as they are able to catch.

Of the Fox.

The craft of the Fox. IN ſubtilty and craft the Fox exceedeth all other Beaſts: When in the chaſe the Dogs are at his heels, he berays and bepiſſes his tail, and ſwings it in the face and eyes of the Dogs that follow him, and ſo blinding them, in the mean time gets ground of them. To fetch the Hens down from their Perch, he hath this device; he ſhakes and ſwings his tail upwards and downwards, as if he meant to throw it at them; which they fearing tumble down, and he takes up one of them for his prey. His warineſs when he paſſes over a River that is frozen, is wonderful; for he goes ſoftly to the bank, and lays his ear to liſten if he can hear the noiſe of the Water running under the Ice: For, if he can, back he goes, and will not venture to paſs over. The knowledge of which thing he could never meerly by his ſubtilty and craft attain unto, but that of neceſſity he muſt have ſome faculty of reaſoning joined with it; which by diſcourſe, and by proving one thing by another, arrives at this concluſion: Whatſoever is liquid and maketh a noiſe, is in motion; whatſoever liquid

The Fox ſeems to reaſon with himſelf. His *Sorites.*

liquid is in motion, is not concrete and frozen; that which is not concrete and frozen, is liquid; whatsoever is liquid, will not bear a heavier body; whatsoever will not bear a heavier body, cannot with safety be adventured on; and therefore back again must I go, and not pass over this River.

That men are taught by Beasts to polish and to whet their weapons, and to lie in ambush.

SOuldiers are careful to keep their Weapons from rust, and therefore they carry them to the Armourers to be polished. But in this care, many Beasts are nothing inferiour unto them; for Boars whet their tusks against they fight. And the Elephant knowing that one of his teeth is doubled with digging at the roots of Trees to get meat, keepeth the other sharp, and touches nothing with it, preserving it for his combat with the *RHINOCEROT* his Enemy. But the craft of

The craft of the Rhinocerot about to fight with the Elephant.

the Rhinocerot is very remarkable, that being in continual enmity with the Elephant, at the time when he prepares for the battel, he whets his horn againſt a Rock, as it were with a Whetſtone; nor (if he can chuſe) will he ſtrike any other part of the Elephant but the belly, becauſe he knows that part of the Elephant is ſo tender, that it may be eaſily pierced. This Beaſt is in length equal to the Elephant, but in height he is inferiour unto him, by reaſon of the ſhortneſs of his feet; he is of a paliſh yellow colour, and full of many ſpots.

Of Swine.

SWine, if in the Woods, they hear any one of the ſame Herd with them crying out, they ſtrait make a ſtand; and marſhalling their Forces, haſte all, as if they had been warned by the ſound of a martial Trumpet, to the aſſiſtance of their fellows.

Of the Fiſhes Scarus *and* Anthia.

The love of Fiſhes one to another.

PLutarch reports of the *Scari*, that when one of them chances to ſwallow a hook, and be taken, the reſt of the ſame kind come to his reſcue, and ſhearing the line with their teeth, ſet him at liberty. But the readineſs of the *Anthiæ* to the mutual aſſiſtance of one another, is yet more manifeſt; for by caſting the line upon which the hook hangeth on their back, with the ſharpneſs of their Fins they cut it aſunder, and ſo ſet free themſelves and their captived fellows.

Of the Pilot-*fiſh.*

THere is a great kindneſs between the Pilot-fiſh and the Whale; For, although in bulk of body the Whale ſo far exceed him, yet he leads the Whale, and goes always before him as his Pilot, to keep him from running himſelf into any ſtraight or muddy place, whence he might not eaſily get out. And therefore the Whale always follow him, and very willingly ſuffers himſelf to be led by him, it being for his own good. And, in like manner, he gets into the Whales mouth, and there lodging himſelf, ſleeps when he ſleeps, and leaves him not either by day or night.

The Whales Pilot or Guide

Of Cranes.

Cranes order themſelves in ranks.

CRanes when they are to take a long journey into ſome Countrey croſs the Seas, put their company in ſo good order, that no Captain can put his Souldiers in better. For before they ſtir out of any place, they have (as it were) their Trumpets to call them together, and encourage them to flie. They come together, and then flie up on high that they may ſee afar off, chuſing a Captain whom they are to follow. They have their Serjeants to take care of their ranks, and keep their nightly Watches by turns. *Plutarch* tells us, that the Crane, which is appointed to ſtand Sentinel for all the reſt, holds a ſtone in her foot, to the end, that if ſhe chance to give way to Nature and ſleep, ſhe may be awaked by the noiſe of the falling ſtone. The Leader, lifting up his head, and ſtretching out his long neck, looks about him far and wide, and gives warning to the reſt, of any danger that may befal them. The ſtrongeſt lead the way, that they may the better with the flapping of their wings break the force of the Air, and this they do by turns. And that they may the eaſilier prevail againſt the force and oppoſition of the Winds, they diſpoſe their company into a Wedge in the form of the Greek letter Δ, or a triangle; and being skilful in the Stars, they fore-ſee when tempeſts are coming, and fly down to the ground to keep themſelves from the injury of the approaching ſtorm.

The Sentinel Crane.

Of Geeſe.

The care of Geeſe that their gagling do them no harm.

THe Geeſe of *Sicily* do with great warineſs take care, that by their keeking and their noiſe, they do not expoſe themſelves to the rapacity of Birds of prey: for *Plutarch* ſaith, that when they are to fly over the hill *Taurus*, for fear of the Eagles that are there, they hold ſtones in their mouths to keep themſelves from gagling, until that they come unto a place where they may be ſecure.

Of Dragons.

The craft of Dragons fighting againſt the Elephant.

NEither are the Dragons leſs crafty; for thus do they overcome thoſe vaſt and otherwiſe invincible Beaſts the Elephants. They lie in ambuſh, and ſuddenly ſet upon the Elephants when they fear no ſuch matter, and involve their legs with the twines of their tail, in ſuch ſort, that they are not able to go forward, and ſtop their noſtrils with their heads, ſo that they cannot fetch their breath; they pull out their eyes, and whereſoever they find the skin moſt tender there they bite and ſuck the bloud until they make them fall down dead. *Pliny* ſaith, that there are Dragons found in *Æthiopia* of ten cubits long, but that in *India* there are Dragons of an hundred foot long, that fly ſo high that they fetch Birds, and take their prey even from the midſt of the Clouds.

Lib.8. c.11,12.

Of the Fiſh called the Fiſherman.

The craft of the Fiſherman-fiſh in taking her prey.

THis fiſh is called the Fiſherman, becauſe he hunts and takes other Fiſhes, which he doth almoſt by the ſame cunning which the Cuttel uſes; for he hath hanging at his throat a certain bag, like the Wattels of a Turkey-Cock, This when he liſteth he caſteth out, and layeth before the little Fiſhes for a bait, and then by little and little draws it up again, until he catch for food the little Fiſhes ſeiſing upon it as a prey.

Of

Of the Cuttel Fiſh.

WOnderful is the craft of the Cuttel-fiſhes, for they carry a bladder at their neck full of a black Juice or Ink, which they pour forth as ſoon as they feel themſelves taken, that ſo they may blind the eyes of the Fiſhermen, as *Plutarch* ſaith, and as *Ariſtotle* witneſſeth, they with their long fangs do not onely hunt and take little Fiſhes, but oftentimes alſo Mullets. The craft of the Cuttel to ſave her ſelf. *Lib.9. de Hiſt. Animal.c.37.*

Of the Arms or Weapons of brute Beaſts.

BRute Beaſts are naturally ſo furniſhed with Arms that they have no need to get, make, or borrow in any other place.

And ſome of them nevertheleſs are ſo furniſhed with ſuch Arms, that they captivate thoſe which hold them Priſoners; an example of this is the *Torpedo*, which doth not onely hurt by touch, but alſo by the Net being between, he breaths ſuch a quality from him as ſtupifies the hands of the Fiſhermen, ſo that they are forced to let go their Nets, and ſo let him go; moreover if it touch a Ship it makes it ſtay. *Thevet* writes, that the *Perſian* Bay towards *Arabia*, nouriſhes a Fiſh equal in length and thickneſs to a Carp, on every ſide encompaſſed with ſharp and ſtrong pricks, like our Porcupine, with which he fights againſt all kinds of Fiſh. If a man chance but to be lightly hurt either with theſe, or his teeth, he will die within 24 hours. *Coſmogr. tom.1. lib.10.c.10.*

Of the Fiſh Utelif.

HE ſaith moreover, that as he was carried by force of tempeſt through the Atlantick Ocean, he ſaw this Fiſh, having (as it were) a Saw in his forehead of three foot long, and four fingers broad, armed on each ſide with ſharp ſpikes; they call it *Utelif* in their Countrey ſpeech.

Of the Fiſh Caſpilly.

THere is another Fiſh to be ſeen in the *Arabian* Gulf which the *Arabians* call *Caſpilly*; it is two foot long, and many broad; it hath a skin not much unlike a Dog-fiſh, but armed with ſpikes; one whereof he carries in his forehead a foot and half broad; in ſharpneſs and force of cutting not much ſhort of a graver or chiſſel: with this weapon, when ſhe is oppreſt with hunger, ſhe aſſails the firſt Fiſh ſhe meets, neither doth ſhe give over before ſhe carry her as a prey whither ſhe pleaſe, as *Thevet* ſaith he hath ſeen. *Tom.1. lib.5. cap.2.*

Of Crabs.

CRabs and Lobſters, though in the quantity of their body they be but ſmall, yet they uſe their forked Claws before, not onely in feeding, but alſo in defending themſelves, and aſſailing others.

Of the docility of Beaſts, and firſt of the Dog.

BEaſts are apt to learn thoſe things which men deſire, whereby they ſhew themſelves not wholly void of reaſon. For Dogs, Apes, and Horſes, learn to creep through the Juglers Hoops, and riſe on their hinder feet, as though they would dance. *Plutarch* tells that a Jugler had a Dog which would repreſent many things upon the Stage befitting the occaſion and argument of the Play; amongſt the reſt, he exceeded all admiration in that, that taking a ſoporifick Medicin, he excellently feigned himſelf dead; for firſt, as taken with a giddineſs in his head he begun to tremble, then preſently fell down, and lying on the ground, as it were contracted his dying members, and laſtly, as if truly dead he waxed ſtiff; and moreover ſuffered himſelf diverſly to be fitted according to divers parts of the Theatre, the Fable ſo requiring. But when he, by thoſe things that were ſaid and done, knew it was time to riſe, he firſt begun to move his Legs by little and little, as if he had been wakened from a ſound ſleep; then preſently with his head a little lifted up, he looked this way and that way, to the great admiration of all the beholders; and finally roſe up, and went familiarly and chearfully to him he ſhould. Than which ſight the Emperour *Veſpaſian* (who was then preſent in *Marcellus* his Theatre) never ſaw any which more delighted him. The wonderful docility of Dogs. A ſpectacle full of admiration and truth.

Of the Ape.

AN Ape is a ridiculous Creature, and which makes men much ſport in imitating their actions. There hath been ſeen an Ape which would pipe and ſing, and beſides, dance and write, and endeavour to perform many other things proper to men. I remember I ſaw in the Duke of *Somes* houſe a great and curſt Ape, who becauſe he much troubled many, had his hands cut off, who ſuffering himſelf to be cured, when the wound was cicatrized, he grew more mild and docile. Wherefore cloathed in a green Coat, and girt over his loins with a Girdle, he carried hanging thereat a Caſe of Spectacles, a pair of Knives, and a Childs Handkerchief. He was committed to the charge of the Maſter-Cook to teach, becauſe he had taken up his lodging in the Chimney-corner, he was taught many tricks and feats. If at any time he ſwerved from his doctrin and precepts, in a trice the whip was upon his back and loins, and much was abated of his daily allowance; for, as *Perſius* ſaith, The belly is the Maſter of Arts, and Sharpner of Wit. By theſe means he profited ſo in a ſhort time, that he much exceeded all the Apes of his time in the glory of his Wit; and there was none counted more skilful in leaping and dancing to the Pipe, running up a Pole, and nimbly leaping through his Maſters Legs. To conclude, he performed all the actions of a ſtrong Ape, and very reverendly carried up Diſhes with the Waiters and Servingmen, and made clean the Diſhes and Platters by licking, and did much other drudgery, ſo that he was commonly called Maſter *John Do-all*. At Dinner and Supper ſitting in a Chair, he ſaid Grace, and caſting his eyes up towards Heaven, and rouled them this way and that way, and ſmote his Breſt with the ſtumps of his hands with much lamentation, and imitated Prayer by the gnaſhing or beating together of his teeth. He would turn up his tail to any *Gal. lib.1. de uſu partium.*

that

that offended him, for his Coat ſcarce covered half his buttock, leſt he ſhould have defiled it) he made much other paſtime, always going upright by reaſon of the cutting away of his hands, unleſs at any time through wearineſs he were forced to ſit on his Buttocks.

Of the Camel.

Camels both tame and wild

THe *Camel* is a very domeſtical and gentle Beaſt, and which is eaſily tamed and taught all kind of obedience and ſervice; although ſome of them are cruel, wild, and troubleſom by biting and ſtriking ſuch as they meet, no leſs then untamed Horſes. There is no need to houſe them

The eaſie and not chargeable keeping of Camels.

in the night, for they may be left in the plain fields in the open and free air, feeding upon the Graſs and Trees, and cropping the tops of Thiſtles, neither in the morning do they any whit the worſe undergo or carry their burdens. They are not put to carry burdens before they be four years old. The *Arabians* geld them young, that they may enjoy their labour the longer; neither being

gelt,

gelt, do they rage for Love or deſire of Venery. At the putting in of the Spring they endure hunger and thirſt for eight days together; they are ſo dutiful, that at the beck of the Turkiſh Slaves, or but touched on the neck with a Twig, they preſently kneel on the ground to take up their burden, neither do they lift themſelves up before they find that they have a ſufficient load laid upon them. Thoſe that have but one bunch upon their back are of *Africk*, but ſuch as have two bunches are of *Aſia* or *Scythia*. Thoſe kind of Camels that are the bigger, are uſed to carry packs, but the leſſer are uſed to ride upon, as our Horſes are. They love nothing ſo well as Beans, and yet they live content with four handfuls of Beans for a day. The greateſt wealth of the *Arabians* conſiſts in Camels, and ſo they eſtimate their riches, not by the quantity of Silver or Gold, but by the number of Camels. The *Turkiſh* Emperour (*Thevet* being the reporter) made a Captain over the herds of his Camels, giving him a great troop of African and Chriſtian Slaves, that they might be the better looked unto. I have heard it reported (ſaith *Thevet*) by certain *Arabian*, *African*, and *Jewiſh* Merchants who were preſent, at that time when *Sultan Selim*, the firſt of that name, beſieged *Caire* in *Ægypt*, (which in former times was called *Memphis*) that there then was in that Emperours Army ſixty thouſand Camels, beſides a mighty company of Mules.

Camels know when they have a ſufficient load.

Camels both to carry burdens, and to ride upon.

A mighty troop of Camels.

Of ravenous Birds.

BUt let us take view of Falconers teaching ravenous Birds, how with ſwift wings carried aloft into the Air, they may ſeize upon other Birds, and caſt them down dead to the ground; in performance whereof, they often too freely ſoar up to the Clouds, ſo that they carry themſelves out of the Falconers ſight, with a deſire to Sun themſelves, neglecting in the mean time their deſigned prey.

The diligence of Falconers in training up their Hawks.

The Heron when ſhe ſees her ſelf kept under, and below the Falcon, carried up by his ſtrong wings with a marvellous ſwiftneſs, with her Beak, which is long and ſharp, hid under her wings, and turned upwards, ſhe receives the Falcon blinded with the heat of fight, and deſire of prey, careleſly flying down and ruſhing upon him; ſo that he often ſtrikes him through the gorge, ſo that oft-times they both fall down dead to the ground. But if the Falcon without harm eſcape the deceits by Art, and the happy turning of his body, and the Heron be not caſt down, the Faulconer calling her back with never ſo loud a voice, yet by ſetting up her Feathers ſhe dares her to the pretended fight.

The fight of the Heron and Falcon.

That Birds have taught us Muſical Tunes.

THe Nightingales are ſweet and excellent ſingers, tuning their notes with infinite quaverings, and diverſities of ſounds, ſo prettily and ſweetly, that humane induſtry can ſcarce equal the ſweetneſs thereof, by ſo many muſical Inſtruments; ſo that we ſay, he ſings like a Nightingale, who varies his voice with much variety. In which thing Birds much excel men, becauſe they have that admirable ſweetneſs of ſinging from Nature it ſelf without any labour of learning; which men can ſcarce attain to in any School of Muſick, by having their ears a thouſand times pluckt by the hands of a curſt Maſter.

To ſing like a Nightingale.

That Beaſts know one anothers voice.

BEaſts know one another by their voice, ſo that they may ſeem to talk and to laugh together, whileſt fluttering with their ears, they pluck in their noſes with a pleaſant aſpect of their eyes; and as ſpeech is given to men, ſo Birds have their natural voice, which is of the ſame uſe to them, as ſpeech is to us. For all Birds of the ſame Species, as men of the ſame Countrey, chant and chirp to one another, when men underſtand not the ſpeech of other men, unleſs of the ſame Nation. Wherefore the *Scythian* Tongue is no more profitable to one living in *Egypt*, than if he were dumb; nor the *Egyptians* underſtand it no more than if they were deaf. Wherefore an *Egyptian* is dumb and deaf to a *Scythian*. This thoſe which travel well underſtand, how many dangers, how many troubles they undergo becauſe they cannot expreſs their minds, and require things neceſſary for life. Wherefore to the aſſiſtance of this unprofitable Tongue, we are compelled to call the reſt of the Members, and to abuſe the geſtures of the Head, Eyes, Hands, and Feet. Truly the condition of brute Beaſts is not ſo miſerable, ſeeing that all of the ſame kind whereſoever they be, may anſwer each other with a known voice. Truly, if any ſhould hear a *German*, *Briton*, *Spaniard*, *Engliſhman*, *Polonian* and *Greek*, ſpeaking amongſt themſelves in their Native Tongues, not underſtanding any of them, he could ſcarce diſcern, and certainly judge, whether he heard the voice of Men or of Beaſts.

The Voice to Beaſts is of the ſame uſe, as Speech is to Men.

We are as ill as deaf, when we hear an unknown Language.

That Birds may counterfeit Mans voice.

LInets, Larks, Pies, Rooks, Daws, Crows, Stares, and other ſuch like Birds, ſpeak, ſing, whiſtle, and imitate the voices of Men and other Creatures. In this Parrats excel all other, being wondrous skilful imitaters of mens voices; and very merry, but ſpecially when they have drank a little Wine.

Parrats are wonderful imitaters of Mans voice.

Plutarch reports that there was a Barber at *Rome* who kept a Pie in his ſhop, which ſpoke exceeding well, and that of her own accord, none teaching her, when ſhe firſt heard men talking together; ſhe imitated the voice or cry of all Beaſts ſhe heard, as alſo the ſound of Drums, and the ſound of Pipes and Trumpets; to conclude, there was nothing which ſhe did not endeavour to imitate. There have been Crows that have ſpoken and articulately ſung Songs and Pſalms, and that of ſome length. To which purpoſe the Hiſtory of *Macrobius* is notable; for he tells that there was one amongſt thoſe who went forth for luck ſake to meet with *Auguſtus Cæſar*, returning from the War againſt *Antonius*, who carried a Crow which he had taught plainly to pronounce this ſalutation, *Salve Cæſar Imperator Auguſtiſſime*, that is, *God ſave thee, O moſt ſacred Emperour Cæſar.*

A talking Pie.

Lib. 2. Saturn. cap. 4.

Cæſar

Cæſar taken with the novelty of this ſpectacle, bought this obſequious Bird with a thouſand pieces of Silver. *Pliny* and *Valerius* have reckoned up amongſt prodigies, Oxen and Aſſes that have ſpoken. I omit infinite other things recorded by the Ancients, *Plato*, *Ariſtotle*, *Pliny*, *Plutarch*, and other Philoſophers of great credit, of the docility of Beaſts, and their admirable felicity of underſtanding. Which things, if untrue, theſe learned men would never have recorded in Writing, leſt ſo they might brand with vanity (than which nothing is more baſe) the reſt of their Writings to poſterity in all enſuing Ages.

Of the Sympathy and Antipathy of Living Creatures amongſt themſelves.

HAving briefly deſcribed the underſtanding of brute Beaſts, it ſeems not impertinent to ſet down ſome things more worthy of knowledge, happening unto them by reaſon of Sympathy and Antipathy; that is, mutual agreement and diſagreement, which happens not onely to them living, but alſo dead, by a certain hidden property, through occaſion whereof ſome deſire, others ſhun, and others proſecute one another even to death. In teſtimony whereof, the Lyon the King of Beaſts excelling all other in courage and magnanimity, fears the Cock, for he is not onely terrified by his preſence, but alſo by his crowing being abſent. So an Elephant fears an Hog; but he is ſo afraid of Mice and Rats, that he will not touch the meat that is given him, if he ſmell that it hath been defiled with ſuch Creatures. There is deadly hatred between the Elephant and Rhinocerot; yet when the Elephant is furious and angry, he becomes quiet and calm at the ſight of a Ram. A Horſe is ſo afraid of a Camel, that he cannot endure his ſight. The Dog hates the Wolf, the Hart flies the Dog. The Snake flies from and fears a naked man, and follows him being clothed. There is deadly hatred between the Aſpis and Ichneumon; for he when he hath rouled himſelf in the clay, dries himſelf in the Sun, and ſo being covered over (by doing thus divers times) as it were with ſhells or armour, he enters into combat, ſtretching out his Tail, and preſenting his Back, until he get opportunity to choak his adverſary by leaping and faſtening on her Jaws, by which ſtratagem he alſo kills the Crocodile, The green Lizard is a capital enemy to the Serpent, but moſt friendly to Man, as *Eraſmus* witneſſeth by many Hiſtories concerning that matter, in his Dialogue of Sympathy and Antipathy. There is a great deal of hatred between a Man and a Wolf, which is moſt manifeſt by this, that if the Wolves firſt ſee a Man, his Voice is taken away, and his intended cry hindered. If the Weaſel intend to ſet upon the Aſpis that moſt venemous Serpent, ſhe arms her ſelf by eating Rue, as a moſt certain Antidote. The Ape fears the Torpedo, as *Eraſmus* manifeſts by a pleaſant Hiſtory in the forementioned Dialogue; where alſo he pretily ſhews the deadly hatred between the Serpent called Areus and the Toad. The like hate is between the Owl and Crows, ſo that the Owl dares not go out, fly abroad, or ſeek her food unleſs by night. The Water or River Fowl are afraid of the Falcon, that if they but hear her bells, they had rather be killed with ſtaves and ſtones, then take wing to flie into the air. So the Lark yields her ſelf to be taken by a Man, leſt ſhe fall into the Talons of the Hobby. The Caſtril, or Merlin, is naturally a terrour to Hawks, ſo that they both ſhun his voice and preſence.

The Lion fears a Cock.

A Horſe fears a Camel.

What Fowl fear the Falcon.

The Kites are all at perpetual enmity with the Crows, wherefore the Crow always gets away the Kites proviſion. All kind of Pullen fear the Fox. The Chicken fears neither a Horſe nor an Elephant; but, ſcarce hatched, it preſently runs away at the voice or ſight of a Kite, and hides it ſelf under the Hens Wings. The Lamb and Kid flie from the Wolf when they firſt ſee him, neither doth Death give an end to that hatred, but it ſupervives their Funeral. An experiment whereof (they ſay) is, that if one Drum be headed with Wolves skins and another with Sheeps, and beaten up together, you ſhall ſcarce hear the ſound of the Drum covered with Sheep skins. And beſides, if you ſtring one Harp with Strings made of Sheeps guts, and another with Strings of Wolves guts, you cannot bring it to paſs by any Art, to make them agree and go in one Tune. It is reported from the experiments of many men, that if a Wolves head be hanged up on high in the place where Sheep are, that they will not touch the Graſs, how good and freſh ſoever it be, nor reſt quiet in any place, but tumultuouſly run up and down, until all ſuch kind of terrour be taken away. The hate betwixt Mice and Weaſels appears by this, that if you mix never ſo little of the brains of a Weaſel in the Rennet, with which you crudle your Cheeſe, the Mice will never gnaw or touch that Cheeſe. The Linnet doth ſo hate the Bird *Florus*, that both their blouds put into one veſſel cannot be mixed together. A Wolves head hung up in a Dove-houſe, drives away Poll-Cats and Weaſels. The Panther and Hyæna burn with ſo great hatred, that if both their skins be laid one againſt the other, the Panthers will ſhed the hair, the hairs of the Hyæna remaining entire and not moved; which thing, they ſay, happens to the Feathers of other Birds, if any one chance to tie them up in a bundle with the Eagles. Let theſe ſuffice for ſome few examples of many, of the Antipathy amongſt Beaſts. But of the Sympathy and conſent of Beaſts amongſt themſelves, I think needleſs to write any thing, being it is ſufficiently known to all, that one Jay aſſociates another, and the cruel Bears agree amongſt themſelves; and Beaſts of ſame ſpecies do wonderfully conſent one with another.

The Enmity between the Kites and Crows.

The diſcord between the Lamb and Wolf is not ended by Death.

How to make Cheeſe that Mice will not gnaw.

That Man excells all Beaſts.

I Now think it fit to aſſay to write of that excellency of Man over Beaſts, which I have ſo long intended. Neither would I that Epicures, and other, too much natural and materiate Philoſophers, ſo take thoſe things I have written of the endowments of Beaſts, as though we ſhould think there were no difference between Man and Beaſt. I had no ſuch meaning, no ſuch intention; but onely that man ſhould not become too ſtately, or too ingrate in leſs acknowledging God to be the Author of ſo many benefits with which he abounds. For whatſoever we have largely ſpoken of Beaſts, yet there is no compariſon between Beaſts and Man; for there is too great a difference between them. For Mans mind is adorned with Religion, Juſtice, Prudence, Magnanimity, Faith, Piety, Modeſty, Clemency, Fortitude, and other Vertues as Lights which ſhine much more bright in Man than

than Beasts. For they are sometimes all in some one Man, each whereof are thought great in Beasts. For seeing that Man is made to the Image of God, it cannot be, how much soever he defile himself with the pollution of Vices, that he can so obscure that inbred light, but that always some beam of the Divine Wisdom will be inherent and shine in him. But although by collation to some Beasts, he may seem a defective and weak Creature; yet no fortitude nor strength of Beasts can be so great as to equal the fortitude of Man. For God hath engraven in Man the Character of his Divine Virtue, by the assistance whereof, he might have all Beasts under and obedient to him. And though by that we have formerly said, Beasts may seem to have a certain shadow of reason, yet that small light is not fit for many and divers uses, but there is onely given them so much providence as should be sufficient for them and the preservation of their bodies. But men have Reason given them to crop or gather the Fruits of Eternal Life, (as *Lactantius* saith) whereby it comes to pass, that Man onely, amongst so many Creatures, hath sense and understanding of Divine things. Which *Cicero* thought to be known by that, because Man onely had a certain knowledge of God in his mind. Wherefore he was enriched by God with Reason, Speech, and Hands, as helps for the performance of all his Actions; moreover by his singular and almost divine Wit he easily excells all brute Beasts. For first, Reason being his guide, he invented things necessary for life, fitly imposed names on the things invented befitting their Natures, framed Letters and Characters, invented all Liberal Arts and Handy-crafts, and found means to measure the Land and Sea. He hath observed and drawn into an Art the spaces of the Celestial Globe, the distinctions of the Stars; the changes and orders of Days and Nights, of Times and Seasons; the rising and setting of Stars, and their power and effects over these lower Bodies. Lastly, He records in writing to perpetual memory that which concerns his own Nature, or the Nature of other things, the Precepts and Ordinances of Life and Manners; by which singular gift, we can now confer with *Socrates*, *Plato*, *Aristotle*, and other Philosophers of ancient Times, as if they were living.

Man bears Gods Image.

Man hath given names to things.

What benefit Man hath by reason of his native Nakedness and Ignorance.

But as Mans Body is by Nature naked and unarmed, so is his Mind like a smooth Table in which nothing is painted, nothing graven; but for help of his Nakedness he hath Hands, and for supply of his Ignorance, Reason and Speech. And by these three being, as it were, the Ministers of infinite variety of things, he clothes and defends his Body with all things needful, and enriches his Mind with the knowledge of Arts and Sciences. Now if he had certain Weapons born with him, he should use them onely; if he should be born skilful in any Art, he would meddle with none else. Therefore, because it was more expedient to use all sorts of Weapons with the Hand, and be skilful in all Arts; therefore he must be born wanting and ignorant of all. *Aristotle* very wittily called the Hand the Instrument of Instruments; in imitation of which speech, one may rightly affirm, that Reason is the Art of Arts: for as the Hand in worth exceeds the other Instruments, because it can make, handle, and fit them for use; so Reason and Speech, though names of no Art, yet comprehend and encrease all Arts. Therefore Man, seeing he hath his Mind instructed by Art, that is, by Reason, it is fit he should have his Body defended with a Weapon or Instrument, that is, the Hand; which in agility and excellency should excel all other Instruments. For so Man hath his Hands in stead of all Weapons, which he may use in War and Peace, as the Instruments of all Arts; he wants not the Bulls Horns, the Boars Tusks, the Horses Hoofs, nor, to conclude, any Arms of any other Beast. For by the benefit of his Hands he can handle other Arms far more profitable and safe; as a Lance, Sword, Spear, Halberd; but Man also can use at some distance the Bow, Sling, and Hand-gun, when the Horn and the Hoof cannot be used but near at hand. But some may say, a Lion exceeds a Man in swiftness of Foot; what then? is Man therefore inferiour to him? no, for by the means of his Hands, and the guidance of his Reason he bridling and riding upon a Horse, out-runs the Lion, and being Victor follows him to and again as he himself pleases, or vanquished flies away; and from the Horses back, as from a Tower, wounds the Lion with what Weapons he pleases. To conclude, Man is abundantly provided with means to defend himself from the violence of all other Beasts. For this purpose he doth not onely harness himself as with brazen Walls, but also makes Ditches and Bulwarks, he makes by the ministry of his Hands all kind of Weapons, weaves himself Garments, casts into the Water and draws forth Nets to catch Fish; and to conclude, he performs all things to his own contentment, and having that priviledge granted him by God, he rules over all the Earth; all things which lie hid in the bowels of the Earth, which go, or creep upon the Earth, which swim in the Sea, and flie through the Air, or are any where shut up in the compass of the Skie, are in Mans dominion.

Gal. cap. 4. lib. 1. de usu partium.

As the Hand is the Instrument of Instruments, so Reason is the Art of Arts.

Man under God is the King and Emperour of the World.

How wonderful God hath shewed himself in making Man.

Gods Deity and Providence hath principally shewed it self in the Creation of Man; neither his so admired Light hath so shone in the production of other Creatures, seeing that God would have them to live and have their being onely for Mans sake, that they might serve him. Therefore Man is, if we diligently consider all his endowments, a certain Pattern and Rule of the Divine Majesty and (if I may so say) Artifice. For being made to Gods Image, he is as it were his Coin, exceeding the capacity of all humane understanding. Which seemed a just reason to the ancient Philosophers that he should be called *Microcosmos*, or a little World, because the particles of all things contained in the compass of Heaven and Earth, are contained in his Mind and Body, that in the mean time I may in silence pass over his Soul, more great and noble than the whole World.

Man is the end of all Mundane things.

Man a little World, yea almost a great World.

Why

Why Nature hath not given Man the faculty of Presaging.

Man is not obnoxious to the Air and Stars.

THis seems the reason, that Men by the instinct of Nature do not foresee the future seasons and dispositions of the Heaven and Air; because, seeing they have received certain sparks of prudence from God, by whose care and guidance they are led to the knowledge of things by no deceitful but certain judgment, being not obnoxious to the conditions and changes of Times and Seasons, as Beasts are: Wherefore knowing all these airy changes to be placed under them, that is to say, their minds; according as occasion serves and their minds desire, they give themselves to mirth when the air is wet, stormy, and dark; and on the contrary in a clear and fair season, to a serene and grave meditation of things sublime and full of doubt. But Beasts accommodating themselves to that disposition of the Air which is present and at hand, are lively or sad, not from any judgment, as Men, but according to the temper and complexion of their bodies following the inclinations of the Air, and of the humours one while diffused, another while contracted. Neither ought we to

One Man will counterfeit the voices of infinite varieties of Beasts.

blame Man, because he can imitate the voice of Beasts, but rather much commend him, that he can infinitely wrest and vary one thing, that is, his Voice; for Men can bark like Foxes and Dogs; grunt like Hogs, whet and grind their teeth like Boars, roar like Lions, bellow like Bulls, neigh like Horses, knack their teeth like Apes, howl like Wolves, bray like Asses, bleat like Goats and Sheep, mourn like Bears, Pigeons, and Turtles, keek and gaggle like Geese, hiss like Serpents, cry like Storks, caw like a Crow, and crow like a Cock, clock like Hens, chatter as Swallows and Pies, sing like Nightingales, croak like Frogs, imitate the singing of Wasps and humming of

The power of Musick.

Bees, mew like Cats. The singing of Birds scarce seems to merit the name of Musical, compared to the Harmony of Men, fitted and tuned with infinite variety of Voices. For with this they possess the Ears of Kings and Princes, provoke and temper their wrath, and carry mens minds beyond themselves, and transform them into what habits they please. But if those cruel Beasts have any humanity, they owe it all to Man: For he tames Lions, Elephants, Bears, Tigers, Leopards, Panthers, and such other like.

That Man may attain unto the knowledge of all Voices and Tongues.

THe docility of Mans Wit is so great, and facility of the body obeying that divine gift of Wit, such, that he is not onely able to learn to speak the Tongues of divers Nations differing in so

Man not onely the imitater, but the interpreter of the Voices of Beasts and Birds.

many peculiar Languages; and not onely to imitate and counterfeit the voices of all Beasts though so much different from Man, which many flattering and jugling Companions, followers of other mens Tables will do; but also be able to know and understand both what they pretend and signifie. In confirmation of which thing, they cite the Philosopher *Apollonius* most famous in this kind of Study and Knowledge, He walking on a time amongst a company of his Friends through the Field, and seeing a Sparrow come flying and chirping much to divers other Sparrows sitting upon a Tree, is reported to have said to those which were with him, That Bird which came flying hither, told the other in her Language, that an Ass laded with Corn was fallen down at the City Gate, and had shed the Wheat upon the ground. Wherefore *Apollonius*, and all his friends which were with him went thither to see whether it were so, and found that it was so as he had told them, and observed that the Sparrows, moved thereto by the coming of the other, were eating up the grains of Corn shed on the ground.

But for Crows and Pies artificially taught to counterfeit mens Voices, it is too small a thing, that for that cause they should contend with men. For they have quickly babled all they have learnt with longer cost and labour, tediously singing still the same song, and whatsoever they prate they do it without Sense, Understanding, or any Reason for what they say. But Man always contemplating somewhat more high, still thinks of greater things than these present, and never rests. But

The unquenchable desire of Learning in Man.

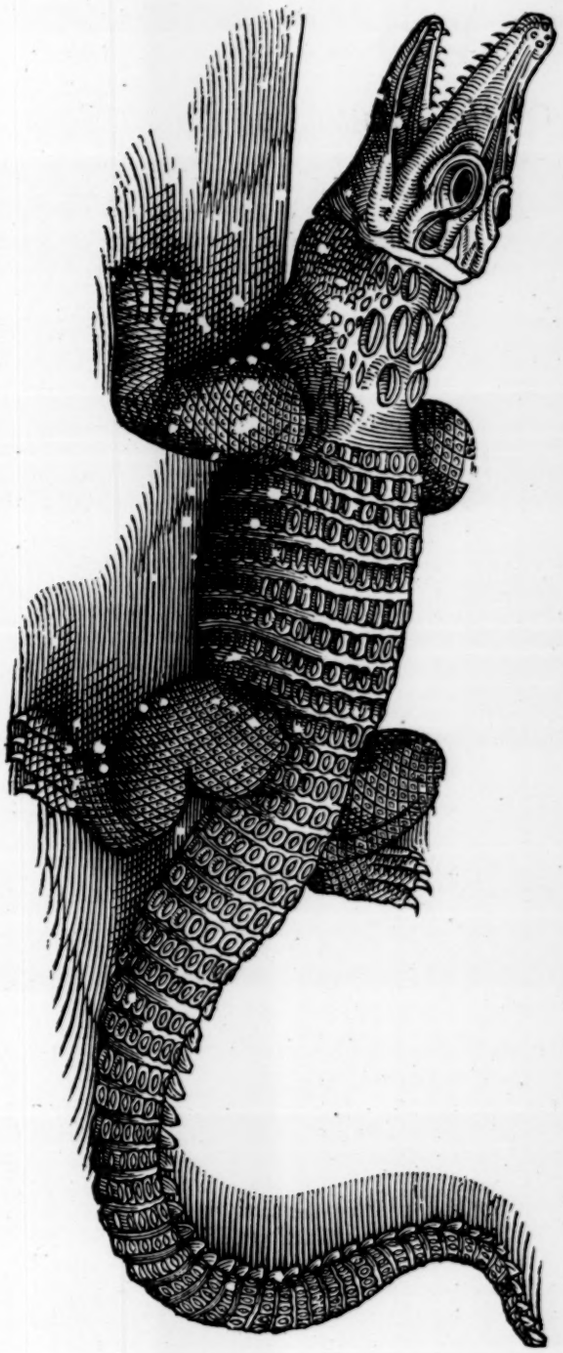
burning with an infinite and endless desire of Knowledge, he doth not onely covet to know those things which appertain to food and cloathing, but by casting his eyes towards Heaven, and by the light of his mind, he learns and understands things Divine. Which is so certain an Argument of the celestial original of our Soul, that he which considers those things, can no ways doubt, but that we have our minds seasoned by the universal Divine Understanding. But now it is time for us to set upon the Description of the Body, the habitation and fit Instrument of all the Functions of the Divine Mind.

Of the Crocodile.

A tame Crocodile.

PLutarch reports of the Crocodile (whose Figure is here delineated) that being tamed, and taught by Man, he doth not onely hear Mans Voice, and answers to his call, but suffers himself to be handled, and opening his throat, lets his teeth be scratched and wiped with a Towel. How small a part of Physick is that which Beasts are taught by Nature? Certainly nothing in comparison of Man, who by the study and practice of a few years, can learn at his fingers ends all the parts of Physick; and practise them not onely for his own, but also for the common good of all men. But why cannot Beasts attain unto the knowledge of Physick so well as Men? I think, because so great Art as Physick is, cannot be attained unto by the dull capacities of Beasts.

But



But for that I have written of the Religion of Elephants, if I muſt ſpeak according to the truth of the matter, we cannot ſay, they worſhip God, or have any ſenſe of the Divine Majeſty. For how can they have any knowledg of ſublime things, or of God, ſeeing they wholly following their food, know not how to meditate on celeſtial things? Now for that they behold and turn themſelves to the Moon by night, and to the Sun in the morning, they do not that as worſhipping, or for that they conceive any excellency or divinity in the Sun; but becauſe Nature ſo requiring and leading them, they feel their bodies to rejoyce in that light, and their entrails and humors to move and ſtir them to it. Therefore when we attributed Religion to Elephants, we ſaid it rather popularly, than truly, and more that we might exhort men to the Worſhip of God, than that we thought Elephants had any knowledge of Divine Worſhip implanted in their minds.

In what ſenſe we ſaid, Elephants had Religion.

The end of the Second Book.

BOOK III.

Of the Anatomy of Mans Body.

IFollowing the cuſtom and the manner of ſuch as before me have written of Anatomy, will firſt, (that I may make the minds of the Readers more attentive and deſirous of theſe ſtudies) declare how neceſſary it is, and alſo how profitable; and then ſhew the order to be obſerved in it, before I come to the particular deſcription of mans body.

The neceſſity of the knowledg of Anatomy.

Furthermore, how Anatomy may be defined, and the manner of the definition of the parts. For the firſt, the knowledg of Anatomy ſeems in my judgment very neceſſary to thoſe that deſire to excel, or attain to perfection of Phyſick; that is, whereby they may be able to preſerve the preſent health of the body, and the parts thereof, and drive away diſeaſes. For how can either Phyſician or Chirurgeon preſerve health by the uſe of the like things, which conſiſts in the temperament, conformation and natural union of the parts; or expel the diſeaſe which hurts thoſe three, by the like uſe of their contraries, unleſs he ſhall know the nature and compoſure of the body, and underſtand, as by the rule of this knowledg, how much it ſwerves from the nature thereof? Wherefore it is excellently ſaid of *Hippocrates*, that the Phyſician, called to cure the ſick Patient, ought diligently to conſider, whether thoſe things that are in him, or appear to be in him, be like or unlike, that is, whether the Patient be like himſelf and his own nature in all his parts and functions, temperature, compoſure and union; that he may preſerve thoſe which are yet contained in the bounds of nature, and reſtore thoſe that are gone aſtray. Which thing *Galen* hath alſo confirmed, ſpecially where he ſaith, He muſt well know the nature and ſtructure, or compoſure of the bones, who takes upon him to reſtore them broken or diſlocated to themſelves and their proper ſeats or places. Moreover, ſeeing that healing doth not only conſiſt in the knowledg of the diſeaſe, but as well in preſcribing fit medicines, and like application of them to the body and the parts thereof, all which by their natural diſſimilitude, do require unlike medicines, according to *Galens* opinion: I prethee tell me, Who can perform this, which is ignorant of the deſcription of the whole and the parts thereof, taught by Anatomy? We may ſay the like of the Apothecary, who ignorant of the ſituation of the parts in the body cannot apply Emplaiſters, Ointments, Cataplaſms, Fomentations, Epithemes, bags to the fit places, as to the ſutures of the skull, to the Heart, Liver, Stomach, Spleen, Reins, Womb, or Bladder. For example: Let us imagine the Liver to be troubled with a hot diſtemperature, but on the contrary, the ſtomach with a cold (which commonly happens, ſeeing the Liver hotter than ought to be, ſends up many vapours to the head; from whence cold humours fall into the ſtomach) if hot things to be applied to the ſtomach by the Phyſicians preſcription, be by the Apothecary, making no difference, applied, to both the ſtomach and neighbouring liver, (which may chance, if he be ignorant, that the ſtomach bends ſomewhat to the left ſide under the breaſt-blade; but the liver ſo takes up the right ſide of the body, that with a great part thereof, it covers almoſt all the ſtomach) will he not be much offend by increaſing the hot diſtemper of the liver, and not thereby giving eaſe, or help to the diſeaſe? Shall not, by this his ignorance, the Patient be fruſtrated of his deſire, the Phyſician of his intent, and the Medicine of its effect? By theſe examples I think it moſt manifeſt, that the Anatomical knowledg of the parts of the body is exceeding neceſſary to all Phyſicians, Chirurgeons, and Apothecaries, who will practiſe Phyſick with any praiſe, to the glory of God, and the benefit and good of man, for whoſe ſake we have writ theſe things, and illuſtrated them by figures, ſubjecting the parts to the eye, and fitly put them in their proper places.

Initio lib. de Offic. Medici.

Lib. de oſſibus.

1. de loc. affectis, & lib. 3. Meth.

Why, when the liver is hot the ſtomach is commonly cold.

The knowledg of Anatomy, is commodious four manner of ways.

But Anatomy is commodious four manner of ways: The firſt is, becauſe thus we are led to the knowledg of God the Creator, as by the effect to the cauſe; for, as we read in St. *Paul*, The inviſible things of God are made manifeſt by the viſible. The ſecond is, that by means hereof we know the nature of mans body, and the parts thereof, whereby we may more eaſily and certainly judge and determine of ſickneſs and health. The third is, that by the knowledg of the body and its parts, and together therewith it affections and diſeaſes, we may prognoſticate what is to come, and foretel the events of diſeaſes. Laſtly, the fourth is, that, conſidering the nature of the diſeaſed part, we may fitly preſcribe medicines, and apply them in their due place.

There is a threefold method.

Now we muſt declare in what order Anatomy may be fitly delivered; but firſt we muſt obſerve, there is a threefold method: The firſt is called of Compoſition, being very commodious for the teaching of Arts, which *Ariſtotle* hath uſed in his Works of Logick, and natural Philoſophy, the order and beginning taken from the leaſt and moſt ſimple, to the more compound. The ſecond of Diviſion, fit for the inventing or finding out of Sciences. *Galen* hath followed this order in his Books of Anatomical Adminiſtrations, and of the uſe of the parts. The third of Definition, which ſheweth the nature and eſſence of things, as appears by *Galen* in his Book *de Arte Parva*. And becauſe this order doth alſo proſecute the diviſions, therefore it is commonly accuſtomed to be comprehended in the compaſs of the ſecond. Therefore I will follow this in my Anatomical Treatiſe, dividing mans body into its parts, which I will not only ſubject to the eye in the way of knowing them, but alſo to the mind in the faithful underſtanding them. For, I will adjoyn thoſe things that are delivered of them by *Galen* in his Book of Anatomy-Adminiſtrations, with thoſe which he hath taught in his Books of the uſe of the parts. For there he fitly lays the parts of mans body before our eyes, to the ſenſe. But here he teaches to know them, not to ſee them; for he ſhews why, and for what uſe, they are made, Having briefly handled theſe things,

The Authors intent.

we

we muſt declare what Anatomy is; that, as *Cicero* ſaith out of *Plato*'s *Phædro*, it may be underſtood of what we diſpute. And becauſe we attain that by definition (which is a ſhort and plain ſpeech, conſiſting of the *Genus* and Difference of the things defined, being the eſſential parts, by which the nature and eſſence of the thing is briefly and plainly explained) firſt we define Anatomy, then preſently explain the particular parts of the definition.

What Anatomy is.

Wherefore Anatomy (if you have regard to the name) is a perfect and abſolute diviſion, or artificial reſolution of mans body into its parts, as well general as particular, as well compound as ſimple. Neither may this definition ſeem illegitimate; ſpecially amongſt Phyſicians and Chirurgeons. For, ſeeing they are Artizans humiliated to the ſenſe, they may uſe the proper and common qualities of things for their eſſential differences and forms. As on the contrary, Philoſophers may refuſe all definitions as ſpurious, which conſiſt not of the next *Genus*, and the moſt proper, and eſſential differences. But ſeeing that, through the imbecillity of our underſtanding, ſuch differences are unknown to us, in their places we are compelled, in defining things, to draw into one many common and proper accidents, to finiſh that definition which we intend: which for that cauſe we may more truly call a deſcription, becauſe for the matter and eſſential form of the thing, it preſents us only the matter adorned with certain accidents. This appears by the former definition, in which *Diviſion* and *Reſolution* ſtand for the *Genus*, becauſe they may be parted into divers others, as it were into *ſpecies*. That which is added over and beſides, ſtands in place of the difference, becauſe they ſeparate and make different the thing it ſelf from all other rath and unartificial diſſections. We muſt know, an artificial diviſion, is no other than a ſeparation of one part from another, without the hurt of the other, obſerving the proper circumſpection of each of them; which if they periſh or be defaced by the diviſion, it cannot be ſaid to be artificial. And thus much may ſuffice for the parts of the definition in general.

How a definition differs from a deſcription.

For as much as belongs to the explication of each word; we ſaid, *of Mans body*, becauſe as much as lies in us, we take care of, preſerve the health, and depel the diſeaſes thereof: By which it may appear that mans body is the ſubject of Phyſick, not as it is mans, or conſiſts of matter and form, but as it is partaker of health and ſickneſs.

The ſubject of Phyſick.

We underſtand nothing elſe by part, according to *Galen*, than ſome certain body, which is not wholly disjoyned, nor wholly united with other bodies of their kinds; but ſo, that, according to his opinion, the whole be compoſed therewith, with which in ſome ſort it is united, and in ſome kind ſeparated from the ſame, by their proper circumſcription. Furthermore by the *parts in general*, I underſtand the head, breaſt, belly, and their adjuncts. By the particular parts of thoſe, I underſtand, the ſimple parts, as the ſimilar, which are nine in number, as a griſtle, bone, ligament, membrane, tendon, nerve, vein, artery, muſculous fleſh; ſome add fibers, fat, marrow, the nails, and hairs; other omit them as excrements: But we muſt note that ſuch parts are called ſimple, rather in the judgment of the ſenſe, than of reaſon. For if any will more diligently conſider their nature, they ſhall find none abſolutely ſimple, becauſe they are nouriſhed, have life and ſenſe, either manifeſt or obſcure, which happens not without a nerve, vein, and artery.

Gal. lib. 1. *de uſu part.* lib. 1. Meth. 1

The ſimilar parts are nine.

But if any ſhall object, that no nerve is communicated to any bone, except the teeth; I will anſwer, that nevertheleſs the bones have ſenſe by the nervous fibers, which are communicated to them by the *Perioſteum*, as by whoſe mediation the *Perioſteum* is connext to the bones, as we ſee it happens to thoſe membranes, which involve the bowels. And the bones, by this benefit of the animal ſenſe, expel the noxious and excrementitious humors from themſelves into the ſpaces between them, and the *Perioſteum*, which, as indued with a more quick ſenſe, admoniſheth us, according to its office and duty, of that danger which is ready to ſeiſe upon the bones, unleſs it be prevented. Wherefore we will conclude according to the truth of the thing, that there is no part in our body ſimple, but only ſome are ſo named and thought, according to the ſenſe; although alſo otherwiſe ſome may be truly named Simple, as according to the peculiar and proper fleſh of each of their kinds. Thoſe parts are called Compound, which are made or compoſed by the mediation, or immediately of theſe ſimple, which they term otherwiſe organical, or inſtrumental; as an arm, leg, hand, foot, and others of this kind.

How the bones come to feel.

The compound or organical parts.

And here we muſt obſerve, that the parts are called ſimple and ſimilar, becauſe they cannot be divided into any particles but of the ſame kind; but the compound are called diſſimilar from the quite contrary reaſon. They are called inſtrumental and organical, becauſe they can perform ſuch actions of themſelves, as ſerve for the preſervation of themſelves and the whole; as the eye of it ſelf, without the aſſiſtance of any other part, ſeeth, and by this faculty defends the whole body, as alſo it ſelf. Wherefore it is called an inſtrument or organ, but not any part of it, as the coats, which cannot of it ſelf perform that act. Whereby we muſt underſtand, that in each inſtrumental part we muſt diligently obſerve four proper parts. One by which the action is properly performed, as the Cryſtalline himor in the eye. Another, without which the action cannot be performed, as the nerve and the other humors of the eye. The third, whereby the action is better and more conveniently done, as the tunicles and muſcles are. The fourth, by which the action is preſerved, as the eye-lids and circle of the eye. The ſame may be ſaid of the hand, which is the proper inſtrument of holding; for it performs this action, Firſt, by the muſcle, as the principal part; Secondly, by the ligament, as a part without which ſuch action cannot be performed; Thirdly, by the bones and nails, becauſe by the benefit of theſe parts, the action is more happily performed; Fourthly, by the veins, arteries and skin, for that by their benefit and uſe, the reſt, and ſo conſequently the action it ſelf is preſerved.

Four particles to be obſerved in each organical part.

But we muſt conſider, that the inſtrumental parts have a fourfold order. They are ſaid to be of the firſt order, which are firſt and immediately compoſed of the ſimple, as only the authors of ſome one action, of which kinds are the muſcles and veſſels. They are of a ſecond, which conſiſt of theſe firſt ſimple, and others beſides, as the fingers. They are counted of the third rank, which

Four ſorts of inſtrumental parts.

are compoſed of parts of the ſecond order, and ſome beſides, as the hand taken in general. The fourth order is the moſt compoſed, as the whole body, the organ and inſtrument of the Soul. But you muſt obſerve, that when we ſay, the muſcles and veſſels are ſimple parts, we refer you to the ſenſe and ſight, and to the underſtanding comparatively to the parts which are more compound; but if any conſider their eſſence and conſtitution, he ſhall underſtand they are truly compound, as we ſaid before. Now it remains, that we underſtand, that in each part, whether ſimple or compound, nine things are to be conſidered; as, ſubſtance, quantity, or magnitude, figure, compoſition, number, connexion, (by which name, we alſo underſtand the original and inſertion) temperature, action and uſe; that by the conſideration of theſe things, every one may exerciſe the Art of Phyſick, in preſerving health, curing diſeaſes, or foreſeeing their events and ends.

Nine things to be conſidered in each part.

But alſo we muſt note, that of the organical parts, there be three, by whoſe power the body is governed; which for that cauſe they call regent and principal, becauſe they govern all the reſt; they are the Liver, Heart, and Brain. But they are called principal, not only, becauſe they are neceſſary for life, (for the ſtomach, wind-pipe, lungs, reins, bladder, and ſuch like parts perhaps are equally as neceſſary for life;) but becauſe from each of theſe three, ſome force, power and faculty, or alſo matter neceſſary for the whole body, flow over all the body, when no ſuch thing proceeds from the reſt of the parts. For from the Liver a matter fit for nouriſhment is diſtributed by the veins through all the body; from the Heart the vital force, diffuſed by the arteries, imparts life to the whole body; from the Brain by the nerves a power or faculty is carried through all the parts of the body, which gives them ſenſe and motion.

Why the three principal parts are ſo called.

Galen would have the Teſticles to be of this kind, not for the neceſſity of the individual, or peculiar body, but for the preſervation of the *Species* or kind. And moreover, in his Book *de Semine*, comparing the Teſticles with the Heart, he makes them the more noble by this reaſon, that by how much it is better to live well and happily, than ſimply and abſolutely to live, by ſo much the Teſticles are more excellent than the heart; becauſe with them we may live well and pleaſantly, but with this ſimply live; as we ſee by the example of Eunuchs, and ſuch as are gelt, by which the Teſticles ſeem rightly to be accounted amongſt the principal parts; for Nature ſeeing it deſired, that this its work ſhould be immortal, for the attaining of that immortality which it intends, frames thoſe parts, like as prudent founders of a City, who do not only procure to furniſh their City with many Inhabitants, ſo long as they are in building it, but alſo that it may remain in the ſame ſtate and condition for ever, or at leaſt for many ages. And yet notwithſtanding of ſo many Cities built in the firſt memory of man, there remains none, whoſe fame and ſtate, together with the Builders name, is not decayed and periſhed. But this humane work of nature, ſtands yet ſecure for theſe many thouſand of years, and ſhall endure hereafter; becauſe it hath found a way, by which every one may ſubſtitute another in his place before he depart. Hence it is, that all Creatures have members fit for generation, and pleaſures inſerted in thoſe members, by which they might be enticed to mutual embraces and copulations. But the mind, which hath dominion over thoſe members, hath an incredible deſire of propagating the iſſue; by which alſo brute Beaſts incited, deſire to propagate their kinds for ever. For ſeeing that Nature underſtands, all theſe her works conſidered particularly by themſelves, are frail and mortal, it hath done what it could to recompence that fatal neceſſity of dying, by a perpetual ſucceſſion of Individuals.

Lib. de arte medica.

The uſe and function of the parts ſerving for generation.

Hitherto we may ſeem to have abundantly ſhewed what neceſſity of knowledge in Anatomy belongs to all Artizans in Phyſick, and alſo what order is to be obſerved in the ſame; and laſtly, how it is defined, and the reaſon of the parts of the definition. Wherefore it remains that we proſecute what we have taken in hand; which is, that we ſhew and declare how to know all and every the parts of mans body, how many, and what they be, and to underſtand wherefore they be. For although the true knowledge of Anatomy may be perfected by the ſight of the eye, and touching and handling each part with the hand, yet nevertheleſs the labour of deſcribing Anatomy is not unprofitable. For by reading, ſuch as have often exerciſed themſelves in the diſſecting of mens bodies, may refreſh and help their memories; and ſuch as have not, may make plain and eaſie the way to the underſtanding of Diſſections.

CHAP. I.

The diviſion or partition of mans Body.

BY reaſon the partition of mans body can hardly be underſtood, if the diſtinction of the proper faculties of the ſoul be not underſtood, for whoſe cauſe the body enjoys that form (which we ſee) and diviſion into divers Inſtruments: Therefore I thought good in few words to touch that diſtinction of the faculties of the ſoul, for the better underſtanding of the partition of the body, which we intend. Wherefore the ſoul, the perfection of the body, and beginning of all its functions, is commonly diſtinguiſhed, and that in the firſt and general diviſion, into three faculties, which are, the Animal, Vital and Natural. But the Animal is divided into the principal, ſenſitive and motive: Again, the Principal is diſtinguiſhed into the imaginative, reaſonable and memorative: And the Senſitive into ſeeing, hearing, ſmelling, taſting, and touching: But the Motive into progreſſive and apprehenſive. And the Vital is divided into the dilative and contractive faculty of the heart and arteries, which we know or underſtand by the pulſifick faculty. But the Natural is parted into the nutritive, auctive, and generative faculties; which three perform their parts by the help and miniſtry of five other faculties, which are, the attractive, retentive, concoctive, aſſimilative and expulſive.

What the Soul is and with how many faculties it is endued.

After

After the self-same manner, the organ or instrument of the soul, to wit, man's body, at the first division is distinguished into three parts, which from their office they call Animal, Vital and Natural. These again, according to the sub-division of the subalternal faculties, are divided particularly into other parts; so that any one may know the organ of each faculty, by the property of the function. For, while other Anatomists divide man's body into four universal and chief parts, they distinguish from the three first, those which they call the Extremities; neither do they teach, to what rank of the three prime parts each Extremity should be reduced. From whence many difficulties happen in reading the writing of Anatomists; for shunning whereof, we will prosecute, as we have said, that distinction of man's body, which we have touched before.

All the parts mans body are distinguished into three.

Wherefore, as we said before, man's body is divided into three principal and general parts, Animal, Vital, and Natural. By the Animal parts, we understand, not only the parts pertaining to the head, which are bounded with the crown of the head, the collar-bones, and the first *Vertebra* of the breast, but also the extremities, because they are organs and instruments of the motive-faculty; *Hippocrates* seems to have confirmed the same; where he writes, Those who have a thick and great head, have also great bones, nerves, and limbs. And in another place he saith, those who have great heads, and, when they stoop, shew a long neck, such have all their parts large, but chiefly the Animal. Not for that *Hippocrates* would therefore have the head the beginning and cause of the magnitude and greatness of the bones and the rest of the members; but that he might shew the equality, and private care, or government of Nature, being most just and exact in the fabrick of man's body, as, if she hath well framed the head, it should not be unlike that she idly or carelesly neglected the other parts which are less seen. I thought good to dilate this passage, lest any might abuse that authority of *Hippocrates*, and gather from thence, that not only the bones, membranes, ligaments, grisles, and all the other animal parts, but also the veins and arteries depend on the head as the original. But if any observe this our distinction of the parts of the body, he will understand, we have a far other meaning.

What parts are here called Animal.

Lib. 6. Epid.

By the Vital parts, we understand only the heart, arteries, lungs, wind-pipe, and other particles annexed to these. But by the Natural, we would have all those parts understood which are contained in the whole compass of the *Peritonæum* or Rim of the body, and the processes of the *Erythroides*, the second coat of the Testicles. For as much as belongs to all the other parts, which we call Containing; they must be reckoned in the number of the Animal, which notwithstanding, we must thus divide into principal, sensitive, and motive; and again, each of these in the manner following: For first, the principal is divided into the Imaginative, which is the first and upper part of the brain, with its two ventricles, and other annexed particles, into the reasoning, which is a part of the brain, lying under the former, and (as it were the top thereof with its third ventricle; into the Memorative, which is the *cerebellum* or after-brain, with a ventricle hallowed in its substance. Secondly, The Sensitive is parted into the visive, which is in the eyes; the auditive in the ears; the smelling, in the nose; the tasting, in the tongue and palat; the active, or touching which is in the body, but most exquisite in the skin which invests the palms of the hands. Thirdly, the motive is divided into the Progressive, which intimates the legs; and the Comprehensive, which intimates the hands. Lastly, into simply-motive, which are three parts, called bellies, for the greatest part terminating and containing; for the Vital, the instrument of the faculty of the heart, and dilatation of the arteries, are the direct or streight fibers, but of the Constrictive the transverse; but the three kinds of fibers together, of the Pulsifick: Or, if you please, you may divide them into parts serving for Respiration, as are the lungs and weazon, and parts serving for vital motion, as are the heart and arteries, furnished with these fibers, which we formerly mentioned. The division of the natural parts remains, which is into the nourishing, active, and generative, which again, are distributed into attractive, universal and particular retentive, concoctive, distributive, assimilative, and expulsive. The attractive, as the gullet and upper orifice of the ventricle; the retentive, as the *Pylorus*, or lower passage of the stomach; the concoctive, as the body of the ventricle, or its inner coat; the distributive, as the three small guts; the expulsive, as the three great guts; we may say the same of the Liver; for that draws by the mesaraick and gate-veins, retains by the narrow orifices of the veins dispersed through the substance thereof; it concocts by its proper flesh; distributes by the hollow vein, expels by the spleen, bladder of the gall, and kidneys. We also see the parts in the Testicles divided into as many functions; for they draw by the preparing vessels; retain by the various crooked passages; in the same vessels they concoct the seed by the power of their proper substance and faculty; they distribute by the ejaculatory, at the glandules called *Prostatæ*, and the horns of the womb, supplying the place of prostates: Lastly, they expel or cast forth by the prostates, horns, and adjoyning parts. For as much as belongs to the particular attraction, retention, concoction, distribution, assimilation of each part, that depends of the particular temper, and, as they term it, occult property of each similar and simple part. Neither do these particular actions differ from the universal, but that the general are performed by the assistance of the three sorts of fibers; but the special, by the several occult property of their flesh, arising from their temperature, which we may call a specifick property. Now in the composition of man's body, Nature principally aims at three things. The first is, to create parts necessary for life, as are the heart, brain, and liver. The second, to bring forth other for the better and more commodious living, as the eyes, nose, ears, arms and hands. The third is, for the propagation and renewing the *species* or kind, as the privy parts, testicles and womb. And this is my opinion, of the true distinction of man's body, furnished with so many parts, for the performance of so many faculties; which you, if you please, may approve and follow. If not, you may follow the common and vulgar, which is, into three bellies or capacities, the upper, middle, lower, (that is, the head, breast, and lower belly) and the limbs or joints. In which, by the head we do not understand all the Animal parts, but only those which are from the crown

What parts are called Vital.

The division of the animal parts.

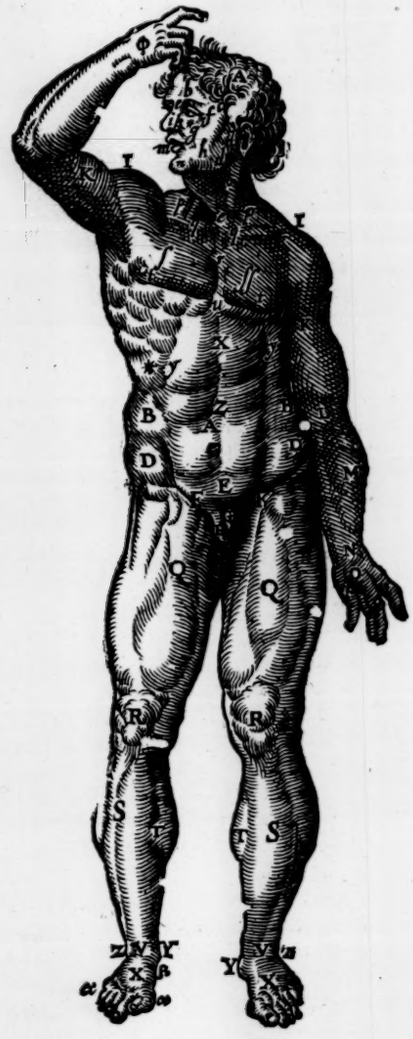
The division of the vital parts.

The division of the natural parts.

The vulgar division of mans body.

of the head to the first *vertebra* of the neck, or to the first of the back; if, according to the opinion of *Galen*, *Lib. de Ossibus*, where he makes mention of *Enarthrosis* and *Arthrodia*, we reckon the neck amongst the parts of the head. By the breast, whatsoever is contained from the collar bones to the ends of the true and bastard, or short ribs, and the midriff. By the lower belly, the rest of the trunk of the body, from the ends of the ribs to the share-bones; by the limbs, we understand the arms and legs. We will follow this division in this our Anatomical Discourse, because we cannot follow the former in dissecting the parts of mans body, by reason the Animal parts are mutually mixed with the Vital and Natural: And first of the lower belly.

The Figure shewing the fore-parts of the body.



A The hairy Scalp, call'd τετιχωτὸς.
b the forehead, call'd *Frons*, μέτωπον.
c The temples call'd *tempora*, κρόταφοι.
From *b* to *d*, the compass of the face.
e The greater or inward corner of the eys, call'd *Canthus internus.*
f the lesser or external angle of the eye, call'd *Canthus externus.*
* The lower eye-brow, which is immoveable, *Palpebra.*
g The cheek-ball call'd *mala*, μῆλα.
h the cheek-puff, call'd *bucca*, γιάθος.
i The ridg of the nose call'd *Nasus externus*, ῥὶν.
k the nostrils call'd *nares*, μυκτῆρες.
l the outward ear, *auris externa.*
m The mouth made of the two lips, *Os.*
n The chin call'd *mentum*, γένειον.
o The neck, *collum*, αὐχὴν, and τράχηλος.
From *o* to *e* the pillar of the neck, *truncus* and ὄλμος.
p p The hollow of the neck called *jugguli*, σφαγαὶ.
q q The Patel bones, *claves*, κλεῖδες.
r The chest, *pectus*, στέρνον.
ſ The right breast.
ſſ The left breast: to this Region we apply cordial *Epithemations* moist and dry.
tt The nipples of the breasts, *papillæ*, θῆλαι.
u The trench of the heart which the Ancients called καρδία; The Latines *scrobiculus cordis.* This part is anointed for the mouth of the stomach.
From u to E. the lower belly, γαστὴρ.
X The *Epigastrium* or upper part of the lower belly.
y y The *Hypochondria* or *Præcordia.*
* The outward Liver-remedies are applied to this place.
z The region of the navil, called *umbilicalis*, or the middle part of the lower belly.
A The navil, *umbilicus.* The root of the belly, ὄμφαλος.

BB The sides, *Latera* πλευραὶ, and in our Author, *Lumbi, seu Lumbaris regio.* C *Hypogastrium*, the water-course *Aqualiculus*, the lower part of the lower belly, ἧτρον. DD The flanks called *Ilia*, and νεφροῖνες. E. The groins called *pubes* or *pecten*, κλεὶς καὶ ἥβη. F F The Lesk called *inguen*, where those tumors which are called *bubones.* G The Yard with the fore-skin, *penis cum præputio.* H The stones or testicles with the cod or *scrotum.* II The shoulders, *humeri*, ἐπωμίδες. KK The arms, *Brachia*, βράχιονα. L The bowt of the arm, called *Gibber*, ἀγκὼν. M The outside of the lower part of the arm, clled *cubitus*, πῆχυς. N The wrist called *Brachiale*, καρπὸς. O The after-wrist *postbrachiale*, μεταμάρπιον. P The palm called *Palma*, or *vola manus.* Θέναρ. Φ The back of the hand, *dorsum manus*, ὑπόθεναρ. Q Q The fore and middle part of the thigh, where we apply cupping-glasses to bring down womens courses, μηρὸν. RR The knee, *genu*, γόνυ. S S The leg, *tibia*, κνήμη. T T The calf of the leg, *sura*, γαστροκνήμιον. V V The instep, *tarsus.* XX The top of the foot, *Dorsum pedis*, ῥὶς ποδὸς. Y Y The inner ankles, σφυρὸν. Z Z The outward ankles. α α The toes of the feet. Ϛ The place under the inner ankle, where the vein called *Saphena* is opened.

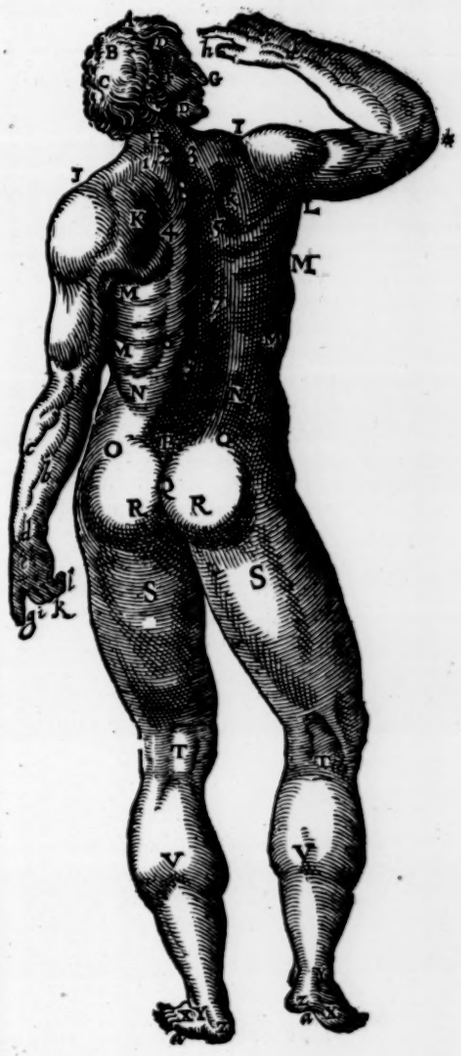
Why the belly is not bony.

Nature would not have this lower belly bony, because the ventricle might be more easily dilated by meat and drink, children might grow the better, and the body be more flexible. It is convenient we begin our Anatomical Administration from this; because it is more subject to putrefaction than the rest, both by reason of its cold and moist temperature, as also by reason of the feculent excrements therein contained. Yet before we go any further, if the Anatomical Administrations must

muſt be performed in publick, the body being firſt handſomly placed, and all the Inſtruments neceſſary for Diſſection made ready, the belly muſt be divided into its parts: Of which ſome contain, and other ſome are contained.

They are called containing, which make all that capacity which is terminated by the *Peritoneum* or rim of the belly. The upper part whereof is bounded by *Galen* within the compaſs of the direct muſcles, and by a general name is called *Epigaſtrium*, or the upper part of the lower belly. That again is divided into three parts, that is, into that which is above the navil, and which carries the name of the whole; into that which is about the navil, and is called the umbilical or middle part; and laſtly, into that which is below the navil, called the *Hypogaſtrium*, or the lower part of the lower belly. The diviſion of the lower belly.

The Figure of the back-parts of a man.



A The fore-part of the head, *ſynciput*, ἔρεγμα.
B The top or crown of the head, *vertex*, κορυφή.
C The hinder part of the head, *occiput*, κοτὶς ὀπίσθιον.
From D to D the face, *facies*, πρόσωπον.
E The eye-brows, *ſupercilia*, ὀφρῦς.
F The upper eye-lid, βλέφαρον.
G The tip of the noſe, called *globulus naſi*.
H The back-part of the neck called *cervix*, αὐχὴν, and the nuke or nape of the neck. There is a hollowneſs at the top of this *cervix*, where we apply Seatons.
I The back-part of the ſhoulder top called *axilla*, ὦμος.
K K The ſhoulder-blades, *ſcapulæ*, ὠμοπλάται.
1 2 3 On this place we ſet Cupping-glaſſes.
4 5 6 7 The back, *dorſum*, νῶτος.
8 9 The ridge, *ſpina dorſi*, ῥάχις.
L The arm-hole, *ala*, μασχάλη.
* The elbow, *gibber brachii*.
M M M M the ſides, *latera*.
N N The loins, *lumbi*, or the region of the kidneys, ὀσφύς.
O O The place of the hips, *coxendices*, where we apply remedies for the Sciatica.
P The place of the holy bone, or *Os ſacrum*, where we apply remedies in the diſeaſe of the right gut.
Q The place of the rump or *Coccyx*.
R R The buttocks, *nates*, πλῶνες.
S S The back part of the thigh, *femur*.
T T The ham, *poples*, ἰσχύς.
V V The calf of the leg, *ſura*.
X X The foot, or *parvus pes*, πούς.
Y Y The outer ankle, *malleolus externus*.
Z Z The heel, *calx*, or *calcaneus*, πτέρνα.
a a The ſole of the foot, *planta pedis*, κοῖλον τοῦ ποδός.
b The inſide of the lower part of the arm called *ulna*, κώνυξ.
c The outſide of the ſame, *cubitus*, πῆχυς.
d d the wriſt, *carpus*. *e e* The back-part of the hand, *dorſum manus*. *g* The fore-finger, *index*, δείκτης. *h* The thumb, *pollex*, ἀντίχειρ. *i* The middle-finger, *medius*, μέσος. *k* The ring-finger, *annularis*, *medicus*, ἰατρικός. The little-finger, *auricularis minimus*, ὠτίτης.

In every of which three parts there be two lateral or ſide-parts to be conſidered, as in the *Epigaſtrium*, the right and left *Hypocondria*, which are bounded above and below, in the compaſs of the midriff, and the ſhort-ribs. In the umbilical the two *Lumbares* (ſome call them *Latera* ſides) which, on both ſides from the loweſt parts of the breaſt, are drawn to the flanks or hanch-bones; in the *Hypogaſtrium*, the two *Ilia*, or flanks bounded with the hanch and ſhare-bones. Neither am I ignorant, the *Ilia*, or flanks, which the Greeks call Λαγόες, ſignifie all the empty parts, from the ends of the ribs, even to the hanch-bones, whereupon they alſo call them Κενεῶνες, as if you ſhould ſay, empty-ſpaces, becauſe they are not encompaſſed with any bone. Yet I thought good, that this doctrine of dividing the belly ſhould be more diſtinct, to call the parts which are on each ſide the navel, *Lumbares*, and thoſe on the lower part of the lower belly, *Ilia*, flanks. But we muſt obſerve, that the Ancients have been ſo diligent in deciphering the containing parts, that as exactly as might be, they deſigned the bowels contained in the belly, which being divers, lie in ſundry places; for the greater portion of the liver lies under the right *Hypocondrium*, under the left almoſt all the ventricle and ſpleen. Under the *Epigaſtrium* the lower orifice of the ventricle, and the The *Hypocondria*.

ſmaller

ſmaller portion of the liver; in the *Lumbares*, or ſides, in the right and upper part the right kidney; in the lower part towards the flank, the blind gut; in the middle part thereof the collick aud empty guts. In the upper part of the left ſide lies the Kidney, in the middle part, the reſt of the empty and colick guts. Under the region of the navel, lies the girdle or upper part of the kall, the colick-gut thruſting it ſelf alſo through that way. Under the *Ilia*, or flanks, the right and left, lie the greater part of the gut, *Ileon*, the horns of the women big with child, and the ſpermatick veſſels in men and women. Under the *Hypogaſtrium* in the lower part lies the right, or ſtrait gut, the bladder, womb, and the reſt of the kall.

A moſt certain note of the part affected by the place where the pain is.

If we know, and well underſtand theſe things, we ſhall more eaſily diſcern the parts affected by the place of the pain; and cure it by fit application of remedies, without the hurting of any part. The diſtinction of ſuch places, and the parts in thoſe places, as ſeeming moſt profitable, I have thought good to illuſtrate by the placing the two precedent figures, in which thou haſt deciphered, not only the foreſaid parts, containing and contained, but alſo of the whole body, and many other things which may ſeem to conduce to the knowledge of the mentioned parts.

CHAP. II.

Of the containing parts of the Epigaſtrium, *and the preparation to Anatomical Adminiſtration.*

The containing parts of the belly.

THe containing parts of the *Epigaſtrium*, are the *Epidermis*, or thin outward skin; the true skin; the fleſhy or fatty Pannicle, the eighth muſcle of the *Epigaſtrium*, with their common coat, the rim of the belly, the five vertebra's of the loins, all the holy-bone, the hanch-bone, ſhare-bone, the white-line and midriff. Of theſe parts, ſome are common to the whole body, as the three firſt; the other, proper to the parts contained in the *Epigaſtrium* taken in general. Which that you may ſee in their order, firſt you muſt cut round about the navel, to the upper *ſuperficies* of the muſcles, that ſo we may keep it, till ſuch time, as occaſion ſhall offer it ſelf, to ſhew the umbilical veſſels lying in that place, which are one vein, two arteries, and the *Urachus* (if it be there.) Which being done, you muſt draw a ſtrait line from the cheſt, over the breaſt-blade, even to the ſhare-bone, which may divide the common-containing parts, even to the white line.

Then preſently it will be convenient to draw two other lines a-croſs or overthwart, of the like depth on each hand, from the circumference of the navel, even to the ſides, that ſo on each part we may draw the skin more commodiouſly from the parts lying under it; the ſight of which otherwiſe it would hinder. Theſe things being done, the skin muſt be divided from the parts lying under it from the deſigned circumference left about the navel. We muſt teach how the skin is two-fold, true and falſe, and render a reaſon of the name, which we will every where do, as far as the thing will ſuffer, and it ſhall lie in our power. And in doing or examining theſe things, it will be convenient diligently to enquire into the nine things mentioned in the Preface. We will begin with the skin, becauſe that part is firſt obvious to our ſenſes.

CHAP. III.

Of the utmoſt Skin or Cuticle.

The skin two-fold.

From what parts the skin cannot be ſeparated.

THe skin being the firſt part, and ſpred over all the body, is twofold, that is, the true, and baſtard skin: The true is called by the *Greeks Derma*, which may almoſt every where be pulled from the parts lying under it, which it inveſts, except in the face, ears, the palms of the hands, ſoles of the feet, fingers, and privities, where it ſticks ſo cloſe that it cannot be ſeparated.

The baſtard skin (which firſt of all we will declare, becauſe it firſt preſents it ſelf to our ſight) is by the *Greeks* called *Epidermis*, becauſe it covers the true skin, they term it commonly the Cuticle. The ſubſtance of it is excrementitious, and (as it were) a certain dry flouring, or production of the true skin. That it draws not its ſubſtance from the Seed, is apparent by this, that as it is eaſily loſt, ſo it is eaſily repaired, which happens not in parts truly ſpermatical. This outmoſt thin skin, or Cuticle, may two manner of ways be made apparent; by it ſelf, and ſeparated from the other, as by burning with fire, or ardent heat of the Sun (in ſome delicate bodies, and ſuch as are not accuſtomed to be converſant in Sun-ſhine.) The quantity in thickneſs is very ſmall, but the extent is moſt large, becauſe it covers all the skin. The figure of it is round, and long, like thoſe parts which it inveſts. The compoſure of it is obſcure; yet becauſe this Cuticle is the excrement of the true skin, we ſay it hath its matter from the excrementitious ſuperfluity of the Nerves, Veins, Arteries and ſubſtance of the true skin.

The matter of the Cuticle.

The quantity.

The figure.

The compoſure.

The number.

The temperature.

The uſe.

It is in number one, like as the true skin which it outwardly covers, that it might be a *medium* between the object and fixed faculty of Touching, diffuſed over all the true skin, which every where lies under it. For the temperature, by the common conſent of Phyſicians, it is in the midſt of all exceſs; for, that ſeeing it is the *medium* between the object and faculty, if it ſhould be hotter, colder, moiſter, or drier, it would deceive the faculty by exhibiting all objects, not as they are of themſelves, but as it ſhould be; no otherwiſe than as to ſuch as look through red or green ſpectacles, all things appear red or green. Wherefore for this reaſon it was convenient the Cuticle ſhould be void of all ſenſe. It hath no action in the body, but it hath uſe; for it preſerves and beautifies the true skin, for it ſeems to be given by the ſingular indulgence of nature, to be a muniment and ornaments to the true skin. This Providence of Nature, the induſtry of ſome Artizans, (or rather Curtizans) doth imitate; who, for to ſeem more beautiful, do ſmooth and poliſh it.

By

By this you may understand, that not all the parts of the body have action, yet have they their use, because, according to *Aristotle*'s opinion, Nature hath made nothing in vain. Also you must note, that this thin skin or Cuticle being lost, may every where be regenerated, unless in the place which is covered with a scar. For here the true skin being deficient, both the matter and former faculty of the Cuticle is wanting. Why the Cuticle cannot be restored in scars.

CHAP. IV.

Of the true Skin.

THe true skin, called by the *Greeks Derma*, is of a Spermatick substance: Wherefore being once lost, it cannot be restored as formerly it was. For in place thereof comes a scar, which is nothing else but flesh dried beyond measure. It is of sufficient thickness, as appears by the separating from the flesh. The substance. Magnitude.

But for the extent thereof, it encompasses the whole body, if you except the eyes, ears, nose, privities, fundament, mouth, the ends of the fingers where the nails grow, that is, all the parts by which any excrements are evacuated. The figure of it is like the Cuticle, round and long, with its productions, with which it covers the extremities of the parts. Figure.

It is composed of nerves, veins, arteries, and of a proper flesh and substance of its kind, which we have said to be spermatical, which ariseth from the process of the secundine, which lead the spermatick vessels even to the navel; in which place each of them into parts appointed by Nature, send forth such vessels as are spred abroad and diffused from the generation of the skin. Which also, the similitude of them both, that is, the skin and membrane *Chorion*, do argue. For as the *Chorion* is double, without sense, encompassing the whole Infant, lightly fastned to the first coat, which is called *Amnios*; so the skin is double, and of it self insensible (for otherwise the nerves were added in vain from the parts lying under it) ingirting the whole body, lightly cleaving to the fleshy Pannicle. But if any object, That the Cuticle is no part of the true skin, seeing it is wholly different from it, and easily to be separated from it, and wholly void of sense: I will answer, These Arguments do not prevail. For, that the true skin is more crass, thick, sensible, vivid and fleshy, is not of it self, being rather by the assistance and admixture of the parts, which derived from three principal it receives into its proper substance; which happens not in the Cuticle. Neither, if it should happen, would it be better for it, but verily exceeding ill for us, because so our life should lye fit and open to receive a thousand external injuries, which encompass us on every side, as the violent and contrary access of the four first qualities. Composure. The skin of it self is void of sense. The number.

There is only one skin, as that which should cover but one body; the which it every-where doth, except in those I formerly mentioned. It hath connexion with the parts lying under it by nerves, veins and arteries, with those subjacent parts put forth into the skin investing them, that there may be a certain communion of all the parts of the body amongst themselves. Connexion.

It is cold and dry in its proper temper, in respect of its proper flesh and substance, for it is a spermatical part. Yet, if any consider the sinews, veins, arteries, and fleshy threds which are mixed in its body, it will seem temperate, and placed (as it were) in the midst of contrary qualites, as which hath grown up from the like portion of hot, cold, moist and dry bodies. The use of the skin is to keep safe and sound the continuity of the whole body, and all the parts thereof, from the violent assault of all external dangers; for which cause it is every where indued with sense, in some parts more exact, in others more dull, according to the dignity and necessity of the parts which it ingirts, that they might all be admonished of their safety and preservation. Lastly, it is penetrated with many pores, as breathing-places, as we may see by the flowing out of sweat, that so the arteries in their *diastole* might draw the encompassing air into the body, for the tempering and nourishing of the fixed inbred heat, and in the *systole* expel the fuliginous excrements, which in Winter, suppresst by the cold air encompassing us, makes the skin black and rough. We have an argument and example of breathing through these, by drawing the air in by transpiration, in women troubled with the Mother, who without respiration live only for some pretty space by transpiration. Use. The reason why the skin is blacker and rougher in Winter.

CHAP. V.

Of the fleshy Pannicle.

AFter the true skin, follows the Membrane, which Anatomists call the fleshy Pannicle, whose nature that we may more easily prosecute and declare, we must first shew what a Membrane is, and how many ways the word is taken; then, wherefore it hath the name of the fleshy Pannicle. A Membrane therefore is a simple part, broad and thin, yet strong and dense, white and nervous, and the which may easily, without any great danger, be extended and contracted. Sometimes it is called a Coat, which is, when it covers and defends some part. This is called the Pannicle; because in some parts it degenerates into flesh, and becomes musculous, as in a man from the collar-bones, to the hair of the head, in which part it is therefore called the broad muscle, whereas in other places it is a simple Membrane, here and there intangled with the fat lying under it, from whence it may seem to take or borrow the name of the fatty Pannicle. But in Beasts (whence it took that name, because in those a fleshy substance maketh a great part of this Pannicle) it appears manifestly fleshy and musculous over all the body, as you may see in Horses and Oxen, that by that means being moveable, they may drive and shake off their flies, and other troublesome things, What a Membrane is. Why it is sometimes called a coat, sometimes the fleshy and fatty Pannicle. Why beasts have this Pannicle wholly fleshy or musculous.

things, by their ſhaking and contracting their backs. Theſe things conſidered, we ſay, the fleſhy Pannicle in its proper body, is of a nervous or membranous ſubſtance, as that which hath its original from the coat *Amnios* (which is next to the Infant) dilated near to the navel, and ſtretched forth for the generation of this Pannicle; in which thing I think good to note, that as the membranes *Chorion* and *Amnios* naturally interwoven with ſmall nervous fibers, encompaſs and inveſt the child as long as it is contained in the womb; ſo the skin and the fleſhy Pannicle, knit together by ſuch like bands, engirt the whole body.

The ſubſtance.

The magnitude & figure.

Number.

Compoſure.

Therefore the fleſhy Pannicle is equal in magnitude and like in figure to the true skin, but that it lies under it, and is contained in it, in ſome places mixt with the fat, in others increaſed by the fleſh interwoven with it, and in ſome other is only a ſimple Membrane.

The compoſition of it is ſuch, as the ſight of it preſents to our eye, that is, of veins, arteries, nerves, and the proper fleſh, ſome whites mixed and interlaced with fat, and ſometimes with muſculous fleſh. It is but one, by reaſon of the uſe we ſhall preſently ſhew; it is ſituated between the skin and fat, or common coat of the muſcles, annexed to theſe, and the other parts lying under it, by the veins, nerves and arteries, aſcending from theſe inward parts, and implanting themſelves into the ſubſtance thereof, and then into the true skin.

The temperature.

The uſe.

The temperature thereof is diverſe, according to the variety of the parts interwoven with it. The uſe of it is, to lead, direct and ſtrengthen in their paſſage, the veſſels which are diſſeminated into the true skin, and the whole ſuperficies of the body. But in Beaſts it hath another commodity, that is, it gives a ſhaking or trembling motion to their skin and back, for that cauſe which we formerly touched.

CHAP. VI.

Of the Fat.

The fat is rather an excrement than a part.

The ſubſtance.

The efficient cauſe of fat.

THe Fat coming near the condition of an excrement, rather than of a part (as we ſaid, when we treated of the ſimilar parts) is of an oily ſuſtance, bred of the airy and vaporous portion of the blood, which ſweating through the pores of the coats, or mouths of the veſſels, becomes concrete about the membranes, and nerves, and cold bodies, and turns into fat by the coldneſs of the place. Whereby we may know, that cold, or a more remiſs heat, is the efficient cauſe of fat, which is manifeſt by contemplation, not only of creatures of divers kinds, but alſo by thoſe of the ſame ſpecies and ſex, if ſo be that the one be colder than the other.

The quantity.

The compoſure.

The ſite.

By which we may underſtand, that the fat is the more or leſs in quantity, according to the different temper of the whole body, and of its particular parts. For its compoſition, it conſiſts of that portion of the blood which we formerly mentioned, intermixt with certain membranes, nervous fibers, veins and arteries. The greateſt part of it lies between the fleſhy Pannicle, and the common coat of the Muſcles. * Otherwiſe it is diffuſed over all the body, in ſome places more, in ſome leſs, yet is always about the nervous bodies, to which it delights to cleave. Moſt Anatomiſts enquire whether the fat lie above or beneath the fleſhy Pannicle. But me-thinks, this queſtion is both impertinent and idle; being we often ſee the fat to be on both ſides. (*a*) It is of a middle temper between heat and cold, being it ariſeth of the more airy portion of the blood; although it may ſeem cold in reſpect of the efficient cauſe, that is, of cold by which it concretes. For the reſt, moiſture is predominant in the fat. (*b*) The uſe thereof is, to moiſten the parts which may become dry by long faſting, vehement exerciſe, or immoderate heat; and beſides, to give heat, or keep the parts warm. Although it do this laſt rather by accident, than of its own nature, as heated by exerciſe, or by ſome ſuch other chance; it heats the adjacent parts, or may therefore be thought to heat them, becauſe it hinders the diſſipation of the native and internal heat; like as cold heats in Winter, whereby the bellies are at that time the hotter. I know, ſome learned Phyſicians of our time ſtiffly maintained, that the fat was hot; neither did they acknowledge any other efficient cauſe thereof, than temperate heat, and not cold. But I think it beſt to leave the more ſubtil agitation of theſe queſtions to natural Philoſophers. But we muſt note, (*c*) that at the joynts which are more uſually moved, there is another ſort of fat, far more ſolid and hard, than that which we formerly mentioned, often found mixed with a viſcid and tough humor like the white of Eggs, that ſo it might be ſufficient for a longer time to moiſten theſe parts, ſubject to be hurt by drineſs, and to make them ſlippery, and ſo fitter for motion; in imitation whereof they uſually greaſe hard bodies, which muſt be in frequent motion, as Coach-wheels and Axletrees. And there is another kind of fat, which is called *Sebum*, ſeam, in one thing differing from the ordinary fat, that it is much drier; the moiſter and ſofter portion of the fat being diſſipated by the raging heat of the place. For it is found principally about the (*d*) Midriff, where there are many windings of arteries and veins; and it is alſo about the reins, loins, and *baſis* of the heart. The fat is waſted by long faſting; is dried and hardened by vehement exerciſe, and immoderate heat. Hence it is, that it is much more compact in the palms of the hands, and ſoles of the feet, about the eyes and heart, ſo that it reſembles the fleſh in denſity and hardneſs; becauſe by the continual motion and ſtrong heat of theſe parts, the thinner portion being diſſipated and diffuſed, the more groſs and terreſtrial remains.

* I was preſent at the opening of a Body, *Feb.* 1630. in which the fat in the lower part of the lower belly was in thickneſs above eight inches, upon the breaſt between four and five inches: which I thought good to remember in this place, both for the rarity of the thing, as alſo becauſe it was increaſed by report, and the place miſtaken; ſome ſaying the *Omentum* or Kall was ſo thick, which was falſe; for it did not much exceed the quantity of that part, in other fat men.

(*a*) The Temper. (*b*) The uſe. (*c*) The ſolider fat or ſeam. (*d*) In what parts, and for what cauſe the fat is more denſe.

CHAP.

CHAP. VII.

Of the common Coat of the Muſcles.

NExt under the fat, appears a certain coat, ſpread over all the muſcles, and called the common coat of the muſcles; it is of a nervous ſubſtance, as all other membranes are. The quantity and breadth thereof is bounded by the quantity of the muſcles which it involves, and fits it ſelf to, as that, which encompaſſes the muſcles of the *Epigaſtrium*, is of equal largeneſs with the ſame muſcles. The figure of it is round: it is compoſed of veins, nerves, arteries, and its peculiar fleſh conſiſting of three ſorts of fibers; the beginning of it is from the *Periоſteum*, in that part where the bones give ligaments to the muſcles; or, according to the opinion of others, of the nervous and ligamentous fibers of the muſcles, which riſing up, and diffuſed over the fleſhy *ſuperficies* thereof, are united for the generation of this coat. But this membrane ariſing from the *Periоſteum* (as every membrane which is below the head, takes its original from the *Periоſteum* either primarily, by the interpoſition of no *medium*, or ſecondarily) is ſtretched over the muſcles by their Tendons. But if any object, that this membrane, pluck'd from the belly of the muſcle, may ſeem to end in a ligament: I will anſwer, that it is the condition of every nervous part, ſo to bind or faſten it ſelf to another part of his own kind to ſtay, ſo that it can ſcarce be pluck'd from thence. We ſee the proof hereof in the *Peritonæum* or rim in the *Epigaſtrium*, or lower part of the lower belly. That which covers the muſcles of the *Epigaſtrium*, is but one, unleſs you had rather part it into two, the right and the left diſtinguiſhed by the interpoſition of *Linea Alba*, or White-Line. It is ſituate betwixt the fat and the muſcles; for it is faſtened above and below to theſe parts with fibers, which in ſmalneſs and fineneſs exceed the Spiders web. But by its veſſels, it participates with the three principal parts, and is of a cold and dry temper. The uſe of it is, to contain the muſcles in their natural union, and to keep them, as much as in it lies, from putrefaction, which may happen to them from *pus* or matter, which is often caſt forth of the ſimilar parts into the empty ſpaces and diſtances of the muſcles. Wherefore going about to ſeparate the fat of the *Epigaſtrium* (where you muſt begin the diſſection of mans body) you muſt have a care that you hurt it not with your knife, but that, before you touch the muſcles, ſee you artificially take it away, that you may the more eaſily ſeparate the muſcles, lying under it, diſtinguiſhed by a manifeſt ſpace at the White-Line, which is made by the meeting together of the proper coats of all thoſe muſcles.

CHAP. VIII.

What a Muſcle is, and how many differences there be thereof.

A Muſcle is the inſtrument of voluntary motion; and ſimple voluntary motion is performed ſix manner of ways, upwards, downwards, forwards, backwards, to the right hand, and to the left; but the compound one way, which is circularly, the which is performed by the continual ſucceſſion of the motion of the muſcles ingirting the part. Such a motion Falconers uſe when they ſtretch forth their hand, and lure their Hawk. We have ſome parts, which have motion without a muſcle, but that motion is not voluntary; ſuch parts be, the heart, ſtomach, guts, both the bladders, (that is, that of the gall, and that of the urine) and divers other which have the motions of attraction, expulſion, and retention, by the means of the three ſorts of fibers; for they draw by the right, expel by the tranſverſe, and retain by the oblique. The differences of muſcles, which are many and diverſe, are taken from their ſubſtance, original, inſertion into the part which they move, form or figure, holes or openings, magnitude, colour, ſite, kind of fibers, their conjugation or connexion, heads, bellies, tendons, oppoſition in action and office. Some in ſubſtance are nervous, venous, arterious; becauſe they have manifeſt nerves, veins, and arteries; as the Midriff, the Intercoſtal, or Epigaſtrick muſcles, and many more, and that for their difference from other muſcles, into which neither nerve, nor vein, or arteries are manifeſtly inſerted, although ſecretly they admit them all for ſenſe and motion, life, and nouriſhment; ſuch are the muſcles of the wriſt, the wormy muſcles of the hands and feet; for if there be any nerves obſerved in them, they are very ſmall. Some had rather make the difference of muſcles thus, that ſome of them are fleſhy, ſome nervous, others membranous. From their original; ſome ariſe from the bones, as thoſe which move the hands, arms and legs; others from griſles, as the muſcles of the throat; others, from membranes which inveſt the tendons, as the wormy muſcles of the hands and feet; others, from ligaments, as the extenders of the fingers; others, from other muſcles, as the two lower muſcles of the Yard which proceed from the Sphincter muſcle of the ſundament. Others have no original, as, the membrane, which we call the fleſhy Pannicle, aſſumes fleſh in certain places, and degenerates into a muſcle; ſuch are the *Cremaſter*, or hanging muſcles of the teſticles, the large muſcles of the face; and if you pleaſe, the midriff as that which is compoſed of two coats; the one, encompaſſing the ribs and the *Peritonæum*, hath fleſh in the midſt between the two membranes. And moreover, ſome muſcles have their original from one only bone, as thoſe which bend and extend the cubit; others ariſe of many bones, as the oblique deſcending, the Dorſal, and many muſcles of the neck, which ariſe together from many ſpondyls, and ſides of ſpondyl. There be others, according to the opinion of ſome men, both from the bones and griſles of the *Pubis* at the right or direct muſcles of the *Epigaſtrium*, yet by their favour I think otherwiſe. Becauſe by the Anatomical and received axiom, A muſcle is there thought to take his beginning, from whence he receives a nerve; but theſe muſcles take a nerve from the intercoſtal muſcles,

What a muſcle is.
How the circular motion is performed.
From whence the differences of muſcles are drawn.
Differences of muſcles from their ſubſtance.
Differences of muſcles from their original.
Where a muſcle hath its original.

Differences of muſcles from their inſertion.

muſcles, wherefore their original ought to be referr'd to the ſides of the breaſt-blades, as ſhall be ſhewed in due place. From their inſertion ariſe theſe differences; ſome are inſerted into a bone, as thoſe which move the head, arms, and legs; others into a griſle, as thoſe of the Throtle, eye-lids, noſe, and the oblique aſcendent muſcles of the *Epigaſtrium*; ſome into a bone and griſle both, as the right muſcles of the *Epigaſtrium* and the midriff: Some into the skin, as the muſcles of the lips; others into the coats, as the muſcles of the eyes; others into ligaments, as the muſcles of the yard. But theſe differences following may be drawn both from their inſertion and original. For ſome muſcles ariſing from many parts, are inſerted into ſome one part, as divers of thoſe which move the arm and the ſhoulder, which ariſing from many ſpondyls, are inſerted into the bone of the ſhoulder, and the ſhoulder-blade. Others ariſe from one part, and inſert themſelves into more, as, thoſe which ariſe from the bottom of the ſhoulder-blades are extended and inſerted into ſome eight or nine of the upper ribs, to help reſpiration; and the benders and extenders of the fingers and toes: Others, ariſing from many bones, are inſerted into as many, as ſome of thoſe which ſerve for reſpiration, to wit, thoſe which we call the hinder Saw-muſcles, and the *Semiſpinatus*, which ſends a tendon into all the ribs. Others have their original from many bones, and end in griſles of the ſeven ribs, as thoſe two which lie under the *Sternon*. Moreover, alſo theſe differences of muſcles may be drawn from the original and inſertion, that ſome proceed from bones, and are inſerted into the next bone, to help and ſtrengthen the motion thereof, as the three muſcles of the hip; Others ariſe from an upper bone, and are not inſerted into the next, but into ſome other, as the long muſcles. Some are named from the part they move, as the temporal muſcles, becauſe they move the temples: Others from their office, as the grinding muſcles; becauſe they move the skin as a Mill, to grind aſunder the meal. From their form or figure; becauſe ſome are like Mice, other like Lizards which have their legs cut off; for that they imitate in their belly, body, or tendon, the belly or tail of ſuch creatures; and from whence the name of *Muſculus* and *Lacertus* are divided. Such are thoſe which bend the wriſt, and which are faſtened to the bone of the leg, and which extend the foot; others are triangular, as that which lifts up the arm, called *Epomis* or *Deltoides*, and that which draws the arm to the breaſt, called the pectoral muſcle. Others quadrangular, as the *Rhomboides*, or Lozenge-muſcle of the ſhoulder-blade, and the two hindſom-muſcles ſerving for reſpiration, and two of the wriſts which turn down the hand; others conſiſt of more than four angles, as the oblique deſcending, and that muſcle which joyns it ſelf to it from the ſhoulder-blade; others are round and broad, as the midriff; others circular, as the Sphincter-muſcle of the fundament and bladder; others are of a pyramidical figure, as the ſeventh muſcle of the eye, which compaſſes the optick nerve in beaſts, but not in men; others have a ſemicircular form, as that which ſhuts up the eye, ſeated at the leſſer corner thereof; others reſemble a Monk's cowl, or hood, as the *Trapezius* of the ſhoulder-blade. Beſides, others at their firſt original are narrow, but broad at their inſertion; as the Saw-muſcle of the ſhoulder, and the tranſverſe of the *Epigaſtrium*; others are quite contrary, as the three muſcles of the hip; others keep an equal breadth or bigneſs in all places, as the intercoſtal muſcles and thoſe of the wriſt; others are long and ſlender, as the long muſcle of the thigh; others are long and broad, as the oblique deſcending muſcles of the *Epigaſtrium*; others are directly contrary, as the Intercoſtal, which are very narrow. From their perforations; for ſome are perforated, as the midriff, which hath three holes, as alſo the oblique and tranſverſe of the *Epigaſtrium*, that ſo they may give paſſage forth to the preparing ſpermatick veſſels, and to the ejaculatory veſſels, the coat *Erythroides* aſſociating and ſtrengthening them; others are not perforated. From their magnitude; for ſome are moſt large, as the two muſcles of the hip; others very ſmall, as the eight ſmall muſcles of the neck, and the proper muſcles of the Throtle, and the wormy muſcles; others are of an indifferent magnitude. From their colour; for ſome are white and red, as the temporal muſcles, which have Tendons coming from the midſt of their belly; others are livid, as the three greater muſcles of the calf of the leg, which colour they have by the admixtion of the white, or tendinous nervy coat with the red fleſh; for, this coat by its thickneſs darkning the colour of the fleſh, ſo that it cannot ſhew its redneſs and freſh colour, makes it ſeem of that livid colour. From their ſituation; for ſome are ſuperficiary, as thoſe which appear under the skin and fat; others deep in, and hid, as the ſmooth and four twin muſcles; ſome are ſtretched out, and (as it were) ſpred over in a ſtrait and plain paſſage, as the muſcles of the thigh which move the leg, except the Ham-muſcle; others oblique, as thoſe of the *Epigaſtrium*; otherſome tranſverſe, as the tranſverſe of the *Epigaſtrium*; where you muſt obſerve, that although all the fibers of the muſcles are direct, yet we call them oblique and tranſverſe, by comparing them to the right muſcles, as which by the concourſe of the fibers make a ſtrait or acute angle.

Differences of muſcles taken from their figure.

Differences from their perforations.

From their magnitude.

From their colour.

From their ſite.

From their Fibers.

From the ſorts of fibers; for ſome have one kind of fiber, yet the greateſt part enjoy two ſorts running ſo up and down, that they either are croſſed like the letter X, as happens in the pectoral and grinding muſcles; or elſe do not concur, as in the *Trapezii*. Others have three ſorts of fibers, as the broad muſcle of the face.

From their Connexion.

From their coherence or connexion, or their texture of nervous fibers; for ſome have fibers ſomewhat more diſtant and remote immediately at their original, than in other places, as you may ſee in the muſcles of the buttocks: Others in their midſt and belly, which by reaſon thereof in ſuch muſcles is more big or tumid, their head and tail being ſlender, as happens in moſt of the muſcles of the arm and leg, in which the denſe maſs of fleſh interwoven with fibers, disjoyns the fibers in ſo great a diſtance; in otherſome the fibers are more diſtant in the tail, as in the greater Saw-muſcle ariſing from the bottom of the ſhoulder-blade; in others, they are equally diſtant through the whole muſcle, as in the muſcles of the wriſt, and between the ribs.

From their Head.

From their head; for in ſome it is fleſhy, interwoven with few fibers, as in the muſcles of the buttocks; in others it is wholly nervous, as in the moſt broad muſcle common to the arm and ſhoulder-blade, and in the three muſcles of the thigh proceeding from the tuberoſity of the huckle-

huckle bone; in ſome it is nervous and fleſhy, as in the internal and external muſcle of the arm. Beſides, ſome have one head, others two; as the bender of the elbow, and the external of the leg; others three, as the three-headed muſcle of the thigh, But we muſt note, that the word nerve or ſinew is here taken in a large ſignification, for a ligament, nerve and tendon, as *Galen* ſaith (*Lib. de Oſſibus*;) and moreover we muſt obſerve, that the head of a muſcle is one while above, another while below, otherwhiles in the midſt, as in the midriff, as you may know by the inſertion of the nerve, becauſe it enters the muſcle by its head.

From their belly alſo, there be ſome differences of muſcles taken; for ſome have their belly immediately at their beginning, as the muſcles of the buttocks; others at their inſertion, as the midriff; others juſt at their head, as thoſe which put forth the calf of the leg; in others it is ſomewhat further off, as in thoſe which draw back the arm, and which bend the leg; in others, the belly extends even from the head unto the tail, as in the intercoſtal muſcles, and thoſe of the wriſt; in others, it is produced even to their inſertion, as in thoſe of the palms of the hands and ſoles of the feet; ſome have a double belly diſtinguiſhed by a nervous ſubſtance; as thoſe which open the mouth, and thoſe which ariſe from the root of the lower of proceſs of the ſhoulder-blade. From their belly.

Moreover the differences of muſcles are drawn alſo from the tendons; for ſome have none, at leaſt which are manifeſt, as the muſcles of the lips, and the ſphincter-muſcles, the intercoſtal, and thoſe of the wriſt; others have them in part, and want them in part, as the midriff; for the midriff wants a tendon at the ends of the ſhorter ribs, but hath two at the firſt *Vertebra* of the loins in which it is terminated; others have a tendon indeed. But ſome of theſe move with the bone, ſome not, as the muſcles of the eyes; and beſides, ſome of theſe have broad and membranous tendons, as the muſcles of the eyes, and *Epigraſtium*, except the right muſcles; in others they are thick and round, as in the benders of the fingers; in others they are leſs round, but more broad than thick, ſuch is the tendon ariſing from the twin muſcles, and *Soleus* of the leg; others have ſhort tendons, as the muſcles which turn down the hand; otherſome long, as thoſe of the palms of the hands, and ſoles of the feet; beſides, others produce tendons from the end of their belly, which tendons are manifeſt; others from the midſt, as the temporal muſcles. From their tendons.

Beſides, alſo others diffuſe many tendons from their belly, as in the hands the benders of the fingers, and extenders of the feet. Otherſome put forth but one, which ſometimes is divided into many, as thoſe which bend the third articulation of the foot; otherwhile many muſcles by their meeting together make one tendon, as the three muſcles of the calf of the leg, and thoſe which bend the cubit and leg. All tendons have their original, when the nerves and ligaments diſperſed through the fleſhy ſubſtance of a muſcle, are by little and little drawn and meet together, until at laſt carried to the joynt, they are there faſtned for the fit bending and extenſion thereof. From the contrariety of their actions; for ſome parts have contrary muſcles, benders and extenders, other have none; for the cods and fundament have only lifters up. From their function; for ſome are made for direct motions, as thoſe which extend the fingers and toes; others for oblique, as the Supinators of the hand, and the Pronators; others perform both, as the pectoral muſcle, which moves the arm obliquely upward and downward, as the upper and lower fibers are contracted; and alſo out-right, if all the fibers be contracted together, which alſo happens to the *Deltoides* and *Trapezius*. I have thought it good to handle particularly theſe differences of muſcles, becauſe that by underſtanding them, the prognoſtick will be more certain, and alſo the application of remedies to each part; and if any occaſion be, either to make inciſion, or ſuture, we may be more certain, whether the part affected, be more or leſs nervous. From their action. From their function.

CHAP. IX.

Of the parts of a Muſcle.

HAving declared the nature and differences of a muſcle, we muſt note that ſome of the parts thereof are compound and univerſal, others ſimple or particular. The compound are the head, belly, and tail. The ſimple are ligaments, a nerve, fleſh, a vein, artery, and coat. For the compound parts; by the head, we underſtand the beginning and original of a muſcle, which is one while ligamentous and nervous, otherwhiles alſo fleſhy. By the belly, that portion which is abſolutely fleſhy: By the tail we underſtand a tendon conſiſting partly of a nerve, partly of a ligament promiſcuouſly coming forth from the belly of the muſcle. For as much as belongs to the ſimple, which are ſix in number, three are called proper, and three common. The proper are a ligament from a bone, a nerve proceeding from the brain, or ſpinal marrow, and fleſh compact by the concretion of blood. The common are a vein from the liver or trunk ariſing from thence; an artery proceeding from the heart, a coat produced by the nervous and ligamentous fibers ſpreading over the *ſuperficies* of the muſcle. But for the ſimple uſe of all ſuch parts, the nerve is (as it were) the principal part of a muſcle, which gives it ſenſe and motion, the ligament gives ſtrength, the fleſh contains the nervous and ligamentous fibers of the muſcle, and ſtrengthens it, filling up all the void ſpaces; and alſo, it preſerves the native humidity of theſe parts, and cheriſheth the heat implanted in them; and, to conclude, defends it from all external injuries; for, like a fan, it oppoſeth it ſelf againſt the heat of the Sun; and is a garment againſt the cold; and is as a cuſhion in all falls and bruiſes; and as a buckler of defence againſt wounding-weapons. The vein nouriſhes the muſcle, the artery gives it life, the coat preſerves the harmony of all the parts thereof, leſt they ſhould be any ways disjoyned or corrupted by purulent abſceſſes breaking into the empty or void ſpaces of the muſcles; as we ſee it hapneth in a Gangrene, where the corruption hath invaded this membrane, by the breathing out of the more acid matter or filth. The compound and ſimple parts of a muſcle. What uſe each ſimple particle hath in a muſcle.

CHAP. X.

A more particular inquiſition into each part of a Muſcle.

The nature of a ligament.

HAving gone thus far, it remains, that we more particularly inquire into each part of a Muſcle, that (if it be poſſible) nothing may be wanting to this Diſcourſe. Wherefore a ligament properly ſo called, is a ſimple part of mans body, next of a bone and griſle, the moſt terreſtrial, dry, hard, cold, white; taking its original immediately, or by the interpoſition of ſome *medium* from the bones or griſles (from whence alſo the muſcles have their beginning) whereby it comes to paſs, that a ligament is void of ſenſe, unleſs it receive a nerve from ſome other place; for ſo the ligaments which compoſe and ſtrengthen the tongue and yard, are partakers of ſenſe, and it inſerts it ſelf into the bone and griſle, that ſo it may bind them together, and ſtrengthen and beautifie the whole joint or connexion; (for theſe three be the principal uſes of a ligament) then diffuſing it ſelf into the membranes and muſcles to ſtrengthen thoſe parts. A nerve, to ſpeak properly, is alſo a ſimple part of our body, bred and nouriſhed by a groſs and phlegmatick humour, ſuch as the brain, the original of all the nerves, and alſo the Spinal marrow endued with the faculty of feeling, and oftentimes alſo of moving. For there be divers parts of the body which have nerves, yet are deſtitute of all voluntary motion, having the ſenſe only of feeling, as the membranes, veins, arteries, guts, and all the entrails. A nerve is covered with a double cover from the two membranes of the brain, and beſides alſo with a third proceeding from the ligaments which faſten the hinder part of the head to the *Vertebra's*, or elſe from the *Pericranium*. We underſtand no other things by the fibers of a nerve, or of a ligament, than long and ſlender threds, white, ſolid, cold, ſtrong, more or leſs, according to the quantity of the ſubſtance, which is partly nervous and ſenſible, partly ligamentous and inſenſible. You muſt imagine the ſame of the fleſhy fibers in their kind; but of theſe threds ſome are ſtrait for attraction; others oblique, for retention of that which is convenient for the creature; and laſtly, ſome tranſverſe, for expulſion of that which is unprofitable. But when theſe tranſverſe threds are extended in length, they are leſſened in bredth; but when they are directly contracted, they are ſhortned in length. But when they are extended all together as it were, with an unanimous conſent, the whole member is wrinkled as contracted into it ſelf: as on the contrary it is extended when they are relaxed. Some of theſe are beſtowed upon the animal parts, to perform voluntary motions; others upon the vital to perform the agitation of the heart and arteries; others upon the natural for attraction, retention, and expulſion. Yet we muſt obſerve, that the attraction of no ſimilar part is performed by the help of the foreſaid fibers or threds, but rather by the heat implanted in them, or by the ſhunning of emptineſs, or the familiarity of the ſubſtance. The fleſh alſo is a ſimple and ſoft part, compoſed of the pure portion of the blood inſinuating it ſelf into the ſpaces between the fibers, ſo to inveſt them for the uſes formerly mentioned. This is (as it were) a certain wall and bulwark againſt the injuries of heat and cold, againſt all falls and bruiſes, as it were, a certain ſoft pillow or cuſhion yielding to any violent impreſſion. There be three ſorts of fleſh; one more ruddy, as the muſculous fleſh of perfect creatures, and ſuch as have blood; for the fleſh of all tender and young things having blood, as Calves, and alſo of all ſorts of fiſh, is whitiſh, by reaſon of the too much humidity of the blood. The ſecond kind is more pallid, even in perfect creatures having blood, ſuch is the fleſh of the heart, ſtomach, weaſon, guts, bladder, womb. The third is belonging to the entrails, or the proper ſubſtance of each entrail, as that which remains of the liver (the veins, arteries and coat being taken away) of the bladder, of the gall, brains, kidneys, milt: Some add a fourth ſort of fleſh which is ſpongy, and that they ſay is proper to the tongue alone.

The threefold uſe of a ligament.

What a nerve is.

What we mean by the nervous and ligamentous fibers.

By what power the ſimilar parts principally draw or attract.

What, and of how many ſorts the fleſh is.

What a vein is.

A vein is the veſſel, pipe or channel of the blood, or bloody matter; it hath a ſpermatick ſubſtance, conſiſts of one coat compoſed of three ſorts of fibers.

What an artery is.

An artery is alſo the receptacle of blood, but that ſpirituous and yellowiſh, conſiſting in like manner of a ſpermatick ſubſtance: But it hath two coats with three ſorts of fibers, the utmoſt whereof is moſt thin, conſiſting of right fibers, and ſome oblique: But the inner is five times more thick and denſe than the utmoſt, inverwoven with tranſverſe fibers; and it doth not only contain blood and ſpirit, but alſo a ſerous humor, which we may believe, becauſe there be two emulgent arteries as well as veins.

Why an artery is more thick and denſe than a vein.

But the inner coat of an artery is therefore more thick, becauſe it may contain blood which is more hot, ſubtil, and ſpirituous; for the ſpirit, ſeeing it is naturally more thin and light, and in perpetual motion, would quickly fly away, unleſs it were held in a ſtronger hold. There is other reaſon for a vein, as that which contains blood, groſs, ponderous, and ſlow of motion. Wherefore if it had acquired a denſe and groſs coat, it could ſcarce be diſtributed to the neighbouring parts: God, the maker of the Univerſe, foreſeeing this, made the coats of the veſſels contrary to the conſiſtence of the bodies contained in them. The *Anaſtomoſis* of the veins and arteries, that is to ſay, the application of the mouths of the one to the other, is very remarkable, by benefit of which they mutually communicate and draw the matters contained in them, and ſo alſo transfuſe them by inſenſible paſſages, although that *Anaſtomoſis* is apparent in the vein and artery that meet together at the joynt and bending of the arm, which I have ſometimes ſhewed in the Phyſick Schools, at ſuch times as I there diſſected Anatomies.

The mutual *Anaſtomoſis* of the veins and arteries.

Where it is manifeſt.

From whence a muſcle hath its beginning or head.

But the action or function of a muſcle is either to move or confirm the part according to our will into which it is implanted; which it doth when it draws it ſelf towards its original, that is to ſay, its head. But we define the head by the inſertion of the nerve, which we underſtand by the manner of the working of the muſcle.

CHAP.

CHAP. XI.

Of the muſcles of the Epigaſtrium, *or lower Belly.*

NOw ſeeing that we have taught what a muſcle is, and what the differences thereof are, and what ſimple and compound parts it hath, and what the uſe, action and manner of action in each part is; it remains that we come to the particular explication of each muſcle, beginning with thoſe of the lower belly, as thoſe which we firſt meet withal in diſſection.

Eight muſcles of the *Epigaſtrium.*

Theſe are eight in number, four oblique, two on each ſide, two right or direct, one on the right, another on the left ſide; and in like manner two tranſverſe. All theſe are alike in force, magnitude and action, ſo mutually compoſed, that the oblique deſcendant of one ſide, is conjoyned with the other oblique deſcendant on the other ſide, and ſo of the reſt.

We may add to this number the two little ſupplying or aſſiſting muſcles, which are of a *Pyramidal* form, and ariſe from the ſhare-bone, above the inſertion of the right muſcles: Of the oblique muſcles of each ſide the one aſcends, the other deſcends, whereupon it comes to paſs, that they are called the oblique deſcendant and aſcendant muſcle. Thoſe oblique which we firſt meet with, are the deſcendant, whoſe ſubſtance is partly ſanguine, partly ſpermatick; for they are fleſhy, nervous, ligamentous, veinous, arterious and membranous. Yet the fleſhy portion is predominant in them, out of which reſpect *Hippocrates* is wont to expreſs the muſcles by the name Fleſhes; their greatneſs is indifferent between the large and the ſmall muſcles; their figure is three ſquare. They are compoſed of the fore-mentioned parts, they are two in number; their ſite is oblique, taking their beginning from the touching of the great ſaw-muſcle, and from the ſixth and ſeventh true ribs, or rather from the ſpaces between the ſix lower ribs, and rather on the forepart of the muſcles, than of the ribs themſelves; from whence ſhunning the *Vertebra's* of the loins, the fleſhy parts of them are terminated in the external and upper eminency of the haunch-bone, and the membranous end in the lower eminency of the ſhare-bone and the white-line. Yet *Columbus* diſſenting from this common deſcription of the oblique muſcles. thinks that they are only terminated in the white-line, and not in the ſhare-bone. For (ſaith he) wherefore ſhould they be inſerted into the ſhare-bone which is not moved? But becauſe it would be an infinite labour and trouble to ſet down at large the ſeveral opinions of all Authors of Anatomy; I have thought it ſufficient for me to touch them lightly by the way. Their connexion is with the oblique aſcendant lying under them, and with the direct or right. Their temperament is twofold, the one hot and moiſt, by reaſon of the belly and fleſhy portion of them; the other cold and dry, in reſpect of their ligamentous and tendinous portion. Their action is to draw the parts into which they are inſerted towards their original, or elſe to unite them firmly. Yet each of theſe privately and properly draws the hip in an oblique manner towards the *Cartilago Scutiformis*, or breaſt-blade. Then follow the oblique aſcendant, who have the ſame ſubſtance, quantity, figure, compoſure, number and temper the deſcendant have. They are ſituate between the deſcendant and tranſverſe with whom they have connexion, eſpecially by the veſſels which are brought from the parts beneath. All the fleſhy parts ariſe from the rack-bones of the haunch to the ends of the baſtard-ribs, which they ſeem to admit above and below, being fleſhy even to the fourth, and then becoming membranous, they take their way to the white-line, with a double *aponeuroſis*, which paſſes through the right muſcles above and below, as we may plainly ſee from the navel downwards. In their fleſhy part they draw their original from the ſpine of the haunch-bones a little lower than the deſcendant end in their fleſhy part. But for their membranous parts, they ariſe before from the ſhare-bone, but behind from the ſpondyls of the holy-bone, and *Vertebra's*, of the loins obliquely aſcending upwards to the white-line, into which they are terminated by an *aponeuroſis* or membranous tendon (which ſeems to penetrate the right muſcle upwards and downwards, eſpecially under the navel) but by their fleſhy part at the ends of all the baſtard ribs, which they ſeem to receive above and below. And becauſe theſe muſcles are terminated in the white-line, they have alſo another uſe, yet ſuch as is common to all the muſcles of the *Epigaſtrium*, that is, to preſs down the guts. Their action is (if they perform it together) to draw and dilate the breaſt; but if their actions be ſeparate, they draw the cheſt to the hip with an oblique motion. After theſe follow the right muſcles, ſo called, becauſe they deſcend according to the length of the body, and becauſe they have right or ſtrait fibers.

The oblique deſcendant.
Their ſubſtance.
Their greatneſs and figure.
Their compoſure and ſite.
Their connexion.
Their temperament.
Their action.
The oblique aſcendant.
Their ſite and connexion.
Their action.
The right muſcles of the *Epigaſtrium.*

We will ſay nothing (to ſhun prolixity, which in all other places we will avoid) of their ſubſtance and other conditions, which they have common with the fore-mentioned muſcles. They are ſituate in the eminenteſt or extuberating region of the belly, bounding the *Epigaſtrium* taken in general, (or the ſuperficiary belly;) they are divided by the manifeſt intercourſe of the white-line, even to the navel, in which place they ſeem to be united even to the place of their inſertion. They draw their original not from the ſhare-bone, as ſome would have it, but according to the inſertion of their nerves from the ſides of the *Cartilago Scutiformis*, and the ends of the ſixth, ſeventh and eighth ribs; but they end in the ſhare-bone, where they make a common tendon ſufficiently ſtrong and ſhort. *Sylvius*, *Veſalius* and *Columbus* think they ariſe from the ſhare-bone, becauſe they cannot be inſerted into that bone, becauſe it is unmoveable. You may perceive in theſe muſcles certain nervous and tranſverſe interſections, oftentimes three in number for the ſtrength of theſe muſcles, (of which *Galen* makes no mention, although they may be ſeen in Apes.) And alſo in the inner ſide of theſe muſcles you may ſee four veins, and as many arteries, of which ſome creep upwards, others run downwards. The upper, called the Mamillary, deſcend from the Axillary by the ſide and lower parts of the *Sternon*, the ſlenderer portions thereof being diſtributed by the way to the *Mediaſtinum*, and about the fourth and fifth rib to the dugs, from whence they take their name.

Their ſite.
Original.

The meeting together of the Epigaſtrick and mamillary veins and arteries.

That which remains breaking out by the ſides of the breaſt-blade, inſerts it ſelf into thoſe muſcles, creeping along, even almoſt to the navel; in which place they are manifeſtly united (that is, the veins with the veins, and arteries with the arteries) with the Epigaſtrick, which aſcend from the upper part of the Iliack; on each ſide under the ſaid muſcles, until they meet with theſe four mamillary veſſels. That you may find the concourſe of the veins and arteries about the navel, you muſt follow both the upper and the lower ſomewhat deep into the fleſh, preſſing the blood on both ſides from above downwards, and from below upward, until you ſhall find the exoſculation of theſe veſſels, which will appear by this, That the blood will flow from this into that, and from that into this; otherwiſe you can ſcarce perceive it, by reaſon of the ſmalneſs of ſuch veſſels which want blood. But that by the benefit of ſuch concourſe of the veſſels, the matters may be communicated and tranſported both from the womb to the dugs, and again from the dugs to the womb, appears in Nurſes who want their courſes, when the milk comes into their dugs; and on the contrary loſe their milk when their courſes flow plentifully. Otherwiſe to what purpoſe ſhould there be ſuch concourſe between the veſſels of the paps and womb? for there are veins and arteries diffuſed to the ſides of the womb from the root of the Epigaſtricks; for indeed the Epigaſtricks which in their aſcent meet with the mamillary, go not to the womb, though they be next to them, and ariſe from the ſame trunk with the Hypogaſtrick vein of the womb. The action of theſe muſcles is, to move or draw near together the parts of the Hypogaſtrium to the *Præcordia*, or Hypochondries. Their uſe, in *Columbus* opinion, is, to draw the breaſt downwards, ſo to dilate it. At the end of theſe, nature hath produced two other ſmall muſcles from the upper part of the ſhare-bone, of a triangular figure, for the ſafety of the thick and common tendon of the right muſcles; whereupon they are called *Succenturiati*, or Aſſiſters.

Their action.

Their uſe.

N *The place of the Haunch-bone bared, to which the oblique and tranſverſe muſcles do grow.*

The Pyramidal or aſſiſting muſcles.

The tranſverſe muſcles of the *Epigaſtrium.*

Some (moved with I know not what reaſon) would have theſe two ſmall muſcles to help the erection of the yard. *Columbus* thinks they ſhould not be ſeparated from the right, and that they only are the fleſhy beginnings of the right. But on the contrary, *Fallopius* manifeſtly proves them different and ſeparate from the right, and ſhews their uſe. The tranſverſe remain to be ſpoken of, ſo called by reaſon of their fibers, which make right angles with the fibers of the right muſcles.

They

They have a quadrangular figure ſituate upon the greateſt part of the *Peritonæum*, to which they ſtick ſo cloſe that they ſcarce can be ſeparated. They take their original from the production of the loins, the eminency of the haunch-bone, the tranſverſe productions of the *Vertebra*'s of the loins, and the ends of the baſtard-ribs; contrary to the opinion of many, whom the inſertion of the nerve convinces, but they end in the White-line, as all the reſt do. Their figure and ſite.

Their action is to paſs the guts, eſpecially for the expulſion of excrements. Their action.

But all the eight recited muſcles, beſide their proper uſe, have another common; that is, they ſtand for a Defence or Bulwark, for all the parts lying under them, and ſerve for the ſtrengthening of the voice, as experience ſhews in thoſe who ſound Trumpets and Cornets. The common uſe and action of the eight muſcles of the *Epigaſtrium*.

Therefore theſe muſcles do equally on every ſide preſs the belly; but the midriff, the intercoſtal muſcles aſſiſting it, doth drive from above downwards, from which conſpiring contention follows the excretion of the excrements by the fundament; but unleſs the midriff ſhould aſſiſt, theſe muſcles would preſs the excrements no more downwards, than upwards to the mouth.

Although to this excretion of the excrements, it is not ſufficient that the Epigaſtrick, Midriff, and intercoſtal muſcles preſs the belly, but the muſcles of the throttle muſt be alſo ſhut. For the mouth being open, the excrements never go well forth; becauſe the vapors do paſs out of the mouth, which being reſtrained and driven to the midriff, by ſtretching it powerfully thruſts down the excrement. Wherefore Apothecaries when they give glyſters, bid the Patient to open his mouth, that the glyſter may eaſily go up, which otherwiſe would ſcarcely go up, the mouth being ſhut; becauſe ſo, we ſhould have no place empty in us, into which the glyſter might be admitted. Why when the mouth is open, the excrements go more ſlowly forth.

Of the White-line, and Peritonæum or Rim of the Belly.

THe White-line is nothing elſe, than the bound and extremities of the muſcles of the *Epigaſtrium*, diſtinguiſhing the belly in the midſt into two parts, the right and left. It is called White, both of its own colour, and alſo for that no fleſhy part lies under it, or is placed above it. It is broader above the navel, but narrower below, becauſe the right muſcles do there grow into one. Now we muſt treat of the coat or membrane, *Peritonæum* or rim of the belly; it is ſo called, becauſe it is ſtretched over all the lower belly, and particularly over all the parts contained in the ventricle, to which alſo it freely lends a common coat. It hath a ſpermatick ſubſtance, as all other membranes have; the quantity of it in thickneſs is very ſmall, (for it is almoſt as thin as a Spiders web) yet differing in divers places in men and women; for men have it more thick and ſtrong below the navel, that ſo it may contain the extenſion of the ſtomach, often ſtretched beyond meaſure with meat and drink. On the contrary, women have it ſo thick and ſtrong below their navel, that it ſeems double, that ſo they may more eaſily endure the diſtention of their womb, cauſed by the child contained in it. But above the navel, men and women have the *Peritanæum* of an equal ſtrength, for the ſelf ſame reaſon. The longitude and latitude of it is known by the circumſcription of the belly. What the White-line is. What the *Peritonæum* is. The ſubſtance and quantity.

The figure is round and ſomewhat long; it puts forth ſome productions, like finger-ſtalls, both for the leading and ſtrengthening the ſpermatick veſſels, and the eremaſter muſcles of the teſticles, and, beſides it, the ejaculatory veſſels; as alſo to impart a coat to the teſticles, and all the natural parts. The figure.

It is compoſed of ſlender, membranous and nervous fibers, certain ſmall branches of veins and arteries concurring with them, which it receives for life and nouriſhment from the adherent parts. The compoſition.

This membrane is one in number, and beſides every where one and equal, although *Galen* would have it perforated in that place where the ſpermatick veſſels deſcend to the teſticles: But, in truth, we muſt not think that a hole, but rather a production, as we ſaid before. The number. *Lib. de ſem.*

The later Anatomiſts have obſerved, the coat *Peritonæum* is doubled below the navel, and that by the ſpaces of theſe reduplications the umbilical arteries aſcend to the navel.

It is ſituate near the natural parts, and compaſſes them about, and joyned by the coat, which it gives them, as alſo on the ſides, it is joyned to the *Vertebra's* of the loins, from whoſe ligaments (or rather *Perioſteum*) it takes the original: On the lower part, it cleaves to the ſhare-bone, and on the upper to the midriff, whoſe lower part it wholly inveſts; on the fore or outer part it ſticks ſo cloſe to the tranſverſe muſcles, that it cannot be pluck'd from them but by force, by reaſon of the complication and adheſion of the fibers thereof with the fibers of the proper membrane of theſe muſcles; which membrane in *Galen*'s opinion proceeds from this *Peritonæum*, ſo that it is no marvel that we may more eaſily break than ſeparate theſe two coats. It is of temperature cold and dry, as all other membranes. The ſite and connexion. *Lib. 6. Meth.*

It hath many uſes, the firſt whereof is, to inveſt and cover all the parts of the lower belly, eſpecially the kall, leſt it ſhould be ſqueezed by great compreſſures and violent attempts into the empty ſpaces of the muſcles, as it ſometimes happens in the wounds of the *Epigaſtrium*, unleſs the lips of the Ulcer be very well united; for then appears a tumor about the wound by the guts and kall thruſting without the *Peritonæum* into thoſe ſpaces of the muſcles; from whence proceeds cruel pain. Uſe.

Another uſe is, to the further caſting forth of the excrements by preſſing the ventricle and guts on the foreſide, as the midriff doth above, as one ſhould do it by both his hands joyned together.

The third uſe is, it prohibits the repletion of the parts with flatulency after the expulſion of the excrements, by ſtraitning and preſſing them down,

The fourth and laſt is, that it contains all the parts in their ſeat, and binds them to the backbone, principally that they ſhould not fly out of their places by violent motions, as by leaping, and falling from on high.

Laſtly, we muſt know, that the rim is of that nature, that it will eaſily dilate it ſelf, as we ſee in Dropſies, in women with child, and in tumors againſt nature.

CHAP. XIII.

Of the Epiploon, Omentum, or Zirbus, that is the Kall.

The ſubſtance, magnitude, figure.

After the containing parts, follow the contained, the firſt of which is the *Epiploon*, (or Kall) ſo called, becauſe it (as it were) ſwims upon all the guts. The ſubſtance of it is fatty and ſpermatick, the quantity of it for the thickneſs is diverſe, in divers men, according to their temperament. The latitude of it is deſcribed by the quantity of the guts. It is in figure like a purſe, becauſe it's double. It is compoſed of veins, arteries, fat, and a membrane, which ſliding down from the gibbous part of the ventricle, and the flat part of the gut *Duodenum* and Spleen over the guts, is turned back from the lower belly to the top of the Colon. It is one as we ſaid covering the guts. It hath its chief connexion with the firſt *Vertebra's* of the Lions, from which place in Beaſts it ſeems to take a Coat, as in men from the hollow part of the Spleen, and gibbous of the ventricle, and depreſſed part of the *Duodenum*; from whence doubled, it is terminated in the fore and higher part of the Colick-gut. Which moved *Galen* to write, that the upper part of the membrane of the Kall was annexed to the ventricle; but the lower, to the laxer part of the Colick-gut. From the Veſſels of which parts it borrows his, as alſo the nerves, if it have any. The temper of it in lean bodies is cold and dry, becauſe their Kall is without fat; but in fat bodies it is cold and moiſt by reaſon of the fat. The uſe of it is two-fold: The firſt is to heat and moiſten the guts, and help their concoction, although it do it by accident, as that which through the denſity of the fat, hinders the cold air from piercing in, and alſo forbids the diſſipation of the internal heat. Another uſe is, that, in want of nonriſhment in times of great famine, ſometimes it cheriſhes, and (as it were) by it dew preſerves the innate heat, both of the ventricle and neighbouring parts, as it is written by *Galen*. Moreover, we muſt obſerve, that in a rupture or relaxation of the *Peritonæum*, the Kall falls down into the *Scrotum*, from whence comes that rupture we call *Epiplocele*. But in women that are ſomewhat more fat, it thruſts it ſelf between the bladder and the neck of the womb, and by its compreſſion hinders, that the ſeed comes not with full force into the womb, and ſo fruſtrates the conception. Beſides, when by a wound or ſome other chance, any part of it be defective, then that part of the belly which anſwers to it, will afterwards remain cold and raw, by reaſon of the fore-mentioned cauſes.

CHAP.

CHAP. XIV.

Of the Ventricle or Stomach.

NOw we muſt ſpeak of the ſtomach; the receptacle of the food neceſſary for the whole body, the ſeat of appetite, by reaſon of the nerves diſperſed into its upper orifice, and ſo into its whole ſubſtance. The ſubſtance thereof is rather ſpermatick than ſanguine, becauſe that for one fleſhy membrane, it hath two nervous: The quantity or magnitude of the ventricle is diverſe, according to the various magnitudes of bodies, and gluttony of men. The figure of it is round and ſomewhat long, like a Bag-pipe. The ſtomach is compoſed of two proper coats, and one common from the *Peritonæum*, together with veins, ſinews, and arteries; the innermoſt of its proper coats is membranous, woven with right fibers, for the attraction of meats; it is extended and propagated even to the mouth thereof, whereby it comes to paſs that the affections of one part may eaſily be communicated to the other by ſympathy or conſent. This coat hath its original from the membranes of the brain which accompany the nerves deſcending from the the third and fourth conjugation to the mouth thereof. And in like ſort from other productions deſcending by the paſſages of the head, from whence alſo another reaſon may be drawn from that, which they commonly bring from the nerves of the ſixth conjugation; why in wounds of the head, the ſtomach doth ſo ſoon ſuffer by conſent with the brain? The exterior or outer is more fleſhy and thick, woven with oblique fibers, to retain and expel. It draws its original from the *Pericranium*, which aſſoon as it comes to the gullet, takes unto it certain fleſhy fibers. There be nerves ſent into the ſtomach from the ſixth conjugation of the brain, as it ſhall be ſhewed in its proper place. Veins and arteries are ſpread into it from the *Gaſtrica*, the *Gaſtrepiploides*, the *Coronaria* and Splenick, from the ſecond, third and fourth diſtribution of the *Vena-porta*, or Gate-vein; and the third of the deſcendent artery to the natural parts, aſſoon as it paſſes forth of the midriff.

What the ventricle is. The ſubſtance. The magnitude. The figure. The compoſure. The cauſe of the conſent of the mouth and ſtomach.

It is one in number, The greater part of it is ſituated on the left ſide, between the Spleen, the hollowneſs of the liver and the guts, that, aſſiſted by the heat of ſuch neighbouring parts, it may more chearfully perform the concoction of the meat. Neither am I ignorant that *Galen* hath written, that a great part of the ſtomach lies on the left ſide. But Inſpection it ſelf and Reaſon, makes me derogate from *Galen*'s authority: for, becauſe there is more empty ſpace on the left ſide, by reaſon the Spleen is leſs than the Liver, it was fit it ſhould lie more on the left ſide. The more proper connexion of it is with the gullet and guts, by its two orifices; with the brain, by its nerves; with the liver and ſpleen, by its veins; with the heart by it arteries; and with all the natural parts by its common membrane.

The number. *Lib. de uſu partium.* The connexion.

The temper of the ventricle in men of good habit, is temperate, becauſe it is almoſt compoſed of the equal commixture of ſanguine and ſpermatick parts; or according to *Galen*'s opinion, it is cold of it ſelf, and by the parts compoſing it; and hot by the vicinity of the bowels. But in ſome it is hotter, in others colder, according to the diverſe temper and complexion of divers bodies. That ſtomach is to be thought well tempered, that powerfully draws down the meat and drink, and embraces and retains them ſo drawn, until by concoction and elixation, they ſhall be turned into a juyce like cream (which the *Greeks* call *Chylos*;) and laſtly, which doth ſtrongly ſend from it, and repel the excrements of this firſt concoction.

The temper. *Lib. 9. Meth.*

The ſtomach is known to be hotter by this, that it better concocts and digeſts coarſe and hard meats, as Beef, hard Eggs, and the like, than ſoft meats eaſie of digeſtion, which it corrupts and turns into belchings. For ſo a young Chicken, is ſooner burnt than well roaſted at a great fire. The ſtomach which is colder, deſires much meat, but is ſlow in concocting them, eſpecially if they be cold and hard of digeſtion, which for that cauſe quickly turn ſower. The action of a well conditioned ſtomach is twofold, one common, another proper. The common is to attenuate, mix and digeſt the meats taken in at the mouth, for the nutrition of it ſelf and the whole body, after the liver hath performed its duty, which before it be done, the ventricle only enjoys the ſweet pleaſure of the *Chylus*, and comforts it ſelf againſt the impurity of the adjacent parts, whereof it is called the work-houſe of concoction. Its firſt action is to attract, retain, and aſſimilate to it ſelf that which is convenient; but to expel whatſoever ſhall be contrary, either in quantity or quality, or in the whole ſubſtance.

Notes of a hot ſtomach. The action twofold.

It hath two orifices, one above, which they commonly call the ſtomach and heart, the other lower, which is called the *Pylorus*, or lower mouth of the ſtomach. The upper bends to the left ſide near the back-bone; it is far more large and capacious than the lower, that ſo it may more commodiouſly receive meats half-chewed, hard and groſs. which Gluttons caſt down with great greedineſs; it hath an exquiſite ſenſe of feeling, becauſe it is the ſeat of the appetite, by reaſon of the nerves incompaſſing this orifice, with their mutual imbracings; whereby it happens that the ventricle in that part is endued with a quick ſenſe, that perceiving the want and emptineſs of meat, it may ſtir up the creature to ſeek food. For albeit nature hath beſtowed four faculties on other parts, yet they are not ſenſible of their wants, but are only nouriſhed by the continual ſucking of the veins, as Plants by juyce drawn from the earth.

The two orifices of the ſtomach.

This orifice is ſeated at the fifth *Vertebra* of the cheſt, upon which they ſay it almoſt reſts. Yet I had rather ſay, that it lies upon the twelfth *Vertebra* of the cheſt, and the firſt of the loins; for in this place the gullet perforates the midriff, and makes this upper orifice. The lower orifice bends rather to the right ſide of the body, under the cavity of the liver. It is far ſtraiter than the upper, leſt any thing ſhould paſs away before it be well attenuated and concocted; and it doth that by the help or aſſiſtance of, as it were, a certain ring, like to the ſphincter muſcle of the fundament, which ſome have thought a glandule made by the tranſpoſition of the inner and fleſhy membrane

The ſite. The glandulous ring of the *Pylorus*.

membrane of the ventricle into that which is the outer of the guts. I know *Columbus* laughs at this glandulous ring, but any one that looks more attentively, ſhall perceive that *Pylorus* is glandulous. The ſtomach in its lower and inner ſide, hath many folds and wrinkles, which ſerve to hold and contain the meats, until they be perfectly concocted. In the ventricle, we obſerve parts gibbous and hollow; the hollow is next to the liver and midriff; the gibbous is towards the guts. Now we muſt note that the ventricle, when it is much reſolved or looſed, may ſlide down even to the navil near the bladder, the which we have obſerved in ſome bodies diſſected after their death.

The falling down of the ſtomach.

CHAP. XIV.

Of the Guts.

Their ſubſtance.

THe Guts the inſtruments of diſtribution and expulſion, are of the ſame ſubſtance and compoſure with the ſtomach, but that the ſite of the coats of the ſtomach is contrary to thoſe of the guts. For that which is the innermoſt coat of the ſtomach, is the outermoſt of the guts, and ſo on the contrary.

Figure.

The figure of the guts is round, hollow and capacious, ſome more, ſome leſs, according to the diverſe bigneſs.

Their number.

But for the quantity of the guts, ſome are ſmall, ſome great, more or leſs, according to the varieties of bodies. But they are ſix in number: For there be three ſmall; the *Duodenum*, the *Jejunum*, or empty gut, and the *Ileon*. Three great, the Blind, the Colick, and the Right-gut. All which have had their names for the following reaſons; the firſt, becauſe it is extended the length of twelve fingers, like another ſtomach, without any turning or winding; of which greatneſs it is found in great bodied men, ſuch as were more frequently to be met withal in *Galen*'s time, than in this time of ours; in which, this gut is found no longer than ſeven, eight or nine fingers at the moſt. The cauſe of this length is, that there may be a free paſſage to the Gate-vein, coming out of the liver, as alſo the artery and nerve which run into it. For ſeeing that this

The *Duodenum*.

gut

gut may ſometimes riſe to the top of the liver, it would poſſeſs the ſpace under the bladder of the gall (with which it is often tinctured) if it had any revolutions that way, which is the paſſage for ſuch like veſſels. Others give another reaſon of this figure, which is, That there ſhould be nothing to hinder the eaſie and fit diſtribution of the perfectly concocted *Chylus* to the liver.

The ſecond is called *Jejunum*, or the empty-gut, not becauſe it is abſolutely ſo, but becauſe it contains little in compariſon of the other. There is a triple cauſe of this emptineſs, the firſt the multitude of the meſeraick veins and arteries which are about it, whereupon there is a greater and quicker diſtribution of the *Chylus*. The ſecond is the vicinity or neighbourhood of the liver, ſtrongly drawing the *Chylus* contained in it; the third is the flowing down of the Cholerick humor from the bladder of the gall into it, which ever and anon by its acrimony cleanſes away the filth, and by continual flowing ſolicites it to expulſion. The third is called *Ileon*, becauſe it lies between the *Ilia*, or flanks; it differs nothing from the reſt in ſubſtance and magnitude, but in this one thing, that there is more matter contained in it than in the reſt, by reaſon of the paucity of the veſſels terminated in it, that it is no marvel that there can be no exact demonſtration made of them. The fourth is called *Cæcum*, or the blind, becauſe it hath but one paſſage to ſend out and receive in the matter. This gut hath a long and ſtrait production, which, according to the opinion of ſome (though altogether erroneous) often falls down into the *Scrotum* in the rupture, or relaxation of the rim of the belly; for, that production in the lower belly ſtrongly ſticks to the *Peritonæum*, or rim, which hinders ſuch falling down. But *Galen* ſeems by ſuch a blind-gut to have meant this long and narrow production; and certainly, ſo thinks the common ſort of Anatomiſts; but here *Veſalius* juſtly reprehended *Galen*. Wherefore *Sylvius* that he might free *Galen* of this fault, would have us by the blind-gut to underſtand the beginning of the colick-gut. The fifth is called *Colon* (or colick-gut) becauſe it is greater and more capacious than the reſt. The ſixth and laſt, the right-gut, by reaſon of the rightneſs or ſtraitneſs of the paſſage. This, in Beaſts, eſpecially, hath a certain fatneſs in it to make the paſſage ſlippery, and leſt the guts ſhould be exulcerated in the paſſage, by the ſharpneſs of hard and acrid excrements.

The Jejunum. *Ileon.* *Cæcum.* *Colon.* *Rectum.*

The ſite of theſe guts is thus: The *Duodenum* upon the back-bone bends to the right hand; the *Jejunum* poſſeſſes a great part of the upper umbilical region, and diffuſes it ſelf into both ſides with windings, like to thoſe of the gut *Ileum*, even to the flanks. The gut *Ileon* is ſituate at the lower part of the umbilical region, going with many turnings and winding, even to the hollowneſſes of the holy bone, above the bladder and ſide parts of the *Hypogaſtrium*, they call the flanks.

Their ſite.

The blind bends to the right hand, a little below the kidney, above the firſt and fourth *Vertebræ* of the loins. The Colon or colick-gut is crooked or bent, in the form of a *Scythian*-bow, filling all the ſpace from the blind-gut, below the right kidney, even to the hollowneſs of the liver, and then it goes by the gibbous part of the ſtomach above the ſmall-guts, even to the hollowneſs of the Spleen; from whence ſliding under the left kidney, with ſome turnings, it is terminated upon the *Vertebra's* of the loins.

By all which turnings and windings of the colick-gut, it is eaſie to diſtinguiſh the pain of the Stone of the kidneys, which remain fixt in one certain place, from the colick wandring through thoſe crooked paſſages we mentioned. The right-gut tends with an oblique ſite towards the left hand, upon the holy-bone even to the very fundament. They have all one and a common connexion; for they are all mutually joyned together by their coats, becauſe there is but one way from the gullet even to the fundament; but they are joyned to the principal parts by their nerves, veins and arteries.

The diſtinction between the colick and the ſtone in the kidneys. *Their connexion.*

But a more proper connexion is that, where the *Duodenum* on the upper part of it, is joyned with the *Pylorus*; but on the lower part to the *Jejunum*, and the parts lying under it, by the coat of the *Peritonæum*. The *Jejunum*, or empty-gut, is joyned to the *Duodenum* and *Ileon*. The *Ileon*, with the empty blind-guts. The blind with the *Ileon* and *Colon*, and with the right ſide of the back-bone where it is tied more ſtraitly. The *Colon* with the blind and right-guts, and in his middle part, with the kidneys and gibbous part of the ſtomach; whereby it comes to paſs, that being diſtended with wind in the colick, it over-turns and preſſes the ſtomach, and ſo cauſes vomiting.

Why vomiting happens in the colick.

Laſtly, the right-gut is annexed with the colick-gut and fundament. At the end whereof there is a muſcle faſtned, of figure round and circular, called the *Sphincter*, ariſing from the lower *Vertebra's* of the holy bone and rump; by the benefit of which, as of a door or gate, the excrements are reſtrained at our will, leſt man born for all honeſt actions, without all ſhame, in every time and place, ſhould be forced every where to eaſe his belly. For ſuch as have loſt the benefit of this muſcle by the Palſie, have their excrements go from them againſt their wills. There is a body ſituate at the end of the right-gut, and of a middle ſubſtance between the skin and fleſh, as it were ariſing from the mixture of them both, like the extremities of the lips, of the ſame uſe with the *Sphincter*, but that it is not altogether ſo powerful. But there are alſo certain veins ſituate about it called the Hæmorrhoidal; of which we will ſpeak in their place.

The Sphincter muſcles of the fundament. *Gal. lib. 5. de uſu partium. cap. 14.*

Beſides, there are two other muſcles that deſcend to the end of this gut, being broad and membranous on each ſide, one ariſing from the ſide and inner parts of the ſhare and hip-bones, which inſerted above the *Sphincter* pull up the fundament falling down, wherefore they are called *Levatores Ani*, or the lifters up of the fundament. Wherefore when as either they are too weak, or reſolved, or the fundament oppreſſed with the weight of flegmatick, ſalt, cholerick and ſharp humors, the gut is ſcarce reſtored into its place, that there is need of the help of the fingers for that purpoſe.

Levatores Ani.

The guts follow the temper of the ſtomach. Their action is the diſtributing the *Chylus* by the meſeraick veins (which of duty belongs to the three ſmall guts) and the receiving the excrements of the *Chylus*, and retention of them, till a fit time of expulſion, which belongs to the third quarter. Beſides, theſe ſmall guts finiſh up the work of concoction, begun in the ſtomach, although

The action of the guts.

though they be not altogether made for that uſe. But nature is often accuſtomed to abuſe the parts of the body for ſome better uſe.

Their fibers. But we muſt note, that for the compoſure of the guts, they have only tranſverſe fibers, for expulſions ſake, unleſs that at the beginning of the *Colon*, and the end of the right gut, you may ſee certain right fibers added to the tranſverſe to ſtrengthen them, leſt theſe guts ſhould chance to be broken and torn by the paſſage of hard excrements, and the laborious endeavour of expulſion, (ſpecially in brute beaſts.)

The fifth figure, of the lower Belly.

H *The blind-gut of the late Writers, for the Ancients took the top of the* Colon *for it.*

I *The beginning of the great or thick guts.*

I *And ſo to* K, *ſheweth the paſſages of the colick-gut from the right kidney to the liver. And ſo the colick and the ſtone on this ſide are in one place, and therefore hardly diſtinguiſhed.*

K *to* L *The ſame colick-gut lieth under the whole bottom of the ſtomach, which is the reaſon that thoſe which are troubled with the colick caſt ſo much.*

L *to* M *The paſſage of the* Colon *from the ſpleen to the ſhare-bone, by the left kidney, a way which maketh the pain of the ſtone and the colick on the left ſide, very hard to diſtinguiſh.*

N *The* Colon *ending in the right gut.*

O *The beginning of the right gut, unto the bladder.*

P Q *The ſunken or fallen ſide of the* Colon *at* P, *and his chambers or cells at* Q R S T. *the leſſer guts eſpecially lying under the navel.*

a a *The two umbilical arteries.*

b *The bottom of the bladder.* * *The connexion of the bladder and the* Peritonæum.

How the guts become fit to retain. But if any ask, how they have retention, being they want oblique fibers; he may know, that the *fæces* are retained in the right-gut, by the force of the *Sphincter*-muſcle, but oft-times in the blind, by their hardneſs and abundance, whereby they ſtick in the paſſage; but in the reſt, by reaſon of their conformation into many windings and turnings.

Their length. The length of the guts, is ſeven times more than the length of the whole body: to this length they have windings, leſt the nouriſhment ſhould quickly ſlide away, and leſt men ſhould be with-drawn by gluttony from action and contemplation. For ſo we ſee it comes to paſs in moſt Beaſts, which have one gut, ſtretched ſtrait out from the ſtomach to the fundament; as in the Lynx, and ſuch other Beaſts of inſatiable gluttony, always, like Plants, regarding their food.

CHAP. XV.

Of the Meſentery.

The ſubſtance. Magnitude. Figure. Compoſure. After the guts follows the Meſentery, being partly of a fatty, and partly of a ſpermatick ſubſtance. The greatneſs of it is apparent enough, although in ſome it be bigger, and in ſome leſſer, according to the greatneſs of the body. It is of a round figure, and not very thick. It is compoſed of a double coat ariſing from the beginning and root of the *Peritoneum.* In the the midſt thereof, it admits nerves from the Coſtal of the ſixth Conjugation; veins from the *Vena Porta*, or gate-vein; arteries from the deſcendent artery, over and beſides a great quantity of fat and many glandulous bodies, to prop up the diviſion of the veſſels ſpread over it, as alſo to moiſten their ſubſtance.

Number. It is in number one, ſituate in the middle of the guts, from whence it took its name.

The connexion. Yet ſome divide it into two parts, to wit, into the *Meſeræum*, that is, the portion interwoven with the ſmall guts, and into the *Meſo-colon* which is joyned with the great. It hath connexion by its veſſels, with the principal parts, by its whole ſubſtance with the guts, and in ſome ſort with the kidneys, from whoſe region it ſeems to take its coats.

The temper. It is of a cold and moiſt temper, if you have reſpect to his fatty ſubſtance; but if to the reſt of the parts, cold and dry.

The

The action and use of it is, to bind and hold together the guts, each in his place, lest they should rashly be folded together, and by the Meseraick-veins (which they term the hands of the liver) carry the *Chylus* to the liver. The action and use.

In which you must note, that all the meseraick veins come from the liver, as we understand by the dissection of bodies; although some have affirmed, that there be some veins serving for the nourishment of the guts, no ways appertaining to the liver, but which end in certain glandulous bodies, dispersed through the mesentery, of whose use we will treat hereafter. All the meseraick veins come from the liver.

CHAP. XVI.

Of the Glandules in general, and of the Pancreas, *or Sweet-bread.*

A Glandule is a simple part of the body; sometimes of a spongy and soft substance, sometimes of a dense and hard. Of the soft Glandules are the *Tonsillæ* (or Almonds, like in substance to blanched Almonds,) the *Thymus*, *Pancreas*, *Testicles*, *Prostatæ*. But the dense and hard are the *Parotides*, and other like. The Glandules differ amongst themselves in quantity and figure, for some are greater than other some, and some are round, and others plain, as the *Thymus* and *Pancreas*. Substance of the glandules. Quantity and figure.

Others are compounded of veins, nerves, arteries, and their proper flesh, as the Almonds of the ears, the milky glandules in the breasts and the testicles. Others want nerves, at least which may be seen, as the *Parotides*, the axillary, or those under the arm-holes, and others. The number of glandules is uncertain, by reason of the infinite multitude and variety of sporting nature. You shall find them always in those places, where the great divisions of vessels are made, as in the middle ventricle of the brain, in the upper part of the chest, in the mesentery, and other like places. Composition. Number.

Although othersome be seated in such places, as nature thinks needful to generate and cast forth of them a profitable humor to the creature; as the Almonds at the root of the tongue, the kernels in the dugs, the spermatick vessels in the *scortum*, and at the sides of the womb; or where Nature hath decreed to make emunctories for the principal parts, as behind the ears, under the arm-holes, and in the groins. The connexion of glandules is not only with the vessels of the parts concurring to their composition, but also with those, whose division they keep and preserve. They are of a cold temper, wherefore Physicians say, the blood *recrudescere*, i.e. to become raw again in the dugs, when it takes upon it the form of milk. But of these some have action, as the Almonds, which pour out spattle useful for the whole mouth, the dugs milk, the testicles seed; others, use only, as those which are made to preserve, under-prop and fill up the divisions of the vessels. Besides this, we have spoken of glandules in general, we must know, that the *Pancreas*, is a glandulous and flesh-like body, as that which hath every where the shape and resemblance of flesh. It is situate at the flat end of the liver, under the *Duodenum*, with which it hath great connexion, and under the gate-vein, to serve as a Bulwark both to it and the divisions thereof, whilst it fills up the empty spaces between the vessels themselves, and so hinders, that they be not pluck'd asunder, nor hurt by any violent motion, as a fall or the like. Connexion. Temper. Action and use. The substance of the *Pancreas*. The site.

CHAP. XVII.

Of the Liver.

HAving gone thus far, order of dissection now requires, that we should treat of the distribution of the gate-vein; but, because it cannot well be understood unless all the nature of the liver from whence it arises, be well known, therefore putting it off to a more fit place, we will now speak of the liver. Wherefore the liver (according to *Galen*'s opinion, *lib. de Form. fœtus*) is the first of all the parts of the body, which is finished in conformation. It is the shop and author of the blood, and the original of the veins; the substance of it is like the concrete mud of the blood, the quantity of it is diverse, not only in bodies of different, but also of the same species; as in men amongst themselves, of whom one will be gluttonous and fearful, and another bold, and temperate or sober; for he shall have a greater liver than this, because it must conceive and concoct a greater quantity of *Chylus*: yet the liver is great in all men, because they have need of a great quantity of blood for the repairing of so many spirits, and the substantifick moisture, which are resolved and dissipated in every moment by action and contemplation. But there may be a twofold reason given, why such as are fearful have a larger liver. The first is, because in those the vital faculty (in which the heat of courage and anger resides) which is in the heart, is weak; and therefore the defect of it must be supplied by the strength of the natural faculty. For thus nature is accustomed to recompence that which is wanting in one part, by the increase and accession of another. The other reason is, because cold men have a great appetite; for by *Galen*'s opinion *In arte parva*, coldness increases the appetite; by which it comes to pass that they have a greater quantity of *Chylus*, by which plenty the liver is nourished and grows larger. Some Beasts, as Dogs and Swine, the liver divided into five or more Lobes, but a man hath but one Lobe, or two or three at the most; and these not so much distinguished, as which cherish the upper and hollow region of the ventricle, with embracing to help forward the work of concoction. Therefore the liver is almost content with one Lobe, although it is always rent with a small division, that the umbilical vein piercing into the roots and substance of it, may have a free passage; but also oftentimes there is, as it were, a certain small Lobe of the liver, laid under that umbilical vein, as a cushion. What the liver is. The substance and quantity. Why Cowards have great livers.

The

The figure. The figure of the liver is gibbous; riſing up and ſmooth towards the midriff; towards the ſtomach is the *ſimous* or hollow ſide of it ſomewhat unequal, and rough by reaſon of the diſtance of the Lobes, the original of the hollow-vein, and the ſite of the bladder of the gall.

The compoſure. The veſſels. The compoſition of the liver is of veins, nerves, arteries, the coat and proper ſubſtance thereof which we call the groſs and concrete blood, or *Parenchyma*. Veins and arteries come to it from the navil; but nerves immediately from theſe which are diffuſed over the ſtomach according to *Hippocrates*; yet they penetrate not very deep into its ſubſtance; for it ſeems not to ſtand in need of ſuch exact ſenſe, but they are diſtributed upon the coat and ſurface thereof, becauſe this part made for diſtribution over the whole body, keeps to it ſelf no acrid or malign humor; for the perception of which it ſhould need a nerve, although the coat inveſting it, ſends many nervous fibers into its ſubſtance, as is apparent by the taking away of the coat from a boiled liver; we muſt think the ſame of the other entrails. The coat of the liver is from the *Peritonæum*, waxing ſmall from the umbilical vein,

The number and ſite. The connexion. when it divides it ſelf for the generation of the gate and hollow veins, as is obſerved by *Galen*, *Lib. de format. Fœtus*. The liver is only one, ſituate in the greater part on the right ſide, but with the leſſer part on the left, quite contrary to the ſtomach. Its chief connexion is with the ſtomach and guts, by the veins and membranes of the *Peritonæum*; by the hollow vein and artery, with the heart; by the

The temper. nerve with the brain; and by the ſame ligatures with all the parts of the whole body. It is of a hot and moiſt temper, and ſuch as have it more hot, have large veins and hot blood; but ſuch as have it

The action. cold, have ſmall veins, and a diſcoloured hew. The action of the liver is the converſion of *Chylus* into the blood, the work of the ſecond concoction. For although the *Chylus* entring into the meſeraick veins, receive ſome reſemblance of blood, yet it acquires not the form and perfection of blood, before

The ligaments. it be elaborate, and fully concoct in the liver. It is bound and tied with three ſtrong ligaments, two on the ſides in the midſt of the baſtard ribs, to bear up its ſides, and the third more highand ſtrong, deſcending from the blade, to ſuſtain its proper part, which with its weight would preſs the lower orifice of the ſtomach, and ſo cauſe a falling or drawing down of the ſternon and collar-bone. And thus much may ſuffice for its proper ligaments, for we before-mentioned its common; the veins, arteries, nerves, and coat of the *Peritonæum*, by which it is knit to the loins and other natural parts. But we muſt note, that beſides theſe three proper ligaments, the liver is alſo bound with others to the baſtard-ribs; as *Sylvius* obſerves in his Anatomical obſervations, and *Hollerius* in his Practice, *c. de Plurit.*

CHAP. XVIII.

Of the Bladder of the Gall.

The ſubſtance greatneſs and figure thereof. NOw we muſt come to the bladder of the gall, which is of a nervous ſubſtance, and of the bigneſs of a ſmall pear; it is of figure round, with the bottom more large, but the ſides and mouth more narrow and ſtrait. It is compoſed of a double coat, one proper, conſiſting of three ſorts of fibers, the other from the *Peritonæum*. It hath a vein from the *Porta* or gate-vein, and an artery from that which is diffuſed into the liver, and a nerve from the ſixth conjugation. It is

The compoſition. Number and connexion. but one, and that hid on the right ſide under the greater lobe of the liver, it is knit with the touching of its own body, and of the paſſages and channels made for the performance of its actions with the liver; and in like manner with the *Duodenum*, and not ſeldom with the ſtomach alſo, by another paſſage; and to conclude, to all the parts by its veins, nerves, arteries, and common coat. It is of a cold

Temper. Action. temper, as every nervous part is. The action of it, is to ſeparate from the liver the cholerick humor, and that excrementitious, but yet natural, by the help of the right fibers, for the purifying of the blood, and by the oblique fibers, ſo long to keep it being, until it begin to become troubleſom in quantity, or quality, or its whole ſubſtance, and then by the tranſverſe fibers, to put it down into the *Duodenum* to provoke the expulſive faculty of the guts. I know, *Fallopius* denies the texture of ſo many

The channels of the Gall. fibers, to be the miniſter of ſuch action to the gall. But *Veſalius* ſeems ſufficiently to have anſwered him. The bladder of the gall hath divers channels: for coming with a narrow neck, even to the beginning of the gate-vein, it is divided into two paſſages, the one whereof ſuffering no diviſion, is carried into the *Duodenum*, unleſs that in ſome it ſend another branch into the bottom of

Lib. 2. de Temper. the ſtomach, as is obſerved by *Galen*; which men have a miſerable and wretched life, being ſubject to cholerick vomitings, eſpecially when their ſtomachs are empty, with great pains of their ſtomach and head, as is alſo obſerved by *Galen*, cap. 74. *Artis Med.* The other, coming out of the body of the liver, divides its ſelf into two or three paſſages, again entring the ſubſtance of the liver, is divided with infinite branches, accompanying ſo many branches of the gate-vein through the ſubſtance of the liver, that ſo the blood unleſs it be moſt elaborate and pure, may not riſe into the hollow-vein, all which things Diſſection doth manifeſtly teach.

The ſixth Figure of the Bladder of the Gall.

CHAP. XIX.

Of the Spleen or Milt.

BUt becauſe we cannot well ſhew the diſtribution of the Gate-vein, unleſs the Spleen be firſt taken away and removed from its ſeat: therefore before we go any further, I have thought good to treat of the Spleen. Therefore the Spleen is of a ſoft, rare, and ſpongious ſubſtance (whereby it might more eaſily receive and drink up the dregs of the bloud from the Liver) and of a fleſh more black than the Liver. For it reſembles the colour of its muddy bloud, from which it is it is generated. It is of an indifferent greatneſs, but bigger in ſome than in other-ſome, according to the diverſe temper and complexion of men. It hath, as it were, a triangular Figure, gibbous on that part, it ſticks to the Ribs and Midriff, but hollow on that part next the Stomach. It is compoſed of a Coat, the proper Fleſh, a Vein, Artery, and Nerve. The membrane comes from the *Peritonæum*, the proper fleſh from the *fæces* or dregs of bloud, or rather of the natural melancholy humour, with which it is nouriſhed. The fourth branch of the *Vena Porta* or Gate-vein, lends it a Vein; the firſt branch of the great Deſcendent Artery, preſently after the firſt entrance without the Midriff, lends it an Artery. But it receives a Nerve from the left Coſtal, from the ſixth conjugation on the inner part, by the roots of the ribs; and we may manifeſtly ſee this Nerve, not onely diſperſing it ſelf through the Coat of the Liver, but alſo penetrating with its Veſſels the proper Fleſh thereof, after the ſelf ſame manner, as we ſee it is in the Heart and Lungs. It is one in number, ſituate on the left ſide between the Stomach and the Baſtard-ribs, or rather the Midriff which deſcends to the roots. For it oft-times cleaves to the Midriff on its gibbous part by a Coat from the *Peritonæum*, as alſo on the hollow part to the Stomach, both by certain Veins which ſends it into the Ventricle, as alſo by the Kall. It hath connexion, either primarily or ſecondarily, with all the parts of the Body by theſe its Veſſels.

The Subſtance. Magnitude. Figure. Compoſition. Number and Site. Connexion.

It is of a cold and dry temper; the action and uſe of it is to ſeparate the Melancholick humor, which being feculent and droſſie, may be attenuated by the force of many Arteries diſperſed through its ſubſtance. For by their continual motion and native heat, which they carry in full force with them from the Heart, that groſs bloud puts off its groſsneſs, which the Spleen ſends away by paſſages fit for that purpoſe, retaining the ſubtler portion for its nouriſhment. The paſſages by which it purges it ſelf from the groſsneſs of the melancholy bloud, are a Vein aſcending from it into the Stomach to ſtir up the appetite by its ſourneſs, and ſtrengthen the ſubſtance thereof by its aſtriction; and alſo another Vein, which ſometimes from the Spleen-branch, ſometimes from the Gate-vein, plainly under its orifice, deſcends to the Fundament, there to make the Hæmorrhoidal Veins.

Temper and uſe.

CHAP. XX.

Of the Vena Porta *or Gate Vein, and the diſtribution thereof.*

THe Gate-vein, as alſo all the other Veins is of a ſpermatick ſubſtance, of a manifeſt largeneſs, of a round and hollow Figure, like to a Pipe or Quill. It is compoſed of its proper Coat, and one common from the *Peritonæum*. It is onely one, and that ſituate in the ſimous or hollow part of the Liver, from whence it breaks forth (or rather out of the Umbilical Vein) into the midſt of all the Guts with which it hath connexion, as alſo with the Stomach, Spleen, Sphincter of the Fundament, and *Peritonæum*, by the Coat which it receives from thence. It is of a cold and dry temper. The action of it is to ſuck the *Chylus* out of the Ventricle and Guts, and ſo to take and carry it to the Liver, until it may carry back the ſame turned into bloud for the nutriment of the Stomach, Spleen, and Guts. This Gate-vein coming out of the ſimous part of the Liver, is divided into ſix branches, that is, four ſimple, and two compound again divided into many other branches; The firſt of the ſimple aſcends from the fore-part of the trunk of the bladder of the Gall by the paſſage of the Choler (and are marked with g g) with a like Artery for life and nouriſhment, and this diſtribution is known by the name of *Cyſticæ Gemellæ*, or Cyſtick Twins. The ſecond called the *Gaſtrica* or Stomach Vein, ariſing in like manner from the forepart of the Trunk, is carried to the *Pylorus* and the ſimous or back part of the Stomach next to it.

The Subſtance and Figure. Compoſition. Number and Site. Temper and Action. Diviſion thereof into 6 branches, of which, four ſimple. 1. *Cyſticæ Gemellæ.* 2. *Gaſtrica.*

The third is called *Gaſtrepiplois*, the Stomach and Kall-Vein, which coming from the right ſide of the gate-vein goes to the gibbous part of the ſtomach next to the *Pylorus* and the right ſide of the kall.

3. *Gaſtrepiplois.*

The fourth going forth from behind on the right hand of the Gate-vein, aſcends above the root of the Meſeraick branch even to the beginning of the Gut *Jejunum* along the Gut *Duodenum*, from whence it is called *Inteſtinalis*, or the Gut-vein. And theſe are the four ſimple Branches. Now we will ſpeak of the compound.

4. *Inteſtinalis.*

The firſt is ſplenick, which is divided after the following manner. For in its firſt beginning and upper part, it ſends forth the *Coronalis*, or Crown-vein of the Stomach, which by the back-part of the Stomach aſcends into the upper and hollow part thereof; to which place, as ſoon as it arrives, it is divided again into two branches, the one whereof climbs up even to its higher orifice, the other deſcends down to the lower, ſending forth by the way other branches to the fore and back parts of the Stomach. Theſe engird and on every ſide encompaſs the Body or the Ventricle, for which cauſe they are named the Crown-veins.

Two compound. I. *Ramus Splenicus*, ſending forth, 1. *Coronalis.*

I have ſometimes obſerved this coming forth of the Trunk, a little above the orifice of the ſplenick branch. But this ſame ſplenick branch on its lower part, produces the branch of the Hæmorrhoidal Veins, which deſcending to the Fundament above the left ſide of the Loins, diffuſes a good portion thereof into the leaſt part of the Colick Gut, and the right Gut, at the end whereof it is often ſeen to be divided into five Hæmorrhoidal Veins, ſometimes more, ſometimes leſs.

2. *Hæmorrhoidalis Interna.*

Silvius writes that the Hæmorrhoidal branch deſcends from the Meſenterick: and truly we have ſometimes obſerved it to have been ſo. Yet it is more ſutable to Reaſon, that it ſhould deſcend from the Splenick, not onely for that we have ſeen with our eyes that it is ſo, but alſo becauſe it is appointed by Nature for the evacuation of the excrementitious melancholick humor. But this ſame ſplenick branch out of the middle almoſt of its upper part, produces the third branch going to the gibbous part of the Stomach and the Kall; they term it the greater, middle, and left *Gaſtrepiplois*. But on the lower part towards the Spleen, it produces the ſimple *Epiplois* or Kall-vein, which it diffuſes through the left ſide of the Kall. Moreover from its upper part, which touches the Liver, it ſends forth a ſhort branch called *Vas breve*, or *Venoſum*, to the upper orifice of the Ventricle for ſtirring up the appetite.

3. *Gaſtrepiplois major ſiniſtra.*

4. *Epiplois ſimplex.*

5. *Vas breve ſeu Venoſum.*

Lib. 4. de uſu Partium.

We have oftentimes and almoſt always obſerved, that this Vein-veſſel, which *Galen* calls *Vas Breve*, comes from the very body of the Spleen, and is terminated in the midſt of the Stomach on the left ſide, but never pierces both the Coats thereof. Wherefore it is ſomewhat difficult to find, how the melancholy juice can that way be poured, or ſent, into the capacity of the Stomach. Now the ſplenick branch, when it hath produced out of it thoſe five fore-mentioned branches, is waſted and diſperſed into the ſubſtance and body of the ſpleen.

II. *Ramus meſenterius* divided into three Parts.

Then follows another compound branch of the *Vena Porta*, called the Meſenterick, which is divided into three parts; the firſt and laſt whereof goes to the Blind-gut, and to the right and middle part of the Colick gut, divided into an infinite multitude of other branches. The ſecond and middle is waſted the *Ileon*, as the third and greater in the *Jejunum* or Empty-gut. It is called Meſenterick, becauſe it is diffuſed over all the Meſentery, as the Splenick is in the Spleen. And thus much we have to ſay of the diviſion of the Gate-vein, the which if at any time thou ſhalt find to be otherwiſe than I have ſet down, you muſt not wonder at it, for you ſhall ſcarce find it the ſame in two bodies, by reaſon of the infinite variety of particular Bodies, which (as the Philoſophers ſay) have each their own, or peculiar gifts; Our judgment is the ſame of other diviſions of the Veſſels. Yet we have ſet down that which we have moſt frequently obſerved.

CHAP. XXI.

Of the Original of the Artery, and the diviſion of the Branch deſcending to the Natural Parts.

THeſe things being thus finiſhed and conſidered, the Guts ſhould be pulled away; but ſeeing that if we ſhould do ſo, we ſhould diſturb and loſe the diviſion of the Artery deſcending to the Natural Parts; therefore I have thought it better to handle the diviſion thereof, before the Guts be pluckt away. Therefore we muſt ſuppoſe, according to *Galens* opinion, that as all the Veins come from the Liver, ſo all Arteries proceed from the Heart. This preſently at the beginning is divided into two branches, the greater whereof deſcends downwards to the Natural Parts upon the Spine of the Back, taking its beginning at the fifth *Vertebra* thereof from whence it goes into the following Arteries. The firſt, called the Intercoſtal, runs amongſt the intercoſtal Muſcles, and the diſtances of the Ribs and Spinal Marrow, through the perforation of the Nerves on the right and left hand from the fifth true, even to the laſt of the Baſtard Ribs.

The original of Arteries. The diviſion of the great deſcendent Artery, is into theſe;

1. *Arteria intercoſtalis.*

This in going this progreſs makes ſeven little branchings, diſtributed after the forementioned manner, and going forth of the trunk of the deſcendent over againſt each of the intercoſtal Muſcles.

2. *Phrenica.*

The ſecond being parted into two, goes on each ſide to the Midriff, whence it may be called, or expreſſed by the name of the *Diaphragmatica*, or *Phrenica*, (*i.*) the Midriff Artery. The third being of a large proportion, ariſing from the upper part of the Artery, preſently after it hath paſſed the Midriff, is divided into two notable branches, whereof one goes to the Stomach, Spleen, Kall, to the hollow part of the Liver and the Gall; the other is ſent forth to the Meſentery and Guts after the ſame manner, as we ſaid of the Meſeraick Vein, wherefore it is called the *Cœliaca*, or Stomach Artery. But we muſt note, all their mouths penetrate even to the innermoſt Coat of the Guts, that by that means they may the better and more eaſily attract the *Chylus* contained in them.

3. *Cœliaca.*

The fourth carried to the Reins, where it is named the Reignal or Emulgent, becauſe it ſucks fit matter from the whole maſs of bloud.

4. *Emulgent.*

The fifth is ſent to the Teſticles with the preparing Spermatick-veins, whence alſo it is named the ſpermatick Artery, which ariſes on the right ſide, from the very Trunk of the deſcendent Artery; that it may aſſociate the ſpermatick Vein of the ſame ſide, they run one above another, beneath the hollow Vein; wherefore we muſt have a great care whileſt we labour to lay it open, that we do not hurt and break it.

5. *Spermatica.*

The ſixth going from the fore and upper part of this deſcendent Artery, deſcends with the Hæmorrhoidal Veins to the Fundament; preſently from his beginning, ſending forth certain branches alongſt the Colick Gut, which by *Anaſtomoſis* are united with other branches of the *Cœliacal* Artery; for whoſoever ſhall look more attentively, he ſhall often obſerve that Veins are ſo united amongſt themſelves, and alſo Arteries, and ſometimes alſo the Veins with the Arteries. For *Anaſtomoſis* is a communion and a communicating of the Veſſels amongſt themſelves by the application of their mouths, that ſo by mutual ſupplies they may eaſe each others defect. But they call this the lower Meſeraick Artery.

6. *Hæmorrhoidalis ſeu meſenterica inferior.*

The

The ſeventh proceeding from the trunk with ſo many branches as there be *Vertebra's* in the loins, goes to the loins, and the parts belonging to them, that is the ſpinal marrow of that part, and other parts encompaſſing theſe *Vertebraes*, whereupon it is ſtiled the *Lumbaris*, or Loin-Artery. 7. *Lumbaris.*

The Seventh Figure of the lower Belly.

The eighth maketh the Iliack Artery, untill ſuch time as it departs from the *Peritonæum* where the Crural Arteries take their original. This Iliack Artery ſends many divarications towards the Holy bone where it takes its beginning, and to the places lying near the Holy bone, which, becauſe they run the ſame courſe as the Iliack Veins, for brevities ſake we will let paſs further mention of them till we come to treat of the Iliack Veins. 8. *Iliaca.*

CHAP. XXII.

Of the diſtribution of the Nerves to the Natural parts.

IT remains that before the bowels be taken away, we ſhew the Nerves ſent to the entrails and Natural parts, that as wiſe and provident men we may ſeem to have omitted nothing. Firſt we muſt know that theſe Nerves are of the ſixth Conjugation, which deſcend as well to the ſtomach all alongſt the Gullet, and the ſides thereof, as thoſe at the roots of the ribs on both ſides within. But when they are paſſed through the Midriff, thoſe which are diſtributed amongſt the Natural parts follow the turnings of the Veins and Arteries, but ſpecially of the Arteries. Wherefore if you have a mind to follow this diſtribution of the Nerves, you muſt chiefly look for it in thoſe places, in which the Artery is diſtributed amongſt the Guts above the Loins. The Original of the Nerves which are carried to the Natural parts.

Theſe Nerves are but ſmall, becauſe the parts ſerving for nutrition, needed none but little Nerves for the performance of the third duty of Nerves, which is in the diſcerning and knowing of what is troubleſom to them. For unleſs they had this ſenſe, there is nothing would hinder, but theſe bowels, neceſſary for life, being poſſeſſed with ſome hurtful thing, the Creature ſhould preſently fall down dead; but we have this benefit by this ſenſe, that as ſoon as any thing troubles and vellicates the bowels, we being admoniſhed thereof, may look for help in time. Their Magnitude and Uſe.

And beſides, if they were deſtitute of this ſenſe, they might be gnawn, ulcerated, and putrified by the raging acrimony of the excrements falling into, and ſtaying in them; but now (by means hereof) as ſoon as they find themſelves pricked or plucked, preſently by the expulſive faculty they endeavour to expel that which is troubleſom, and ſo free themſelves of preſent and future dangers.

CHAP. XXIII.

The manner of taking out the Guts.

WHen the Guts are to be taken out, you muſt begin with the right Gut. And you muſt divide it, being firſt ſtraitly tied in two different places, at a juſt diſtance about four fingers from the end, with a ſharp knife between two ligatures. Then you muſt ſhew its proper Coats and Fibres, and that common one which it hath from the *Peritonæum*. This being done, you muſt in like manner bind the trunk of the Gate-vein as neer the original as you can; that ſo all his branches being in like manner tied, there may be no fear of effuſion of bloud: you muſt do the like with the Cœliack Artery at the left Kidney, and in the lower Meſenterick, which deſcends to the right Gut with Hemorrhoidal Veins. This being done pull away the Guts even to the *Duodenum*, which being in like manner tied in two places, which ought to be below the inſertion of the *Porus Cholagogus*, or paſſage of the Gall, that you may ſhew the oblique inſertion thereof into that Gut; for the obliquity of its inſertion is worth obſervation, as that which is the cauſe that the Gall cannot flow back into its bladder by the compreſſion of this Gut from below upwards. Then all theſe windings of the Guts may be taken away from the body.

CHAP. XXIV.

The Original and Diſtribution of the deſcendent Hollow Vein.

The original of the Hollow Vein. It is divided into two Trunks.

BEcauſe the reſt of the natural parts, do almoſt all depend upon the deſcendent Hollow Vein, therefore before we go any further, we will ſhew its Original and Diſtribution. We ſaid before that all Veins proceeded from the Liver, but yet in divers places. For the Gate-vein goes out of the hollow part, and the Hollow Vein out of the gibbous part of the Liver, which going forth like the body of a Tree, is divided into two great branches; the leſſer of which goes to the Vital and Animal parts, and the extremities of theſe parts, as we ſhall ſhew in their place. The greater, deſcending from the back part of the Liver above the *Vertebraes* of the Loins to the parts beneath, goes in the manner following. The firſt diviſion thereof is to the membranes of the Reins, which come from the *Peritonæum*. Wherefore there it produces the *Venæ adipoſæ*, or fatty Veins, ſo called, becauſe they bring forth a great quantity of fat in thoſe places; Of theſe fatty Veins there is a diverſe original; for the right doth oftentimes ariſe from the right emulgent, becauſe it is higher; but the leſs comes from the very trunk of the Hollow Vein, becauſe the emulgent on that ſide is lower; and you ſhall ſcarce ſee it otherwiſe.

The diviſion of the greater branch of the Hollow Vein.

1. *Adipoſa.*

2. *Emulgens.*

The ſecond, being the Kidney or Emulgent Veins, go to the Reins, which, at their entrance, or a little before, is divided into two branches, like as the Artery is, the one higher, the other lower, and theſe again into many other through the ſubſtance of the Kidneys, as you may learn better by Ocular Inſpection than by Book. They are thick and broad, that the ſerous humour may without impediment have freer paſſage. Their original is different; for the right emulgent oftentimes comes forth of the Hollow Vein ſomewhat higher than the left; that ſeeing their office and duty is to purge the maſs of bloud from the cholerick and ſerous humour, that if any part thereof ſlide by the one, it may not ſo ſcape, but fall as it were into the other. Which certainly would not have happened if they had been placed the one juſt oppoſite to the other. For the ſerous or wheyiſh humour would have ſtaid as equally ballanced, or poiſed, by reaſon of the contrariety of the action, and traction or drawing thereof. But we muſt remember, that in diſſecting of Bodies, I hove oftentimes found in ſuch as have been troubled with the Stone, ſeven emulgent Veins, and ſo many Arteries; four from the left ſide coming from divers places, of which the laſt came from the Iliack; three from the right hand likewiſe in divers places.

3. *Spermatica.*

The third diviſion is called the Spermatick or Seed Vein, it goes to the Teſticles; the original thereof is thus; that the right ariſes on the fore-part of the trunk of the Hollow Vein; but the left moſt commonly from the emulgent. Beſides, you ſhall ſometimes find that theſe have companions with them, to the right emulgent; but to the left, another from the Hollow Vein; in ſome but on one ſide, in others on both. But alſo I have ſometimes obſerved the left emulgent to proceed from the Spermatick or Seed Vein.

4. *Lumbaris.*

The fourth, becauſe it goes to the Loins, is called *Lumbaris*; which in his original and inſertion is wholly like the Artery of the Loins. But there are four *Lumbares* or Loin Veins on each ſide, that is, one in each of the four ſpaces of the five *Vertebraes* of the Loins.

5. *Iliacæ*, which are divided into,

1. *Muſculoſæ.*

2. *Sacræ.*

The fifth diviſion makes the *Iliacæ*, until, paſſing through the *Peritonæum*, they take the names of Crural Veins: Theſe are firſt divided into the Muſculous, ſo called, becauſe they go to the oblique aſcendent and tranſverſe Muſcles, and to the *Peritonæum*. Sometimes they have their original from the end of the Trunk. And the ſame *Iliacæ* are divided into the *Sacræ*, or Holy; which go the ſpinal marrow of the Holy bone through thoſe holes, by which the Nerves generated of this marrow, have their paſſage.

Thirdly,

Thirdly, The *Iliacæ* are divided into the *Hypogaſtricæ*, ſo called becauſe they are diſtributed to all the parts of the *Hypogaſtrium*, or lower part of the lower belly, as to the right Gut, the muſcles thereof, the muſculous skin (in which place they often make the external Hemorrhoidal, ordained for the purging of ſuch bloud as offends in quantity, as thoſe other, [that is, the inward Hemorrhoidal] which deſcend from the right Gut from the Gate-vein by the ſpleenick branch, ſerves for cleanſing that which offends in quality,) to the Bladder and the neck thereof, even to the end of the Yard, to the Womb, and even to the neck of the Womb and utmoſt part of the Privities, from whence it is likely the Courſes break forth in Women with Child and Virgins. But this ſame Vein alſo ſends a portion without the *Epigaſtrium* by that perforation which is common to the Share and Haunch-bones, which, ſtrengthened by the meeting of the other internal Crural Vein, deſcends even to the Ham; but in the mean time, by the way, it is communicated to the muſcles of the Thigh, called *Obturatores*, and other parts within. 3 *Hypogaſtricæ, which produce the Hæmorrhoidales externæ.*

Fourthly, The *Iliacæ* produce the *Epigaſtricæ*, which on both ſides from below aſcend according to the length of the right muſcles, ſpreading alſo by the way ſome branches to the oblique and tranſverſe muſcles, and alſo to the *Peritonæum*. 4 *Epigaſtricæ.*

Fifthly, Theſe *Iliacæ* produce the *Pudendæ*, or Veins of the Privities; becauſe they go in Women to their Privities, and in men to the Cods; where they enter that fleſhy Coat filled with Veins, and going to the skin of the Yard they take their beginning under the *Hypogaſtricæ*. 5. *Pudendæ.*

CHAP. XXV.

Of the Kidneys or Reins.

NOw follow the Kidneys, which that they may be more eaſily ſeen, (after that you have diligently obſerved their ſituation) you ſhall deſpoil of their fat, if they have any about them, as alſo of the membrane they have from the *Peritonæum*. Firſt, You ſhall ſhew all their conditions, beginning at their ſubſtance.

The Nineth and Tenth Figure of the Veſſels of Seed and Urine.

The ſubſtance of the Kidneys is fleſhy, denſe, and ſolid, leſt they ſhould be hurt by the ſharpneſs of the Urine. Their magnitude is large enough, as you may ſee. Their figure is ſomewhat long and *Their Subſtance.*

Magnitude. Figure. and round, almoſt reſembling a ſemicircle, and they are lightly flatted above and below. They are partly hollow and partly gibbous; the hollow lies next the hollow Vein, and on this ſide they receive the emulgent Veins and Arteries, and ſend forth the Ureters; their gibbous part lies towards the loins.

Compoſition. They are compoſed of a coat coming from the *Peritonæum*; their own peculiar fleſh, with the effuſion of bloud about the proper Veſſels, (as happens alſo in other entrails) generates a ſmall Nerve, which ſpringing from the Coſtal of the ſixth Conjugation, is diffuſed to each Kidney on his ſide into the coat of the Kidney it ſelf, although others think it always accompanies the Vein and Artery.

But *Fallopius*, that moſt diligent Author of Anatomy hath obſerved that this Nerve is not onely oftentimes divaricated into the coat of the Kidneys, but alſo pierces into their ſubſtance.

Number. Site. They are two in number, that if the one of them ſhould by chance be hurt, the other might ſupply thoſe neceſſities of Nature for which the Kidneys are made. They lie upon the loins at the ſides of the great Veſſels, on which they depend by their proper Veins and Arteries, and they ſtick to them as it were, by a certain ſecond coat, leſt that they might be ſhaken by any violent motions. Wherefore we may ſay that the Kidneys have two coats, one proper adhering to their ſubſtance, the other, as it were, coming from the *Peritonæum* on that part they ſtick to it. The right Kidney is almoſt always the higher, for thoſe reaſons I gave, ſpeaking of the original of the emulgent Veſſels. *Columbus* ſeems to think the contrary; but ſuch like controverſies may be quickly decided by the Eye.

Connexion. They have connexion with the principal Veſſels by the Veins, Nerves, and Arteries; by the Coats with the Loins and other parts of the lower Belly, but eſpecially with the Bladder by the Ureters.

Temper. Action. They are of a hot and moiſt temper, as all fleſhy parts are. Their action is to cleanſe the Maſs of the Bloud from the greater part of the ſerous and cholerick humour. I ſaid the greater part, becauſe it is needful that ſome portion thereof ſhould go with the alimentary bloud to the ſolid parts, to ſerve in ſtead of a vehicle, leſt otherwiſe it ſhould be too thick.

Their Strainer. Beſides, you muſt note, that in each Kidney there is a cavity bounded by a certain membrane, encompaſſed by the diviſion of the emulgent Veins and Arteries through which the Urine is ſtrained partly by the expulſive faculty of the Kidneys, partly by the attractive of the Ureters which run through the ſubſtance of the Kidneys on the hollow ſide, no otherwiſe than the *Porus cholagogus* through the body of the Liver.

CHAP. XXVI.

Of the Spermatick Veſſels.

Ureters. NOw we ſhould have ſpoken of the Ureters, becauſe, as we ſaid before, they are paſſages derived from the Kidneys to carry the Urine to the Bladder. But, becauſe they cannot be diſtinguiſhed and ſhewed, unleſs by the corrupting and vitiating the ſite of the ſpermatick Veſſels, therefore I have thought it better to paſs to the Explication of all the ſpermatick parts.

And firſt of all you muſt gently ſeparate them, (that ſo the Declaration of them may be more eaſie and manifeſt) and that from the coat which comes from the *Peritonæum*, and the fat which inveſts them even to the Share-bone, having diligently conſidered their ſite, before you ſeparate them.

Their Subſtance. Quantity. Then you ſhall teach that the ſubſtance of theſe Veſſels is like to that of the Veins and Arteries. Their quantity is ſmall in thickneſs, but of an indifferent length, by reaſon of the diſtance of their original from the Teſticles. They are longer in Men than in Women, becauſe theſe have their Teſticles hanging without their Belly, but Women have them lying hid within their Belly.

Figure and Compoſure. Their figure and compoſure is wholly like the figure and compoſition of the Veins and Arteries, except in this one thing, that from that place where they go forth of the great capacity of the *Peritonæum*, they are turned into many intricate windings, like crooked ſwoln Veins, even to the Teſticle; That the ſpermatick matter in that one Tract, which yet is no other than bloud, may be prepared to concoction, or rather be turned into Seed in theſe Veſſels, by the irradiation of the faculty of the Teſticles.

Number. Theſe Veſſels are ſix in number, four preparing, and two ejaculatory, of which we will ſpeak hereafter. Therefore on each ſide there be two preparing Veſſels, that is, a Vein and an Artery, ariſing as we told you when we ſpoke of the diſtribution of the hollow Vein.

Site. They are inſerted into the Teſticles through that coat which we call *Epididymis*, others *Dartos*. Their ſite is oblique above the Loins and Flanks, whileſt they run down between the ends of the Share and Haunch-bone, they are knit to the parts lying under them, both by certain Fibers which they ſend from them, as alſo by the membrane they have from the *Peritonæum*. They have like temperature as the Veins and Arteries have. Their action is to carry bloud to the Teſticles for generating of Seed.

CHAP. XXVII.

Of the Teſticles, or Stones.

Their Subſtance. Magnitude and Figure. Compoſition. THe Teſticles are of a Glandulous, white, ſoft and looſe ſubſtance, that ſo they may the more eaſily receive the ſpermatick matter: their magnitude and figure equal, and reſemble a ſmall Pullets Egg ſomewhat flatted; their compoſure is of Veins, Arteries, Coats, and their proper fleſh. Their Veins and Arteries proceed from the ſpermatick Veſſels, their Nerves, from the ſixth Conjugation, by the roots of the Ribs, and out of the Holy-bone. They are wrapped in four Coats, two whereof are common, and two proper. The common, are the *Scrotum* or skin

skin of the Cods, proceeding from the true skin; and the fleshy Coat, which consists of the fleshy Pannicle in that place receiving a great number of Vessels, through which occasion it is so called. The proper Coats are first the *Erythrois* arising from the process of the *Peritonæum*, going into the *Scrotum* together with the spermatick Vessels, which it involves and covers; this appears red both by reason of the Vessels, as also of the Cremaster-muscles of the Testicles; then the *Epididymis* or *Dartos* which takes its original of the membrane of the spermatick preparing Vessels. The flesh of the Testicles, is as it were, a certain effusion of matter about the Vessels, as we said of other entrails. But you must observe, that the *Erythrois* encompasses the whole Stone, except its head, in which place it strikes to the *Epididymis*, which is continued through the whole substance of the Testicle. This *Epididymis* or *Dartos* was therefore put about the Stones, because the Testicles of themselves are loose, spongious, cavernous and soft, so that they cannot safely be joined to the spermatick Vessels, which are hard and strong. Wherefore Nature, that it might join extreams by a fit *Medium*, or mean, formed this Coat *Epididymis*. This is scarce apparent in Women by reason of its smalness. The two forementioned common Coats, adhere or stick together by the Vessels not onely amongst themselves, but also with the *Erythrois*. You must besides observe, the Cremaster-muscles are of the said substance with other muscles, small and thin, of an oblique and broad figure, arising from the membrane of the *Peritonæum*, which (as we said before) assumes flesh from the flanks. Their composition is like other muscles. They are two, on each side one. They are situate from the ends of the Flanks even to the Stones. They have connexion with the process of the *Peritonæum* and Testicles. Their temper is like that of other muscles. Their action is to hang and draw up the Testicles towards the Belly, whence they are called hanging muscles. The Testicles are most commonly two in number, on each side one; sometimes there be three, sometimes one alone; as it happens also in the Kidneys, for some have but one Kidney. They lie hid in the *Scrotum* at the very roots of the Share-bone, connexed to the principal parts of their Vessels, with the neck of the Bladder and Yard; but by their Coats they adhere to the parts from whence they have them. They are of a cold and moist temper, because they are glandulous; although they may be hot by accident, by reason of the multitude of the Vessels flowing thither. Those whose Testicles are more hot, are prompt to Venery, and have their Privities and adjacent parts very hairy; and besides, their Testicles are very large and compact. Those on the contrary that have them cold, are slow to Venery, neither do they beget many children, and those they get, are rather female than male; their Privities have little hair upon them, and their Testicles are small, soft, and flat. The action of the Testicle is to generate Seed, to corroborate all the parts of the Body, and by a certain manly irradiation to breed or increase a true masculine courage. This you may know by Eunuchs, or such as are gelt, who are of a womanish nature, and are oftentimes more tender and weak than Women. As *Hippocrates* teaches by example of the *Scythians*, *Lib. De Aere, Locis & Aquis.*

The Coat *Erythrois.*

The *Epididymis*, or *Dartos.*

The Cremaster muscles.

Temper.

Action.

CHAP. XXVIII.

Of the Varicous Bodies or Parastates, *and of the ejaculatory Vessels, and the glandulous or* Prostates.

THe Varicous *Parastatæ* are nervous and white bodies, like as the nerves, wound and close woven amongst themselves; they are stretched even from the top to the bottom of the Testicles, from whence presently by their departure they produce the *Vasa ejaculatoria*, or leading Vessels. But unless we do very well distinguish their names, they shall scarce shun confusion. For that which I call *Parastatæ*, that is, as it were the head of the Testicle, being, as it were, like another Stone, is called *Epididymis* by *Galen*, *l.* 1. *De Semine*. But I, by the example and authority of many Anatomists, understand by the *Epididymis* the proper Coat of the Testicles, of which thing I thought good by the way to admonish you of. Their Action is, by their crooked passages to hinder the Seed from departing out of the preparing into the leading Vessels, before it shall be most perfectly laboured and concocted in these Vessels by the power and force of the Testicles. For in the first windings the bloud looks pure, but in the last it is not so red, but somewhat whitish. For Nature commonly doth thus delay the matter in its passage, either by straitness or obliquity, which it desires to make more perfect and elaborate by any new concoction; this we may learn by the foldings of the *Rete mirabile*, the windings in the Guts, the wrinkles in the bottom of the Stomach, the straitness of the *Pylorus*, the Capillary Veins dispersed through the body of the Liver; Certainly Nature hath intended some such thing in the making of the spermatick Vessels. Their quantity is visible, and figure round, tending somewhat to sharpness. They are composed of Veins, Nerves, and Arteries, which they enjoy from the Vessels of the Testicles, from the *Epididymis*, or the Coat, from the *Peritonæum*, and their proper substance. Their temper is cold and dry. They be two in number, one to each Testicle. But these Varicous bodies are called *Parastatæ*, Assisters, because they superficially assist, and are knit to the Testicles according to their length, or long ways. Out of the *Parastatæ* proceed the *Vasa ejaculatoria*, or leading Vessels, being of the same substance as their Progenitors, that is, solid, white, and as it were nervous. Their quantity is indifferent, their figure round and hollow, that the Seed may have a free passage through them, yet they seem not to be perforated by any manifest passage, unless by chance in such as have had a long *Gonorrhœa*. They have like temper as the *Parastates*, between which and the *Prostates* they are seated, immediately knit with them both, as both in the Coat, and the other Vessels with the parts from whence they take them.

Their Substance.

Here the Author speaks otherwise than *Galen*.

Their Action.

Their Quantity, Figure and Composure.

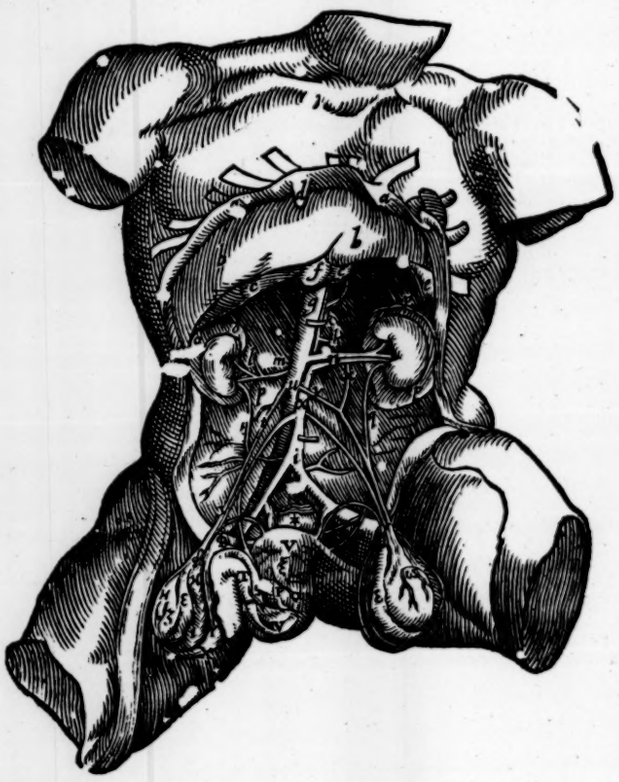
Their temper and number.

Vasa ejaculatoria, the ejaculatory or leading Vessels.

But we must note, that such like Vessels coming out of the *Parastates* ascend from the bottom of the Stones even to the top, in which place meeting with the preparing Vessels, they rise into the Belly by the same passages, and bind themselves together by nervous fibres, even to the inner capacity

capacity of the belly; from whence turning back, they forſake the preparing, that ſo they may run to the bottom of the Share-bone, into the midſt of two glandulous bodies, which they call *Proſtates* ſituate at the neck of the bladder, that there meeting together, they may grow into one paſſage,

The Tenth Figure, wherein thoſe things ſhewed in the former Figure, are more exactly ſet forth.



a a *A part of the Midriff, and of the* Peritonæum *with the ribs broken.*
bb cc *The convex or gibbous part of the liver marked with* bb, *the hollow or concavous part with* cc.
d e *The right and left ligaments of the Liver.*
f *The trunk of the gate-vein.*
g *The trunk of the hollow vein.*
h l *The fatty veins, both left and right.*
i *The aſcent of the great Artery above the hollow vein, and the diviſion thereof.*
k *The* Cœliacal *Artery.*
m n *The emulgent Veſſels.*
oo pp *The fat tunicles or coats torn from both the Kidneys.*
qq *The Ureters that go unto the Bladder.*
t u *The right ſpermatical Vein which ariſeth near to* u.
x y *The double original of the left ſpermatical Vein.*
x *From the Emulgent.*
y *From the hollow vein.*
α *The original of the ſpermatical Arteries.*
ß *Certain branches from the ſpermatick Arteries which run unto the* Peritonæum. γ *The paſſage of the ſpermatical Veſſels through the productions of the* Peritonæum, *which muſt be obſerved by ſuch as uſe to cut for the Rupture.* δ *The ſtiry bodden Hidie's entrance into the teſticle, it is called* Corpus varicoſum pyramidale. ε *The* Paraſtatæ. ζ *The Stone or Teſticle covered with his inmoſt coat.* η *The deſcendent of the leading Veſſel called* Vas deferens. V V *The Bladder.* * *The right Gut.* ξ *The Glandules, called* Proſtatæ, *into which the leading Veſſels are inſerted.* ρ *The muſcle of the Bladder.* σ τ υ *Two bodies of the Yard,* σ *and* τ *and* υ *his Veſſels.* Φ χ *The coat of the Teſticle.* ⏚ ω *The muſcle of the Teſticle* ⏚, *his Veſſels* ω.

For thus of three paſſages, that is of the two leading Veſſels, and one paſſage of the Bladder, there is one common, one in men for the caſting forth of Seed and Urine. A Caruncle riſing like a Creſt at the beginning of the neck of the Bladder, argues this uniting of the paſſages, which receiving this ſame paſſage which is ſufficiently large, is oft-times taken by ſuch as are ignorant in Anatomy for an unnatural Caruncle, then eſpecially when it is ſwollen through any occaſion. Theſe leading Veſſels are two in number, on each ſide one. Their action is to convey the Seed made by the Teſticles to the Proſtates, and ſo to the neck of the Bladder, ſo to be caſt forth at the common paſſage. But if any ask whether that common paſſage made by the two leading Veſſels between the glandulous Bodies be ſo obvious to ſenſe or no: We anſwer, it is not manifeſt, though reaſon compel us to confeſs that that way is perforated by reaſon of the ſpermatick, groſs, and viſcous matter carried that way. But peradventure the reaſon why that paſſage cannot be ſeen, is, becauſe in a dead carkaſs all ſmall paſſages are cloſed and hid, the heat and ſpirits being gone; and the great appear much leſs, by reaſon all the perforations fade, and fall into themſelves. Yet certainly theſe paſſages muſt needs be very ſtrait even in a living Man, ſeeing that in a dead they will not admit the point of a needle. Wherefore we need not fear, leſt in ſearching, whileſt we thruſt the *Catheter* into the Bladder, it penetrate into the common paſſage of the leading Veſſels which runs within the Caruncle, unleſs peradventure by ſome chance, as a *Gonorrhœa*, or ſome great *Phlegmon*, it be much dilated beſides Nature. For I have ſometimes ſeen ſuch paſſages ſo open, that they would receive the head of a Spathern; which thing ſhould admoniſh us, that in ſearching we take great care that we do not raſhly hurt this Caruncle; for being ſomewhat raſhly handled with a *Catheter*, it caſts forth bloud, eſpecially if it be inflamed. But alſo the concourſe of the ſpirits flowing with great violence together with the Seed, much helps forward ſuch ejaculation thereof performed through theſe ſtrait paſſages by the power of the imaginative faculty in the Act of Generation.

Their Number and Action.

This Caruncle muſt be obſerved and diſtinguiſhed from a *Hyperſarcoſis* or fleſhy excreſcence.

After the leading Veſſels, follow the *Proſtatæ*, being glandulous Bodies of the ſame ſubſtance and temper that other Glandules are. Their quantity is large enough, their figure round, and ſomewhat long, ſending forth on each ſide a ſoft production of an indifferent length. They are compoſed of Veins, Nerves, Arteries, a coat (which they have from the neighbouring parts) and laſtly their proper fleſh, which they have from their firſt conformation. They are two in number, ſituate at the root of the neck of the Bladder, ſomewhat ſtraitly bound or tied to the ſame, to the leading

The *Proſtatæ*. Their quantity and figure.

Number and ſite.

Veſſels

Veſſels, and the parts annexed to them. But always obſerve, that every part which enjoys nouriſhment, life, and ſenſe, either firſt or laſt, hath connexion with the principal parts of the Body, by the intercourſe of the Veſſels which they receive from thence. An Anatomical Axiom.

The uſe of the Proſtates is to receive in their proper body the ſeed laboured in the Teſticles, and to contain it there, until it be troubleſom either in quantity or quality, or both. Beſides, they contain a certain oily and viſcid humour in their glandulous body, that continually diſtilling into the paſſage of the Urine, it may preſerve it from the acrimony and ſharpneſs thereof. But we have obſerved alſo on each ſide other Glandules, which *Rondeletius* calls *Appendices Glanduloſæ*, glandulous dependences to ariſe from theſe Proſtates, in which alſo there is ſeed reſerved. Their uſes. *Rond. in method. ad morbos.*

CHAP. XXIX.

Of the Ureters.

NOw it ſeems fit to ſpeak of the Ureters, Bladder, and parts belonging to the Bladder. Therefore the Ureters are of a ſpermatick, white, denſe, and ſolid ſubſtance, of an indifferent bigneſs in length and thickneſs. Their Figure is round and hollow. They are compoſed of two Coats, one proper conſiſting of right and tranſverſe Fibres which comes from the emulgent Veins and Arteries; the other common, from the *Peritonæum*; beſides, they have Veins, Nerves, and Arteries, from the neighbouring parts. The ſubſtance, magnitude, figure and compoſure of the Ureters.

They be two in number, on each ſide one; they are ſituate between the Kidnies (out of whoſe hollow part they proceed) and the Bladder. But the manner how the Ureters inſert or enter themſelves into the Bladder, and the *Porus Cholagogus* into the *Duodenum*, exceeds admiration; for the Ureters are not directly but obliquely implanted near the orifice of the Bladder, and penetrate into the inner ſpace thereof; for within they do, as it were, divide the membrane, or membranous Coat of the body of the Bladder, and inſinuate themſelves into that, as though it were double. But this is opened at the entrance of the Urine, but ſhut at other times, the cover, as it were falling upon it, ſo that the humour which is fallen into the capacity of the Bladder, cannot be forced or driven back; no not ſo much as the Air blown into it can come this way out, as we ſee in Swines Bladders blown up and filled with Air. Number and Site.

For we ſee it is the Air contained in theſe which fills them thuss neither can it be preſſed forth but with extraordinary force.

For as this Skin or Coat turned in by the force of the humour gives way, ſo it being preſſed out by the body contained within, thruſts its whole body into the paſſage as a ſtopple; like to this, is the inſertion of the *Porus Cholagogus* into the Guts.

The Ureters have connexion with the above-mentioned parts, with the muſcles of the Loins, upon which they run from the Kidneys to the Bladder. Connexion.

Wherefore nothing hinders, but that the ſtone ſliding through the Ureters into the Bladder, may ſtupifie the Thigh as much as it did when it was in the Kidney. They are of a cold and dry temper.

Their uſe is, to ſerve as paſſages or channels, for carrying the Urine into the Bladder. Temper and uſe.

CHAP. XXX.

Of the Bladder.

THe Bladder is of the ſame ſubſtance that the Ureters, that is, nervous, that ſo it may be the more eaſily dilated. The ſubſtance

It is of a large proportion, in ſome bigger, in ſome leſs, according to the difference of Age and habit of body. It is of a round Figure, and as it were, Pyramidal. Figure.

It is compoſed of two Coats, one proper, which is very thick and ſtrong, compoſed of the three ſorts of Fibres, that is, in the inner ſide of the direct, without of the tranſverſe, and in the midſt of the oblique. The other common Coat coming from the *Peritonæum*, hath Veins and Arteries on each ſide one, from the *Hypogaſtrick* Veſſels above the Holy bone; alſo it hath Nerves on each ſide from the ſixth conjugation mixt with the Nerves of the Holy bone. For theſe Nerves deſcend from the Brain even to the end of the Holy bone. Compoſition.

It is but one, and that ſituate in men in the lower belly upon the right Gut, and below the Share-bone; but in Women between the Womb and that bone, to which it cleaves with his membranous ligaments, as it doth to the Yard by its neck, and to the right gut by its common Coat and proper Veſſels. It is of a cold and dry temper.

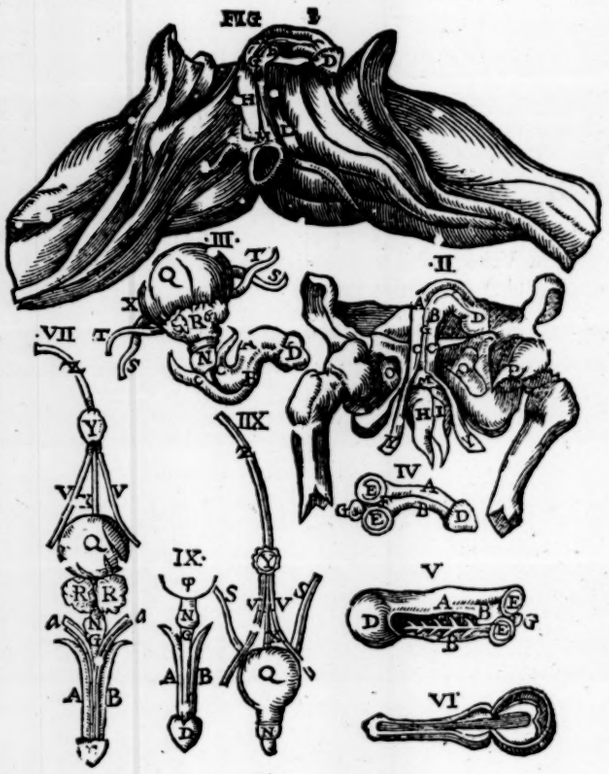
The uſe and action thereof is by the Fibers continually to draw the Urine, and contain it as long as need requires, and then to expel it by the neck, partly by compreſſion either of it ſelf, or rather to the muſcles of the *Epigaſtrium* and Midriff; becauſe this motion, ſeeing it is voluntary, cannot be performed unleſs by a muſcle which the Bladder wants; partly by the dilatation and relaxation of the Sphincter muſcle compoſed of tranſverſe Fibers, like the Sphincter of the Fundament, after the ſame manner to ſhut up the orifice of the Bladder, that the Urine flow not out againſt our will. But the Bladder, as it fills, is dilated; but as it is emptied, it is contracted like a purſe. You may eaſily obſerve this muſcle in a Sows bladder: it is ſtretched from the orifice of the Bladder, and beginning of the Urinary paſſage even to the Privities in Women; but in Men it is terminated in the *Peritonæum* as ſoon as it hath left the right Gut. Beſides, this muſcle is thus far Temper, uſe or action. The ſphincter of the Bladder.

ſtretched

ſtretched forth, that the Urine by its compreſſion ſhould be wholly preſſed out of the Bladder, which by too long ſtay would by its acrimony do ſome harm. This is the common opinion of Anatomiſts concerning the Sphincter of the Bladder, which nevertheleſs *Fallopius* allows not of. For (ſaith he) if this muſcle ſhould be ſituate beneath the glandulous bodies, the Seed in copulation could never be caſt forth without ſome ſmall quantity of Urine. Wherefore he thinks that this muſcle is ſituate above the *Proſtates*, and that it is nothing elſe but the beginning of the neck of the Bladder, which becomes more fleſhy whileſt it is woven with tranſverſe fibers.

The Eleventh Figure of the Bladder and Yard.

AB 1 2 3 4 5 7 9 *The two bodies which make the Yard.*
CC 2 3 *The place where theſe two bodies do firſt ariſe.*
D 1 2 3 4 5 7 9 *The Nut of the Yard, called* Glans Penis.
EE 4 5 *The fungous and red ſubſtance of the bodies of the Yard.*
F 4 5 *The mutual connexion of the bodies of the Yard, and the nervous outward ſubſtance of the ſame, compaſſing round about the former fungous ſubſtance.*
G 1 2 3 4 5 7 9 *The paſſage of the Urine, or common Pipe, running under the Yard all along his length.*
HI 1 2 *The firſt pair of Muſcles of the Yard, which in the firſt Figure do yet grow to it, but in the ſecond they hang from their original.*
KL 1 2 *The ſecond pair of Muſcles of the Yard, in the firſt Figure, growing; in the ſecond, hanging from their inſertion.*
M 1 2 *The Sphincter of the right Gut.*
N 3 7 8 9 *The round Sphincter-muſcle of the bladder.*
OO *A Membrane which is over the holes of the Share-bone.*



P 2 *A round Ligament from the meeting of the Share-bones on the head of the thigh.* Q 3 7 8 *The body of the Bladder.* RR 3 7 *The* Proſtatæ, *which into Seed when it is perfectly laboured, is led.* SS 3 8 *Portions of the Ureters.* TT*3 *Portions of the Veſſels which lead down the ſeed.* VV 7 8 *The Umbilical Arteries.* X 7 8 *The Ligament of the Bladder called* Urachus. Y 7 8 *The Navel or Umbilicus.* Z 7 8 *The Umbilical Vein.* aa 7 *The Vein and Artery of the Yard.* b 5 *The Artery diſtributed through the body of the Yard.*

The neck of the Bladder.

For the neck of the Bladder: it differs nothing in ſubſtance, compoſure, number, and temper from the Bladder, but onely in quantity, which is neither ſo large, nor round in Figure, but ſomewhat long together with the Yard, repreſenting the ſhape of the letter S. It is placed in men at the end of the right Gut and *Peritonæum*, riſing upwards even to the roots of the Yard, and with it bending it ſelf downwards; in Women it is ſhort, broad, and ſtreight, ending at the orifice of the neck of the Womb between the nervous bodies of the *Nymphæ*.

The connexion and uſe thereof.

In men it hath connexion with the Bladder, the ejaculatory Veſſels, the right Gut and Yard, but in Women onely with the neck of the Womb and Privities. The uſe of it is in Men to caſt forth Seed and Urine, in Women onely Urine. But we muſt note that the Share-bones muſt be divided and pulled aſunder in that part where they are joined, that ſo you may the more exactly obſerve the ſituation of theſe parts. Beſides you muſt note, that by the *Peritonæum*, we underſtand nothing elſe, in Men and Women, than that ſpace which is from the Fundament to the Privities, in which the ſeam is called *Taurus*.

CHAP. XXXI.

Of the Yard.

The ſubſtance, quantity and figure of the Yard.

NOw follows the declaration of the privy parts of Men and Women; and firſt we will treat of Mens. The Yard is of a ligamentous ſubſtance, becauſe it hath its original from bones; it is of an indifferent magnitude in all dimenſions, yet in ſome bigger, in ſome leſs; the Figure of it is round, but yet ſomewhat flatted above and beneath.

Compoſure.

It is compoſed of a double Coat, Nerves, Veins, Arteries, two Ligaments, the paſſage of the Urine, and four Muſcles. It hath its Coats both from the true Skin, as alſo from the fleſhy Pannicle; but the

the Veins and Arteries from thoſe of the lower part of the lower belly which run on the lower part of the Holy-bone into the Yard, as the ſeminary Veſſels run on the upper part.

The ligaments of the Yard proceed on both ſides from the ſides and lower commiſſure of the Share-bones; wherefore the Yard is immediately at his root furniſhed with a double ligament; but theſe two preſently run into one ſpongy one. The paſſage of the Urine ſituate in the lower part of the Yard, comes from the neck of the Bladder between the two ligaments. The ligaments

For the four Muſcles, the two ſide-ones compoſing or making a great part of the Yard, proceed from the inward extuberancy of the Hip-bone, and preſently they are dilated from the original, and then grows leſs again. The two other lower ariſe from the Muſcles of the Fundament, and accompany the Urinary paſſage the length of the *Peritonæum* until they enter the Yard; but theſe two Muſcles cleave ſo cloſe together, that they may ſeem one, having a triangular Form. The Muſcles.

The action of theſe four Muſcles in the act of generation is, they open and dilate this common paſſage of Urine and Seed, that the Seed may be forcibly or violently caſt into the Field of Nature; and beſides, they then keep the Yard ſo ſtiff that it cannot bend to either ſide. Their Action.

The Yard is in number one, and ſituate upon the lower parts of the Share-bone, that it might be more ſtiff in erection. It hath connexion with the Share-bone and neighbouring parts, by the particles of which it is compoſed. It is of a cold and dry temper. The action of it is to caſt the Seed into the Womb, for preſervation of mankind.

The head of it begins where the tendons end; this head from the Figure thereof is called *Glans* and *Balanus*, that is, the Nut; and the skin which covers the head, is called *Præputium*, that is, the foreskin. The fleſh of this *Glandule* is of a middle nature between the glandulous fleſh and true skin. But you muſt note that the ligaments of the Yard, are ſpongy contrary to the condition of others, and filled with groſs and black bloud. But all theſe ſtirred up by the delight of deſired pleaſure, and provoked with a venereal fire, ſwell up and erect the Yard. The Nut. The *Præputium*, or Foreskin.

CHAP. XXXII.

Of the Spermatick Veſſels and Teſticles in Women.

NOw we ſhould treat of the Privy parts in Women, but becauſe they depend upon the neck and proper body of the Womb, we will firſt ſpeak of the Womb, having firſt declared what difference there is between the ſpermatick Veſſels and Teſticles of Men and Women. Wherefore we muſt know that the ſpermatick Veſſels in Women do nothing differ from thoſe in Men in Subſtance, Figure, Compoſure, Number, Connexion, Temper, Original, and Uſe; but onely in Magnitude and Diſtribution; for Women have them more large and ſhort. In what the ſpermatick Veſſels in Women differ from thoſe in Men.

It was fit they ſhould be more large, becauſe they ſhould not onely convey the matter fit for generation of Young and nouriſhment of the Teſticles, but alſo ſufficient for the nouriſhment of the Womb and Child; but ſhorter, becauſe they end at the Teſticles and Womb within the belly in Women. Where you muſt note, that the preparing ſpermatick Veſſels, a little before they come to the Teſticles, are divided into two unequal branches, of which the leſſer, bended after the ſame manner, as we ſaid in Men, goes into the head of the Teſticle, through which it ſends a ſlender branch into the Coats of the Teſticles for life and nouriſhment, and not onely into the Coats, but alſo into leading Veſſels. But the bigger branch deſcends on each ſide by the upper part of the Womb between the proper Coat and the common, from the *Peritonæum*, where it is divided into divers branches. By this difference of the ſpermatick Veſſels, you may eaſily underſtand why Women caſt forth leſs Seed than Men. Why Womens ſpermatick Veſſels are larger, but ſhorter then Mens.

For their Teſticles, they differ little from Mens but in quantity; for they are leſſer, and in Figure more hollow and flat, by reaſon of their defective heat which could not elevate or lift them up to their juſt magnitude. Their compoſure is more ſimple; for they want the *Scrotum* or Cod, the fleſhy Coat, and alſo, according to the opinion of ſome, the *Erythroides*; but in place thereof they have another from the *Peritonæum* which covers the proper Coat, that is, the *Epididymis* or *Dartos*. *Silvius* writes, that Womens Teſticles want the *Erythroides*; yet it is certain, that beſides their peculiar Coat *Dartos*, they have another from the *Peritonæum*, which is the *Erythroides*, or, as *Fallopius* calls it the *Elythroides*, that is as much as the *Vaginalis*, or ſheath. But I think that this hath ſprung from the miſunderſtanding that place in *Galen*, where he writes that Womens Teſticles want the *Epididymis*. For we muſt not underſtand that to be ſpoken of the Coat, but of the Varicous Paraſtates (as I formerly ſaid.) They differ nothing in number, but in ſite; for in Men they hang without the belly at the Share-bone above the *Peritonæum*; Women have them lying hid in their belly, near the bottom at the ſides of the Womb, but yet ſo as they touch not the body of the Womb. In what their Teſticles differ from Mens. *Lib. 14. de uſu Partium.* Site.

But theſe Teſticles are tied to the Womb, both by a Coat from the *Peritonæum*, as alſo by the leading Veſſels deſcending to the Horns of the Womb; but to the reſt of the body, by the Veſſels and the Nerves ariſing from the Holy-bone and Coſtal Nerves. They are of a colder Temper than Mans. The ejaculatory, or leading Veſſels in Women differ thus from Mens; they are large at the beginning, and of a Veiny conſiſtence, or ſubſtance, ſo that you can ſcarce diſcern them from the Coat *Peritonæum*, then preſently they become nervous, and wax ſo ſlender, that they may ſeem broken or torn, though it be not ſo; but when they come nearer to the Horns of the Womb, they are again dilated; in their own conditions, they agree with Mens, but that they are altogether more ſlender and ſhort. They have a round figure, but more intricate windings than Mens; I believe that theſe windings might ſupply the defect of the Varicous Paraſtates. They are Connexion. Temper. Their ejaculatory Veſſels. Why they have more intricate windings.

Their Site. are ſeated between the Teſticles and Womb; for they proceed out of the head of the Teſticle, then preſently, armed with a Coat from the *Peritonæum*, they are implanted into the Womb by its horns.

The Twelfth Figure of the Womb.

The Firſt Figure.

A *The bottom of the Womb laid open without any membrane.*

BB *The Neck of the Womb turned upward.*

CD *A part of the bottom of the Womb like the Nut of the Yard, ſwelling into the upper part of the Neck of the Womb, in the middle whereof the orifice appeareth.*

EE *A membrane knitting the Womb to the* Peritonæum, *and holding together the Veſſels thereof.*

F *The left Teſticle.*

G *The ſpermatical Vein and Artery.*

H *A part of the ſpermatical Veſſels reaching unto the bottom of the Womb.*

I *One part of the Veſſels coming to the Teſticles.*

* *A Veſſel leading the Seed unto the Womb.*

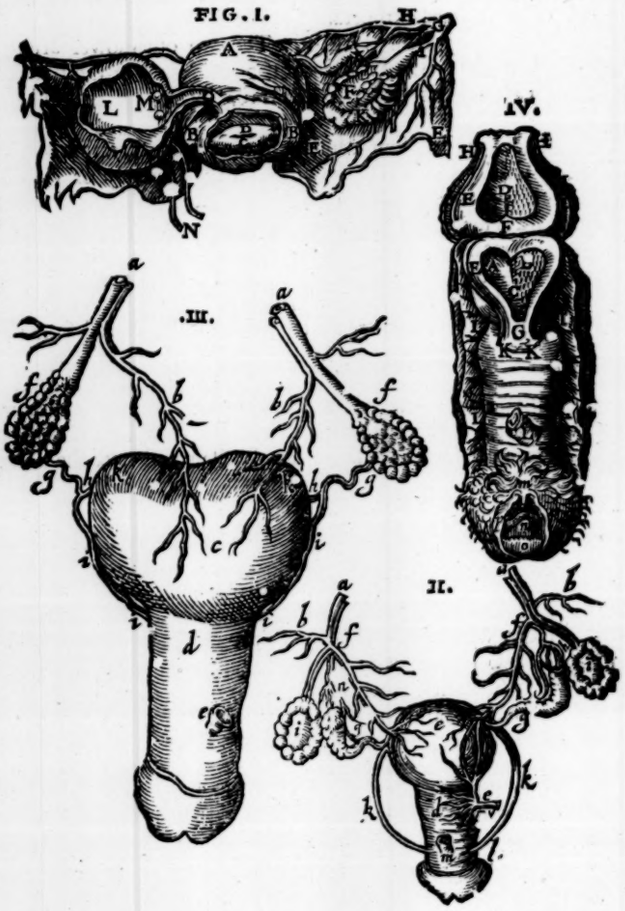
K *The Coat of the Teſticle with the implication of the Veſſels.*

L *The cavity of the Bladder opened.*

M *The inſertion of the Ureters into the Bladder.*

N *The Ureters cut from the Kidnies.*

O *The inſertion of the Neck of the Bladder into the Lap or Privity.*



The Second Figure.

a a *The ſpermatical Vein and Artery.* b b *Branches diſtributed to the* Peritonæum *from the ſpermatical Veſſels.* c *The bottom of the Womb.* d *The neck of the Womb.* e *Certain Veſſels running through the inſide of the Womb, and the neck thereof.* f f *Veſſels reaching to the bottom of the Womb produced from the ſpermatical Veſſel.* g g *The leading Veſſel of the Seed called* Tuba, *the Trumpet.* h h *A branch of the ſpermatical Veſſel compaſſing the Trumpet.* i i *The Teſticles.* k k *The lower ligaments of the Womb, which ſome call the Cremaſters or hanging Muſcles of the Womb.* l *The Lap or Privity in which the Cremaſters do end.* m *A portion of the neck of the Bladder.*

The Third Figure.

a a *The ſpermatical Veſſels.* b b *A branch from theſe ſpermatical Veſſels to the bottom of the Womb.* c *The body or bottom of the Womb.* d *The neck of the ſame.* e *The neck of the Bladder ending into the neck of the Womb.* f f *The Teſticles.* g g *The leading Veſſels, commonly (though not ſo well) called the Ejaculatory Veſſels.* h h *The diviſion of theſe Veſſels, one of them determining into the horns at double* k k. i i *The other branch ending in the neck, by which Women with child avoid their ſeed.* k k *The Horns of the Womb.*

The Fourth Figure.

AB *The boſom of the bottom of the Womb, at whoſe ſides are the Horns.* CD *A line like a ſuture or ſeam, a little diſtinguiſhing that boſom.* EE *The ſubſtance of the bottom of the Womb, or the thickneſs of his inner Coat.* F *A protuberation or ſwelling of the Womb in the middle of the boſom.* G *The orifice of the bottom of the Womb.* HH *The Coat or ſecond Cover of the bottom of the Womb, coming from the* Peritonæum. IIII *A portion of the Membranes which tie the Womb.* KK *The beginning of the neck of the Womb.* L *The neck of the Bladder inſerted into the neck of the Womb.* m *The* Clitoris *in the top of the Privity.* n *The inequality of the Privity where the* Hymen *is placed.* o *The hole or paſſage of the Privity in the cleft.* p *The ſkinny caruncle of the Privity.*

CHAP.

CHAP. XXIII.

Of the Womb.

THe Womb is a part proper onely to Women, given by nature in ſtead of the *Scrotum*, as the neck thereof, and the annexed parts in ſtead of the Yard; ſo that if any more exactly conſider the parts of generation in Women and Men, he ſhall find that they differ not much in number, but onely in ſituation and uſe. For that which man hath apparent without, that Women have hid within, both by the ſingular providence of Nature, as alſo by the defect of heat in Women, which could not drive and thruſt forth thoſe parts, as in men. The Womb is of a nervous and membranous ſubſtance, that it may be more eaſily dilated and contracted, as need ſhall require. Wherein the Privy parts in Women differ from thoſe in Men.

The magnitude thereof is divers, according to the diverſity of Age, the uſe of Venery, the flowing of their Courſes, and the time of Conception. The Womb is but ſmall in one of unripe Age, having not uſed Venery, nor which is Menſtruous; therefore the quantity cannot be rightly defined. The ſubſtance and magnitude of the Womb.

The figure of the Womb is abſolutely like that of the bladder, if you conſider it without the productions, which *Herophilus* called Horns, by reaſon of the ſimilitude they have with the horns of Oxen at their firſt coming forth. It conſiſts of ſimple and compound parts. The ſimple are the Veins, Arteries, Nerves, and Coats. The Veins and Arteries are four in number, two from the preparing ſpermatick Veſſels, the two other aſcend thither from the *Hypogaſtrick*, after this manner. Figure. The horns of the Womb. Compoſure. The Veins and Arteries.

Firſt, Theſe Veſſels before they aſcend on each ſide to the Womb, divide themſelves into two branches, from which otherſome go to the lower part of the Womb, otherſome to the neck thereof, by which the menſtruous bloud, if it abound from the Conception, may be purged.

Nerves come on both ſides to the Womb, both from the ſixth Conjugation, deſcending by the length of the back-bone, as alſo from the holy bone, which preſently united and joined together, aſcend and are diſtributed through the Womb, like the Veins and Arteries. Nerves.

The utmoſt or common Coat of the Womb proceeds from the *Peritonæum*, on that part it touches the holy bone; but the proper it hath from the firſt conformation, which is compoſed of the three ſorts of Fibers, of the right on the inſide of the attraction of both ſeeds; the tranſverſe without to expel, if occaſion be; the oblique in the midſt, for the due retention thereof. The Coats.

The Womb admits no diviſion, unleſs into the right and left ſide, by an obſcure line or ſeam, ſuch as we ſee in the *ſcrotum*, but ſcarce ſo manifeſt; neither muſt we after the manner of the Ancients, imagine any other Cells in the Womb. For by the Law of Nature, a Woman at one birth can have no more than two. An Argument hereof is, they have no more than two Dugs. If any chance to bring forth more, it is beſides Nature, and ſomewhat monſtrous, becauſe Nature hath made no proviſion of nouriſhment for them. No Cells in the Womb.

Nature hath placed the Womb at the bottom of the Belly, becauſe that place ſeems moſt fit to receive the ſeed, to carry and bring forth the Young. It is placed between the Bladder and right Gut, and is bound to theſe parts much more ſtraitly by the Neck than by the Body thereof; but alſo beſides, it is tied with two moſt ſtrong ligaments on the ſides and upper parts of the Sharebone, on which it ſeems to hang; but by its common Coat from the *Peritonæum*, chiefly thick in that place, it is tied to the Hollow bone, and the bones of the Hanch and Loins. The ſite.

By reaſon of this ſtrait connexion, a Woman with child feeling the painful drawings back, and as it were, convulſions of thoſe ligaments, knows her ſelf with child. It of a cold and moiſt temper, rather by accident than of it ſelf. The action thereof is to contain both the ſeeds, and to cheriſh, preſerve, and nouriſh it ſo contained, until the time appointed by Nature; and alſo beſides, to receive and evacuate the menſtruous bloud. The compound parts of the Womb are the proper Body and Neck thereof. That Body is extended in Women big with child, even to the Navel, in ſome higher, in ſome lower. The temper and action.

In the inner ſide the *Cotyledones* come into our conſideration, which are nothing elſe than the orifices and mouths of the Veins ending in that place. They ſcarce appear in Women, unleſs preſently after child-bearing, or their menſtrual purgation; but they are apparent in Sheep, Goats, and Kine, at all times like Wheat-corns, unleſs when they are with young; for then they are of the bigneſs of haſel nuts: but then alſo they ſwell up in Women, and are like a rude piece of fleſh of a finger and a half thick, which begirt all the natural parts of the Infant ſhut up in the Womb; out of which reſpect this ſhapeleſs fleſh, according to the opinion of ſome, is reckoned amongſt the number of Coats inveſting the Infant, and called *Chorion*, becauſe as in Beaſts the *Chorion* is interwoven with Veins and Arteries, whence the umbilical Veſſels proceed, ſo in Women this fleſhy lump is woven with Veins and Arteries, whence ſuch Veſſels have their original. Which thing, how true and agreeable to reaſon it is, let other men judge. The *cotyledones*. *Columbus* juſtly reproved.

There is one thing whereof I would admoniſh thee, that as the growth of the *Cotyledones* in Beaſts are not called by the name of *Chorion*, but are onely ſaid to be the dependents thereof; ſo in Women ſuch ſwollen *Cotyledones* merit not the name of *Chorion*, but rather of the dependences thereof.

This Body ends in a certain ſtraitneſs which is met withall, in following it towards the Privities, in Women which have born no children, or have remained barren ſome certain time, for in ſuch as are lately delivered you can ſee nothing but a cavity and no ſtraitneſs at all. This ſtraitneſs we call the proper orifice of the Womb, which is moſt exactly ſhut after conception, eſpecially until the Membrane, or Coats encompaſſing the Child be finiſhed and ſtrong enough to contain the ſeed that it flow not forth, nor be corrupted by entrance of the air; for it is opened to ſend forth the Seed, and in ſome the Courſes and ſerous humours which are heaped up in the Womb in the time of their being with Child The orifice of the Womb. The proper orifice of the Womb is not always exactly ſhut, in Women with Child.

The neck of the Womb.

From this orifice the neck of the Womb taking its original, is extended even to the Privities. It is of a muſculous ſubſtance, compoſed of ſoft fleſh, becauſe it might be extended and contracted, wrinkled, and ſtretched forth, and unfolded, and wreſted, and ſhaken at the coming forth of the child, and after be reſtored to its former ſoundneſs and integrity. In proceſs of age it grows harder, both by uſe of venery, and alſo by reaſon of age, by which the whole body in all parts thereof becomes dry and hard. But in growing and in young Women it is more tractable and flexible for the neceſſity of Nature.

Its Magnitude. Compoſition.

The magnitude is ſufficiently large in all dimenſions, though diverſe, by reaſon of the infinite variety of bodies. The figure of it is long, round, and hollow. The compoſition is the ſame with the Womb, but it receives not ſo many Veſſels as the Womb; for it hath none but thoſe which are ſent from the *Hypogaſtrick* Veins by the branches aſcending to the Womb. This neck on the inſide is wrinkled with many creſts, like the upper part of a Dogs mouth, ſo in copulation to cauſe greater pleaſure by that inequality, and alſo to ſhorten the act.

Number and Site.

It is onely one, and that ſituate between the neck of the bladder and the right Gut, to which it cloſely ſticketh, as to the Womb by the proper orifice thereof, and to the Privities by its own orifice; but by the Veſſels to all the parts from whence they are ſent.

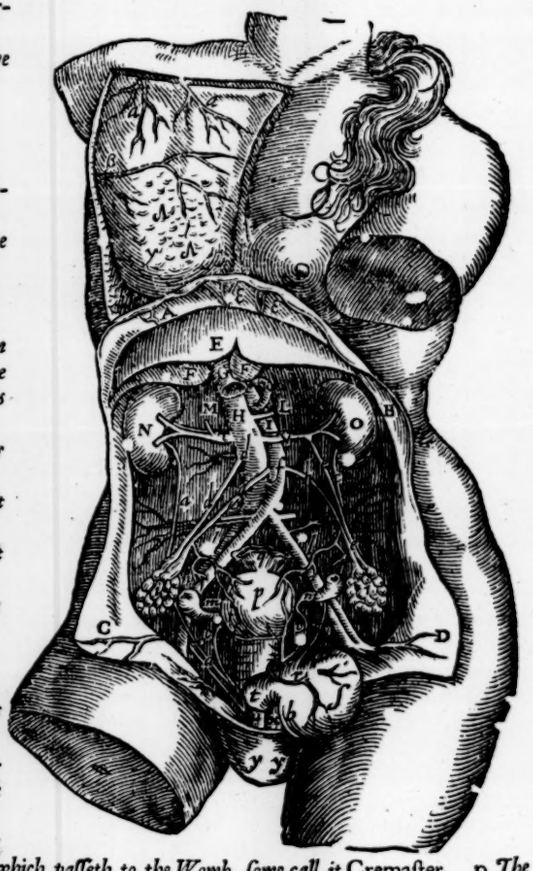
Temper.

It is of a cold and dry temper, and the way to admit the ſeed into the Womb, to exclude the Infant out of the Womb, as alſo the menſtrual evacuation. But it is worth obſervation, that in

No *Hymen*.

all this paſſage there is no ſuch Membrane found as that they called *Hymen*, which they feigned to be broken at the firſt coition. Yet notwithſtanding *Columbus*, *Fallopius*, *Wierus*, and many other learned men of our time think otherwiſe, and ſay, that in Virgins a little above the paſſage of the Urine, may be found and ſeen ſuch a nervous Membrane, placed overthwart, as it were, in the middle way of this neck, and perforated for the paſſages of the courſes. But you may find this falſe by experience; it is likely the Ancients fell into this errour through this occaſion, becauſe that in ſome a good quantity of bloud breaks forth of theſe places at the firſt copulation.

The thirteenth Figure, ſhewing the parts of Women different from thoſe in Men.



A B C D *The* Peritonæum *reflected or turned backward, above and below.*

E F *The gibbous part of the Liver* E, *the cave or hollow part* F.

G *The trunk of the Gate Vein.*

H *The hollow Vein.*

d d *The Spermatick Vein which goeth to the left teſticle marked with* i.

e e *The Spermatick Vein which goeth to the left teſticle with* i *alſo.*

f *The trunk of the great Artery from whence the ſpermatical Arteries do proceed.*

g h *The ſpermatical Arteries.*

i i *The two teſticles.*

l l *A branch which from the ſpermatick Veſſels reacheth unto the bottom of the Womb.*

m m *The leading Veſſel of the Seed which* Fallopius *calleth the* Tuba *or trumpet, becauſe it is crooked and reflected.*

n *A branch of the ſpermatick Veſſel compaſſing the leading Veſſel.* o o *A Veſſel like a Worm which paſſeth to the Womb, ſome call it* Cremaſter. p *The bottom of the Womb, called* Fundus Uteri. q *A part of the right Gut.* r ſ *The bottom of the Bladder whereto is inſerted the left Ureter, and a Vein led from the neck of the Womb near unto* r. t *the neck of the Bladder.* u *The ſame inſerted into the Privity or Lap.* x *A part of the neck of the Womb above the Privity.* y y *Certain skinny Caruncles of the Privities, in the midſt of which is the ſlit, and on both ſides appear little billocks.*

The Figures belonging to the Dugs and Breſts.

α α *The Veins of the Dugs which come from thoſe, which deſcending from the top of the ſhoulder, are offered to the Skin.* β *The Veins of the Dugs derived from thoſe which through the arm-hole are led into the hand.* γ *The body of the Dug or Breſt.* δ δ *The Kernels and fat between them.* ε ε *The Veſſels of the Dugs deſcending from the lower part of the neck called* Jugulum, *under the Breſt-bone.*

From

But it is more probable that this happens by the violent attrition of certain Veſſels lying in the inward *ſuperficies* of the neck of the Womb, not being able to endure without breaking ſo great extention as that nervous neck undergoes at the firſt coition. For a Maid which is marriageable, and hath her genital parts proportionable in quantity and bigneſs to a Mans, ſhall find no ſuch effuſion of bloud, as we ſhall ſhew more at large in our Book of Generation. From whence the blood proceeds that breaks forth in ſome Virgins at the firſt coition.

This neck ends at the Privities, where its proper orifice is: which privy parts we muſt treat of, as being the productions and *appendices* of this neck. This *Pudendum* or Privity is of a middle ſubſtance, between the fleſh and a nerve; the magnitude is ſufficiently large, the figure round, hollow, long. It is compoſed of Veins, Arteries, Nerves, deſcending to the neck of the Womb, and a double Coat proceeding from the true Skin and fleſhy Pannicle; both theſe Coats are firmly united by the fleſh coming between them; whereupon it is ſaid that this part conſiſts of a muſculous Coat. It is one in number, ſituate above the *Peritonæum*. It hath connexion with the Fundament, the neck of the Womb and Bladder, by both their peculiar orifices.

It hath a middle temper, between hot and cold, moiſt and dry. It hath the ſame uſe as a mans *Præputium* or fore-skin, that is, that together with the *Nymphæ* it may hinder the entrance of the air, by which the Womb may be in danger to take cold. The lips of the Privities called by the *Greeks* Πτερυγώματα, by the *Latines Alæ*, contain all that region which is inveſted with hairs; and becauſe we have fallen into mention of theſe *Nymphæ*, you muſt know that they are, as it were, productions of the muſculous skin, which deſcend on both ſides from the upper part of the Share-bone downwards, even to the orifice of the neck of the bladder, oft-times growing to ſo great a bigneſs, that they will ſtand out like a Mans Yard. Wherefore in ſome they muſt be cut off in their young years, yet with a great deal of caution, leſt if they be cut too raſhly, ſo great an effuſion of bloud may follow, that it might cauſe either death to the Woman, or barrenneſs of the Womb, by reaſon of the refrigeration by the too great effuſion of bloud. The later Anatomiſts, as *Columbus* and *Fallopius*, beſides theſe parts, have made mention of another Particle, which ſtands forth in the upper part of the Privities, and alſo of the urinary paſſage, which joins together thoſe Wings we formerly mentioned. *Columbus* calls it *Tentigo*; *Fallopius Cleitoris*, whence proceeds that infamous word *Cleitorizein*, (which ſignifies impudently to handle that part.) But becauſe it is an obſcene part, let thoſe which deſire to know more of it, read the Authors which I cited. *Alæ.* Πτερυγώματα. *Cleitoris, Tentigo.*

CHAP. XXXV.

Of the Coats containing the Infant in the Womb, and of the Navel.

THe Membranes or Coats containing the Infant in the Womb of the Mother, are of a ſpermatick and nervous ſubſtance, having their matter from the ſeed of the Mother. But they are nervous, that ſo they may be the more eaſily extended, as it ſhall be neceſſary for the Child. They are of good length and bredth, eſpecially near the time of deliverance, they are round in figure like the Womb. Their ſubſtance, magnitude, figure, and compoſure.

Their compoſition is of Veins, Arteries, and their proper ſubſtance. The Veins and Arteries are diſtributed to them (whether obſcurely or manifeſtly, more or fewer) from the Womb by the *Cotyledones*, which have the ſame office, as long as the Child is contained in the Womb, as the Nipples or Paps of the Nurſes after it is born. For thus the Womb brings the *Cotyledones*, or Veins degenerating into them through the Coats like certain Paps to the Infant ſhut up in them.

Theſe Coats are three in number, according to *Galen*; one called the *Chorion*, Secundine, or After-birth; the other *Allantoides*, the third *Amnios*. I find this number of Coats in Beaſts but not in Women, unleſs peradventure any will reckon up in the number of the Coats the *Cotyledones*, ſwollen up and grown into a fleſhy maſs, which many skilful in Anatomy do write; which opinion notwithſtanding we cannot receive as true. I could never in any place find the *Allantoides* in Women with child, neither in the Infant born in the ſixth, ſeventh, eighth, or in the full time, being the nineth Moneth, although I ſought it with all poſſible diligence, the Midwives being ſet apart, which might have violated ſome of the Coats. The number.

But thus I went about this buſineſs: I divided the dead body of the Mother croſswiſe upon the region of the Womb, and taking away all impediments which might either hinder, or obſcure our diligence, with as much dexterity as was poſſible, we did not onely draw away that Receptacle or Den of the Infant from the inward ſurface of the Womb, to which it ſtuck by the *Cotyledones*, but we alſo took away the firſt Membrane which we called *Chorion*, from that which lies next under it, called *Amnios*, without any rending and tearing; for thus we poured forth no moiſture, whereby it might be ſaid, that any Coat made for the containing of that humour, was rent or torn. And then we diligently looked, having many Witneſſes and Spectators preſent, if in any place there did appear any diſtinction of theſe two Membranes, the *Allantoides* and *Amnios*, for the ſeparating the contained humours, and for other uſes which they mention.

But when we could perceive no ſuch thing, we took the *Amnios* filled with moiſture on the upper ſide, and having opened it, two ſervants holding the apertion, that no moiſture might flow out of it into the circumference of the *Chorion*, or Womb, then preſently with Spunges we drew out by little and little all the humidity contained in it, the Infant yet contained in it, which was fit to come forth, that ſo the Coat *Amnios* being freed of this moiſture, we might ſee whether there were any other humour contained in any other Coat beſides. But having done this with ſingular diligence and fidelity, we could ſee no other humour, nor no other ſeparation of the Membranes beſides.

He ſhews by three ſeveral reaſons that there is no *Allantoides*.

So that from that time I have confidently held this opinion, that the Infant in the Womb is onely wrapped in two Coats, the *Chorion* and *Amnios*. But yet not ſatisfied by this experience, that I might yet be more certain concerning this *Allantoides*, having paſſed through the two former Coats, I came to the Infant, and I put a quill into its Bladder, and blew it up as forcibly as I could, ſo to try if by that blowing I might force the Air into that Coat which we queſtioned, as ſome have written. But neither thus could I drive any Air from hence through the Navel into the controverted Coat, but rather I found it to fly out of the Bladder by the Privities. Wherefore I am certainly perſuaded that there is no *Allantoides*. Moreover I could never find, nor ſee, in the Navel, that paſſage called the *Urachus*, which they affirm to be the beginning and original of the Coat *Allantoides*. But if it be granted that there is no ſuch Coat as the *Allantoides*, what diſcommodity will ariſe hereof? ſpecially ſeeing the Sweat and Urine of the Infant may eaſily, and without any diſcommodity be received, collected, and contained in the ſame Coat, by reaſon of the ſmall difference which is between them. But if any object that the Urine by its ſharpneſs and touching will hurt the Infant: I will anſwer, There can be no ſo great ſharpneſs in the Urine of ſo ſmall an Infant; and that, if there be any, it is tempered by the admixture of the gentle vapour of Sweat.

Beſides, If you conſider or have regard to the uſe of ſuch an humour (which is to hold up the Child, leſt by its weight it break the ties, by which it is bound to the Womb;) we ſhall find no humour more fit for this purpoſe than this ſerous, as which by its thickneſs is much more fit to bear up a weight, than the thin and too liquid Sweat. For ſo we ſee the Sea or Salt-water carries greater weights without danger of drowning than freſh Rivers do. Wherefore I conclude that there is no need that the Urine ſhould be kept and contained in one Coat, and the Sweat in another. The Ancients who have writ otherwiſe, have written from obſervations made in Beaſts. Wherefore we make but onely two Coats, the *Chorion* and *Amnios*; the one of which, ſeeing it contains the other, they both ſo encompaſs the Child, that they veſt it on every ſide.

Fallopius in ſome ſort ſeems to be of this opinion; for he onely makes two Coats, the *Chorion* and *Amnios*; but he thinks the Infant makes the Water into a certain part of the *Chorion*, as you may perceive by reading of his Obſervations. Both theſe Coats are tied between themſelves by the intercourſe of moſt ſlender nervous Fibers, and ſmall Veſſels penetrating from the outer *Chorion* to the inner *Amnios*. Wherefore unleſs you warily handle theſe Coats, you may eaſily tear the *Amnios* in ſeparating it. They are of the ſame temper with other Membranes. Their uſe is different; for the *Chorion* is made both for the preſervation of the Veſſels which it receives from the Womb for the generating of the umbilical Veins and Arteries, as alſo to keep whole and ſafe the parts which it inveſts.

Their temper and uſe.

But the *Amnios* is to receive and contain the excrementitious and ſerous humours, which the Child ſhut up in the Womb is accuſtomed to evacuate. But this Coat is very thin and ſoft, but ſtrong and ſmooth, leſt by its touch it might hurt the Infant, whereupon it is called the Lambskin Coat.

CHAP. XXXV.

Of the Navel.

What the Navel is.

The Navel is the center of the body.

The Figure and Compoſure.

Lib. de format. fœtus in utero.

There is onely one Vein in a Childs Navel, but no *Urachus*

THe Navel follows theſe Coats: It is a white body, ſomewhat reſembling the wreathen Cord, or Girdle of the *Franciſcan* Friers, but that it hath not the knots ſtanding ſo far out, but onely ſwelling in certain places, reſembling a knot, onely lifted up on one ſide; it ariſes and takes its original from a fleſhy maſs, which we expreſſed by the name of ſwelling *Cotyledones*, and goes into the midſt of the lower Belly of the Infant, yea verily into the midſt of the whole Body, whoſe root it is therefore ſaid to be. For even as a Tree by the root ſucks nouriſhment from the Earth, ſo the Infant in the Womb draws its nouriſhment by the Navel. The greatneſs of it in breadth and thickneſs, equals the bigneſs of the little finger. But it is a foot and a half long, ſo that children are brought forth with it encompaſſing their middle, neck, arms, or legs. The Figure of it is round. It is compoſed of two Arteries, one Vein, and two Coats. It hath theſe Veſſels from that great multitude of capillary Veins and Arteries, which are ſeen diſperſed over the *Chorion*. Wherefore the Vein entring in at the Navel, penetrates from thence into the hollow part of the Liver, where divided into two, according to *Galen*'s opinion, it makes the Gate and Hollow Veins. But the Arteries carried by themſelves the length of the Navel, caſt themſelves into the *Iliacæ*, which they make, as alſo all other, that from thence the Vital ſpirit may be carried by them over all the Infant. It hath its two Coats from the *Chorion*.

But ſeeing they are mutually woven and conjoined without any *medium*, and are of a ſufficient ſtrength and thickneſs over all the Navel, they may ſeem to make the Infants external Skin and fleſhy Pannicle. I know very many reckon two umbilical Veins, as alſo Arteries, and the *Urachus*, by, or through which the Urine flows into the Coat *Allantoides*. But becauſe this is not to be found in Women, but onely Beaſts, I willingly omit it, becauſe I do not intend to mention any parts, but ſuch as belong to humane bodies. Yet, if there be any which can teach me, that theſe parts, which I think proper to brute Beaſts, are to be found in Women, I will willingly confeſs that to his credit, from whom I have reaped ſuch benefit.

The other things that may be required concerning the Navel, as of its number, ſite, connexion, temper, and uſe, may eaſily appear by that we have ſpoken before. For we have apparently ſet down the uſe, when we ſaid the Navel was made for that purpoſe, that the Infant may be nouriſhed by it, as the Tree by the root, by reaſon of the continuation of the Veſſels thereof, with the preparing ſpermatick Veſſels made by God for that purpoſe: To whom be honour and glory for ever and ever. *Amen.*

The End of the Third Book.

BOOK IV.

Treating of the Vital parts contained in the CHEST.

The PREFACE.

HAving finiſhed the firſt Book of our Anatomy, in explanation of the Natural Parts contained in the lower Belly: Now Order requires that we treat of the Breſt; that ſo the parts in ſome ſort already explained (I mean the Veins and Arteries) may be diſpatched after the ſame order and manner, without interpoſition of any other matter,

And beſides alſo, that we may the more exactly and chearfully ſhew the reſt of the parts which remain, as the Head and Limbs, knowing already the original of thoſe Veſſels which are diſperſed through them. To this purpoſe we will define what the Cheſt *is, and then we will divide it into its parts. Thirdly, in theſe we will conſider which parts contain, and which are contained; that ſo we may more happily finiſh our intended Diſcourſe.*

CHAP. I.

What the Thorax or the Cheſt is; into what parts it may be divided, and the nature of theſe parts.

THe *Thorax*, or Cheſt, is the middle Belly, terminated or bounded above with the Collar bones, below with the Midriff, before with the *Sternon* or Breſt, behind with the twelve *Vertebraes* of the Back, on both ſides, with the true and Baſtard Ribs, and with the intercoſtal and intercartilagineous Muſcles. Nature hath given it this ſtructure and compoſition, leſt that being a defence for the Vital parts againſt external injuries, it ſhould hinder reſpiration; which is no leſs needful for the preſervation of the native heat diffuſed by the vital ſpirits, and ſhut up in the Heart, as in the Fountain thereof, againſt internal injuries, than the other forementioned parts againſt the external. For if the Cheſt ſhould have been all bony, verily it had been the ſtronger, but it would have hindred our reſpiration or breathing, which is performed by the dilating and contracting thereof. Wherefore leſt one of theſe ſhould hinder the other, Nature hath framed it, partly bony and griſly, and partly fleſhy. Some render another reaſon hereof, which is, That Nature hath framed the Cheſt, that it might here alſo obſerve the order uſed by it in the Fabrick of things, which is, that it might conjoin the parts much diſagreeing in their compoſure, as the lower Belly, altogether fleſhy, and the Head all bony, by a medium partaker both of the bony and fleſhy ſubſtance; which courſe we ſee it hath obſerved in the connexion of the Fire and Water, by the interpoſition of the Air; of the Earth and Air, bythe Water placed between them.

The containing parts of the Cheſt.

Why Nature hath made the Cheſt partly bony, partly griſly.

The Cheſt is divided into three parts, the upper, lower, and middle,; the collar-bones contain the upper, the Midriff the lower, and the *Sternon* the middle. The *Sternon* in *Galen*'s opinion is compoſed of ſeven bones, I believe by reaſon of the great ſtature of the people that lived then. Now in our times you ſhall oft find it compact of three, four, or five bones, although we will not deny, but that we have often obſerved it (eſpecially in young bodies) to conſiſt of ſeven or eight bones.

The number of the bones of the *Sternon*.

Wherefore thoſe who have fewer bones in number in their *Sternon*, have them larger, that they might be ſufficient to receive the ribs, This is the common opinion of the *Sternon*. Yet *Fallopius* hath deſcribed it far otherwiſe; wherefore let thoſe who deſire to know more hereof, look in his Obſervations.

At the lower part of the *Sternon* there is a griſle called commonly *Furcula*, and *Malum granatum*, or the Pomegranate, becauſe it reſembles that fruit; others call it *Cartilago ſcutiformis*, that is, the Breſt-blade.

Cartilago ſcutiformis, the Breſt-blade.

It is placed there, to be (as it were) a Bulwark or defence to the mouth of the Stomach, endued with moſt exquiſit ſenſe; and alſo that it ſhould do the like to that part of the Midriff which the Liver bears up in that place ſituate above the orifice of the Ventricle by the ligament coming between, deſcending from the lower part of the ſame griſle into the upper part of the Liver.

The common people think that this Griſle ſometime falls down. But it ſo adheres, and is united to the bones of the *Sternon*, that the falling thereof may ſeem to be without any danger, although oft-times it may be ſo moiſtned with watery and ſerous humidities, with which the orifice of the Stomach abounds, that (as it were) ſoaked and drunk with theſe, it may be ſo relaxed, that it may ſeem to be out of its place; in which caſe it may be preſſed and forced by the hand into the former place and ſeat, as alſo by applying outwardly, and taking inwardly aſtringent and drying Medicins to exhauſt the ſuperfluous humidity.

This Griſle at its beginning is narrow, but more broad and obtuſe at its end, ſomewhat reſembling the round or blunt point of a Sword, whereupon it is alſo called *Cartilago Enſiformis*, or the Sword-like griſle. In ſome it hath a double, in others a ſingle point.

In old people it degenerates into a Bone. Now becauſe we make mention of this Griſle, we will ſhew both what a Griſle is, and how many differences thereof there be, that henceforward as often as we ſhall have occaſion to ſpeak of a Griſlle, you may underſtand what it is.

What a Griſle is. A Griſle is a ſimilar part of our bodies, next to a Bone moſt terreſtrial, cold, dry, hard, weighty, and without ſenſe, differing from a Bone in drineſs onely, the which is more in a Bone. Wherefore a Griſle being loſt, cannot be regenerated, like as a Bone, without the interpoſition of a *Callus*.

The differences thereof. The differences of theſe are almoſt the ſame with Bones, that is, from their conſiſtence, ſubſtance, greatneſs, number, ſite, figure, connexion, action, and uſe. Omitting the other for brevity ſake, I will onely handle thoſe differences which ariſe from ſite, uſe, and connexion. Therefore Griſles either adhere to the Bones, or of, and by themſelves make ſome part, as the Griſles of the Eye-lids called *Tarſi*, of the *Epiglottis*, and Throttle. And others which adhere to Bones, either adhere by the interpoſition of no *medium*, as thoſe which come between the Bones of the *Sternon*, the Collar-bones, the Share and Haunch-bones, and others; or by a ligament coming between, as thoſe which are at the ends of the Baſtard Ribs to the *Sternon* by the means of a Ligament, that by thoſe Ligaments being ſofter than a Griſle, the motions of the Cheſt may be more quickly and ſafely performed. The Griſles which depend on Bones, do not onely yield ſtrength to the Bones, but to themſelves, and the parts contained in them, againſt ſuch things as may break and bruiſe them. The Griſles of the *Sternon*, and at the ends of the Baſtard Ribs, are of this ſort.

Their twofold uſe. By this we may gather, that the Griſles have a double uſe, one to poliſh and levigate the parts to which that ſlippery ſmoothneſs was neceſſary for performance of their duty; and for this uſe ſerve the Griſles which are at the Joints, to make their motions the more nimble. The other uſe is to defend thoſe parts upon which they are placed, from external injuries, by breaking violent aſſaults, by ſomewhat yielding to their impreſſion, no otherwiſe than ſoft things oppoſed againſt Cannon-ſhot. We will proſecute the other differences of Griſles in their place, as occaſion ſhall be offered and required.

CHAP. II.

Of the containing and contained parts of the Cheſt.

The diviſion of the Cheſt into its parts. THe containing parts of the Cheſt are both the Skins, the fleſhy Pannicle, the Fat, the Breſts, the common Coat of the Muſcles, the Muſcles of that place, the fore-mentioned Bones, the Coat inveſting the Ribs, and the *Diaphragma* or Midriff. The parts contained are the *Mediaſtinum* the *Pericardium* or Purſe of the heart, the Heart, the Lungs and their Veſſels. Of the Containing parts, ſome are common to all the Body, or the moſt part thereof, as both the Skins, the fleſhy Pannicle and Fat. Of which being we have ſpoken in our firſt Book, there is no need now further to inſiſt upon: Others are proper to the Cheſt, as its Muſcles (of which we will ſpeak in their place) the Breſts, the fore-mentioned Bones, the Membrane inveſting the Ribs, and the *Diaphragma* or Midriff.

We will treat of all theſe in order, after we have firſt ſhewed you the way how you may ſeparate the Skin from the reſt of the Cheſt. Putting your Knife down even to the perfect diviſion of the Skin, you muſt draw a ſtraight line from the upper part of the lower Belly, even to the Chin; then draw another ſtraight line, overthwart at the Collar-bones even to the Shoulder-blades; and in the places between the Collar-bones: (if you deſire to ſhun prolixity) you may at once ſeparate both the Skins, the fleſhy Pannicle, the Fat, and common Coat of the Muſcles; becauſe theſe parts were ſhewed and ſpoken of in the diſſection of the lower Belly.

Yet you muſt reſerve the Breſts in diſſecting of the Bodies of Women; wherefore from the upper parts of the Breſts, as artificially as you can, ſeparate onely the Skin from the parts lying under it, that ſo you may ſhew the Pannicle which there becometh fleſhy and muſculous, and is ſo ſpred over the neck and parts of the Face, even to the roots of the hairs.

CHAP. III.

Of the Breſts or Dugs.

Their ſubſtance. THe Breſts, as we ſaid, when we ſpoke of the Nature of Glandules, are of a glandulous ſubſtance, white, rare, or ſpongious; in Maids and Women that do not give ſuck, they are more ſolid, and not ſo large.

Magnitude. Figure. Compoſure. Wherefore the bigneſs of the Dugs is different, although of a ſufficient magnitude in all. Their Figure is round, ſomewhat long, and in ſome ſort Pyramidal, their compoſure is of the Skin, the fleſhy Pannicle, Glandules, Fat, Nerves, Veins, and Arteries, deſcending to them from the *Axillaris* under the *Sternon*, betwixt the fourth and fifth, and ſometimes the ſixth of the true Ribs.

And there they are divided into infinite Rivulets by the interpoſition of the Glandules and Fat, by which fit matter may be brought to be changed into the Milk by the faculty of the Dugs.

Which Glandules have Nerves, and which have none. We will ſpeak no more of the Nature of the Glandules or Kernels, as having treated of them before; onely we will add this, that ſome of the Glandules have Nerves, as thoſe of the Breſts, which they receive from the parts lying under them, that is, from the intercoſtal, by which it comes to paſs, that they have moſt exquiſite ſenſe. Others want a nerve, as thoſe which ſerve only for diviſion of the veſſels, and which have no action, but only uſe.

They be two in number, on each ſide one, ſeated at the ſides of the *Sternon* upon the fourth, fifth, and ſixth true ribs.

Their connexion. Wherefore they have connexion with the mentioned parts with their body, but by their veſſels with all other parts, but eſpecially with the womb by the reliques of the mamillary veins and arteries,

teries, which deſcend down at the ſide of the Breſt-blade; in which place theſe Veins inſinuating themſelves through the ſubſtance of the Muſcles, are a little above the Navel conjoined with the *Epigaſtricks*, whoſe original is in ſome ſort oppoſite to the *Hypogaſtricks*, which ſend forth branches to the Womb. By the meeting of theſe it is more likely that this commerce ſhould ariſe, than from other, and thoſe almoſt capillary branches, which are ſometimes ſeen to deſcend to the Womb from the *Epigaſtrick*. How the breſts and womb communicate each with other.

They are of a cold and moiſt temper; wherefore they ſay, that the bloud by being converted into Milk, * becomes raw, flegmatick, and white, by the force of the proper fleſh of the Dugs. Their action is to prepare nouriſhment for the new-born Babe, to warm the Heart from whence they have received heat, and to adorn the Breſt. Their temper * *Recrudeſcit.* Their action and uſe.

By this you may know that ſome Glandules have action, others uſe, and ſome both. At the top of the Dugs there are certain hillocks, or eminencies called Teats or Nipples, by ſucking of which the Child is nouriſhed through certain ſmall and crooked paſſages, which though they appear manifeſt to the ſight, whileſt you preſs out the milk by preſſing the Dug, yet when the milk is preſſed out, they do not appear, nor ſo much as admit the point of a Needle, by reaſon of the crooked ways made by Nature in thoſe paſſages for this uſe, that the Milk being perfectly made, ſhould not flow out of its own accord againſt the Nurſes Will. For ſo the Seed is retained and kept for a certain time in the Proſtates. The Nipples.

CHAP. IV.

Of the Clavicles or Collar-bones, and Ribs.

IF we ſhould handle theſe parts after the common order, we ſhould now treat of the Muſcles of the Cheſt which move the Arm, and ſerve for reſpiration, and which firſt offer themſelves to our ſight.

But for that they cannot be fitly ſhewed, unleſs we hurt the Muſcles of the Shoulder-blade and Neck, therefore I think it better to defer the explanation of theſe Muſcles, until ſuch time as I have ſhewed the reſt of the contained and containing parts, not onely of the Cheſt, but alſo of the Head, that having finiſhed theſe we may come to a full demonſtration of all the reſt of the Muſcles, beginning with thoſe of the Head, which we firſt meet with, and ſo proſecuting the reſt even to the Muſcles of the Feet, as they ſhall ſeem to offer themſelves more fitly to diſſection, that ſo, as much as lies in us, we may ſhun confuſion.

Wherefore to return to our propoſed task; after the aforeſaid Muſcles, come the Collar-bones, *Sternon*, and Ribs.

But that theſe parts may be the more eaſily underſtood, we muſt firſt know what a Bone is, and whence the differences thereof are drawn.

Therefore a Bone is a part of our Body moſt terreſtrial, cold, dry, hard, wanting all manifeſt ſenſe, if the Teeth be excepted. What a Bone is.

I ſaid [manifeſt ſenſe,] that you may underſtand that the parts have a double ſenſe of Touching, the one manifeſt, ſuch as reſides in the Fleſh, Skin, Membranes, Nerves, Teeth, and certain other parts; the other obſcure, yet which may ſuffice to diſcern the helping and hurting tactile qualities, ſuch ſenſe the Bowels and Bones have; for very ſmall Fibers of the Nerves are diſſeminated to theſe parts by mediation of their Coat, or Membrane, I ſay, ſo ſmall that they can ſcarce be diſcerned by the eyes, unleſs (as *Galen* ſaith) by plucking ſuch Coats away from the parts. A double ſenſe. *Lib.* 1. *de Locis affectis.*

But it is no marvail, if Nature would have theſe parts in like manner to have ſuch ſmall Veins, contrary to the Lungs and moſt part of the Muſcles, onely to yield ſo much nouriſhment to the part, as ſhould be needful; for ſeeing the ſubſtance of the Bones is cold, hard, denſe and ſolid, it waſtes the leſs. Why the Bones have ſuch ſmall Veins.

Wherefore they need not ſo much bloud for their nouriſhment, as the hot and ſoft parts; and beſides the leſſer Bones have neither Veins or Arteries, but draw fit nouriſhment, onely by the force of the attractive faculty implanted in them.

The differences of Bones are taken from many things, as from their *Apophyſes*, *Epiphyſes*, Griſles, Necks, Heads, Solidity, Cavity, Eminencies, Marrow, Conſiſtence, Bigneſs, Number, Figure, Site. We will proſecute all theſe as they ſhall offer themſelves in the demonſtration of the Bones; to which doctrine we will give a beginning at the Clavicles or Collar-bones. Whence the difference of Bones may be taken.

The Clavicles are two very hard and ſolid Bones, without any great or notable cavity, ſituate on each ſide betwixt the ſide and upper part of the *Sternon* and top of the Shoulder-blade, for the ſtrength and ſtability of theſe parts, whence they take the name of *Clavicule* Clavicles, (from the *Greek* Κλεὶς, which ſignifies a Key, or any other Bar or faſtning of a Door.) They carry the ſhape of a Surgeons Levatory. The Clavicles or Collar-bones.

But you muſt note that the Clavicles ſeem to be faſtned to the *Sternon* by the mediation of a griſly bone, Moreover the ſpace and cavity contained within the Collar-bones, is called by the Latines *jugulum*, by the French the Upper *Furcula*, becauſe the Jugular Veins paſs that way; it ſticks to the Upper Proceſs of the Shoulder by a Griſle, which *Galen* calls the ſmall Griſle-bone, although it be nothing elſe but a production of the *Os juguli*. *Lib.* 13. *de uſu Part. cap.* 13.

For the *Sternon*, which we ſaid is framed of divers Bones, as ſometimes 3, ſometimes 4, 5, 6, 7, and ſometimes 8; you muſt note they are very ſpongy and full of pores, and of a far ſofter conſiſtence than the Collar-bones, wherefore more ſubject to corruption; beſides, they are mutually joined by interpoſition of Muſcles. Their uſe is to be as a ſhield to defend the Vital parts.

The Ribs are 24 in number, on each ſide 12, ſeven of theſe are called true or perfect Ribs, becauſe The Ribs.

cauſe they make a circle, at the one end joined to the *Sternon*, on the other to the *Vertebraes*; the other are called Baſtard, or ſhort Ribs, becauſe they fall ſhort in their way, and come not to the *Sternon*; but they are faſtned on the fore-ſide of the *Sternon* by Griſles and Ligaments, but on the back-part to the tranſverſe *Vertebraes* of the Back-bone, and to the ſides of the ſaid *Vertebraes*. But the ſhort Ribs are onely knit to the *Vertebraes*, wherefore that part of the *Vertebraes* is called the roots of the Ribs.

Their Conſiſtence.

The exterior, or fore-part of the Baſtard or ſhort Ribs, is griſly, that they ſhould not be broken, and that they might be the eaſier lifted up in the diſtenſions of the Stomach filled with meat. They are of a conſiſtence ſufficiently hard, yet more towards their root than at the *Sternon*, where they come nearer together, and are more hardly broken; they are ſmooth both within and without, but in the midſt they have ſome ſign of being double, or hollow, to receive the Veins and Arteries, which nouriſh their bony ſubſtance; they are faſhioned like a Bow; their uſe is the ſame with the *Sternon*, and beſides, to carry and ſtrengthen the Muſcles ſerving for reſpiration.

CHAP. V.

The Anatomical adminiſtration of the Sternon.

THe Coat inveſting the Ribs, which the common Anatomiſts call *Pleura*, is the laſt of the containing parts of the Cheſt, which becauſe it lies hid in the inner part thereof, it cannot be ſhewn unleſs by pulling aſunder of the *Sternon*; wherefore we muſt now ſhew the manner of opening the *Sternon*, that hereby they may not violate the original or inſertion of any of the Muſcles. Wherefore firſt you muſt underſtand, that he which will ſhew in their proper place their original and inſertion of the pectoral Muſcles, of the *Maſtoides*, of the two Muſcles of the Bone *Hyois*, of the Muſcles *ſubclavii*, and *intercartilaginei*, ought firſt of all to ſeparate all the pectoral Muſcles from the *Sternon*, and the Griſles from the true Ribs; then to cut the Ligaments, next the Bones themſelves, even from the ſixth true Rib to the Clavicles.

And then ſhewing the *Mediaſtinum* ſtretched under the *Sternon* all the length thereof, he muſt ſeparate the *Sternon* with his Knife, and bend it up to the Clavicles, and there cut it, reſerving together with it the four Muſcles, that is, the two *Maſtoides*, and the two moving the Bone *Hyois*, becauſe they either wholly, or for the moſt part, ariſe from the *Sternon*.

Laſtly, The Clavicles being ſomewhat thruſt upwards, the Griſles muſt on each ſide be turned outward toward the Arm; that ſo the containing parts of the Cheſt may not lie onely open to view, and be eaſily ſhewed, but alſo the Muſcles may be contained in their place, until they come to be ſhewed in their order.

And becauſe the Collar-bones muſt be lifted up very high, that the recurrent nerves may be more eaſily ſeen, and the diſtribution of the Veins and Arteries, the two ſmall Subclavian Muſcles, one on each ſide muſt be ſhewn by the way, who have their original from the inner and fore-part of the Clavicles and an oblique deſcent to the *Sternon*, towards the griſle of the firſt rib.

For the Clavicles cannot be thus ſeparated, but that theſe Muſcles muſt be violated and ſpoiled. Alſo you may divide the *Sternon* in the midſt, that you may ſhew the inward pectoral Muſcles whole having ſeparated the Muſcles which ariſe from the upper part. All which things being performed as they ought, we muſt come to the Coat inveſting the Ribs, and then to the *Mediaſtinum*, as ariſing from it.

CHAP. VI.

Of the Pleura, *or Coat inveſting the Ribs.*

What the membrane inveſting the ribs is.

THe *Tunica Subcoſtalis*, or Coat inveſting the Ribs, being the laſt of the containing parts of the Cheſt, is a large and a broad membrane anſwerable in proportion of uſe and action to the *Peritonæum* of the lower Belly. For as the *Peritonæum* generally and particularly covers all the natural parts, binding and holding them in their places, ſo this Coat inveſts all the Vital parts in general, becauſe it is ſtretched over all the inſide of the Cheſt, but in particular whileſt it gives each a Coat from it ſelf.

Its original.

It hath its original from the *Perioſteum* (or, as others will have it, from the *Pericranium*) inveſting the *Vertebraes* of the Cheſt at the roots of the Ribs. Wherefore it ſticks very faſt to the Ribs, ſcarce to be ſeparated, as alſo to all the parts bounding the Cheſt, and contained in it.

Veſalius reprehends *Galen*, becauſe he ſaid, that this was double on both ſides; yet *Columbus* defends *Galen*, and verily it is ſeen to be double in the inner part of the Cheſt, under the Ribs and the Muſcles of the Ribs, that in that ſpace there may be way for the Veins, Arteries, and Nerves.

Whether, as there is a twofold Pleuriſie, ſo alſo a double *Pleura*.

Some have made it twofold, and divided it into the internal and external; as thoſe which have made two ſorts of Pleuriſies, the true and baſtard; placing the external above the Ribs and intercoſtal Muſcles; but the internal under the Ribs, Muſcles, *Diaphragma*, and *Sternon*.

But we to ſhun ambiguity, intend onely to proſecute thoſe things which are manifeſt to the eyes; wherefore we ſay, that the Ribs are lined on the inſide with a double Coat; One which immediately and firmly ſticks to them on every ſide called the *Perioſteum*, which is common to them and other Bones. The other which lies upon that *Perioſteum*, and on the inſide inveſts all the Ribs, whence is it called the *Subcoſtalis tunica*. The ſubſtance, temper, and compoſure, are the ſame, as in other membranes.

The

The magnitude in length, as alſo the Figure, is the ſame with the compaſs of the inner part of the Cheſt; the thickneſs of it, is very little. The Coat is commonly called the *Pleura*, from the name of the part which it covers or lines, (for the *Greeks* call the Ribs Πλεῦρα,) and in like manner that which happens betwixt the *Perioſteum* and this *Pleura*, is called either a true or baſtard Pleuriſie. The Magnitude and Figure.

CHAP. VII.

Of the Mediaſtinum.

NOw we muſt ſpeak of the parts contained in the Cheſt, ſeeing we have already handled the containing: beginning with the *Mediaſtinum*, as being a part which in diſſection firſt preſents it ſelf to our ſight. The *Mediaſtinum* is of the ſame ſubſtance, thickneſs, compoſure, number, temper, as the *Pleura*. For the ſubſtance of the *Mediaſtinum* is membranous, and though it be ſtretched all the length of the Cheſt, yet it is of a ſmall thickneſs, receiving Veins, Nerves and Arteries from all the parts to which it is knit, like as the *Pleura* doth; but eſpecially from the Mammillary Veſſels, deſcending under the *Sternon*. The Subſtance and Magnitude.

It is in number one, but it is made of two Membranes produced from the Subcoſtal: for this aſcending on each ſide by the hollowneſs of the Cheſt to the *Sternon*, and then at right Angles, is reflected to the bodies of the *Vertebraes*, whence the *Pleura* hath it original.

In that reflection there is ſo much diſtance between each Membrane as may be ſufficient to receive two fingers. For otherwiſe, ſeeing that they cannot penetrate through the Heart, it was fit each ſide of the *Pleura* ſhould turn to the *Pericardium*, that ſo they might arrive at the appointed place without offence. Neither yet is that ſpace void and empty, but woven with many ſmall nervous Fibers. *Columbus* adds, that that place is often filled with a certain humour beſides Nature, which you may draw out, or evacuate, by opening the *Sternon*.

Yet I would gladly learn of *Columbus* by what ſigns we may know that ſuch an humour is contained there. For the Figure, the *Mediaſtinum* with the *Pleura* on each ſide, repreſents the Figure of a Leather Bottle, whoſe flat ſide is the *Mediaſtinum*, whoſe other ſide the *Pleura*; the bottom that part of the *Pleura* which is next the Midriff; the mouth the upper part of the *Pleura* at the firſt Ribs. We ſhewed the ſite and connexion of the *Mediaſtinum*, when we declared its original. The Figure.

The uſe thereof is to ſeparate the Vital parts (as it were) into two Cels, the right and left, that if peradventure it happen that the one be hurt, the Creature may live by the benefit of the other. The Uſe.

And it hath another uſe, which is, to prop and hold up the *Pericardium*, that it fall not upon the Heart with its weight, but toſſed with the motions of the Heart and Cheſt, it may move to this or that ſide.

CHAP. VIII.

Of the Diaphragma *or Midriff.*

ALthough the Midriff may ſeem to be accounted rather a part containing than contained, yet for commodities ſake, we have deferred the demonſtration thereof till now. Therefore, it is a Muſcle round and long, terminating the lower part of the Cheſt. What the Midriff is.

It is of the ſame ſubſtance, compoſition, and temper, as the Muſcles of the *Epigaſtrium*; it is made of two Coats, the lower whereof is from the *Peritonæum*, and the upper from the *Pleura*. Which getting to them fleſh, but not there, but in their circumference, by the benefit of the bloud brought thither by the Veins and Arteries diſtributed through it, turn into a Muſcle; whoſe middle is nervous and membranous, but the extremities by which it is inſerted, one while fleſhy, as in that part next to the Baſtard-Ribs; another while tendonous, as where it touches the firſt and ſecond *Vertebraes* of the Loins, for it ends in them by two Tendons manifeſt enough. It is one in number, interpoſed with an oblique ſite betwixt the Natural and Vital parts. It hath connexion with the lower part of the *Sternon* and Short-ribs, and the two firſt *Vertebraes* of the Loins, but by its Coats and Veſſels with the parts from whence it received them. Its ſubſtance, compoſition, &c. Connexion.

The extent thereof is equal to the compaſs of the lower part of the Cheſt. The length of it is from the Breſt-blade, even to the firſt and ſecond *Vertebra* of the Loins. The thickneſs is diverſe, for it is far thicker in its fleſhy extremity than in its nervous original. Quantity.

The action thereof is to help the expulſion of the Excrements by the mutual aſſiſtance of the *Epigaſtrick* Muſcles: but the chief uſe is for reſpiration, of which it is one of the prime inſtruments. This partition the Ancients called *Phrenes*, becauſe the inflammation thereof cauſed like ſymptoms, as the inflammation of the Brain, by reaſon of the large Nerves on each ſide one, which come to it directly and primarily from the third, fourth, and fifth *Vertebraes* of the neck. This Muſcle differs from other Muſcles, eſpecially in figure. It is perforated in three places, to give way or paſſage to the aſcendent Hollow-vein, to the Artery, *Aorta*, and the Gullet. Action. Why the *Diaphragma* was called *Phrenes*.

CHAP.

CHAP. VI.

Of the Lungs.

Their Substance. Quantity. The Lobes thereof.

THe Lungs are of a ſoft ſubſtance and fleſhy, rare and like a Sponge, of a various colour pamered; their quantity is ſufficiently large, for moſt commonly they are divided into four lobes, disjoined with a manifeſt and viſible diviſion, on each ſide two, whereby they may be the more eaſily opened and contracted, and the Air may the better enter.

Beſides alſo in large bodies, who have a very great Cheſt, there is found a fifth lobe, ariſing from the ſecond lobe of the right ſide, as a cuſhion or bolſter to bear up the Hollow Vein aſcending from the Midriff to the Heart.

In little Men who have a ſhorter Cheſt, becauſe the Heart is ſo near as to touch the *Diaphragma*, this lobe is not ſeen, yet it is always found in Dogs.

Figure. The Lungs repreſent the figure or ſhape of an Oxes foot or hoof; for like it they are thicker in their baſis, but ſlenderer in their circumference, as you may ſee in blowing them up by the weazon,

Compoſition. with your mouth or a pair of bellows. They are compounded of a Coat coming from the *Pleura* which on each ſide receives ſufficient number of Nerves from the ſixth conjugation; and alſo of the *Vena arterioſa* coming from the right Ventricle of the Heart, and the *Arteria venoſa* from the left, as ſhall be ſhewed in the Anatomy of the Heart; beſides the *Aſpera arteria* or Weazon coming from the Throat; and laſtly, its own fleſh, which is nothing elſe than the concretion of cholerick Bloud poured out like foam about the diviſions of the foreſaid Veſſels, as we have ſaid of other parts.

The body of the Lungs is one in number, unleſs you will divide it into two, by reaſon of the variety of its ſite, becauſe the Lobe of the Lungs ſtretched forth into the right and left ſide do almoſt involve all the Heart, that ſo they may defend it againſt the hardneſs of the bones which are about it, they are tied to the Heart chiefly at its baſis, but to the roots of the ribs, and their *Vertebraes* by the Coat it hath from thence; but by the Veſſels to theſe parts from whence they proceed. But oftThe ſticking of the Lungs to the Ribs. times preſently from the firſt and natural conformation they are bound to the circumference of the Ribs by certain thin and membranous productions which deſcend from thence to the Lungs, otherwiſe they are tied to the Ribs by the *Pleura*.

Their nouriſhment. The nouriſhment of the Lungs is unlike to the nouriſhment of other parts of the Body; for you cannot find a part equally rare, light, and full of air, which may be nouriſhed with bloud equally thin and vaporous. In temper they incline more to heat than to cold, whether you have regard to their compoſure of cholerick bloud, or their uſe, which is to prepare and alter the air, that it hurt not the Heart by its coldneſs. The Lungs is the inſtrument of Voice and Breathing by the Weazon or Wind-pipe. For the Lobes are the inſtruments of Voice, and the Ligaments of Reſpiration. But the *Larinx* or Throttle, is the chief inſtrument of the Voice; for the Weazon firſt prepares the Voice for the Throttle, in which it being in ſome meaſure formed, is perfected in the Palate of the Mouth, as in the upper part of a Lute, or ſuch like Inſtrument, by the help of the *Gargareon* or *Uvula*, as a certain quill to play withall.

But as long as one holds his breath he cannot ſpeak, for then the Muſcles of the *Larinx*, Ribs, the *Diaphragma*, and the *Epigaſtrick* Muſcles are preſſed down, whence proceeds a ſuppreſſion of the Vocal matter, which muſt be ſent forth in making or uttering a Voice.

Why the Lungs are light. Nature would have the Lungs light for many reaſons; the firſt is, That ſeeing they are of themſelves immoveable, they might be more obſequious and ready to follow the motion of the Cheſt; for when it is ſtraitned, the Lungs are ſtraited and ſubſide with it; and when it is dilated, they alſo are dilated, and ſwell ſo big, that they almoſt fill up all the upper capacity thereof.

Another cauſe is, That by this their rarity they might more eaſily admit the entring air at ſuch times as they have much or ſudden neceſſity, as in running a Race.

And laſtly, That in Pleuriſies and other purulent abſceſſes of the Cheſt, the *Pus* or matter poured forth into the capacity of the Cheſt, may be ſuckt in by the rare ſubſtance of the Lungs, and by that means the ſooner ſent forth and expectorated,

The uſe of reſpiration or breathing. The uſe of Reſpiration is to cool and temper the raging heat of the Heart. For it is cooled in drawing in the breath by the cool air, and in ſending out thereof by avoiding the hot fuliginous vapour. Therefore the Cheſt performs two contrary motions, for whileſt it is dilated it draws in the encompaſſing the air, and when it is depreſſed, it expels the fuliginous vapour of the Heart; which any one may eaſily perceive by the example of a pair of Smiths Bellows.

CHAP. X.

Of the Pericardium, *or Purſe of the Heart.*

Whence it hath its matter. THe *Pericardium* is (as it were) the houſe of the Heart, which ariſing at the baſis thereof (either the Ligaments of the *Vertebraes* ſituate there, or elſe the Veſſels of the Heart yielding it matter) is of a nervous, thick and denſe ſubſtance without any Fibers. It retains the Figure of the Heart, and leaves an empty ſpace for the Heart to perform its proper motion. Wherefore the bigneſs of the *Pericardium* exceeds that of the Heart.

It conſiſts of a double Coat, one proper, of which we have ſpoken; another common, coming from the *Pleura*; and alſo of the Veins, Arteries, and Nerves; the Veſſels partly coming from the Mamillary, partly from the *Diaphragma*, chiefly there where it touches it; the Nerves come on each ſide from the ſixth conjugation.

It

It is onely one, placed about the Heart, and annexed to it at the baſis thereof by its Membranes, to the original of the Lungs, and the *Vertebraes* lying under them, and by the Veſſels to the parts from whence it received them. It is of a cold and dry temper, as every Membrane is. Number and connexion.

The uſe thereof is to cover the Heart, and preſerve it in its native humidity, by certain natural moiſture contained in it, unleſs you had rather ſay, that the moiſture we ſee contained in the *Pericardium*, is generated in it after death by the condenſation and concretion of the ſpirits. Although this ſeems not very likely, becauſe it grows and is heaped up in ſo great quantity in living bodies, that it hinders the motion of the Heart, and cauſes ſuch palpitation, or violent beating thereof, that it often ſuffocates a man. Uſe.

For this Palpitation happens alſo to hearty and ſtout men, whoſe hearts are hot, but bloud thin and wateriſh, by reaſon of ſome infirmity of the Stomach or Liver; and this humour may be generated of vapours which on every ſide exhale into the *Pericardium* from the bloud boiling in the Ventricles of the Heart, where kept in by the denſity thereof, they turn into yellowiſh moiſture; as we ſee it happens in an Alembeck. From whence the matter of the watery humour contained in the *Pericardium*.

Nature would have the *Pericardium* of a denſe and hard conſiſtence, that by the force thereof the Heart might be kept in better ſtate; for if the *Pericardium* had been bony, it would have made the Heart like Iron by the continual attrition; on the contrary, if it had been ſoft and fungous, it would have made it ſpongy and ſoft like the Lungs. The Conſiſtence.

CHAP. XI.

Of the Heart.

THe Heart is the chief Manſion of the Soul, the Organ of the Vital Faculty, the beginning of Life, the Fountain of the Vital Spirits, and ſo conſequently the continual nouriſher of the Vital Heat, the firſt living and laſt dying; which becauſe it muſt have a natural motion of it ſelf, was made of a denſe, ſolid, and more compact ſubſtance than any other part of the Body. What the Heart is, and of what ſubſtance.

The fleſh thereof is woven with three ſorts of fibers, for it hath the right in the inner part deſcending from the baſis into the point, that they might dilate it, and ſo draw the bloud from the Hollow Vein into the receptacles thereof, and the breath or air from the Lungs by the *Arteria venoſa*; it hath the tranſverſe without, which paſs through the right at right angles, to contract the Heart, and ſo drive the Vital Spirits into the great Artery *Aorta*, and the cholerick bloud to the Lungs by the *Vena arterioſa* for their nouriſhment; It hath the oblique in the midſt to contain the air and bloud drawn thither by the fore-mentioned Veſſels, until they be ſufficiently elaborate by the Heart. The three ſorts of Fibers of the Heart.

All theſe Fibers do their parts by contracting themſelves towards the original, as the right from the point of the Heart towards the Baſis, whereby it comes to paſs, that by this contraction of the Fibers the Heart dilated becomes ſhorter, but broader, no otherwiſe than it is made more long and narrow by the contraction of the tranſverſe: but, by the drawing of the oblique, it is leſſened in that part which looks towards the *Vertebraes*, which chiefly appears in the point thereof.

It is of an indifferent bigneſs, but yet in ſome bigger, in ſome leſs, according to the diverſe tempor of cold or hot men, as we noted in the Liver. The Magnitude.

The figure thereof is pyramidal, that is, it is broader in the baſis, and narrower at his round point. Figure.

It is compoſed of the moſt denſe fleſh of all the body, by the effuſion of bloud at the diviſions and foldings of the Veſſels, and there concrete, as it happens alſo to the other entrails. For the bloud being there a little more dried than that which is concrete for the making of the Liver, turns into a fleſhy ſubſtance more denſe than the common fleſh, even as in hollow Ulcers, when they come to cicatrize. Compoſition.

It hath the Coronal Veins and Arteries, which it receives either on the right ſide from the Hollow Vein, or on the left from the Baſis at the entrance of the Artery *Aorta*. You cannot by your eye diſcern that the Heart hath any other Nerves than thoſe which come to it with the *Pleura*. The proper Veſſels.

Yet I have plainly enough obſerved others in certain Beaſts which have great hearts, as Swine; they appeared ſeated under the fat which covers the Veſſels and Baſis of the heart, leſt the humid ſubſtance of theſe parts ſhould be diſſolved and diſſipated by the burning heat of the Heart. Whereby you may perceive that the heat of the Heart is different from the Elementary heat, as that which ſuffers fat to grow about this entrail, where otherwiſe it doth not concrete, unleſs by cold, or a remiſs heat, which thing is chiefly worth admiration. The Nerves.

The Heart is one alone, ſituate moſt commonly upon the fourth *Vertebra* of the Cheſt, which is in the midſt of the Cheſt. Yet ſome think that it inclines ſomewhat to the left ſide, becauſe we there feel the motion or beating thereof; but that happens by reaſon of its left Ventricle, which being it is filled with many Spirits, and the beginning of the Arteries, it beats far more vehemently than the right. It required that ſeat by the decree of Nature, becauſe that region is the moſt ſafe and armed, and beſides it is here on every ſide covered (as it were with the hands of the Lungs. Number and Site.

It hath connexion with the fore-mentioned *Vertebraes*, but by the parts compoſing it, with thoſe parts from whence it hath them; with the Lungs by the *Vena arterioſa* and the *Arteria Venoſa*; and laſtly, with all the parts of the body by the Arteries which it ſends to them all. Connexion.

It is of a hot and moiſt temper, as every fleſhy part is. The action thereof is, firſt to prepare the bloud in its right Ventricle, for the fit nouriſhment of the Lungs; for from hence it is that *Galen* ſaith the right Ventricle was made for the neceſſity of the Lungs. Secondly to generate the Vital Spirits in its left Ventricle for the uſe of the whole body. But this Spirit is nothing elſe than a Temper and Action. What the Vital Spirit is.

certain

certain middle ſubſtance between Air and Bloud, fit to preſerve and carry the native heat, wherefore it is named the Vital, as being the Author and preſerver of life. In the inner parts of the heart there preſent themſelves to our conſideration, the Ventricles, and the parts contained in the Ventricles and between them; ſuch are the *Valvulæ*, or Valves, the Veſſels and their Mouths, their diſtribution into the Lungs, the Wall or Partition, and the two productions or Ears of the Heart; which becauſe they are doubtful, whether they may be reckoned amongſt the external or internal parts of the Heart, I will here handle in the firſt place.

The *Auriculæ cordis*, or Ears of the Heart.

Therefore theſe *Auriculæ* or Ears, are of a ſoft and nervous ſubſtance, compact of three ſorts of Fibers, that ſo by their ſoftneſs they might the more eaſily follow the motions of the Heart, and ſo break the violence of the matter entering the Heart with great force when it is dilated. For otherwiſe by their violent and abundant entrance they might hurt the Heart, and (as it were) overwhelm and ſuffocate it; but they have that capacity which we ſee given by Nature, that ſo they might (as it were) keep in ſtore the Bloud and Air, and then by little and little draw it forth for the uſe of the neceſſity of the Heart. But if any enquire if ſuch matters may be drawn into the Heart by the onely force of the *Diaſtole*, *ad fugam vacui*, for avoiding of emptineſs; I will anſwer, That that drawing in, or attraction, is cauſed by the heat of the Heart, which continually draws theſe matters to it, no otherwiſe then a Fire draws the adjacent Air, and the flame of a Candle the Tallow which is about the wiek for nouriſhments ſake. Whileſt the Heart is dilated it draws the air, whileſt it is drawn together, or contracted, it expels it. This motion of the Heart is abſolutely natural, as the motion of the Lungs is animal. Some add a third cauſe of the attraction of the Heart, to wit, the ſimilitude of the whole ſubſtance. But in my judgment, this rather takes place in that attraction which is of bloud by the *Venæ coronales* for the proper nouriſhment of the Heart, than in that which is performed for attraction of matters for the benefit of the whole Body.

Their magnitude and number.

Theſe Ears differ in quantity, for the right is far more capacious than the left, becauſe it was made to receive a greater abundance of matter. They are two in number, on each ſide one, ſituate at the baſis of the Heart: The greater at the entrance of the Hollow Vein into the Heart, the leſs at the entrance of the veinous and of the great Artery, with which parts they have both connexion.

Their uſe.

We have formerly declared what uſe they have, that is, to break the violence of the matters, and beſides to be ſtays or props to the *Arteria venoſa* and great Artery, which could not ſuſtain ſo rapid and violent a motion as that of the Heart, by reaſon of their tenderneſs of ſubſtance.

Of the Ventricles of the Heart.

The partition between the Ventricles of the Heart.

THe Ventricles are in number two, on each ſide one, diſtinguiſhed with a fleſhy partition ſtrong enough, having many holes in the ſuperficies, yet no where piercing through.

The right of theſe Ventricles is the bigger, and encompaſſed with the ſofter and rarer fleſh; the left is the leſſer, but is engirt with a threefold more denſe and compact fleſh; for the right Ventricle was made for a place to receive the bloud brought by the hollow Vein, and for diſtributing of it, partly by the *Vena arterioſa* into the lungs for their nouriſhment, partly into the left Ventricle by ſweating through the wall or partition, to yield matter for the generation of the Vital ſpirits.

Why the right Ventricle is more capacious and leſs compact.

Therefore becauſe it is needful there ſhould be ſo great a quantity of this bloud, it was likewiſe fit that there ſhould be a place proportionable to receive that matter. And becauſe the bloud which was to be received in the right Ventricle was more thick, it was not ſo needful that the fleſh to contain it ſhould be ſo compact; but on the contrary, the arterious bloud and vital ſpirit have need of a more denſe receptacle, for fear of waſting, and leſt they ſhould vaniſh into air; and alſo leſs room, that ſo the heat being united, might become the ſtronger, and more powerfully ſet upon the elaboration of the bloud and ſpirits.

The action of the right Ventricle.

Therefore the right Ventricle of the Heart is made for preparation of the bloud appointed for the nouriſhment of the Lungs, and the generation of the vital ſpirits, as the Lungs are made for the mitification or qualifying of the Air. Which works were neceſſary if the Phyſical Axiom be true, *That like is nouriſhed by like*, as the rare and ſpongious Lungs with more ſubtil bloud; the ſubſtance of the Heart groſs and denſe, with the veinous bloud, as it flows from the Liver, that is groſs.

The action of the left Ventricle.

And it hath its Coronal Veins from the hollow Vein, that it might thence draw as much as ſhould be ſufficient.

But the left Ventricle is for the perfecting of the vital ſpirit, and the preſervation of the native heat.

Of the Orifices and Valves of the Heart.

The uſes of the four orifices of the Heart.

THere be four Orifices of the Heart, two in the right, and as many in the left Ventricle; the greater of the two former gives paſſage to the Vein, or the bloud carried by the hollow Vein to the Heart; the leſſer opens a paſſage to the *Vena arterioſa*, or the cholerick bloud carried in it for the nouriſhment of the Lungs.

The larger of the two other makes a way for the diſtribution of the Artery *Aorta*, and the vital ſpirit through all the Body; but the leſſer gives egreſs and regreſs to the *Arteria venoſa*, or to the air and fuliginous vapours. And becauſe it was convenient that the matters ſhould be admitted into their proper Ventricles by theſe orifices, by the *Diaſtole*, to wit, into the right Ventricle by the greater orifice, and into the left by the leſſer; and becauſe on the contrary it was fit that the matters ſhould be expelled by the *Syſtole* from their Ventricles, by the fore-mentioned orifices.

The Valves.

Therefore Nature to all theſe orifices hath put eleven Valves, that is to ſay, ſix in the right Ventricle, that there might be three to each orifice; five in the left, that the greater orifice might have three and the leſſer two, for the reaſon we will preſently give.

How they differ.

Theſe Valves differ many ways: Firſt in action; for ſome of them carry in matter to the Heart, others

others hinder that which is gone out, that it come not back again. Secondly, they differ in ſite: For thoſe which bring in, have membranes without, looking in; thoſe which carry out, have them within looking out. Thirdly, in figure; for thoſe which carry in, have a Pyramidal figure, but thoſe which hinder the coming back again, are made in the ſhape of the Roman Letter C. Fourthly, in ſubſtance; for the former for the moſt part are fleſhy, or woven with fleſhy fibers into certain fleſhy knots ending towards the point of the heart: The later are wholly membranous. Fifthly; they differ in number: for there be only five which bring in, three in the right ventricle at the greater orifice, and two in the left at the leſſer orifice; thoſe which prohibit the coming back, are ſix in each ventricle, three at each orifice. Laſtly, they differ in motion: for the fleſhy ones are opened in the *Diaſtole*, for the bringing in of blood and ſpirit, and contrariwiſe are ſhut in the *Syſtole*, that they may contain all, or the greater part of that they brought in. The membranous on the contrary are opened in the *Syſtole* to give paſſage forth to the blood and ſpirits over all the body, but ſhut in the *Diaſtole*, that that which is excluded might not flow back into the heart. But you ſhall obſerve that Nature hath placed only two Valves at the orifice of the *Arteria venoſa*, becauſe it was needful that this orifice ſhould be always open, either wholly, or certainly a third part thereof; that the air might continually be drawn into the heart by this orifice in Inſpiration, and ſent forth by Exſpiration in the contraction of the heart. Whereby we may gather this, that there is but one third part of that air we draw into the heart in breathing, ſent forth again in the form of vapor in Exſpiration, becauſe Nature would have but one third part of the orifice to lye open for its paſſage out. Therefore the Exſpiration or breathing out, and the *Syſtole* of the heart and arteries, is ſhorter than the Inſpiration, ſo that we may truly ſay, that the Inſpiration, or drawing the breath in, is equally ſo long as the Exſpiration is together with the reſt, which is in the midſt between the two motions.

Action. Site. Figure. Subſtance. Number. Motion.

Why there be only two Valves at the orifice of the *Arteria venoſa*.

CHAP. XII.

Of the diſtribution of the Vena arterioſa, *and the* Arteria venoſa.

HAving hitherto ſhewed the original of the veſſels of the heart, we muſt now ſpeak of their diſtribution. The *Vena arterioſa*, or the arterious vein; and the *Arteria venoſa*, or the veinous artery, each proceeding out of his proper ventricle, that is, the right and left, are divided into two large branches; one of which goes to the right, and the other to the left hand, the one lying croſs-ways over the other, the vein always riding over the artery, as you may underſtand better by the ſight of your eyes, than by reading of Books. Theſe branches at their entrance of the Lungs are divided into two other large branches, and each of them go to his peculiar Lobe of the Lungs; and theſe again run almoſt into infinite other branches, diſperſed in the places over the Lungs.

The artery always lies under the vein.

Theſe veſſels have acquired their names by reaſon of that Tranſmutation of conſiſtence, whereby the compoſure of a vein degenerates into an artery, and that of an artery into a vein, for the commodity of life. For this is a miracle of prudent Nature to change the coats of the veſſels of the Lungs; producing a vein which in its body ſhould imitate an artery, and an artery which ſhould repreſent a vein: For if the *Vena arterioſa* ſhould have retained its proper conſiſtence, the arterious blood which is carried by it from the Heart to nouriſh the Lungs, might by reaſon of its ſubtilty penetrate through, and flow away by reaſon of the rarity of the veinous texture: And ſo Nature ſhould never have attained her conceived end, that is, to nouriſh the Lungs, by reaſon of the continual motion of their contraction and dilatation.

A twofold reaſon why the vein was made arterious, or like an artery.

For nouriſhment cannot be aſſimilated to the part, unleſs it be put and cleave to it. Wherefore it was fit, that Nature ſhould make the body of this vein ſolid, that it might be immoveable, unſhaken and ſtubborn (in reſpect of a vein which by its ſoftneſs would have been too obſequious and yielding to the agitation of the Lungs) that ſo it might have nouriſhment, which might be diffuſed into all parts thereof, and which might neither be drawn by its *Diaſtole*, nor driven back into the heart by its *Syſtole*. But the artery hath the conſiſtence of a vein, that by that veinous ſoftneſs according to the neceſſity of Nature, it might be the more readily contracted and dilated, to bring the air in, and carry the vapours forth of the heart. Here we meet with a difficulty, which is, by what way the blood is carried out of the right and left ventricle of the heart.

Wky the artery was made like a vein.

Galen thinks that there be certain holes in the partition made for that purpoſe; and verily there are ſuch, but they are not perforated. Wherefore *Columbus* hath found out a new way, which is, that the blood is carried to the Lungs by the *Vena arterioſa*, and there attenuated; and carried from thence together with the air by the *Arteria venoſa* to the left ventricle of the heart; this he writes, truly very probably. *Botallus*, in his Treatiſe *de Catarrho*, hath found out a third way, to wit, a vein, which he calls *Arteriarum nutrix*, that is, the nurſe of the arteries, which creeps a little above the coronal to the right ear of the heart, and then goes into the left ear thereof. But yet I am very much afraid, that this vein obſerved by *Botallus*, is that veſſel obſerved by *Fallopius*, whereby the *Vena arterialis* is joyned to the *Aorta*, and by which all the vital blood is carried for the forming and nouriſhment of the Lungs while the Infant is yet in the womb. Of which alſo *Galen* makes mention, but it had lain hid from his time to this day, but that *Fallopius* raiſed up the memory of it again.

By what way blood may paſs out of the right into the left ventricle.

The vein called the Nurſe of the arteries. *Fallop. initio obſer. Arteriarum. Gal. l. 15. de uſu partium, cap. 6.*

CHAP. XIII.

The Diſtribution of the aſcendent Hollow-vein.

Gal. lib de ſorm. fœtus. The greater deſcendant branch of the hollow vein.

THe hollow vein riſing out of the gibbous part of the liver, and reſembling (according to *Galen*) the body of a Tree, is divided into two notable branches, but not of a like bigneſs. For the greater, by the hind-part of the liver upon the back-bone, and by the way, receives certain other branches from the ſubſtance of the liver, which enter not into the great trunk with the reſt. You may often ſee this deſcendent branch even to the back-bone, upon which it lies in this its deſcent, covered with the ſubſtance of the liver, ſo that it may ſeem that branch proceeds not from that common trunk together with the aſcendent, although indeed it always doth. But the leſſer branch aſcends to the upper parts, and is diſtributed after this manner following: For firſt ariſing into the midriff, it beſtows two ſmall veins upon it, on each ſide one, which from that part are called *Phrenicæ*. But from thence when it arrives at the right ear of the heart, it makes the *Coronales*, the Coronal or Crown-veins, which compaſs the *baſis* of the heart in manner of a crown. Thirdly, entring ſomewhat more deeply into its right ear, in its greater part it produces the *Vena arterioſa*. Fourthly, lifted up above the heart, on the right ſide it produces the vein *Azygos* or *ſine pari* (that is, without a fellow) which deſcending to the fourth rib, (reckoning from above downwards) nouriſheth the intercoſtal muſcles, and alſo the membranes of the eight lower ribs, on both ſides, ſending a branch into each of the muſcles at the lower part of the rib, which may be ſufficient for their nouriſhment. Beſides alſo oftentimes, eſpecially in little men, this vein *Azygos* nouriſhes all the ſpaces between all the ribs by the like branches, which it ſends in the ſame manner to the four ribs. Moreover alſo, this *Azygos* ſometime, though but ſeldom, is found double, that is, on each ſide one. Here you muſt chiefly obſerve, that this vein, after it hath nouriſhed the ſpaces between the lower ribs, in its remainder deſcends under the *Diaphragma*, and is joyned on the left ſide to the Emulgent vein; by which it is manifeſt how an Abſceſs may be critically evacuated by the urine, in a Pleuriſie. But this ſame *Azygos* is more depreſſed on the right ſide, and meets with the *Venæ lumbares*, but eſpecially with one of them which goes down to the thigh, whereby *Fallopius* gathers, that it is very convenient in the beginnings of Pleuriſies, to open the *Vena poplitis*, the vein of the ham. Fifthly, above the *Azygos* (when it is wanting there) it ſends forth the branch called *Intercoſtalis* to the other ſpaces between the upper ribs; although this is ſometimes ſeen to come from the *Axillaris*, which *Sylvius* calls the *Subclaviæ*. Sixthly, it brings forth the *Mammariæ*, ſo called, becauſe in their greater part they run to the dugs between the fourth and fifth ribs, for the uſes formerly mentioned, men and women have on each ſide one of theſe coming from the *Subclaviæ*. They are ſometimes found to proceed by a certain common orifice from the hollow vein, before it be divided into the *ſubclavian* branches, but it is rather in beaſts than in men; theſe veins deſcending by the ſides of the *Sternon*, yield nouriſhment to the two inner muſcles of the cheſt, to the ſeven intercoſtal muſcles of the true ribs, to the *Sternon* it ſelf, and to its ligaments and griſtles, as alſo to the *Mediaſtinum* and the upper part of the right muſcles, and the adjacent parts. Seventhly, it produces the *Cervicalis*, which on both ſides through the holes of the productions of the *Vertebra's* of the neck, aſcends to the head, ſending many ſmall branches into the ſpinal marrow through the holes by which the nerves paſs; and alſo into the membranes, ligaments, griſtles, bones, and neighbouring muſcles. Eighthly, the *Muſculoſa*, or muſculous, which alſo ariſing out of the *Subclaviæ*, is divided into two other branches: The one whereof goeth upon the breaſt to the paps nouriſhing the fore-moſt muſcles; wherefore in a baſtard-pleuriſie, cupping-glaſſes may be fitly applied in this place.

The upper branch of the hollow vein is the leſs.

Venæ phrenicæ Coronales.

Vena Arterioſa.

Muſculoſa.

In what place cupping-glaſſes may be fitly applied in a baſtard pleuriſie.

The other branch deſcends to the upper muſcles of the cheſt, but ſpecially to that which is called *Latiſſimus*. The Tenth is the *Axillaris*. The Eleventh the *Humeralis*, of which we will treat in their place. The Twelfth and laſt is the *Jugularis* properly ſo called, which is twofold, the internal and external. The internal being the leſſer, doth preſently on both ſides from this very beginning aſcend by the ſides of the *Aſpera Arteria*, or weazon, even to the mouth and skull, yielding nouriſhment to the parts by which it paſſes, as to the next membranes and nerves. But when it comes to the *baſis* of the *Cranium*, it is divided into two branches; the greater whereof going back along the *baſis* of the *Cranium* to the hind-part thereof, ſending a branch to the long muſcle ſituate upon the *œſophagus*, it enters the *Cranium* with the ſmall *Carotides* through the hole of the nerves of the ſixth conjugation, where they become one common veſſel. The leſſer ſending a ſlip to the organ of hearing by the hole called *Cæcum* (or the Blind) alſo enters the *Cranium*, and is ſpent in the thicker *meninx* near to the hole of the third and fourth conjugation of nerves. The external Jugular vein being greater and fairer, moſt commonly ſimple, yet ſometimes double, either preſently at his beginning, or a little after, aſcends ſuperficially on both ſides of the neck, between the broad muſcle, or fleſhy pannicle, being there eaſie to be diſcerned, and other muſcles ſituate at the ſides of the neck, into which, as alſo into the skin, it ſends certain branches for nouriſhment.

Axillaris.

This branch descendeth together with the fourth nerve.* q *Division of the* Basilica *into two branches, and that which is noted with* q, *is ever accompanied with an artery.* ſ *A branch of this vein bestowed upon the arm.* t *A branch of the* Basilica *which together with the branch of the* Cephalica *marked with* h, *makes the* mediana *or middle vein marked with* a. u *A branch of the* Basilica *going to the inner head of the arm.* xx *A branch issuing out of the former that creepeth along unto the wrist, and toward the little finger conjoyning it self with a branch of the* Cephalica. y *A vein running out unto the skin at the outside of the cbuit. Upper* z *a propagation issuing out of a branch of the* Basilica *marked with* t; *lower* z, *A branch of the* Basilica x, *going to the inside of the arm.* α *The* median *or common vein.* β *The partition of the* median *vein above the wrist. This division should have been made above* γ. γ *The external branch of the partition which goeth to the outside of the head.* δ *From which issueth a small branch to the inside.* ε *The internal branch under* ε, *which toward the middle and the ring finger is especially disposed.* ϛ, *The vein of the thumb dispersed into the mountainet or hillock, which is conjoyn'd with the branch noted with* δ. ζ *The trunk of the hollow-vein from which issue branches unto the parts seated under the liver.* η *The fatty vein called* Adipoſa ſiniſtra, *which goeth unto the fat of the kidneys.* θ ι *The two Emulgents which lead whey-blood unto the kidneys.* λμ *The two ſpermatical veins leading the matter of the seed unto the testicles.* Ν *The beginning of the bodden vessel called* Vas varicoſum. ξ *The veins of the loins called* Lumbares, *which are sent in the knots or knees to the rack-bones, to the marrow of the back, to the muscles that lie upon the loins, and to the* Peritonæum. ο *The bifurcation of the hollow vein into the Iliack branches, which bifurcation is not unlike* ^. ϖ Muſcula ſuperior, *a transverse branch going to the muscles of the* Abdomen, *and to the* Peritonæum. ρ σ *The division of the left Iliack vein, into an inner branch at* ρ, *and an utter at* σ. τ Muſcula media, *the utter propagation of the branch* ρ. *Distributed through the muscles of the* coxa *and the skin of the buitock.* υ *An inner propagation of the same branch* ρ, *which goeth unto the holes of the holy-bone.* ΦΦ *The vein called* Sacra, *which goeth unto the upper holes of the holy-bone.* χψ *The vein* Hypogaſtrica *distributed to the bladder, to the muscles of the fundament, and the neck of the womb.* ω *A vein arising from the utter branch marked with* σ, *which is joyned with some branches of the internal vein, near the holes or perforations of the share-bone.* 31 *A vein which when it is passed the share-bone, distributeth one branch into the cup of the* coxendix, *and to the muscles of that place.* ϰ *Another small branch which runneth under the skin at the inside of the thigh.* χ *The congress or meeting of the fore-said vein, with a branch marked with* char. 2. *and distributed into the leg.* 1 *The* Epigaſtrick *vein, a propagation of the utter branch* σ *perforating the* Peritonæum, *whereto, as also the muscles of the* Abdomen, *and the skin it offereth branches, the chief branch of this vein is joyned with the descending mammary above the navel at* M. Δ Pudenda *an inner propagation of the branch.* σ *Running overthwart unto the privities.* ☉ ρ Saphæna *or the ancle-vein or the inner branch of the crural trunk, which creepeth through the inside of the leg under the skin unto the tops of the toes.* A *The first interior propagation of the* Saphæna *offered to the groin.* Ξ *The utter propagation thereof divided to the foreside or outside of the thigh.* Π *The second propagation of the* Saphæna *going to the first muscle of the leg.* Σ *The third propagation of the* Saphæna *going to the skin of the whirl-bone, and unto the ham.* Φ *The fourth propagation of the* Saphæna *dispersing his muscles forward and backward.* Ψ *Branches from this unto the foreside of the inward ankle, to the upper part of the foot, and to all the toes.* Ω Iſchias minor, *called also* Muſcula interior *the utter branch of the crural trunk divided into the muscles of the* coxendix, *and to the skin of that place.* 1 2 *And this also may be called* Muſcula. 1 *The exterior and lesser which passeth into some muscles of the leg.* 2 *The interior, greater, and deeper unto the muscles of the thigh.* 3 4 *The vein called* Poplitea, *made of two crural veins divided under the knee.* 5 *From this, a surcle is reached upward unto the skin of the thigh,* 6 *but the greater part runs by the bent of the knee under the skin as far as the heel.* 7 *Also to the skin of the outward ankle.* 8 *The vein called* Suralis, *or calf-vein, because it runneth unto the muscles that make the calf of the leg.* 9 *The division of the Sural-vein into an exterior trunk* 9, *and an interior* 14. 10 11 *The division of the exterior trunk under the knee into an external branch, which along the brace attaineth unto the muscles of the foot,* 11 *and an internal.* 12 13 14 *Which descending along the outside of the leg to the upper of the foot is cloven into divers branches, and in the back of the foot mixeth it self with* Poplitea, *or the ham-vein* 20. 15 *The interior branch of the Sural-vein which runneth into the back-side of the leg.* 16 *A branch hereof descending to the inside of the heel, and the great toe, and is divided into divers surcles.* 17 Iſchias major *issuing out of the internal trunk at* 14, *and running through the muscles of the calf.* 18 *A propagation hereof is derived unto the upper part of the foot, and affording two surcles to every toe.* 19 *The remainder of the inner inner trunk, behind the inner ankle approacheth to the bottom of the foot, and is consumed into all the toes.* 20 *The commixtion of the vein* Poplitea *with the small or calf-branch at* 13.

Where the external Jugular-vein may be fitly opened in the inflammations of the parts of the mouth.

But when it arrives to the basis of the lower part of the head, it is divided into more branches, one whereof is carried to the muscles of the bone *Hyois*, the *Larinx*, the tongue and the lower part of the tongue (in which place it is commonly opened in the Squinances, and other inflammations of the mouth) and to the coat of the nose. Another is carried to the *Dura mater*, passing on both sides through a hole, situate under the bone *mastoides*; and besides, ascending to the bone of the back-part of the skull, it comes obliquely to the upper part of the future *Lambdoides*, where these branches meeting together, pass into the reduplication of the *Dura mater*, dividing the fore-part of the brain, that so, joyned and united, they may make the *Torcular*; the third ascendent is distributed upon the back-part and basis of the lower jaw, to the lips, the sides of the nose, and the muscles thereof; and in like manner to the greater corner of the eyes, to the fore-head and other partr of the face, and at length by meeting together of many branches, it makes in the fore-head of the vein which is called *vena recta*, or *vena frontis*, that is, the fore-head vein. The

Vena recta.

fourth

fourth aſcending by the glandules behind the ears, after it hath ſent forth many branches to them, is divided into two others, one whereof paſſing before, and the other behind the ear, are at length ſpent in the skin of the head. The fifth and laſt wandring over all the lower part of the head going to the back-part thereof, makes the *Vena pupis*, which, extended the length of the head by the ſagittal ſuture, at length goeth ſo far, that it meets with the *Vena frontis*, which meeting is the cauſe, that a vein opened in the fore-head, is good in griefs of the hinder-part of the head, and ſo on the contrary. But we muſt obſerve, that in the *Cranium* of ſome, the *Vena pupis* by one or more manifeſt paſſages, ſends ſome portion thereof to the inner part of the head, ſo that the *Vena pupis* being opened, may make revulſion of the matter which cauſeth the internal pains of the head.

Vena pupis.

CHAP. XIV.

The diſtribution of the Nerves, or Sinews of the ſixth Conjugation.

BEcauſe the diſtribution of the Arteries cannot be well ſhewed, unleſs we violate thoſe nerves which are carried over the cheſt, therefore before we ſhew the diſtribution of the arteries, we will, as briefly as we can, proſecute the diſtribution of theſe nerves.

Three pair of nerves of the ſixth conjugation.

Now the ſixth conjugation brings forth three pair of nerves; for paſſing out of the skull, as it comes down to the cheſt, it by the way ſends forth ſome branches to certain muſcles of the neck, and to the three aſcendent muſcles of the *Larinx* on each ſide of the *Sternon*, and upon the clavicles. Then the remainder deſcending into the cheſt, is divided on each ſide into theſe three pair. The firſt pair makes the *Ramus coſtalis*. The ſecond, the *Ramus recurrent*. The third pair, the *Ramus ſtomachicus*. The *Ramus coſtalis*, or coſtal branch, is ſo called, becauſe deſcending by the roots of the ribs, even to the holy bone, and joyning themſelves to theſe which proceed from each of the *Vertebra's* of the ſpine, they are carried to all the natural parts.

Ramus Coſtalis.

The *Recurrens*, or recurrent, is alſo ſo called, becauſe as it were ſtarting up from the cheſt, it runs upward again: But theſe two recurrent nerves do not run back from the ſame place; but the right from below the artery, called by ſome the Axillary, by others Subclavian, and the left from beneath the great artery, deſcending to the natural part. But each of them on each ſide aſcending along by the weazon, even to the *Larinx*, and then they inſinuate themſelves by the wings of *Cartilago ſcutiformis*, and *Thyroides* into the proper muſcles, which open and ſhut the *Larinx*.

Recurrens.

An anatomical *Axiome.*

By how much the nerves are nearer the original, to wit, the brain, or ſpinal-marrow, they are by ſo much the ſofter. On the contrary, by how much they are further abſent from their original, they are ſo much the harder and ſtronger, which is the reaſon that nature would have theſe recurrent nerves to run back again upwards, that ſo they might be the ſtronger to perform the motions of the muſcles of the *Larinx*. But the *Stomachicus* or ſtomach-branch is ſo called, becauſe it deſcends to the ſtomach or ventricle. For this branch deſcending on both ſides by the ſides of the gullet, ſends many branches from it into the inner ſubſtance of the lungs, into the coat thereof, into the *Pericardium* and heart, and then coming into the upper orifice of the ſtomach, it is ſpent in many branches, which folded after divers manners and ways, chiefly makes that mouth or ſtomach, which is the ſeat of the animal appetite (as they term it) and hunger, and the judger of things convenient or hurtful for the ſtomach. But from thence they are diverſly diſſeminated over all the body of the ventricle.

Why Nature would have the vocal nerves recurrent.

Ramus Stomachicus.

Moreover the ſame branch ſends forth ſome ſmall braaches to the liver and bladder of the gall, giving each part by the way, ſo much ſenſe as ſhould be ſufficiently neceſſary for it. Here you muſt note, the ſtomach branch deſcends on each ſide one, knit to the gullet, and by the way they divide themſelves into two branches, each of which goes to the oppoſite ſide, that it may there joyn it ſelf to the nerve of that ſide. To which purpoſe, the right is carried above the gullet, the left below it; ſo that theſe two ſtomatick become four, and again theſe four preſently become two.

CHAP. XV.

The diviſion of the Arteries.

THe artery ariſing forth of the left ventricle of the heart, is preſently (the two coronal arteries being firſt ſpread over the ſubſtance of the heart) divided into two unequal branches. The greater whereof deſcends to the lower parts, being diſtributed, as we formerly mentioned in the third Book, Chap. 22. The leſſer aſcending to the upper parts, is again divided into two other unequal branches, the leſſer of which aſcending towards the left ſide, ſends forth no artery from it, until it arrive at the rib of the cheſt, where it produces the Subclavian artery, which is diſtributed after the manner following.

The left branch of the aſcendent artery is leſs than the right.

The diſtribution of the left ſubclavian artery into the,

1. *Intercoſtalis.*

2. *Mammaria.*

3. *Cervicalis.*

Firſt, it produces the intercoſtal, and by it imparts life to the three intercoſtal muſcles of the four upper ribs, and to the neighbouring places.

Secondly, It brings forth the mammillary branch, which is diſtributed as the mammillary vein is.

Thirdly, the *Cervicalis*, which aſcends along the neck by the tranſverſe productions to the *Dura mater*, being diſtributed as the *Vena Cervicalis* is.

The Figure of the Arteries.

ΠΦ *The lower and backer* Tibiæa *running unto the upper ſide of the foot at* Φ. Ψ *A propagation of the* crural *artery going to the inner and upper ſide of the foot, and ſprinkling a branch unto the ankle.* Ω *A propagation unto the lower part of the foot which affordeth ſtir-cles to each toe.*

Fourthly, paſſing out of the cheſt, from the back-part of the cheſt, it ſends forth the *muſculoſa*, whereby it gives life to the hind-muſcles of the neck, even to the back-part of the head. 4. *Muſculoſa.*

Fifthly, having wholly left the cheſt, it ſends forth the two *Humeraria*, or ſhoulder-arteries, the one whereof goes to the muſcles of the hollow part of the ſhoulder-blade, the other to the joynt of the arm and muſcles ſituate there, and the gibbous part of the ſhoulder-blade. 5. *Humeraria duplex.*

Sixthly and laſtly, it produces the *Thoracica*, which is alſo twofold; for the one goes to the fore-muſcles of the cheſt, the other to the *Latiſſimus*, as we ſaid of the vein, the remnant of it makes the *Axillaris* of that ſide. 6. *Thoracica duplex.*

The other greater branch likewiſe aſcending, by the right ſide, even to the firſt rib of the cheſt, makes alſo the ſubclavian of that ſide, which, beſides thoſe diviſions it makes on this ſide, like thoſe of the left ſide, hath alſo another which makes the right and left *Carotides*, or ſleepy arteries, which aſcending undivided with a nerve of the ſixth conjugation and the internal jugular vein, by the ſides of the *Aſpera Arteria*, or wind-pipe, when they come to the *Pharinx*, they are divided on each ſide into two branches, the one internal, the other external. The internal and greater is ſent to the *Pharinx*, *Larinx*, and tongue; then entring into the head by the long hole and back-part of the upper jaw, it ſends many branches to the noſe, eyes, the inſide of the temporal muſcles, and to the *Craſſa menynx*, or *Dura mater*: The remainder of this branch going by the ſide-holes of the ſame, that it might there make the *Plexus admirabilis*, as we ſee. And then it is ſpent upon the *baſis* of the brain abundantly diffuſed over the *tenuis meninx*, or *Pia mater*, and then the membrane or *Plexus Choroides*. The external or leſſer branch of the ſleepy arteries goes to the cheeks, the temples, and behind the ears; laſtly, it ſends a branch into the long muſcle of the neck with which the internal Jugular-vein inſinuates it ſelf into the *Dura mater*, entring by the hole of the nerves of the ſixth conjugation.

The diſtribution of the right ſubclavian artery.

The *Carotides*, or ſleepy arteries.

Their diviſion.

The diſtribution of the internal branch of the ſleepy arteries.

To what parts the external branch of the ſleepy artery arrives.

But we muſt note, that there be more veins in a mans body, than arteries; and beſides, that the veins are far thicker. For there is no need for preſerving the native heat in the parts themſelves, either of ſo many, or ſo large inſtruments of that kind. Therefore you may often find veins without arteries, but never arteries without veins.

But we underſtand, that an artery is companion to a vein, not only when it touches it, or adheres to it by common membranes, as uſually it happens: but alſo when it is appointed together with the vein for the uſe of the ſame part.

CHAP. XVI.

Of the Thymus.

THe *Thymus* is a glandule, of a ſoft, rare, and ſpongious ſubſtance, of large bigneſs, ſituate in the furtheſt and higheſt part of the cheſt, amongſt the diviſions of the ſubclavian or Jugular veins and arteries, as yet contained in the cheſt, for this uſe; that it might ſerve theſe veſſels for a defence againſt the bony hardneſs of the cheſt; and beſides, that, as it were by this prop or ſtay, the diſtributions of theſe veſſels might become the ſtronger; for ſo we ſee that nature hath provided for others, eſpecially ſuch as are the more noble and worthy. This glandule appears very large in beaſts and young men, but in ſuch as have attained to full growth it is much leſs, and ſcarce to be ſeen.

What the *Thymus* is.

The uſe.

The magnitude.

CHAP. XVII.

Of the Aſpera Arteria, *the rough Artery or Weazon.*

THe *Aſpera Arteria*, or Weazon, ſeeing it is the inſtrument of voice and reſpiration, is of a griſtly, ligamentous, and wholly various ſubſtance. For if had been one rough and contined body with the *Larinx* or throttle, it could not be neither dilated nor compreſſed; opened, nor ſhut; neither could it order the voice according to our deſire.

The ſubſtance.

P *A revolution of ſmall branches of the right nerve to the right* Axillary Artery.
QQ *The right recurrent nerve.*
R *A revolution of ſmall branches of the left nerve unto the deſcending of the great artery.*
SS *The left recurrent nerve.*

Compoſure. It is compoſed of veins from the internal Jugular, of arteries ariſing from the *Carotides*, and of nerves, proceeding from the recurrent branch of a double membrane, of which the external comes from the *Peritonæum*; the internal, which is the ſtronger and woven with the right fibers, from the inner coat of the mouth, the which is common with the inner coat of the *œſophagus* or gullet. And alſo it conſiſts of round griſles, yet not drawn into a perfect circle, compoſed in manner of a channel, and mutually joyned together in order, by the ligaments that proceed from their ſides and ends.

Why the back part of the weazon is ligamentous. Theſe ſame ligaments perfect the remnant of the circle of this *Aſpera Arteria*, on that part next the gullet, which is thought to be done to this end; that that ſoftneſs of a ligament, might then give place, when we ſwallow harder and greater gobbets of meat. Of the two ſorts of ligaments which are annexed to the griſtles of the weazon, ſome tie and faſten together the rings or circles which give means both to it and theſe circles to be drawn in length; otherſome bring theſe griſtles into a perfect circle, which alſo yield them means of dilatation. Theſe ligaments cover the inner ſuperficies, but the griſtles are placed without, to reſiſt the incurſion of external injuries.

Why the forepart is griſtly. But we muſt note, that by this communion of the inner coats of the weazon and gullet, we reap this benefit in the commodiouſneſs of the action, that one of theſe parts being depreſſed, the other is lifted up, like a rope running in a wheel or pully. For thus whileſt the gullet is depreſt to ſwallow any thing, the weazon is lifted up; and on the contrary, when the ſtomach riſes up in vomiting, the weazon is depreſt.

The number and ſite. The diviſion of the weazon through the lobes of the lungs. It is only one, and that ſeated between the *Larinx*, (from which it takes its beginning,) and the lungs in which it ends; firſt dividing it ſelf into two large branches, the right and the left; and beſides, each of theſe entring into the ſubſtance of the lungs, is again divided into two others; to each of the lobes one; and, to conclude, theſe be ſubdivided into infinite others, through the ſubſtance of the lobes.

All theſe branches are griſtly even to the ends. They are ſituate between the ends of the *Arteria venoſa*, and the *Vena arterioſa*, that the entrance of air into the heart by the *Arteria venoſa*, might be ſpeedier; as alſo the paſſage out of the vapour, by the *Vena arterioſa*, Thus it hath connexion with theſe in the ends, or utmoſt parts thereof, but by the other parts compaſſing it, with the members from whence it takes them.

The temper and action. The temperament thereof is cold and dry. The action is to carry the air to, and vapours from the lungs; that by dilating, but this by preſſing the griſtles together.

CHAP.

CHAP. XVIII.

Of the Gullet.

THe *Oeſophagus*, or Gullet, which is the paſſage of the meat and drink, is of a middle ſubſtance between fleſh and ſinews, becauſe it conſiſts of one nervous membrane, and another fleſhy. The nervous is placed the innermoſt, and is continued to the inner coat of the mouth even to the lips, (whereby it comes to paſs, that the lips tremble in diſeaſes which are ready to be judged by a critical vomiting) and to the inner part of the *Aſpera Arteria*; it conſiſts of right Fibers for the attraction of the meat, which we ſee is ſometimes ſo quick and forcible in hungry people, that they have ſcarce time to chaw it, before they find it, to be pluck'd down, as it were, with hand, The fleſhy coat placed without is woven with tranſverſe fibers, to haſten the going of the meat into the ſtomach, and for expulſion in vomitting and breaking of wind. Theſe two coats are continued with the two coats of the ſtomach, and have the like ſite. Beſides, the gullet hath theſe parts compoſing it, as a vein from the gate and hollow aſcendent vein; a nerve from the ſixth Conjugation, an artery from that which creeps alongſt the bottom of the ſtomach with the *Vena Gaſtrica*, or elſe from the arteries aſcending the hollow part thereof; but alſo, beſides all theſe veſſels, it may have a third coat from the membrane inveſting the ribs, or *Pleura*. The magnitude of the gullet is large enough, yet ſome be bigger, ſome leſs, according to the varieties of bodies. The figure of it is round, that ſo it might be more large to ſwallow meat, and leſs ſubject to offence. It is placed between the back-bone and weazon from the roots of the tongue even to the ſtomach. But as it deſcends alongſt the back-bone, when it comes to the fourth *Vertebra* of the cheſt, it turns to the right ſide, to give way to the great Artery *Aorta*, and the deſcendent artery; then it turns to the left ſide to the ſtomach, or mouth of the ventricle. Nature hath faſtened it to the *Diaphragma* with ſtrong membranous ties, leſt that, if it had lain upon the artery, it ſhould have hindered the paſſage of the vital ſpirit to the lower parts. It is only one, and that tied to the fore-mentioned parts, both by its veſſels and membranes. It is of temper rather cold than hot, as all thoſe parts, which are more nervous than fleſhy, are. The action thereof is to draw and carry down the meat, and to caſt forth ſuch things by vomit as trouble the ſtomach. Here you muſt note, that whileſt we ſwallow down, the gullet is drawn downwards, and the weazon upwards, which is the cauſe that we cannot ſup and blow, ſwallow and breathe, together at the ſame inſtant; which we muſt think to happen by Gods ſingular providence, to whoſe name be glory for everlaſting. *Amen.*

The End of the Fourth Book.

BOOK

BOOK V.

Of the Animal parts contained in the Head.

CHAP. I.

A general deſcription of the Head.

HAving hitherto declared two general parts of mans body, that is, the natural and vital, it is now fit to betake our ſelves to the laſt, that is, the animal, beginning with the head.

Wherefore we will firſt define the head, then divide it into its parts; thirdly, deſcribe each of theſe parts; fourthly, demonſtrate them after the order they offer themſelves to our ſight in diſſection.

What the head is. Why ſeated in the higheſt place.

The head therefore is the ſeat of the ſenſes, the palace and habitation of reaſon and wiſdom, from whence, as from a fountain, infinite actions and commodities ariſe. It is ſeated above the reſt of the body, that the animal ſpirit from thence, as from a Tower, may govern and moderate the whole body, and perform all actions according to the preſcript of nature. By the head we underſtand all that which is contained from the crown of the head to the firſt *Vertebra* of the neck.

The figure.

The beſt figure of the head is round, lightly flatted on each ſide, *extuberating* ſomething to the fore and hind-part thereof. For from hence is taken an argument of the goodneſs of the ſenſes; on the contrary, thoſe which are exactly round, or acuminate, and ſharp towards the top, are not thought good. The head is divided into the face, forehead, temples, the forepart, the crown, and hind-part.

The diviſion thereof.

By the face we underſtand, whatſoever is contained between the eye-brows and the lower part of the chin. By the forehead, all the ſpace from the eye-brows even to the coronal ſuture. By the temples, whatſoever is hollowed from the leſſer corner of the eye, even to the ears. By the forepart of the head, whatſoever runs in length from the top of the forehead, or the coronal ſuture, even to the ſuture *Lambdoides*, and on each ſide to the *Oſſa petroſa*, the ſtony bones, or ſcaly ſutures. By the crown we ſignifie a certain point exquiſitely in the midſt of the ſagittal ſuture, which is ſufficiently known. By the *Occiput* or hind-part of the head, that which is terminated by the ſuture *Lambdoides* and the firſt *Vertebra* of the neck.

The containing parts of Head.

Of all theſe parts there be ſome ſimple, ſome compound; beſides, ſome are containing, ſome contained. Of the containing, ſome are common to all the parts of the head, as the skin, the fleſhy pannicle, and *pericranium*; others are proper to certain parts, as the fleſhy pannicle to the neck, face, forehead, and skin covering the *cranium*, the common coat of the muſcles to the fat and face; the skull and both the *Meninges* to the brain.

The parts contained.

The parts contained, are the ſubſtance of the brain, the four ventricles, and the bodies contained in them, the nerves, the mammillary proceſſes; the *Plexus Choroides* or *Rete admirabile*; the *Glandula baſilaris*, and others, of which we will ſpeak hereafter.

We muſt now ſpeak of the containing parts beginning with the skin; for the order of teaching requires, that we take our *Exordium* from the more ſimple; but firſt we will ſay ſomething of the hair.

What the hair is. The uſe thereof.

The hair is nothing elſe than an excrement generated and formed of the more groſs and terrene portion of the ſuperfluities of the third concoction, which could not be waſted by inſenſible tranſpiration. The benefit of it is, that conſuming the groſs and fuliginous, or ſooty excrements of the brain, it becomes a cover and ornament for the head.

This hair of the head and eye-brows have their original from the firſt conformation of the infant in the womb, the reſt of the hairs of the body ariſe and grow forth as the body grows and becomes more dry, of which ſort are the hairs which cover the chin, arm-holes, groins, and other parts of our bodies.

CHAP. II.

Of the muſculous skin of the Head (commonly called the hairy ſcalp) and of the Pericranium.

What the hairy ſcalp is.

THe skin which covers the skull, and is covered with the hair, is far more fleſhy, thick, hard, and dry than any other part of the body, eſpecially which wants hair. The skin hath almoſt the like condition of quality as thoſe parts have, which it doth ſimply cover, but is as it were, loſt in them, or grown into one with them, as in the lips and forehead with the fleſhy pannicle, wherefore it is there called muſculous; in other places it adheres to the grittles, as on the ſides of the noſtrils and corners of the eyes, whereupon it is there called griſtly.

Its connexion.

It hath connexion with the *Pericranium*, becauſe joyned to it, it receives nerves from the firſt and ſecond *Vertebra* of the neck, and from the third conjugation of the brain, which are diſſeminated through all its ſubſtance, whereby it comes to paſs, that the wounds, contuſions and impoſthumes, that happen in or upon this skin, are not to be neglected.

The

The * *Pericranium*, (but I ſuppoſe it ſhould be the *Perioſteum*) is a moſt thin membrane, which next and immediately covers all the bones of the body, and this on the head is called by a peculiar name the *Pericranium*, by reaſon of the excellency of the *Cranium* or skull; in other bones it is termed the *Perioſteum:* And as the *Pericranium* takes its original from the *Craſſa meninx*, propagating it ſelf by certain ſtrings or threds ſent forth by the ſutures and holes of the skull, ſo all other membranes of the body have their original either from this *Pericranium*, or *Craſſa meninx*, ſending forth their productions, as well by the holes or paſſages of the head, as by thoſe of the ſpinal marrow or back-bone it ſelf even to the holy bone.

* Our Author (with *Falleptus* and *Laurentius*) confounds the *Pericranium* and *Perioſteum*: but *Veſalius*, *Bauhinus* and *Bartholinus* diſtinguiſh them, making the *Pericranium* thin and ſoft, and the *Perioſteum* moſt thin and nervous, and of moſt exquiſite ſenſe.

Of which this is an argument; for in what part ſoever of the body a membrane is hurt, preſently the hurt or ſenſe thereof comes to the *Craſſa meninx*. For ſo thoſe who have but their little toe hurt, when they ſneeze or cough, perceive an increaſe of their pain, by the paſſage thereof to the brain.

Why the wounds thereof muſt not be neglected.

* The uſe of this *Pericranium* is to cover the skull; and to give notice of things hurtful, by the power of the quick ſenſe which it is endued withal, and the *Perioſteum* doth the like in other bones. Beſides, it ſuſtains and faſtens by the ſutures the *Craſſa meninx* to the skull; leſt it ſhould fall by reaſon of its weight upon the *Pia mater*, and ſo hurt it, and hinder the pulſation of the brain and arteries that are plenteouſly ſpread through both the *Meninges*. Wherefore the *Pericranium* hath moſt ſtrait connexion with the *Craſſa meninx*, becauſe it takes the original from thence.

The *Pericranium* and *Perioſteum* of the ſame nature.

Whence all the membranes proceed.

We muſt think the ſame of the other membranes of the body, which thing is very notable in the ſolution of the continuity of the membranes.

Why when any membranous part is hurt in any part of the body, the head is affected by conſent.

CHAP. III.

Of the Sutures.

* The uſe of the *Pericranium*.

THe Sutures do ſew or faſten together the bones of the skull; theſe be five in number. Three, are true and legitimate; two, falſe and ſpurious. The Coronal, the firſt of the true Sutures, is ſeated in the forepart of the head, deſcending downwards overthwart the forepart of the head to the midſt of the temples; it is ſo called, becauſe *Corollæ*, that is, wreaths, crowns, or garlands are ſet upon that place.

Their uſe and number.

The ſecond is called the *Sagittalis*, or right ſuture, as that, which running through the crown, divides the head into two equal parts, as with a ſtrait line, running the length of it from the coronal to the *Lambdoides* or hind-ſuture.

But this third Suture *Lambdoides* is ſo called, becauſe it repreſents the capital Greek Letter *Lambda* Λ. You muſt underſtand this deſcription of the ſutures, not as always, but as for the greater part, to be thus. For there be ſome skulls that want the foremoſt ſuture, otherſome the hind, and ſometimes ſuch as have none of the true ſutures, but only the falſe and ſpurious. And alſo you ſhall ſometimes find the ſagittal to run to the noſe.

Some skulls want ſutures.

And oft-times there be three or four ſutures in the back-part of the head, ſo that indeed the number of the ſutures is not certain. Which alſo we find obſerved by *Cornelius Celſus*, where he writes, that *Hippocrates* was deceived by the ſutures by chance; for that he conjectured, that the bones of the back-part of the head, were broken; becauſe his Probe, thruſt to the roughneſs of the ſecond ſuture *Lambdoides*, ſtaid as at a cleft made in the bone by a ſtroke. *Celſ. lib. c. 40.*

The other two are called the falſe, ſtony and ſcaly ſutures, by reaſon they are made by a ſcaly conjunction of the bones, but not by a toothed ſaw or comb-like connexion. But if any ask, Why the head conſiſts not of one bone, that ſo it might be the ſtronger? I anſwer, It is, that ſo it might be the ſafer both from internal and external injuries. For the skull, being, as it were, the tunnel of the chimney of this humane fabrick, to which all the ſmoaky vapours of the whole body aſcend, if it had been compoſed of one bone, theſe vapours ſhould have had no paſſage forth.

Why the skull conſiſts of divers bones.

Wherefore the groſſer vapours paſs away by the ſutures, but the more ſubtil by the pores of the skull; ſome have their ſutures very open, but others on the contrary very cloſe.

Therefore nature hath otherwiſe compendiouſly provided for ſuch as want ſutures: For it hath made one or two holes, ſome two fingers breadth from the *Lambdoides*, through which the *Vena pupis* enters into the skull, and they are of that largeneſs, that you may put a points tag into them, that the vapours may have free paſſage forth, otherwiſe there would be danger of death; thus Nature hath been careful to provide for man againſt internal injuries; And in like manner againſt external; for it hath made the head to conſiſt of divers bones, that when one is broken, the other may be ſafe, the violence of the ſtroke being ſtaid in the diviſion of the bones.

In what bodies and by what mean, the *vena pupis* ſometimes enters into the parts within the skull.

Whereby you may know, that if the skull chance to be broken in the oppoſite ſide to that which received the blow, that it happens either by reaſon of the defect of ſutures, or elſe becauſe they are unperfect, and too firmly cloſed; otherwiſe it is impoſſible ſuch fractures ſhould happen by reaſon of the ſeparation of the bones, which breaks the violence of the blow that it can go no further.

In what men one part of the head, being ſtricken, the oppoſite is broken.

And certainly, as it is rare to find a skull without ſutures, ſo it is rare to find ſuch kind of fractures. Therefore Chirurgeons muſt diligently obſerve the ſutures and ſite of them, leſt they be deceived, and take them for fractures, or unawares apply a Trepan to them, whence by breaking the veins, arteries and nervous fibers by which the internal parts communicate with the external, there may enſue increaſe of pain, a violent defluxion of blood upon the *Craſſa meninx*, and the falling thereof upon the brain, (the fibers being broken by which it ſtuck to the *Pericranium*) and ſo conſequently a deadly interception of the pullion of the brain.

Why we muſt not apply a Trepan to the ſutures.

CHAP.

CHAP. IV.

Of the Cranium, *or Skull.*

What the *Cranium* is.

THe *Cranium*, or Skull covering the brain like an Helmet, is compoſed and conſiſts of ſeven bones; of which ſome are more denſe, thick and hard than otherſome. The firſt is the *Os Occipitis*, or nowl-bone ſeated in the back-part of the head, more hard and thick than the reſt, becauſe we want hands and eyes behind, whereby we may keep or ſave our ſelves from falling.

Why the nowl-bone is harder than the reſt.

This bone is circumſcribed, or bounded by the ſuture *Lambdoides*, and the * *Os baſilare*. The eminencies, and, as it were, heads of this bone are received into the firſt *Vertebra*; for upon this the head is turned forwards and backwards, by the force of fourteen muſcles and ſtrong ligaments, which firmly tie theſe heads of the nowl-bone in the cavities of this firſt *Vertebra*.

* My Author means by the *Os baſilare* in this place the wedg-bone: but ſome Anatomiſts make it a *Synonyma* of this *Os occipitis*.

The ſecond bone of the skull is in the fore-part, and is called the *Os coronale*, or *Os frontis*, the fore-head-bone; it hath the ſecond place in ſtrength and thickneſs. It is bounded by the coronal ſuture, and the ends of the wedg-bone: In this fore-head bone there is often found a great cavity under the upper part of the eye-brows, filled with a glutinous, groſs, viſcid and white matter or ſubſtance, which is thought to help to elaborate the air for the ſenſe of ſmelling.

The forehead-bone, next to the nowl-bone is harder than the reſt.

Chirurgeons muſt take ſpecial notice of this cavity; becauſe when the head chances to be broken in that place, it may happen, that the fracture exceeds not the firſt table; wherefore being ignorant of this cavity, and moved with a falſe perſwaſion that they ſee the brain, they may think the bone wholly broken, and ſo preſs the *Meninges*, whereupon they will dilate the womb, and apply a Trepan and other inſtruments to lift up the ſecond table of the bone, without any need at all, and with the manifeſt danger of the life of the Patient.

A cavity to be obſerved in the forehead-bone.

The third and fourth bones of the skull, are the *Oſſa parietalia*, or *Bregmatis*, having the third place of denſity and thickneſs; although this denſity and thickneſs be different in divers places of them. For on the upper part of the head, or crown (where that ſubſtance turns not to a bone in children, until they have all their teeth, ſo that it feels ſoft in touching, and through it you may feel the beating of the brain) theſe bones are very tender, ſo that oft-times they are no thicker than ones nail, that ſo the moiſt and vapourous excrements of the brain, ſhut up where the greater portion of the brain reſides, may have a freer paſſage by the brains *Diaſtole* and *Syſtole*. Theſe two ſquare bones are bounded above with the ſagittal ſure, below with the ſcaly, on the fore-part with the coronal, and on the hind-part with the *Lambdoides*.

Oſſa parietalia & Bregmatis.

Oſſa petroſa, or the ſcaly-bone.

The fifth and ſixth bones of the skull, are the two *Oſſa petroſa*, ſtony or ſcaly bones, which are next to the former in ſtrength. They are bounded with the falſe or baſtard-ſuture, and with part of the *Lambdoides*, and wedg-bone.

Os ſphenoides, or the wedg-bone.

The ſeventh is the *Os ſphenoides*, *baſilare*, or *Cuneiforme*, that is, the wedg-bone. It is called *Baſilare*, becauſe it is (as it were) the *baſis* of the head. To this the reſt of the bones of the head are fitly faſtned in their places. This bone is bounded on each ſide with the bones of the forehead, the ſtony bones, and bones of the nowl and palat. The figure repreſents a Bat, and its proceſſes her wings.

Os Ethmoides, or *Cribroſum*.

There is beſides theſe another bone at the *baſis* of the forehead-bone, into which the mammillary proceſſes end; the Greeks call it ἠθμοειδὲς, the Latines, *Cribroſum* and *Spongioſum*, the ſpongy-bone; becauſe it hath many holes in it not perforated in a direct paſſage, as in a ſive, but winding and anfractuous, that the air ſhould not by the force of attraction, preſently leap or aſcend into the brain, and affect it with its qualities, before it be elaborated by its lingring in the way. There are beſides alſo, ſix other little bones lying hid in the ſtony bones at the hole or auditory-paſſage; on each ſide three, that is to ſay, the *Incus* or Anvil, the *Malleolus* or Hammer, and the *Stapes* or ſtirrop, becauſe in their figure they repreſent theſe three things; the uſe of theſe we will declare hereafter.

The three bones of the Auditory-paſſage.

But alſo in ſome skulls there are found ſome diviſions of bones, as it were collected fragments, to the bigneſs almoſt of ones thumb, furniſhed and diſtinguiſhed by their proper commiſſures, or ſutures, which thing is very fit to be known to a Chirurgion in the uſe of the Trepan.

By what means a Chirurgion may conjecture that there are extraordinary ſutures in certain places of the skull.

Verily he may give a conjecture hereof, whilſt he ſeparates the *Pericranium* from the skull, for the *Pericranium* is with greater difficulty pluck'd away from the ſutures, becauſe the *Craſſa meninx* hath ſtraiter connexion therewith by his nervous fibers ſent forth in ſuch places. The skulls in women are ſofter and thinner than in men, and in children more than in women, and in young men more than in men of a middle age. Alſo the *Æthiopians* and Black-moors, as alſo all the people inhabiting to the South, have their skulls more hard and compoſed with fewer ſutures.

The skulls of ſuch as inhabit the Southern countreys, are more hard and denſe.

Therefore, as it is written by *Hippocrates*, ſuch as have their skulls the ſofter, the ſymptomes in fractures, are more dangerous and to be feared in them. But the skull by how much the ſofter it is, by ſo much it more eaſily and readily yields to the perforating Trepan. Moreover in ſome skulls, there be bunches ſtanding out beſides nature, made either round or cornered, which the Chirurgeon muſt obſerve for two cauſes; the firſt is for the better conſideration of a blow or fracture. For in theſe bunches or knots, the ſolution of the continuity cannot be, if it ſeem to be ſtretched in length, but that the wound muſt penetrate to the inner parts. For in a round body there can be no long wound, but it muſt be deep, by the weapon forced the deeper; becauſe as a round body touches a plain but only in *puncto*, in a prick or point: So whatſoever falls only lightly or ſuperficially upon it, touches a point thereof. But on the contrary, a long wound muſt be upon a plain ſurface, which may be but only ſuperficial.

We muſt obſerve the extuberances beſides nature, which are in ſome skulls.

Another cauſe is, becauſe ſuch bunches change the figure and ſite of the ſutures. And the Chirurgeon muſt note, that the skull hath two tables, in the midſt whereof the *Diploe* is; which is a ſpongy ſubſtance into which many veins and arteries, and a certain fleſhineſs are inſerted, that the skull ſhould not be ſo heavy, and that it might have within it ſelf proviſion for the life thereof; and laſtly, that there might be freer paſſage out for the fuliginous vapours of the brain.

The ſite and ſubſtance of the *Diploe*.

The

The upper table is thicker, denſer, ſtronger and ſmoother than the lower. For this as it is the ſlenderer, ſo it is the more unequal, that it may give place to the internal veins and arteries, (which make a manifeſt impreſſion into the ſecond table on the inſide thereof) from which branches enter into the skull by the holes which contain the eyes. Which thing faſtens the *Craſſa meninx* to the skull, and is therefore very worthy to be obſerved.

For in great Contuſions, when no fracture and fiſſure appears in the skull, by reaſon of the great concuſſion or ſhaking of the brain, theſe veſſels are often broken, whence happens a flux of blood between the skull and membranes, and laſtly death. But it is fit the Chirurgeon take good heed to the tender and ſoft ſubſtance of the *Diploe*, that when he comes to it, having paſſed the firſt table, he may carefully uſe his Trepan, leſt by leaning too hard, it run in too violently, and hurt the membranes lying underneath it, whence convulſion and death would follow. To which danger I have found a remedy, by the happy invention of a Trepan, as I will hereafter more at large declare in handling the wounds of the head.

There may be a deadly rupture of the veſſels of the brain without any fracture of the skull.

Caution to be had in the uſe of the Trepan.

CHAP. V.

Of the Meninges, that is, the two Membranes called Dura mater *and* Pia mater.

THe *Craſſa meninx* is one of the firſt and principal membranes of the body; it goes forth by the ſutures and holes of the nerves that proceed out of the skull; and it paſſes forth by the bone *Ethmoides* perforated for that purpoſe, to carry ſmells to the brain, and purge it of excrementitious humors. This ſame *Craſſa meninx* inveſts the inner coat of the noſe; alſo it paſſes forth of the great hole through which the ſpinal marrow paſſes, veſted with this *Craſſa meninx*, with all the nerves and membranes. For which cauſe if any membrane in the whole body be hurt, by reaſon of that continuation which it hath with the *Meninges*, it ſtraight communicates the hurt to the head by conſent.

Why the bone *Ethmoides* is perforated.

The *Craſſa meninx* is thicker and harder than all other membranes in the body; whereupon it hath got the name of the *Dura mater*; beſides alſo, it begirts, produces and defends the other membranes.

The conſiſtence of the *Craſſa meninx*.

The uſe of it is to involve all the brain, and to keep it when it is dilated, that it be not hurt by the hardneſs of the skull. For the courſe of nature is ſuch, that it always places ſome third thing of a middle nature, betwixt two contraries. Alſo the *Craſſa meninx* yields another commodity, which is, that it carries the veins and arteries, entring the skull for a long ſpace. For they inſinuate themſelves into that part, where the duplicate or folded *Meninges* ſeparate the brain from the *Cerebellum*, and ſo from thence they are led by the ſides of the *Cerebellum*, until they come (as it were) to the top thereof; where being united, they inſinuate themſelves into that other part of the *Craſſa meninx*, where, in like manner being duplicated and doubled, it parts the brain at the top into the right and left. Theſe united veins run in a direct paſſage even to the forehead, after the manner of the ſagittal ſuture: They have called this paſſage of the mutually infolded veins, the *Torcular* or Preſs, becauſe the blood which nouriſhes the brain, is preſſed and drops from thence by the infinite mouths of theſe ſmall veins. Therefore alſo here is another uſe of the *Craſſa meninx*, to diſtinguiſh the brain by its duplication, being it thruſts it ſelf deep into its body, into two parts, the fore and hind, and preſently to ſeparate the ſame into the right and left; that one part being hurt, the other may remain ſafe and ſound, performing its duty to the creature, as we ſee in ſome that have the Palſie. *Columbus* obſerved that this *Meninx* was double, and verily I have found it true by my own ſight.

The uſe.

What the *Torcular* is.

One part of the brain being hurt, the other keeps the creature alive.

The other *Meninx* or membrane of the brain, called *Pia mater*, is moſt ſlender, interchaſed with divers veins and arteries, for its own and the brains nouriſhment and life. This doth not only involve the brain, as the *Craſſa meninx* doth, but alſo more deeply penetrate in the anfractuous paſſages thereof, that it may every where joyn and bind it to it ſelf, not eaſily to be drawn from thence, by many ſmall fibers, whereby it deſcends even to the cavities of the ventricles thereof. Wherefore you muſt ſee it abſolutely in the ſite, as we have mentioned, and not pluck it away unleſs with the ſubſtance of the brain.

The conſiſtence of the *Pia mater*.

Theſe membranes when they are hurt or afflicted, cauſe grievous and moſt bitter torment and pain; wherefore I dare ſay, that theſe membranes are rather the authors of ſenſe, than the brain it ſelf, becauſe in diſeaſes of the brain, as in the Lethargy, the part affected is troubled with little or no ſenſe of pain.

The ſenſe of the *Meninges*.

CHAP. VI.

Of the Brain.

NOw followeth the brain, the beginning of the nerves and voluntary motion, the inſtrument of the firſt and principal faculty of the Soul, that is, the Animal and Rational. Man hath this part in greater plenty than any other Creature, for it almoſt fills the whole skull. But if it ſhould have filled it all, the brain could not be moved, that is, dilated and contracted in the skull. It is of a cold and moiſt Temperature. The laudable temper of the brain is known by the integrity and perfection of the internal and external ſenſes; the indifferency of ſleep and waking, the maturity or ripeneſs of judgment, and conſtancy of opinions, from which, unleſs it meets with better and more probable, it is not eaſie to be moved.

What the brain is.

The quantity.

Temper.

C C *The beginning of the veſſels out of the third* Sinus *into the* Pia mater.
D D D *The propagation or branches of theſe veſſels.*
E E E *The* Pia mater, *or thin* meninx, *immediately compaſſing the brain.*
F F F *Certain veſſels running through the convolutions or branches of the brane.*
G G G *Certain branches of veins running through the ſides of the* Dura meninx. H H H *The thick membrane reflected downward.*

You ſhall know the brain is more hot, by the quickneſs of the ſenſes and motions of the body, by ſhortneſs of ſleep, the ſudden conceiving of opinions, and change of them, by the ſlippery and failing memory, and laſtly, by eaſily receiving hurt from hot things, as the Sun and Fire. Such as have a cold brain, are ſlow to learning, and to conceive other things, but they do not eaſily put away their once conceived opinions. They have ſlow motion to action, and are ſleepy. Thoſe who have a dry brain, are alſo ſlow to learn, for you ſhall not eaſily imprint any thing in dry bodies, but they are moſt conſtant retainers of thoſe things they have once learned; alſo the motions of their bodies are quick and nimble. Thoſe who have a moiſt brain do eaſily learn, but have an ill memory, for with like facility as they admit the ſpecies of things and imprint them in their minds, do they ſuffer them to ſlide and ſlip out of it again. So clay doth eaſily admit what character or impreſſion ſoever you will, but the parts of this clay, which eaſily gave way to this impreſſion, going together again, mixes, obliterates and confounds the ſame. Therefore the ſenſes proceeding from a cold brain are dull, the motions ſlow, the ſleep profound.

The action. The action of the brain is to elaborate the animal ſpirit and neceſſary ſenſe ſerving the whole body, and to ſubject it ſelf as an inſtrument to the principal faculties, as to reaſon. The brain is twofold, the fore and hind. The hind by reaſon of its ſmallneſs is called the *Cerebellum*, (the little or after-brain.) But the fore by reaſon of its magnitude, hath retained the abſolute name of the brain. Again, this fore-brain is twofold, the right and the left, parted by that depreſſion which we formerly mentioned, of the *Meninges* into the body of brain. But this diviſion is not to be here ſo abſolutely taken, as though the brain were exactly divided, and ſeparated into ſo many parts; but in the ſenſe we ſay the liver and the lungs are divided a pretty way, whereas at their Baſis they have one continued body. The outward ſurface of the brain is ſoft, but the inward hard, callous and very ſmooth; when on the contrary, the outward appears indented and unequal with many windings, and creſted, as it were, with many worm-like foldings.

Number.

CHAP.

CHAP. VII.

Of the Ventricles and Mammillary Proceſſes of the Brain.

FOr the eaſie demonſtration of the Ventricles of the Brain, it is convenient you cut away a large portion thereof, and in your cutting, obſerve the blood ſweating out of the pores of it. But beſides, it is fit you conſider the ſpongy ſubſtance by which the excrements of the brain are heaped up, to be preſently ſtrained out, and ſent away by the hollow paſſage. In the ſubſtance of the brain you muſt obſerve four ventricles, mutually conjoyned by certain paſſages, by which the ſpirits endued with the *ſpecies* of things ſenſible, may go from one into another The firſt and two greater, one on each ſide are placed in the upper brain. The third is under them in the middle part of the brain. The fourth and laſt at the foreſide of the *Cerebellum*, towards the beginning of the ſpinal marrow. The two foremoſt are extended the length way of the brain in the form of a ſemicircle, whoſe horns look or bend outwards. They are ſpacious and large, becauſe it was meet the ſpirits contained there together with their excrements, ſhbuld be there purified and cleanſed; but in other ventricles, the pure and already elaborate ſpirits are only received. Theſe ventricles are white and ſmooth in their inner ſuperficies; but, that on each ſide they have an extuberancy at the midſt of the ſemi-circle, ſituate at the baſis of the pillar of the middle ventricle towards the noſe under the *Septum lucidum*, or clear partition, ſevering or parting in ſunder theſe two ventricles.

The ſubſtance of the brain is porous, and ſweats forth blood.

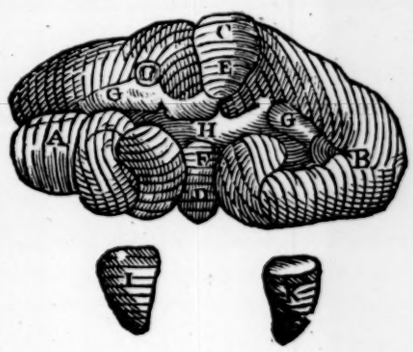
The four ventricles thereof.

The magnitude of the upper ventricles of the brain.

The *Septum lucidum*, or clear or thin partion, is nothing elſe than a portion of the brain indifferently ſolid, but very clear, that ſo through this partition the animal ſpirits contained in theſe two Ventricles, may mutually paſs and be communicated, and yet no other groſſer ſubſtance may pierce the thin denſity thereof.

The *Septum lucidum*.

The third Figure repreſents the Cerebellum *with the wormy Proceſſes ſeparated from it.*



AB *The right and left part of the After-brain.*
CD *The* Anterior *and* Poſterior *regions of the middle part of the After-brain.*
E *The* Anterir *wormy proceſs.*
F *The* Poſterior *wormy proceſs.*
GG *In this place the After-brain did grow to the ſpinal marrow.*
H *The cavity in the ſpinal marrow maketh the fourth ventricle.*
IK *The* Anterior *and* Poſterior *proceſſes of the bain, called* Vermi-formes, *or the wormy proceſſes.*

Wherefore it is not to be feared, that the water contained in one of the ventricles may paſs to the other through this partition, as I have oft-times obſerved to the great admiration of the ſpectators in the dead bodies of ſuch as died of the Palſie, in which I have found the ventricle of that ſide which was taken with the Palſie much dilated, according to the quantity of the water contained therein, the other being either wholly empty and without any; or certainly no fuller than in any other, dead through any other occaſion. For ſome affirm, that there is a certain kind of wateriſh moiſture always to be found in the ventricles, which may be made by the condenſation of the animal ſpirits by the force of the deadly cold. But theſe two firſt ventricles of the brain go into one common paſſage, as both the bellows of a fornace, whereby the ſpirit inſtructed with the ſpecies of things, goes into the under or middle ventricle from the former. In theſe ſame firſt ventricles, the *Plexus choroides* is to be conſidered, and in like manner the paſſage by which the groſſer excrements are driven or ſent into the pituitary glandule.

Why the Palſie of one ſide is not preſently communicated to the other.

This *Plexus choroides* is nothing elſe, but a production of the *Pia mater* diverſly folded with the mutual implication of veins and arteries woven in the form of a net. Theſe veſſels are of magnitude and capacity ſufficient, both to yield life and nouriſhment to that particle to which they are faſtened, as alſo for the generation of the animal ſpirits, as which take fit matter from the veins ſtretched forth into the ſame *Plexus*, the hind-artery and vein *Torcular*; and alſo from the air entring into the brain by the mammillary proceſſes. But the mammillary proceſſes are certain common ways for conveyance of the air and ſmells, into the brain, and carrying of excrements from the brain.

The *Plexus choroides*.

For thus in them who have the Catarrh and *Coriza*, or Poſe, neither the air, nor ſmells can penetrate into the brain; when frequent ſneezings enſue, the brain ſtrongly moving it ſelf to the expulſion of that which is troubleſome to it. But of the excrements of the brain, whether bred there, or proceeding from ſome other part, ſome are of a fumid and vaporous nature, which breathe inſenſibly through the ſutures of the ſkull; others are groſs and viſcid, of which a great part is expelled by both theſe productions, or through each of them. For thus in the Poſe you may ſee ſome who have one of their noſtrils ſtopt, the other running, and ſome who have both obſtructed. The moſt proper benefit of the two firſt ventricles of the brain is to entertain the Phantaſie, as in a convenient ſeat and habitation, ſeeing the mind there eſtimates and diſpoſes in order the ſpecies of things brought in from the external ſenſes, that ſo it may receive a true judgment of them from reaſon, which reſides in the middle ventricle.

The

The third ventricle is ſeated between the hindermoſt extremities of the former ventricles, and the laſt ventricle of the *Cerebellum*. In this, ſix parts preſent themſelves to our conſideration, that is, the *Pſalloides* or Arch, the *Conarium* or pine glandule, the buttocks, worm-like productions, the baſon and paſſage which is from this middle into the laſt and hindmoſt ventricle. The *Pſalloides* or Arch, is nothing elſe, but the cover of the middle ventricle, reſembling a roof, born up with three ſtays or pillars, the one whereof is extended to the noſe under the *Septum lucidum*; the two other on each ſide one, look toward the back-part of the brain. This is the reaſon of this figure which is outwardly convex, and inwardly concave, to wit, that there might be free ſpace for that motion which the animal ſpirit inwardly produces, and beſides, that it might more eaſily ſuſtain the burthen of the brain lying upon it. For an arched figure is the moſt convenient of all other to ſuſtain a weight.

The ſeat of the third ventricle of the brain.

The parts to be conſidered in it.

What the *Fornix*, or arch is, and the uſe thereof.

The *Conarium*, or Pine-glandule is a ſmall glandule of the ſame ſubſtance with the brain, round and ſomewhat long, like a Pine-apple, from whence it hath the name: This glandule is ſeated over againſt a ſmall hole which deſcends to the loweſt ventricle. It hath this uſe, to ſtrengthen the diviſion of the veſſels led thither with the production of the *Pia mater* for the generation of the animal ſpirits, and the life and nouriſhment of the brain.

What the *Conarium* or pine-glandule is.

The *Nates*, or buttocks, are ſubjected, or placed, under this glandule, that is, bodies of a ſolid and white ſubſtance drawn out in length like a childs buttocks, eſpecially in Beaſts, and chiefly in a ſheep. Theſe buttocks have ſuch a ſolid ſubſtance, that ſo they may keep open and free the paſſage, or channel, that runs down from the middle to the lower ventricle, by means of which the brain participates with the *Cerebellum*.

What the *Nates* or Buttocks are.

The Worm is a production of the *Cerebellum*, or after-brain, to wit, a portion of the ſame being in the top, or beginning, and as it were in the entrance thereof, being like many little circles, or wheels mutually knit together by ſlender membranes; and it is ſo called becauſe it reſembles thoſe thick white worms which are found in rotten wood. It doth, as it were, perform the office of a Porter to the formerly mentioned paſſage, that it may give way and entrance into the *Cerebellum*, to a neceſſary quantity of ſpirits, when need requires; leſt that, if they ſhould ruſh with a ſudden violence into the *Cerebellum*, they might confound the imprinted notions of things to be remembred.

What the worm is.

The *Pelvis*, or Baſon, is a paſſage appointed for the carrying away of the groſs excrements by the palat; and is ſo called, becauſe it hath the ſimilitude and uſe of a baſon, or tunnel; it deſcends from the third ventricle into the glandule which is ſeated between the proceſſes of the wedg-bone called the ſaddle thereof, as you may perceive by putting in a ſpathern. Now there remains the laſt of the ſix parts propoſed to our conſideration in the third ventricle, that is, the channel or paſſage, running from this third ventricle into the fourth, for the uſe formerly mentioned.

Here the *Pelvis* or Baſon is confounded with the Tunnel.

This channel deſcending in its original from the baſon, goes from thence under the buttocks into the laſt ventricle, the *Meninges* being perforated; which, that you may ſhew, it is fit you put the end of a Spathern through it. The benefit of a third ventricle, is, that it may be as a Tribunal or Judgment-ſeat, to the reaſoning faculty, when the mind will draw concluſions from things ſeen.

The Channel from the third into the fourth ventricle.

The fourth ventricle ſeated in the place we formerly mentioned; it is leſs than the reſt, but more ſolid; leſs as that which was not to receive the ſpirit before it was purified, and cleanſed from all impurities; but more ſolid, that it might contain it the ſafer. The uſe thereof is, to be as a treaſury and ſtore-houſe of the opinion, and judgments which reaſon ſhall decree, that when need requires, we may fetch and draw them from thence as laid up in ſtore. I know *Galen* and the *Greek* Phyſicians have not ſo diſtinguiſhed in places, the three forementioned faculties; but have written, that they all are all over-confuſed through the whole ſubſtance of the brain, which opinion alſo *Fernelius* in his *Pathologia* hath renewed. Yet I had rather follow this opinion, as commonly received and celebrated by the *Arabian* Phyſicians.

The mammillary proceſſes are the inſtruments and paſſages of Smelling, being of the ſame ſubſtance with the brain, and like nerves, which run out from the hind-horns of the upper or foremoſt ventricles of the brain to the *Ethmoides* and ſpongy bones of the noſe, that hence they may receive the diverſe kind of ſmells, and carry them into the brain. But although they be like nerves, yet they are not accounted nerves, becauſe they go not out of the skull.

The uſe of the Mammillary proceſſes.

CHAP. VIII.

Of the ſeven Conjugations of the Nerves of the Brain, ſo called, becauſe they always ſhew the nerves conjugated and doubled; that is, on each ſide one.

THe nerves are the ways and inſtruments of the animal ſpirit and faculty, as of which thoſe ſpirits are vehicles, as long as they are contained in the brain; they conſiſt of the only and ſimple marrowy ſubſtance of the brain, or ſpinal marrow. But paſſing forth of the brain, the have another membranous ſubſtance which involves them, joyned with them from the two membranes of the brain; and according to the opinion of ſome Anatomiſts, they have alſo a third from the ligaments, drawn as well from divers others, as from theſe by which they are tied to the *Vertebra's*; yet this opinion ſeems abſurd to me, ſeeing ſuch a membrane, as that which is inſenſible, wholly repugns the condition of a nerve, which is to give ſenſe to the parts to which it is inſerted.

What a nerve or ſinew is.

Its ſubſtance.

Whether the nerve have a third membrane from the ligaments of the *Vertebra's*.

The magnitude of the nerves is different, according to the diverſe neceſſity of ſenſe incident to the parts into which they are inſerted. Their figure is round, and long, like to a Conduit-pipe to carry water in; the membranes of the brain, with which the nerves are covered, being dilated and ſtretched over them, after the ſame manner that the proceſſes of the *Peritonæum* involves the

Their magnitude.

Their figure.

ſpermatick veſſels, with which they go down to the teſticles, and take life and nouriſhment by the capillary veins and arteries, which deſcend to them with the membranes.

Their uſe.

They are made for this uſe, that they may impart ſenſe to the ſenſitive parts, and motion to thoſe that are fit to be moved.

Their number.

All the nerves deſcend from the brain either mediately, or immediately; their number is ſeven and thirty pair, or conjugations; whereof ſeven have their original immediately from the brain, the other thirty from the ſpinal marrow.

The firſt conjugation of the nerves.

The firſt Conjugation of the nerves of the brain is thicker than all the reſt, and goes to the eyes, to carry the viſive ſpirit to them. Theſe ariſing from divers parts of the brain, in the middle way before they go out of the skull meet together croſs-wiſe, like the Iron of a Mill (which is faſtned in the upper ſtone) going into one common paſſage with their cavities not viſible to the eye; that ſo the ſpirits brought by thoſe two nerves may be communicated, and they are mutually joyned and meet together ſo, that being driven back from one eye they may flie back into the other. An argument whereof may be drawn from ſuch as aim at any thing, who ſhutting one of their eyes ſee more accurately; becauſe the force of the neighbouring ſpirits united into one eye, is more ſtrong than when it is diſperſed into both. This conjugation, when it comes into the glaſſie humor, is ſpent in the ſtructure of the net-like coat which contains this humor on the back-part.

The ſecond Conjugation.

The ſecond conjugation goes into many parts, at its paſſing forth of the skull; and in the bottom of the circle of the eye it is diſtributed into the ſeven muſcles moving the eyes.

The third conjugation.

The third is twofold, in the paſſage out of the skull, it is likewiſe divided into many branches of

of which ſome are carried to the temporal muſcles, into the *Maſſeteres*, or grindling muſcles, into the skin of the face, forehead and noſe; Otherſome are ſent into the upper part of the cheek, and the parts belonging to it, as into the teeth, gums, and the muſcles of the upper lip; and thoſe which are called the round, which incompaſs the mouth on the inſide; the laſt are waſted in the coat of the tongue, to beſtow upon it the ſenſe of taſting.

The fourth conjugation is much ſmaller, and is almoſt wholly waſted upon the coat of the Palat of the mouth, to endue it alſo with the ſenſe of taſting. The fourth conjugation.

The fifth as its original, and having not as yet paſſed forth of the skull, is divided into two, and ſends the greater portion thereof to the hole of the ear, or paſſage of hearing, that it may ſupport the auditory faculty; and it ſends forth the other leſſer portion thereof to the temporal muſcles by the paſſage next to it; by which the ſecond conjugation paſſes forth. The fifth conjugation.

The ſixth being the greateſt next to the firſt, paſſing entire forth of the skull, imparts ſome ſmall branches to certain muſcles of the neck and throttle, and then deſcending into the cheſt, it makes the recurrent nerves; and diſperſed over all the parts of the two lower bellies, it paſſes even to the bladder and teſticles, as we ſhewed in the former Book. The ſixth conjugation.

The ſeventh inſerted and ſpent upon the muſcles of the bone *Hyois*, the tongue, and ſome of the throttle, to give them motion; it paſſes forth of the skull by the hole of the nowl-bone at the extuberancies thereof. The ſeventh conjugation.

CHAP. IX.

Of the Rete Mirabile, *or wonderful Net, and of the Wedge-bone.*

THe Animal ſpirit is made of the vital, ſent from the heart by the internal ſleepy arteries to the brain. For it was requiſite, that it ſhould be the more elaborate, becauſe the action of the animal is more excellent than that of the vital: Nature hath framed a texture of arteries in many places running croſs one another, in the form of a Net divers times doubled; (whereupon it had the name of the wonderful Net) that ſo the ſpirit by longer delay in theſe Labyrinthian or Maze-like turnings, might be perfectly concocted and elaborated, and attain to a greater fitneſs to perform the animal functions. The exiſtence of the animal ſpirit. What the *Rete mirabile* is.

This wonderful Net ſituate at the ſides of the *Apophyſes clinoides*, or productions of the wedg-bone, is two-fold; that is, divided by the pituitary glandule, which is ſituate between the ſaid *Apophyſes clinoides*, having the wedg-bone lying under them, next to the *Craſſa meninx*, being perforated on the right and left ſide, next to which lye bones as a rare as a ſponge even to the palat, by which the phlegm is purged by the mouth and noſe; and there-hence, I think, that ſpattle flows, which ſuch as have a moiſt brain, continually ſpit out of their mouth. The ſite and number.

What the *Apophyſes clinoides* are.

Theſe *Apophyſes clinoides* are certain productions of the *Os baſilare*, or wedg-bone (called the ſaddle thereof) between which, as I ſaid, the pituitary glandule lies with part of the wonderful Net.

Whether the *Rete mirabile* differs from the *Plexus choroides.*

There is a great controverſie amongſt Anatomiſts concerning this part; for, *Veſalius* denies that it is in man, *Columbus* admits it; yet he ſeems to confound it with the *Plexus choroides.* Truly, I have obſerved it always after the manner, as *Sylvius* alledges againſt *Veſalius.* It remains, that we recite the perforations of the skull, becauſe the knowledg of theſe much conduces to the underſtanding of the inſertions of the veins, arteries and nerves.

CHAP. X.

Of the holes of the inner Baſis of the Skull.

IN the firſt place are reckoned the holes of the bone *Ethmoides*; then thoſe of the Optick-nerves. Thirdly, of the nerves moving the eyes. Fourthly, of that portion of the nerves of the fourth conjugation which go to the temporal muſcles. Fifthly, are reckoned thoſe holes ſcarce viſible, ſituate under the pituitary glandule, by which the ſpittle is evacuated. Sixthly, that hole which is in the wedg-bone made for the entrance into the internal ſleepy Arteries, compoſing the wonderful Net, and then paſſing into the brain by a great Slit. That perforation which we reckon in the ſeventh place is commonly double, made for the entrance of one of the branches of the internal Jugular-vein. The eighth hole is ſomewhat long, of an oval figure, by which, part of the third conjugation, and all the fourth conjugation paſſes forth. The ninth are the auditory paſſages. The tenth are very ſmall holes, and give way to the vein and artery going to the auditory paſſage, above the *foramen cæcum.* In the eleventh place are reckoned the perforations which yield paſſage forth to the ſixth pair of nerves, to part of the ſleepy arteries, and of the internal jugular. In the twelfth, thoſe which yield a way out to the ſeventh conjugation. The great hole of the nowl-bone through which the ſpinal marrow paſſes, is reckoned the thirteenth. The fourteenth is that which moſt commonly is behind that great hole, by which the Cervical veins and arteries enter in.

CHAP. XI.

Of the perforations of the external Baſis of the Brain.

THere is a hole on each ſide at the eye-brows, by which paſſes a ſmall nerve from the third conjugation coming out of the cavity of the orb of the eye, and going by the forehead bone to the eye-brows, that it may give motion to the two muſcles of the upper eye-brow and forehead. Yet oftentimes the hole is but to be ſeen on one ſide, often-times there is a cleft in ſtead thereof, other-whiles it is not perforated nor cleft at all. The ſecond is the perforation of the greater corner of the eye, by which a portion of the nerves of the third conjugation deſcends to the coat of the noſe; in this hole the *Glandula Lacrymalis* is ſeated. The third is ſeated under the eye, that it may give way to the other portion of the nerves of the third conjugation going to the part of the face, and the teeth of the upper jaw. The fourth is at the beginning of the palat, amongſt the cutting and ſhearing-teeth, through which a vein, an artery, and the coat of the palat paſſes out. In the fifth order, are reckoned the perforations of the palat, by which the nerves deſcend from the fourth conjugation, to give or cauſe the taſte. In the ſixth order are ranked

ed

ed the holes of the palat ſerving for the reſpiration, and the flegm falling from the brain by the noſtrils. And there is a cleft under the yoke-bone aſcending into the orb of the eye, by which there is a way, as well for the nerves of the third conjugation to the temporal muſcles, as alſo for certain veins and arteries. But alſo, there is noted another hole at the mammillary proceſs, which is not perforated in the judgment of the ſenſe. Beſides, there is thought to be another at the hind root of the ſame proceſs, by which a certain ſmall vein paſſes from the Jugular to the *Torcular*. But I have only noted theſe three paſſages by the way, becauſe there is ſo much variety in them, that nothing can be certainly ſaid of them.

CHAP. XII.

Of the Spinal Marrow, or Pith of the Back.

What the ſpinal marrow is.

THe ſpinal marrow is like a river running from the fountain of the Brain. This ſends nerves for ſenſe and motion to all the neigbouring parts under the head, ſpreading its branches as from the body of a tree. Theſe branches, as we ſhall hereafter ſhew, are on each ſide thirty. This ſame ſpinal marrow is covered with the two membranes inveſting the brain, diſtinguiſhed by no diſtance of place, as in the Brain. But alſo it hath another membrane added to theſe, being very hard and denſe, which keeps it from being broken and violated by the violent bending of the body forwards and about. The diſeaſes of this marrow do almoſt cauſe the like ſymptomes, as the diſeaſes of the brain; for they hurt the ſenſe and motion of all the parts lying beneath them; as, for example, If any of the *Vertebra's* of the back-bone be moved out of their place, there follows a diſtortion or wreſting aſide of the marrow; but then eſpecially if it happen that one of the *Vertebra's* be ſtrained, ſo ſharp and bitter a compreſſion urges the marrow by reaſon of the bony body of the *Vertebra*, that it will either rend it, or certainly hinder the paſſage of the ſpirit by it. But by theſe ſame holes of the *Vertebra's* the veins and arteries go to the ſpinal marrow for to give life and nouriſhment to it, as the nerves by them paſs forth into all the lower parts of the body.

The coats of the ſpinal marrow.

The diſeaſes from the hurting of the ſpinal marrow.

The end of the Fifth Book.

BOOK VI.

Treating of the Muſcles and Bones, and the other Extreme parts of the Body.

The PREFACE.

PEradventure ſome may wonder that I have ended my Fifth Book of Anatomy, before I have fully deſcribed all the parts of the Head, the which ſeemed, as it were, only appointed for that purpoſe. Therefore I muſt yield a reaſon of this my intention. I have a deſire, in one Treatiſe, and, as it were, at one breath, to proſecute the Anatomy of the Muſcles. *Wherefore, becauſe the parts of the Head not yet deſcribed, principally conſiſt of the Muſcles, therefore I deſired to comprehend them together with this ſame deſcription of the extreme parts of the body; beginning at the upper part of the face; to wit, the eyes: But having firſt deſcribed the bones of the face, without the knowledg of which it is impoſſible to ſhew the original and inſertion of the Muſcles. We have formerly noted, that by the face is meant whatſoever lies from the eye-brows even to the chin. In which there is ſuch admirable induſtry of Nature, that of the infinite multitude of men you cannot find two ſo like, but that they may be diſtinguiſhed by ſome unlikeneſs in their faces; alſo, it hath adorned this part with ſuch exquiſite beauty, that many have died by longing to enjoy the beauty deſired by them. This ſame face albeit it little exceeds half a foot, yet it indicates and plainly intimates by the ſudden changes thereof, what affections and paſſions of hope, fear, ſorrow and delight poſſeſs our minds; and what ſtate our bodies are in, ſound, ſick, or neither. Wherefore ſeeing the face is of ſo much moment, let us return to the Anatomical deſcription thereof: Which that we may eaſily and plainly perform, we will begin with the bones thereof; whereby, as we formerly ſaid, the original and inſertion of the Muſcles may be more certain and manifeſt to us.*

The deſcription of the bones being unknown, it muſt neceſſarily follow that the original and inſertion of the Muſcles muſt be ſo alſo.

The endowments of the face.

The Countenance is the bewrayer of the will.

CHAP. I.

Of the Bones of the Face.

Bones in each orb of the eye.

THe bones of the face are ſixteen or ſeventeen in number. And firſt, there be reckoned ſix about the orbs of the eyes, that is three to each orb, of which one is the bigger, another leſſer, and the third between both; each of theſe touch the forehead-bone in their upper part. Beſides, the greater is joyned with a ſuture to the proceſs of the ſtony-bone, and ſo makes the *Zygoma*, that is, the *Os Jugale*, or Yoke-bone, framed by Nature for preſervation of the temporal muſcle. The leſſer is ſeated at the greater corner of the eye, in which there is a hole perforated to the noſe, and in this is the glandule in which the *Ægilops* doth breed. The middle is in the bottom, or inner part of the orb, very ſlender, and as it were of a membranous thinneſs: Then follow the two bones of the noſe which are joyned to the fore head-bone by a ſuture, but on the foreſide between themſelves by harmony. But on the back and hind-part with two other bones, on each ſide one, which deſcending from the bone of the forehead (to which alſo they are joyned by a ſuture) receive all the teeth. Theſe two in *Galens* opinion are ſeldom found ſeparated. But theſe are the thickeſt of all the bones of the face hitherto mentioned, knit by a ſuture with the greateſt bone of the orb, on the back part with the wedge-bone, on the inner ſide with the two little inner bones of the palat, which on the inſide make the extremity thereof, whereby it comes to paſs, that we may call theſe bones the hinder, or inner bones of the palat. They reckon one of theſe bones the eleventh, and the other the twelfth-bone of the head; theſe two little bones on their ſides next to the winged productions of the wedg-bone, receive on each-ſide one of the nerves of the fourth conjugation, which, in the former Book, we ſaid were ſpent upon the membrane of the palat.

What the *zygoma* is, and what uſe it hath.

The *Ægilops*.

The two bones of the noſe.

The two inner bones of the palat.

The two bones of the jaw.

And in *Galen*'s opinion there be other two in the lower jaw, joyned at the middle of the chin; although ſome think it but one bone, becauſe by the judgment of ſenſe there appears no diviſion or ſeparation therein. But you may ſee in children how true this their ſuppoſition is, for in men of perfect growth it appears but one bone; theſe two are reckoned for the thirteenth and fourteenth bones. Now theſe two bones making the lower jaw, have in their back-part on each ſide two productions, as they lie to the upper jaw, the one of which repreſents the point of a Sword, and is called the *Corone:* Thee other is obtuſe and round; which is inſerted into the cavity ſeated at the root of the proceſs of the ſtony-bone, near to the paſſage of the ear.

Two productions on each ſide of the lower jaw.

The Luxation of the lower jaw.

This may be ſtrained to the fore-part by violent gaping, by retraction of the muſcles ariſing from the wing-like proceſſes, and ending at the lower angles of the broader part of the ſame jaw.

The lower jaw filled with a marrowy humor.

This jaw is hollow, as alſo the upper, eſpecially in the back-part, being filled with a white and glutinous humor, conducing to the growth of the teeth. This humor hath its matter from the blood brought thither by the veſſels, veins, arteries and nerves from the third Conjugation entring here by a paſſage large enough. Whereby it comes to paſs, that this part is not only nouriſhed and lives, but alſo the teeth receive ſenſe by the benefit of the nerves entring thither with the

the vein and artery: by ſmall holes to be ſeen at the lower roots of the teeth; and thence it is that a beating pain may be perceived in the Tooth-ach, becauſe the defluxions may be by the arteries; or rather becauſe the humor flowing to the roots of the teeth, may preſs the artery in that place: Beſide alſo you may ſee ſome appearance of a nervous ſubſtance in the root of a tooth newly pluck'd out.

How the teeth feel.
Why the teeth have a beating pain.

But alſo you muſt conſider, that this jaw from its inner capacity produces at the ſides of the chin two nerves of a ſufficient magnitude, over againſt the lower Dog-teeth, and the firſt of the ſmaller grinding teeth, as I have noted in the deſcription of nerves of the third conjugation. I have thought good to put thee in mind of theſe, that when thou ſhalt have occaſion to make inciſion in theſe places, thou mayeſt warily and diſcreetly handle the matter, that theſe parts receive no harm.

The nerves of the lower jaw muſt be obſerved.

There remains another bone ſeated above the palat, from which the griſtly partition of the noſe ariſes, being omitted of all the Anatomiſts, for as much as I know. Now therefore that you may the better remember the number of the bones of the face, I will here make a repetition of them.

The bone of the noſe above the palat, or the partition of the noſe.

There are ſix of the orbs of the eyes, at each three. The ſeventh and eighth we may call the Naſel, or Noſe-bones. The ninth and tenth the Jaw-bones. The eleventh and twelfth are called the inner bones of the palat. The thirteenth and fourteenth, the bones of the lower Jaw. The partition of the noſe may reckoned the fifteenth.

Now it remains, having ſpoken of theſe bones, that we treat of the Teeth, the Eye-brows, the Skin, the fleſhy pannicle, the muſcles; and laſtly, the other parts of the Face.

CHAP. II.

Of the Teeth.

The teeth are bones.

THe teeth are of the number of the bones, and thoſe which have the moſt, have thirty two, that is, ſixteen above, and ſo many below; of which in the forepart of the mouth there are four above, and as many beneath, which are called *Inciſorii*, cutting or ſhearing teeth, to cut in ſunder the meat, and they have but one root. To theſe are joyned two in each jaw, that is, on each ſide of the other one, which are called the *Canini dentes*, Dog-teeth, becauſe they are ſharp and ſtrong like Dogs-teeth; theſe alſo have but one root, but that is far longer than the other have.

The ſhearing-teeth.

The Dog-teeth.

Then follow the *Molares*, or grinders, on each ſide five; that is, ten above, and as many below, that they may grind, chaw, and break the meat, that ſo it may be the ſooner concocted in the ſtomach; for ſo they vulgarly think, that meat well chawed is half concocted; thoſe grinders which are faſtned into the upper jaw, have moſt commonly three roots, and oft-time four. But theſe which are faſtned into the lower, have only two roots, and ſometimes three, becauſe this lower jaw is harder than the upper, ſo that it cannot be ſo eaſily hollowed, or elſe becauſe theſe teeth being fixed and firmly ſeated, needed not ſo many ſtays as the upper, which, as it were, hang out of their ſeats. The ſhearing-teeth cut the meat, becauſe they are broad and ſharp; the Dog-teeth break it becauſe they are ſharp pointed and firm: but the Grinders being hard, broad and ſharp, chaw and grind it aſunder, But if the Grinders had been ſmooth, they could not fitly have performed their duty; for all things are chawed and broken aſunder more eaſily by that which is rough and unequal.

The grinding teeth.

Why the upper grinding teeth have more roots.

The uſe of the teeth.

Wherefore they ſharpen their Milſtones when they are ſmoother than they ſhould be, by picking them with a ſharp Iron. The teeth are faſtened in the Jaws by *Gomphoſis*, that is, as a ſtake or nail, ſo are they fixed into the holes of the jaws; for they adhere ſo firmly thereto in ſome, that when they are pluck'd out, part thereof follows together with the tooth; which I have often obſerved to have been alſo with great effuſion of blood. This adheſion of the teeth faſtned in the jaws, is beſides ſtrengthned with a ligament, which applies it ſelf to their roots together with the nerves and veſſels. The teeth differ from the other bones, becauſe they have action whilſt they chaw the meat; becauſe being loſt they may be generated, and for that they grow as long as the party lives; for otherwiſe by the continual uſe of chawing, they would be worn and waſted away by one another. You may perceive this by any that have loſt one of their teeth; for that which is oppoſite to it becomes longer than the reſt, becauſe it is not worn by its oppoſite. Beſides alſo, they are more hard and ſolid than the reſt of the bones, and indued with a quick ſenſe by reaſon of the nerves of the third conjugation which inſert themſelves into their roots; for if you rub or grind a tooth newly puck'd out, you may ſee the remains of the nerve; they have ſuch quick ſenſe, that with the tongue they might judg of taſtes. But how feel the teeth, ſeeing they may be filled without pain? *Fallopius* anſwers, that the teeth feel not in their upper or exterior part, but only by a membrane which they have within. And the teeth have another uſe, eſpecially the fore-teeth, which is, they ſerve for diſtinct and articulate pronuntiation; for thoſe that want them faulter in ſpeaking, as alſo ſuch as have them too ſhort, or too long, or ill-ranked. Beſides children ſpeak not diſtinctly before they have their fore-teeth. And muſt note, that the Infant as yet ſhut up in its Mothers womb hath ſolid and bony teeth; which you may perceive by diſſecting it preſently after it is born.

The teeth are faſtned in the jaws by *Gomphoſis*.

The faſtening of the teeth into the jaw is to be obſerved.

Wherein the teeth differ from the other bones.

For what uſe the teeth have ſenſe.

The foreteeth help for the articulation of the voice.

But even as there are two large cavities in the forehead-bone at the eye-brow, filled with a viſcous humour, ſerving for the ſmelling; and in like manner, the air ſhut up in the mammillary proceſſes is for hearing: So in the jaws, there be two cavities furniſhed with a viſcid humor for the nouriſhment of the teeth.

CHAP.

CHAP. III.

Of the Broad Muſcle.

NOw we ſhould proſecute the containing parts of the face; to wit, the skin, the fleſhy pannicle and fat; but, becauſe they have been ſpoken of ſufficiently before, I will only deſcribe the fleſhy pannicle, before I come to the diſſection of the eye, that we may the more eaſily underſtand all the motions performed by it, whether in the face or forehead.

Firſt, that you may more eaſily ſee it, you muſt curiouſly ſeparate the skin in ſome part of the face. For unleſs you take a good head you will pluck away the fleſhy pannicle together with the skin, as alſo this broad muſcle to which it immediately adheres, and in ſome places ſo cloſely and firmly, as in the lips, eye-lids, and the whole forehead, that it cannot be ſeparated from it. Nature hath given motion, or a moving force, to this broad muſcle, that whilſt it extends or contracts it ſelf, it might ſerae to ſhut and open the eye. It will be convenient to ſeparate the muſcle thus freed from the skin, beginning from the fore-part of the clavicles even to the chin, aſcending in a right line, and shen turning back as far as you can; for thus you ſhall ſhew how it mixes it ſelf with the skin and muſcles of the lips.

There are no particular Muſcles appointed to ope n and ſhut the eye, for that is the broad muſcle only.

When thou ſhalt come to the eyes, thou ſhalt teach how the eye is ſhut and opened by this one muſcle, becauſe it is compoſed of three ſorts of fibers; although by the opinion of all who hitherto have written of Anatomy, thoſe actions are ſaid to be performed by the power of two muſcles appointed for that purpoſe; one of which is at the greater corner on the upper part, the other reſembling a ſemicircle at the leſſer corner, from whence extending it ſelf to the middle of the griſtle *Tarſus*, it meets with the former ending there; but they are in part extended over all the eye-lid, whereby it cometh to paſs, that it alſo in ſome ſort becometh moveable. But although in publick diſſections, theſe two muſcles are commonly wont to be ſolemnly ſhewed, after the manner I have related; yet I think, that thoſe which ſhew them, know no more of them than I do. I have grounded my opinion from this, that there appears no other muſculous fleſh in theſe places, to thoſe which ſeparate the fleſhy pannicle, or broad muſcle, than that which is of the pannicle it ſelf, whether you draw your Inciſion-knife from the forehead downwards, or from the cheek upwards.

Divers reaſons to that purpoſe.

Beſides, when there is occaſion to make inciſion on the eye-brows, we are forbidden to do it tranſverſe, leſt this broad muſcle falling upon the eye, make the upper eye-lid unmoveable; but, if ſuch a cut be received accidentally, we are commanded preſently to ſtitch it up; which is a great argument, that the motion of the upper eye-lid is not performed by its proper muſcles, but wholly depends, and is performed by the broad muſcle, Now if theſe ſame proper muſcles which we have deſcribed ſhould be in the upper eye-lid, it ſhould be meet (becauſe when one of the muſcles is in action, the other, which is its oppoſite or Antagoniſt, reſts or keeps holy-day) that when that which is ſaid to open the eye is employed, the oppoſite thereof reſting, the upper eye-lid ſhould be drawn towards its original, as we ſee it happens in Convulſions; becauſe the operation of a muſcle is the collection of the part which it moves towards its original.

Why you muſt take heed of making a tranſverſe inciſion upon the eye-brows.

The action of a muſcle.

Therefore ſeeing ſuch a motion or collection appears not any where in the eye-lid, I think it therefore manifeſt, that all the motion of this upper eye-lid depends upon this broad muſcle, and that it alone is the author of the motion thereof.

The original of the broad muſcle.

The original of this broad muſcle is from the upper part of the *Sternon*, the clavicles, the ſhoulder-blades, and all the ſpines of the *vertebra's* of the neck: But it is inſerted into all theſe parts of the head which want hair, and the whole face, having divers fibers from ſo various original, by the benefit of which it performs ſuch manifold motions in the face (for it ſo ſpreads it ſelf over the face, that it covers it like a vizard) by reaſon of the variety of the original and the production of the divers fibers of this muſcle. But I have not in the deſcription of this muſcle proſecuted thoſe nine conditions, which in the firſt Book of my Anatomy I required in every part, becauſe I may ſeem to have ſufficiently declared them in the deſcription of the muſcles of the *Epigaſtrium*. Wherefore hence forward you muſt expect nothing from me in the deſcription of the Muſcles beſides their original, inſertion, action, compoſition, and the deſignation of their veſſels.

The inſertion, and reaſon why we expreſs ſo many motions with the face.

CHAP. IV.

Of the Eye-lids, and Eye-brows.

What the eye-brows are.

BEcauſe we have fallen into mention of the eye-lids, and eye-brows, and becauſe the order of Diſſection alſo requires it, we muſt tell you what they are, of what they conſiſt, and how, and for what uſe they were framed by Nature. Therefore the eye-brows are nothing elſe, than a rank of hairs ſet in a ſemicircular form upon the upper part of the orb of the eye, from the greater to the leſſer corner thereof, to ſerve for an ornament of the body, and a defence of the eyes againſt the acrimony of the ſweat falling from the forehead.

Their uſe.

What the eye-lids are.

Their compoſure and uſe.

But the eye-lids on each ſide two, one above, and another below, are nothing elſe than as it were certain ſhuttings appointed and made to cloſe and open the eyes when need requires, and to contain them in their orbs. Their compoſure is of a muſculous skin, a griſtle and hairs ſet like a pale at the ſides of them to preſerve the eyes when they are open, chiefly againſt the injuries of ſmall bodies, as motes, duſt, and ſuch like. Theſe hairs are always of equal and like bigneſs, implanted at the edges of the griſtly part, that they might always ſtand ſtrait and ſtiff out. They

are

are not thick, for ſo they ſhould darken the Eye. The Griſle in which they are faſtned is encompaſſed with the *Pericranium* ſtretched ſo far before it produce the *Conjunctiva*. It was placed there, that when any part thereof ſhould be drawn upwards or downwards by the force of the broad Muſcle, or of the two proper Muſcles, it might follow entirely and wholly by reaſon of its hardneſs. They call this ſame Griſle, eſpecially the upper, *Tarſus*. The upper and lower Eye-lid differ in nothing, but that the upper hath a more manifeſt motion, and the lower a more obſcure: for otherwiſe Nature ſhould have in vain encompaſſed it with a Muſculous ſubſtance. What the *Tarſus* is.

CHAP. V.

Of the Eyes.

THe Eyes are the Inſtruments of the faculty of Seeing, brought thither by the viſive ſpirit of the Optick Nerves, as in an *Aquæ-ductl*. They are of a ſoft ſubſtance, of a large quantity, being bigger or leſſer, according to the bigneſs of the body. They are ſeated in the head, that they might over-look the reſt of the body, to perceive and ſhun ſuch things as might endanger or endamage the body; for the action of the Eyes is moſt quick, as that which is performed in a moment, which is granted to none of the other ſenſes. Wherefore this is the moſt excellent ſenſe of them all. For by this we behold the Fabrick and Beauty of the Heavens and Earth, diſtinguiſh the infinite varieties of colours, we perceive and know the Magnitude, Figure, Number, Proportion, Site, Motion, and reſt, of all bodies. The Eyes have a pyramidal Figure whoſe Baſis is without, but the Cone or point within at the Optick Nerves. Nature would have them contained in a hollow circle, that ſo by the profundity and ſolidity of the place they might be free from the incurſions of bruiſing and hurtful things. What the Eyes are. Their ſite. The quickneſs and excellency of their action. Figure.

They are compoſed of ſix Muſcles, five Coats, three Humours, and a moſt bright Spirit, (of which there is a perpetual afflux from the Brain) two Nerves, a double Vein, and one Artery, beſides much fat; and laſtly, a Glandule ſeated at the greater angle thereof, upon that large hole which on both ſides goes to the Noſe, and that, leſt that the humours falling from the Brain ſhould flow by the Noſe into the Eyes, as we ſee it fares with thoſe whoſe Eyes perpetually weep or water by reaſon of the eating away of this Glandule, whence that affect is called the *Fiſtula lacrymalis*, or weeping Fiſtula. Compoſition. *Glandula Lacrymalis.* *Fiſtula Lacrymalis.*

But there is much fat put between the Muſcles of the Eye, partly that the motion of the Eyes might be more quick in that ſlipperineſs of the fat, as alſo that the temper and complexion of the Eyes, and chiefly of their nervous parts, might be more conſtant and laſting, which otherwiſe by their continual and perpetual motion would be ſubject to exceſſive drineſs. For Nature for the ſame reaſon hath placed Glandules flowing with a certain moiſture near thoſe parts which have perpetual agitation. Why fat is placed about the Eyes.

CHAP. VI.

Of the Muſcles, Coats, and humours of the Eye.

THere are ſix Muſcles in the Eye, of which four perform the four direct motions of the Eye: they ariſe from the bottom of the Orb, and end in the midſt of the Eye, encompaſſing the Optick Nerve. When they are all moved with one endeavour, they draw the Eye inwards. But if the upper onely uſe its action, it draws the Eye upwards; if the lower, downwards; if the right, to the right ſide; if the left, to the left ſide. The number ſite, and action of the Muſcles.

The two other Muſcles turn the Eye about; the firſt of which being the longer and ſlenderer, ariſes almoſt from the ſame place from which that Muſcle ariſes which draws the Eye to the right ſide to the greater corner. But when it comes to the utmoſt part of the inner angle, where the *Glandula lacrymalis* is ſeated, it ends in a ſlender Tendon, there piercing through the middle Membrane which is there, as through a Ring; from whence it preſently going back, is ſpent in a right angle towards the upper part of the Eye, betwixt the inſertions of thoſe two Muſcles, of the which one draws the Eye upwards, the other directly to the outward corner, as it is obſerved by *Fallopius*, or rather, which I remember, I have always obſerved, they turn between the Muſcles which move the Eye upwards, and to the inner corner.

This fifth Muſcle when it is drawn in towards its beginning, ſo draws the eye with its circular tendon that it carries it to the greater corner.

The ſixth Muſcle is contrary to that, for that it hath its original from the lower part of the orb at a ſmall hole, by which a Nerve of the third conjugation paſſes forth; and being that it is moſt ſlender, whileſt it aſcends tranſverſly to the outward corner, it involves the eye ſo alſo, that it is inſerted in it by a ſmall Tendon, ſo that the Tendons of them both are often-times taken but for one. That thou mayeſt truly and accurately obſerve this anatomical deſcription of the Eye, the Eye muſt not be pluckt out of its orb, but rather the orb it ſelf muſt be broken and ſeparated.

For thus thou ſhalt certainly and plainly ſee the fore-mentioned original of the Muſcles. For the five Coats, the firſt which is firſt met with in diſſection, comes from the *Pericranium*, and is extended over all the white of the Eye even to the *Iris* or Rainbow. The duty of it is to ſtrengthen, bind, and contain the Eye in its orb, wherefore it had the name *Conjunctiva*; others call it *Adnata*, or *Epipophycos*. The five coats of the Eye. 1. *Conjunctiva*, or *Adnata*.

The ſecond is called the *Cornea*, becauſe it reſembles a Horn in colour and conſiſtence; this

2. *Cornea*, or the Horny Coat. coat differs and varies from it ſelf; for in the fore-part, as far as the *Iris* goes, it is clear and perſpicuous, but thick and obſcure in the hind part, by reaſon of the diverſe poliſhing. On the fore-part it is denſe; that it may preſerve and contain the Cryſtalline and wateriſh humour, but withall tranſparent, ſo to give the object a free paſſage to the Cryſtalline. It hath its original from the *Craſſa Meninx*, proceeding forth from the inner holes of the orb of the eye, for it compaſſes the eye on every ſide.

3. *Uvea*, or the Grapy Coat. The third is called *Uvea* or Grapy Coat, becauſe in the exteriour part it repreſents the colour of black Grape; it ariſes from the *Pia Mater*, and encompaſſes all the Eye, except the *Pupilla* or Apple of the Eye, for here being perforated, it adheres to the horny Coat by the Veins and Arteries which it communicates to it for life and nouriſhment. But when it arrives at the *Iris*, then forſaking the *Cornea*, it deſcends deep in the Eye, and in ſome ſort is turned about the Cryſtalline humour, to which alſo it moſt firmly adheres, ſo bounding the wateriſh humour, and alſo prohibiting that the Albugineous humour do not overwhelm the Cryſtalline. This grapy Coat is, as it were, died on the inſide with divers colours, as black, brown, blue, or green like a Rainbow, and that for theſe enſuing benefits.

Why the Grapy Coat reſembles divers colours. The firſt is, if that it had been tinctured with one colour, all objects would have appeared of the ſame colour, as it comes to paſs when we look through green or red Glaſs. But it muſt be coloured, that ſo it may collect the ſpirits diſſipated by the Sun and Seeing.

Thirdly, It was convenient it ſhould be planted with infinite variety of colours for the preſervation of the ſight. For as the extreme colours corrupt and weaken the ſight, ſo the middle refreſh and preſerve it, more or leſs, as they are nearer or further remote from the extremes. It was fit it ſhould be ſoft, that ſo it might not hurt the Cryſtalline humour upon whoſe circumference it ends; and perforated in the part objected to it, leſt by its obſcurity it ſhould hinder the paſſage of the objects to the Cryſtalline, but rather that it might collect by its blackneſs, as a contrary, the great, and as it were, diffuſed variety of colours, no otherwiſe than we ſee the heat is ſtrengthened by the oppoſition of cold; ſome call this Coat *Choroides*, becauſe it is woven with many Veins and Arteries, like the Coat *Chorion* which involves the infant in the Womb.

Now follows the fourth Coat called *Amphibleſtroides* or *Reti-formis*, the Net-like Coat, becauſe proceeding from the Optick Nerve dilated into a Coat, it is woven like a Net with Veins and Arteries which it receives from the grapy Coat, both for the life and nouriſhment both of it ſelf, alſo of the Glaſſie humour which it encompaſſes on the back-part. The principal commodity of this Coat is, to perceive when the Cryſtalline humour ſhall be changed by objects, and to lead the viſive ſpirit inſtructed or furniſhed with the faculty of Seeing, by the mediation of the Glaſſie humour even to the Cryſtalline, being the principal inſtrument of Seeing. It is ſofter then any other Coat, leſt the touch of it ſhould offend that humour. Wherein thou wilt admire the ſingular order of Nature, which as in other things it paſſes not from one extreme to another, unleſs by a *Medium*; ſo here it hath not fitted the hard horny Coat to the ſoft humours, but by interpoſition of divers *media* of a middle conſiſtence. For thus, after the harder Coats *Adnata* and *Cornea*, it hath placed the grapy Coat; by ſo much ſofter than theſe two, as the Net-like Coat is ſofter than it, that thus it might paſs from extreme to extreme, as it were, by theſe degrees of hardneſs and ſoftneſs.

4. *Amphibleſtroides* or *Reti-formis*, Net-like Coat.

An Anatomical Axiom.

The fifth and laſt Coat is called *Arachnoides*, becauſe it is of the conſiſtence of a Spiders Web. And we may well reſemble this Coat to that skin of an Onion which exceeds the other in clearneſs, whiteneſs, and thinneſs. This *Araneoſa* or Cobweb-like Coat encompaſſes the Cryſtalline humour on the fore-ſide, peradventure that ſo it might defend it, as the chief inſtrument of Seeing, if the other humours ſhould at any time be hurt. It hath its original from the excrementitious humidity of the Cryſtalline humour, hardned into that Coat by the coldneſs of the adjacent part; abſolutely like the thin skin which encompaſſes the white of an Egg.

5. *Arachnoides, ſive Araneoſa*, the Cobweb Coat.

The firſt humour of the Eye is called *Aqueus*, or Wateriſh, from the ſimilitude of Water; it is ſeated between the tranſparent part of the horny Coat, the portion of the Cryſtalline humour lying towards the Apple of the Eye, and that reflection of the grapy Coat which comes from the *Iris* to the circumference of the Cryſtalline humour, that filling the empty ſpace it may diſtend the *Cornea*, and ſo hinder the falling thereof upon the Cryſtalline which would ſpoil the ſight; as alſo that by its moiſture it might hinder the drying of the Cryſtalline humour. Peradventure it is made of the whayiſh humour ſweating out of the Veſſels of the Coats, having their orifices for the moſt part in that place where this wateriſh humour reſides. The ſecond humour and middlemoſt in ſituation is called the Cryſtalline, becauſe it imitates Cryſtal in the brightneſs and colour; if ſo be, that we may attribute any colour to it. For indeed it was fit, that none of the three humours ſhould be tinctured with any colour, as thoſe which would be the inſtruments of Sight, leſt they might beguile us in ſeeing, as red and green ſpectacles do; for, that is true which we have read written by the Philoſopher, That the ſubject or matter, appointed for the reception of any form, ſhould want all impreſſion thereof. Hence Nature hath created a formleſs Matter, the humours of the Eyes without colours, Wax without any Figure, the Mind without any particular knowledge of any thing, that ſo they might be able to receive all manner of Forms. The figure of the Cryſtalline humour is round, yet ſomewhat flatted on the fore-ſide, but yet more flatted behind, that ſo the objects might be the better retained in that, as it were plain figure, and that they might not fly back as from a Globe, or round body, in which they could make but ſhort ſtay; leſt it might be eaſily moved from its place by the force of any thing falling or hitting againſt it, becauſe that body which is exactly round touches not a plain body, but onely in a point or prick. Half this humour ſwims in the Glaſſie humour, that ſo it may be nouriſhed from it by tranſpoſition of matter; or rather (ſeeing it is encompaſſed on every ſide with the fifth Coat, that the matter cannot eaſily be ſent from the one into the other) by the benefit of the Veſſels produced even unto it as well by the Net-like Coat as by the Grapy; but it is filled with a bright ſpirit on the fore-part, which lies next to the wateriſh humour, and the ſpace of the Apple of the Eye.

The three humours of the Eye.

1. *Aqueus*, or Watery.

2. *Cryſtallinus*, or Cryſtalline.

A Philoſophical Axiom.

Of which thing this is an argument, that as long as a man remains alive, we ſee the Eye every way full and ſwollen, but lank and wrinkled when he is dead; beſides alſo, one of the Eyes being ſhut, the *Pupilla* of the other is dilated by the ſpirit compelled to fly thither. And alſo for the ſame cauſe the horny Coat is wrinkled in very old men, and the *Pupilla* is ſtraitned by the wrinkles ſubliding into themſelves, which is the cauſe that they ſee little or not at all; for by Age and ſucceſs of Time the humour is conſumed by little and little, the implanted ſpirit vaniſhes away, and ſmaller quantity of ſpirits flow from the Brain, as from a Fountain which is alſo exhauſted. The

Gal. cap. 5. lib. 10. de uſu Part.

horny Coat at his original, that is, in the parts next the *Iris*, ſeemeth to be very nigh the Cryſtalline humour, becauſe all the Coats in that place mutually cohere as touching one another; but as it runs further out to the *Pupilla*, ſo it is further diſtant from the Cryſtalline. Which you may eaſily perceive by Anatomical diſſection, and the operation of touching or taking away a Catarrhact: for whereas a Catarrhact is ſeated between the horny Coat and Cryſtalline humour, the needle thruſt in, is carried about upwards, downwards, and on every ſide through a large and free ſpace, neither touching the horny Coat nor Cryſtalline humour, by reaſon theſe bodies are ſevered by a good diſtance filled with ſpirit and a thin humour. The uſe of it is, that it may be like a Looking-glaſs to the faculty of Seeing carried thither with the viſive ſpirit.

In what place a Catarrhact or a Suffuſion breeds.

3. *Vitreus ſeu Albugineus*, that is Glaſſie, or like the white of an Egg.

The third and laſt humour is the *Vitreus*, the Glaſſie, or rather Albugineous humour; called ſo, becauſe it is like molten Glaſs, or the white of an Egg. It is ſeated in the hind-part of the Cryſtalline humour, that ſo it may in ſome ſort break the violence of the ſpirit flowing from the Brain into the Cryſtalline humour, no otherwiſe than the watery humour is placed on the fore-ſide of the Cryſtalline to hinder the violence of the light and colours entering that way. This Glaſſie humour is nouriſhed by the Net-like Coat.

The Veins of the Eye.

We have formerly ſpoken ſufficiently of the Nerves of the Eye: Wherefore it remains that we ſpeak of the Veins. Some of theſe are internal, carried thither with the Coats of the Veſſels of the Brain; otherſome external ſtretched over the external parts of the Eye, as the Muſcles and Coat *Adnata*; and by theſe Veins inflammations and redneſs often happen in the external parts of the Eye: for which the *Vena pupis* muſt be opened, and Cupping-glaſſes and Horns muſt be applied to the nape of the Neck and ſhoulders: as, in the internal inflammations of the Eye, the Cephalick-Vein muſt be opened to avert and evacuate the morbifick humour.

What Veins may be opened in what inflammations of the Eyes.

CHAP. VII.

Of the Noſe.

THe Noſe is called in Greek *Ris*, becauſe the excrements of the Brain flow forth by this paſſage; thou maiſt underſtand it hath divers ſubſtances by compoſition. The quantity, figure and ſite are ſufficiently known to all. But it is compoſed of the Skin and Muſcles, Bones, Griſles, a Membrane or Coat-nerves, Veins, and Arteries. The Skin and Bones, both contained and containing, have formerly been explained, as alſo the Nerves, Veins, and Arteries. The Griſles of the Noſe are ſix in number; the firſt is double, ſeparating both the noſtrils in the top of the Noſe extended even to the Bone *Ethmoides*. The ſecond lies under the former. The third and fourth are continued to the two outward Bones of the Noſe. The fifth and ſixth being very ſlender, and deſcending on both ſides of the Noſe, make the wings or moveable parts thereof. Therefore the uſe of theſe Griſles is, that the Noſe moveable about the end thereof, ſhould be leſs obnoxious to external injuries, as fractures, and bruiſes; and beſides, more fit for drawing the air in, and expelling it forth in breathing. For Nature for this purpoſe hath beſtowed four Muſcles upon the Noſe, on each ſide two, one within and another without.

The Griſles of the Noſe.

The Muſcles thereof.

The External taketh its original from the Cheek, and deſcending obliquely from thence, and after ſome ſort annexed to that which opens the upper lip, is terminated into the wing of the Noſe, which it dilates.

The Internal going on the inner ſide from the Jaw-bone, ends at the beginning of the Griſles that make the Wings, that ſo it may contract them. The Coat which inwardly inveſts the Noſtrils and their paſſages, is produced by the Sive-like Bones from the *Craſſa meninx*, as the inner Coat of the Palat, Throttle, Weazon, Gullet, and inner Ventricle; that it is no marvail, if the affects of ſuch parts be quickly communicated with the Brain. This ſame Coat on each ſide receives a portion of a Nerve from the third Conjugation, through the hole which deſcends to the Noſe by the great corner of the Eye.

The temper, action, and uſe.

The Noſe in all the parts thereof is of a cold and dry temper. The action and profit thereof is to carry the air, and oft-times ſmells to the mamillary proceſſes, and from thence to the four Ventricles of the Brain, for the reaſons formerly ſhewed. But becauſe the mammillary proceſſes being the paſſages of the Air and Smells are double, and for that one of theſe may be obſtructed without the other, therefore Nature hath alſo diſtinguiſhed the paſſage of the Noſe with a griſly partition put between, that when the one is obſtructed, the air by the other may enter into the Brain for the generation and preſervation of the animal ſpirit. The two holes of the Noſe at the firſt aſcend upwards, and then downwards into the Mouth, by a crooked paſſage, leſt the cold air or duſt ſhould be carried into the Lungs. But the Noſe was parted into two paſſages, as we ſee, not onely for the forementioned cauſe, but alſo for helping the reſpiration and vindicating the Smell from external injuries; and laſtly, for the ornament of the Face.

Why the Noſe was parted in two.

CHAP. VIII.

Of the Muſcles of the Face.

Their number

NOw we muſt deſcribe the Muſcles of the Face pertaining as well to the Lips as to the lower Jaw. Theſe are 18 in number, on each ſide nine, that is, four of the Lips, two of the upper, and as many of the lower. But there belong five to the lower Jaw. The firſt of the upper Lip being the longer and narrower, ariſing from the Yoke-bone, deſcends by the corner

ner of the mouth to the lower lip, that ſo it may bring it to the upper lip, and by that means ſhut the mouth. The other being ſhorter and broader, paſſing forth of the hollowneſs of the cheek, or upper Jaw (by which a portion of the nerves of the third conjugation deſcends to theſe two Muſcles, and other parts of the face) ends in the upper part of the ſame upper lip, which it compoſes together with the fleſhy pannicle and skin, and it opens it by turning up the exterior Fibers towards the Noſe, and ſhuts it by drawing the internal inwards towards the Teeth.

The firſt of the lower lip being the longer and ſlenderer, entering out of that region which is between the external perforation of the upper Jaw (through which, on the inner part of the ſame, a Nerve paſſeth forth to the ſame Muſcles) and the Muſcle *Maſſeter* (of which hereafter,) then aſcending upwards by the corner of the Mouth, it ends in the upper lip, that ſo it may draw it to the lower.

The other broader and ſhorter, begins at the lower part of the chin, and the hollowneſs thereof, and ends at the lower lip which it makes, opening it within and without, by its internal and external Fibers, as we alſo ſaid of its oppoſite. And that I may ſpeak in a word, Nature hath framed three ſorts of Muſcles for the motion of the Mouth; of which ſome open the Mouth, others ſhut it, and other ſome wreſt it and draw it awry: but you muſt note, that when the Muſcles of one kind jointly perform their functions (as the two upper which we deſcribed in the firſt place, on each ſide one, which draw the lower lip to the upper, and the Muſcles oppoſite to them) they make a right or ſtreight motion; but when either of them moves ſeverally, it moves obliquely, as when we draw our mouth aſide. But theſe Muſcles are ſo faſtned and fixed to the skin, that they cannot be ſeparated; ſo that it is no great matter whether you call it a muſculous skin, or a skinny Muſcle: (Which alſo takes place in the palms of the hands, and ſoles of the feet:) but theſe Muſcles move the lips, the upper Jaw being not moved at all.

CHAP. IX.

Of the Muſcles of the lower Jaw.

WE have ſaid theſe Muſcles are five in number, that is, four which ſhut it, and one which opens it, and theſe are alike on both ſides. The firſt and greater of theſe four Muſcles which ſhut the Jaw is called *Crotophita* or Temporal Muſcle: it ariſes from the ſides of the forehead, and *Bregma*-bones, and adhering to the ſame and the ſtony-bone, it deſcends under the yoke-bone, from whence it inſerts it ſelf to the proceſs of the lower Jaw, which the *Greeks* call *Corone*, that it may draw it directly to the upper, ſo to ſhut the Mouth. Their number. The Temporal Muſcle.

But you muſt note that this Muſcle is tendinous even to his Belly, and that it fills and makes both the Temples. It is more ſubject to deadly wounds than the reſt, by reaſon of the multitude of Nerves diſperſed over the ſubſtance thereof, which becauſe they are near their original, that is, the Brain, they infer the danger of ſudden death by a Convulſion, which uſually follows the affects of this Muſcle, but alſo in like manner it cauſes a Fever, the Phrenſie and *Coma*. Why the wounds of the Temporal Muſcle are deadly.

The Figure of the chief Muſcles of the Face.

FIG. II.

A *The Muſcle of the Fore-head and the right Fibers thereof.*
B *The Temporal Muſcle.*
α β γ *His ſemicircular original.*
D *The Muſcle of the upper lip.*
G *The Yoke-bone under which the Temporal Muſcles paſs.*
I *The Maſſeter, or Grinding Muſcle.*
K *The upper Griſle of the Noſe.*
M *A Muſcle forming the Cheeks.*
N *The Muſcle of the lower lip.*
O *A part of the fifth Muſcle of the lower Jaw called* Digaſtricus, *that is, double-bellied.*
Q R *The firſt Muſcle of the Bone* Hyoides, *growing unto the rough Artery.*
S *The ſecond Muſcle of the Bone* Hyoides *under the Chin.* T *The third Muſcle of the Bone* Hyoides *ſtretched to the Jaw.* T K *The ſeventh Muſcle of the Head, and his inſertion at* T. V V *The two venters of the fourth Muſcle of the Bone* Hyoides. Φ *The place where the Veſſels paſs which go to the Head, and the Nerves which are ſent to the Arm.*

Therefore that it ſhould be leſs ſubject or obvious to external injuries, Nature hath, as it were, made it a retiring place in the Bone, and fortified it with a Wall of Bone raiſed ſomewhat higher about it. The other Muſcle almoſt equal to the former in bigneſs, being called the *Maſſeter*, or Grinding Muſcle makes the Cheek; it deſcends from the loweſt part of the greateſt Bone of the Orb (which bends it ſelf, as it were, back, that it may make part of the Yoke-bone) and inſerts it ſelf into the lower Jaw, from the corner thereof to the end of the root of the proceſs *Corone*, that ſo it may draw this Jaw forward and backward, and move it like a Hand-Mill. The *Maſſeter* or Grinding Muſcle.

Wherefore Nature hath compoſed it of two ſorts of Fibers, of the which ſome from the Neck (the Cheek in that place under the Eyes ſtanding ſomewhat out like an Apple ariſing from the concourſe of the greater Bones of the Orb and upper Jaw) deſcend obliquely to the corner and

hinder part of the lower Jaw, that it may move it forwards. Otherſome ariſe from the lower part of the ſame Yoke-bone, and deſcending obliquely interſect the former Fibers after the ſimilitude of the letter X, and inſert themſelves into the ſame lower Jaw at the roots of the proceſs *Corone*, that ſo they might draw it back: Truly by reaſon of theſe contrary motions, it is likely this Muſcle was called the *Maſſeter*, or Grinder.

The Round Muſcle.

The third which is the round Muſcle, ariſes from all the Gums of the upper Jaw, and is inſerted into all the Gums of the lower, inveſting the ſides of all the Mouth with the Coat, with which it is covered on the inſide, being otherwiſe covered on the outſide with more fat then any other Muſcle. The action thereof is, not onely to draw the lower Jaw to the upper, but alſo as with a ſhovel to bring the meat diſperſed over all the Mouth under the Teeth, no otherwiſe than the Tongue draws it in.

The leſſer Muſcle of the lower Jaw.

The fourth being ſhorter and leſs than the reſt ariſing from all the hollowneſs of the winged proceſs of the Wedge-bone, is inſerted within into the broadeſt part of the lower Jaw, that ſo in like manner it may draw the ſame to the upper. This is the Muſcle through whoſe occaſion we ſaid this lower Jaw is ſometimes diſlocated.

The Figure of the Muſcles of the lower Jaw.

FIG. III.

A *A hole in the fore-head bone in the brim of the ſeat of the Eye, ſending a ſmall Nerve of the third pair to the Muſcles of the fore-head and the upper eye-brow.*
B *The temporal Muſcle.*

The fifth and laſt Muſcle.

The fifth and laſt Muſcle of the lower Jaw iſrom the proceſs *Styloides* of the Stony bone, aſcends to the fore-part of the Chin, near to the connexon of the two bones of this Jaw, to draw this Jaw downwards from the upper in opening the Mouth. This Muſcle is ſlender and tendinous in the midſt, that ſo it might be ſtronger, but it is fleſhy at the ends. All theſe Muſcles were made by the ſingular Providence of Nature, and engraffed into this part for the performance of many uſes and actions, as biting aſunder, chawing, grinding and ſevering the meat into ſmall particles, which the tongue by a various and harmleſs motion puts under the teeth. Thus much I thought good to ſay of the parts of the Face, as well containing as contained.

The uſe of theſe mentioned Muſcles.

CHAP. X.

Of the Ears and Parotides, *or Kernels of the Ears.*

The nature and compoſition of the ears.

THe Ears are the Organs of the ſenſe of Hearing. They are compoſed of the skin, a little fleſh, a griſle, veins, arteries, and nerves. They may be bended or folded in without harm, becauſe being griſly, they eaſily yield and give way; but they would not do ſo if they ſhould be bony, but would rather break. That lap at which they hang Pendants and Jewels, is by the Ancients called *Fibra*, but the upper part *Pinna*. They have been framed by the Providence of Nature into two twining paſſages like a Snails ſhell, which as they come nearer to the *foramen cæcum* or blind hole, are the more ſtraitned, that ſo they might the better gather the air into them, and conceive the differences of ſounds and voices, and by little and little lead them to the Membrane.

What the *Fibra* and *Pinna* are.

The figure and reaſon thereof.

This Membrane which is indifferently hard, hath grown up from the Nerves of the fifth conjugation, which they call the Auditory. But they were made thus into crooked windings, leſt the ſounds ruſhing in too violently ſhould hurt the ſenſe of Hearing. Yet for all this, we oft find it troubled and hurt by the noiſe of Thunder, Guns, and Bells. Otherwiſe alſo, leſt that the air too ſuddenly entering, ſhould by its qualities, as Cold, cauſe ſome harm; and alſo that little creeping things and other extraneous Bodies, as Fleas and the like, ſhould be ſtaid in theſe windings and turnings of the ways, the glutinous thickneſs of the cholerick Excrement, or Ear-wax, hereunto alſo conducing, which the Brain purges and ſends forth into this part, that is, the auditory paſſage framed into theſe intricate Mæanders.

For what uſe the Ear-wax ſerves.

For what uſe the membrane ſtretched under the Auditory paſſage ſerves.

What ſound is

But that we may underſtand how the Hearing is made, we muſt know the ſtructure of the Organ, or Inſtrument thereof. The Membrane which we formerly mentioned to conſiſt of the Auditory Nerve, is ſtretched in the inſide over the Auditory paſſage, like as the head of a Drum. For it is ſtretched and extended with the Air, or Auditory Spirit implanted there, and ſhut up in the cavity of the mamillary proceſs and *foramen cæcum*, that ſmitten upon by the touch of the external air entering in, it may receive the object, that is, the ſound, which is nothing elſe than a certain quality ariſing from the Air, beaten or moved by the colliſion and conflict of one or more bodies.

Such a colliſion is ſpred over the Air, as the Water which by the gliding touch of a Stone produces many circles and rings, one as it were riſing from another. So in Rivulets running in a narrow Channel, the Water ſtrucken, and as it were, beaten back in its courſe againſt broken, craggy and ſteep Rocks,

Rocks, wheels about into many turnings: this colliſion of the beaten air flying back divers ways from arched and hollow-roofed places, as Dens, Ciſterns, Wells, thick Woods, and the like, yields and produces a double ſound, and this reduplication is called an *Echo*. Wherefore the Hearing is thus made by the air, as a *medium*; but this air is two-fold, that is, External and Internal. The cauſe of an echo.

The Figure of the Ears and Bones of the Auditory paſſage.

Tab. 10. *Sheweth the Ears and the divers internal parts thereof.*

Fig.1. *Sheweth the whole external Ear, with a part of the Temple-bone.*

Fig.2. *Sheweth the left Bone of the Temple divided in the midſt by the inſtrument of Hearing, whereabout on either ſide there are certain paſſages here particularly deſcribed.*

Fig. 3. and 4. *Sheweth the three little bones.*

Fig.5. *Sheweth a portion of the bone of the Temples which is ſeen near the hole of Hearing divided through the midſt, whereby the Nerves, Bones, and Membranes may appear, as* Veſalius *of them conceiveth.*

Fig.6. *Sheweth the Veſſels, Membranes, Bones and Holes of the Organ of Hearing, as* Platerus *hath deſcribed them.*

Fig. 7. and 8. *Sheweth the little Bones of the Hearing of a Man and of a Calf, both joined and ſeparated.*

Fig.9. *Sheweth the Muſcle found out by* Aquapendens.

For the particular Declaration ſee *Dr. Crooks Anatomy*, pag.577.

The exteriour is that which encompaſſes us, but the interiour is that which is ſhut up in the cavity of the mamillary proceſs and *foramen cæcum*, which truly is not pure and ſole air, but tempered and mixed with the auditory ſpirit. Thence proceeds the noiſe or beating of the Ears when vapors are there mixed with the air in ſtead of the ſpirits, whereby their motion is perturbed and confuſed. But neither do theſe ſuffice for hearing; for Nature for the more exact diſtinction of ſounds hath alſo made the little bones, of which one is called the *Incus* or Anvil, another the *Malleolus* or hammer, the third the *Stapes* or Stirrop, becauſe the ſhape thereof reſembles a *German* Stirrop. Alſo it may be called *Deltoides*, becauſe it is made in the ſhape of the Greek Letter Δ. The three bones of the auditory paſſage.

They are placed behind the Membrane; wherefore the Anvil and Hammer moved by the force of the entrance of the external air, and beating thereof againſt that Membrane, they more diſtinctly expreſs the difference of ſounds, as ſtrings ſtretched within under the head of a Drum. As for example; Theſe bones being more gently moved repreſent a low ſound to the common ſenſe and faculty of Hearing, but being moved more vehemently and violently, they preſent a quick and great ſound. To conclude, according to their diverſe agitation, they produce divers and different ſounds. Their uſe. Whence the difference of ſounds.

The Glandules ſhould follow the Ears in the order of Anatomy, as well thoſe which are called the emunctories of the Brain, that is, the *Parotides*, (which are placed, as it were, at the lower part of the Ears) as theſe which lie under the lower Jaw, the Muſcles of the Bone *Hyoides*, and the Tongue, in which the *Scrophulæ*, and other ſuch cold abſceſſes breed. It ſhall here ſuffice to ſet down the uſe of all ſuch like Glandules.

Therefore the *Parotides* are framed in that place by Nature, to receive the virulent and malign matter ſent forth by the ſtrength of the Brain, by the Veins and Arteries ſpred over that place. The reſt ſerve to ſtrengthen the diviſion of the Veſſels, to moiſten the Ligaments and Membranes of the Jaw, leſt they ſhould be dried by their continual motion. Their other conditions and uſes are formerly handled in our firſt Book of Anatomy.

CHAP.

CHAP. XI.

Of the Bone Hyoides, *and the Muſcles thereof.*

The reaſon of the name. THe ſubſtance of the Bone *Hyoides* is the ſame with that of other Bones. The figure thereof imitates the Greek Letter υ from whence it took the name, (as alſo the name ὑψιλοειδὲς; And from the Letter λ it is in like ſort called λαμβδοειδὲς; by ſome it is ſtiled *os Gutturis*, and *os Linguæ*, that is, the Throat-bone and Tongue-bone.

The compoſition. The compoſition thereof conſiſts of many Bones joined into one by the interpoſition of Griſles.

The ſite. This Bone is bigger in Beaſts and compoſed of more Bones, and that not onely by the intercourſe of Griſles, but alſo of Ligaments. It is ſeated with its baſis (being gibbous on the fore-part for conſtancy, and arched on the inſide that it might receive and contain the root of the Tongue) upon the upper part of that Griſle of the Throttle, which is called *Scutiformis*, or Shield-like, (for this ſeems to prop it up by the ſtrength of two proceſſes riſing at the baſis thereof) and the root of the Tongue. From this baſis it ſends forth two horns to the ſides of the Tongue on each ſide one, which in men are tied to the Appendix *Styloides* by Ligaments ſent from it ſelf. Contrary than it is in Beaſts, who have it of many Bones; united, as we ſaid,, by the intercouſe of Ligaments even to the

The temper and uſe. root of the *Styloides*. Wherefore this Bone hath connexion with the fore-mentioned parts, and other hereafter to be mentioned. It hath the ſame temper as other bones have. The uſe of it is, to miniſter Ligaments to certain Muſcles of the Tongue, and inſertion as well to the two foremoſt and upper Muſcles of the Throttle, as to its own, of which we will now treat.

The Muſcles of the bone *Hyoides*. The Muſcles of the Bone *Hyoides*, according to the opinion of ſome, are eight, one each ſide four; of which there be two, one of which *Galen* refers to the common Muſcles of the *Larinx* or Throttle; and the other to thoſe which move the Shoulder-blade upwards. Howſoever it be, the firſt of the four before-mentioned ariſes from the Appendix *Styloides*, and paſſing over the nervous ſubſtance of the Muſcle opening the lower Jaw, is inſerted into the horns of the Bone *Hyoides*. This Muſcle is very thin, yet ſomewhat broad, the which in that reſpect may eaſily be cut, unleſs you have a care in ſeparating the Muſcle which opens the lower Chap. The ſecond aſcends obliquely from the upper part of the Shoulder-blade near the production thereof called *Coracoides*, to the beginnings of the horns of the ſaid Bone *Hyoides*. This is round and nervous in the midſt that ſo it might be the ſtronger, as that is which we formerly ſaid opens the lower Jaw; and it is referred by *Galen* amongſt thoſe which move the Shoulder-blade upwards. The third ariſes from the upper part of the *Sternon*, and is inſerted at the root and baſis of the Bone *Hyoides*; yet *Galen* refers it to the common Muſcles of the *Larinx*; whoſe opinion takes place rather in Beaſts than in Man, ſeeing in Man this Muſcle cannot be found either to proceed, or be inſerted into the Throttle, as it is in Beaſts. The

The action of theſe Muſcles. fourth and laſt deſcends within from the Chin to the root of the Bone *Hyoides*. The firſt of theſe Muſcles with its Companion or Partner, moves the Bone *Hyoides* upwards, the ſecond downwards, the third backwards, and the fourth forwards. I would declare whence theſe Muſcles have their Veſſels, had I not abundantly ſatisfied that thing, when I treated of the diſtribution of the Nerves, Veins and Arteries.

CHAP. XII.

Of the Tongue.

What kind of fleſh the Tongue hath. THe Tongue is of a fleſhy, rare, looſe, and ſoft ſubſtance; it enjoys fleſh of a different kind from the reſt of the fleſh, as chiefly appears when you cut it from the firſt original of the Muſcles thereof; which thing hath moved ſome, that they have made a fourth kind of fleſh proper to the Tongue and different from the reſt, *viz.* the Fibrous Muſculous, and that of the Bowels.

The quantity. The quantity thereof is ſuch, that it may be contained in the Mouth, and eaſily moved to each part

The figure. thereof. The Figure of it is triangular, which it rather expreſſes in the baſis, which is at the root of the Bone *Hyoides*, than in its point, or fore-part, where from a triangle it becomes more dilated.

Compoſure. It is compoſed of a Membrane (which it hath from that which lines all the inſide of the Mouth,)

The Nerves. Muſcles four, Nerves two on each ſide, the one whereof is ſent from the third conjugation, into the coat thereof; the other, from the ſeventh is ſent into the muſculous ſubſtance even to the end thereof for motions ſake; ſo that thoſe ſenſifick Nerves from the third conjugation, onely give to judge of Taſtes, compoſe the Coat, and touch or enter not the fleſh. Beſides, it is compoſed of Veins and Arteries on each ſide one, which it receives from the external Jugular and *Carotides*, running manifeſtly to the end thereof on the lower ſide, that ſo they might be eaſily opened in the diſeaſes of the Mouth and Throttle; they commonly term theſe the *Venæ nigræ*, or black Veins.

The Muſcles of the Tongue. The Muſcles of the Tongue are abſolutely ten, on each ſide five. The firſt narrow at the beginning, and broader at the end, deſcends into the upper ſide of the Tongue from the Appendix *Styloides*, and together with its Co-partner draws it upwards. The ſecond hath its original within from the lower Jaw, about the region of the Grinding Teeth, and is inſerted into the lower ſide of the Tongue, the which with its Partner draws it downward. The third proceeds from the inner part of the Chin, and goes to the root of the Tongue, that when need requires, it may put it forth of the Mouth. The fourth, the greateſt and broadeſt of them all, compoſed of all ſorts of Fibers, paſſeth forth from the baſis of the bone *Hyoides*, and ends at the lower part of the Tongue, which with its Companion plucks it back into the mouth. The fifth and laſt moſt uſually ariſes from the upper part of the horns of the bone *Hyoides*, and goes to the roots of the Tongue between the two firſt, that

it

it may move it to the ſides of the Mouth. The temper thereof, as of all other fleſh, is hot and moiſt. The firſt action and commodity thereof is, to be the Organ of the ſenſe of Taſting, wherefore it was made fungous and ſpongy, that by reaſon of the rarity of it, it might more eaſily admit the taſtes conjoined with the ſpettle as a vehicle, Another to be an inſtrument to diſtinguiſh the voice by articulate ſpeech, for which it was made moveable into each part of the Mouth. The third is to be a help to chaw and ſwallow the meat. For which cauſe it is like a ſcoop or diſh with which we throw back the Corn into the Mill, which hath ſcaped grinding. And becauſe, when the Tongue is drie, it is leſs nimble and quick to perform its motions, as appears by thoſe which can ſcarce ſpeak by reaſon of thirſt, or a burning Fever: therefore Nature hath placed very ſpongy glandules at the roots thereof, on each ſide one, which like ſponges ſuck and receive, both from the Brain and other places, a wateriſh and ſpettely humour, with which they humect and make more glib, not onely the Tongue, but alſo the other parts of the Mouth, as the Throat and Jaws; theſe glandules are called the *Tonſillæ*, or Almonds of the Throat.

The temper, action, and manifold uſe of the tongue.

The uſe of the glandules placed at the roots of the tongue.

CHAP. XIII.

Of the Mouth.

THE Mouth is that capacity, which, bounded with the Cheeks and Lips contains within its Precincts the Teeth, Tongue, and the beginning of the Throttle and Gullet. Therefore the uſe of the Mouth is to contain the Tongue, and ſerve it in the fitter performance of its actions; and although many parts hereof have been formerly handled, as the Lips, Teeth, Jaws, Tongue, Almonds, and paſſages of the Palat coming from the Noſe, yet it remains that we declare what the Palate, the *Gargareon* or Uvula, the *Pharinx*, and *fauces* or Chops, are. The Palat (or, as it is commonly called, the Roof of the Mouth) is nothing elſe but the upper part of the Mouth bounded with the Teeth, Gums, and upper Jaw. In which place the Coat common to the whole Mouth, is made rough with divers wrinkles, that the meats put up and down between the Tongue and the Palat might be broken and chawed more eaſily by that inequality and roughneſs. If any would find find the Nerves, which deſcend into the Palate from the fourth Conjugation, let him ſeparate that Coat, and caſt it from the fore to the hind-part of the Mouth; for ſo he ſhall find them at the ſides and hind-parts of the bones of the Palate, which incompaſs the Palat, and at the beginning of the inner holes of the Mouth, which deſcend from the Noſe, and region of the productions of the Wedg-bone called the Saddle. Theſe holes or paſſages are open, that we may breath the better when we ſleep, and that when the Noſe is not well, the excrements which ſeek their paſſage by it, may be eaſilier drawn away by the Mouth. This ſame Coat is woven with nervous Fibers, that like the Tongue it may judge of Taſtes; theſe Fibers compoſe a Coat that hath a middle conſiſtence betwixt ſoft and hard. For if it ſhould have been any harder, like a Bone or Griſle, it would have been without ſenſe; but if ſofter, hard, acid and ſharp meats would have hurt it.

What it is.

The uſe.

What the Palat is.

The Nerves thereof.

Why the holes of the Palat are open.

What kind of Coat the Palat hath.

CHAP. XIV.

Of the Gargareon, *or Uvula.*

BY the *Gargareon* we underſtand a fleſhy and ſpongy body, in ſhape like a Pine-Apple, hanging directly down at the further end of the Palat and baſis of the bone *Ethmoides*, where the two holes of the Palat come from the Noſe, above the entrance of the Throttle. This little body is ſituate in this place to break the violence of the air drawn in by breathing and that by delay it might in ſome ſort temper and mitigate it by the warmneſs of the Mouth. Beſides, that it might be as it were the *Plectrum*, or quill of the Voice, ſo to diffuſe the fuliginous vapour ſent forth in breathing, that it may be diſperſed over all the mouth, that reſounding from thence it may be articulate, and by the motion of the Tongue diſtinguiſhed and formed into a certain Voice. Which uſe is not ſmall; when we ſee by experience, that ſuch as have this particle cut away, or eaten, or corrupted by any accident, have not onely their Voice vitiated and depraved, but ſpeak ill-favouredly, and, as they ſay, through the Noſe; and beſides, in proceſs of time they fall into a Conſumption by reaſon of the cold air paſſing down before it be qualified. This ſame patricle is alſo a means to hinder the duſt from flying down through the Weazon into the Lungs. By the *Pharinx* and *Fauces* is meant the inner and back-part of the mouth, ſet or placed before the entrance of the Throttle and Gullet; being ſo called, becauſe that place is narrow and ſtrait, that as it were by theſe ſtraits, the air drawn in by the mouth might be forced down by the Throttle, and the meat into the Gullet.

What the *Gargareon* or Uvula is.

The ſite and manifold uſe thereof.

The diſcommodities that enſue the loſs of the Uvula.

What the *Pharinx* and *Fauces* are.

CHAP. XV.

Of the Larinx, *or Throttle.*

FIrſt we muſt ſhew what is meant by the *Larinx* and Throttle, then proſecute the other conditions of it after our accuſtomed manner. Therefore by the *Larinx* we underſtand nothing elſe in this place than the Head and extremity of the rough Artery, or Weazon, which comes nearer to griſly ſubſtance, than to any other. The quantity thereof is ſufficiently large, yet

What is meant by the *Larinx*.

The magnitude, figure, and compoſure.

yet diverſe according to the diverſity of bodies. It reſembles in ſhape the head of a *German* pipe. The compoſure of it conſiſts of 18 Muſcles, on each ſide nine, which as they are like in quantity, ſo alſo in ſtrength and action; of three Griſles, Veins, Arteries, and Nerves, as we ſhewed when we ſpoke of the diſtribution of the Veſſels; as alſo of a double Coat, the one external, the other internal, as we ſhewed when we ſpoke of the Weazon.

The deſcription of the three Griſles of the *Larinx*.

Theſe three Griſles are joined together by certain Ligaments and Muſcles; the foremoſt Griſle, which alſo is the greater, is called by the *Greeks* θυρεοειδὴς, in Latin commonly *Scutiformis*, that is ſhield-like, becauſe it reſembles a ſhield. The ſecond, being the hinder and middle in magnitude, wants a Name, wherefore it is called the *innominata*, or nameleſs Griſle. The laſt and leaſt, which notwithſtanding may be parted into two, ſo lies upon the edges of the other, that it reſembles the mouth of an Oil-pot, or a Pitcher, whereupon the *Greeks* call it *Arytenoides*.

Whence the infinite variety of Voices proceed.

Theſe Griſles thus fitted amongſt themſelves utter a diſtinct Voice, by the benefit of the *Epiglottis*, or After-tongne; and alſo of the Muſcles opening and ſhutting, dilating and compreſſing them, whence proceed infinite varieties of Voices. For thus when they are opened and dilated, they yield a heavy or dull ſound; when they are ſhut or drawn together, a quick or ſharp ſound; and to conclude, they make it infinite ways different according to the infinite variety of the dilatation, or conſtriction thereof.

The Muſcles of the *Larinx*.

Therefore, becauſe it was fit theſe Griſles ſhould be moveable, eſpecially the *Arytenoides* and *Thyroides*, Nature hath put to them on

Their number

each ſide nine Muſcles, of which three are common, and ſix proper. The firſt of the common lying hid under the third Muſcle of them that move the bone *Hyoides*, ariſes from the root of the ſame bone, and by an oblique deſcent inſerts it ſelf at the baſis of the ſhield-like Griſle, to dilate it upwards and downwards. The ſecond aſcends obliquely from the inner part of the *Sternon* according to the length of the Weazon (whence it is called *Bronchius*) to the bottom and ſides of the ſame ſhield-like Griſle, that it may open and dilate it with its wings. This Muſcle is ſeen from the firſt original thereof, even a great part of the way ſtraitly to cohere with the third Muſcle of the Bone *Hyoides*; therefore under each of the Muſcles there is a glandulous body ſpred about the fore and upper part of the Weazon, on that place where it applies it ſelf to the Throttle; this body although it reſemble

A notable Hiſtory.

a fleſhy ſubſtance, yet it is a glandule: which being pluckt away by a certain Emperick taking upon him to cure the Kings-evil, cauſed a defect of Voice on one ſide, becauſe he pulled away the recurrent Nerve lying upon the glandule as it goes to the Throttle, as *Galen* reports, *Lib. de Locis Affectis*. The third and laſt ariſes from the parts of the *Vertebraes* of the Neck lying tranſverſly upon the ſides of the Gullet, and ends at the wings and ſides at the ſhield-like Griſle, that it may tie it more ſtraitly to the ſecond Griſle. But theſe three are called common Muſcles, becauſe they take their original from ſome other place than the Throttle, that ſo they may be inſerted into ſome part thereof; for they are called the proper Muſcles which ariſe from the Throttle it ſelf, which we have ſaid to be ſix on each ſide: the firſt of which ariſing from the fore-part of the ſecond Griſle, makes a circle under the baſis of the ſhield-like Griſle; whileſt aſcending obliquely to the baſis thereof, it is afterwards inſerted in a part of it, ſo to ſtrengthen and dilate it. The ſecond in like manner ariſing from the ſecond Griſle, from that place where it adheres to the firſt, it runs obliquely croſſing the firſt to the inner and forepart of the Griſle *Thyroides* near to the baſis thereof, that it may join it to the ſecond. The third from the hind-baſis of the ſecond Griſle aſcends directly to the baſis of the third Griſle *Arytenoides*, that with the ſecond Muſcle it may open and ſhut it. The fourth aſcends from the ſides of the ſecond Griſle, near the original of the ſecond Muſcle, to the ſides of the *Arytenoides*, that with the ſecond Muſcle it may open and ſhut it. The fifth ariſes from the inner middle of the ſhield-griſle, and ends in the fore-part of the *Arytenoides* at the inſertion of the fourth Muſcle, that ſo it may preſs down the ſaid Griſle.

Whence the Muſcles of the Throttle have their Nerves.

The ſixth and laſt aſcends by the hind-baſis of the *Arytenoides* to the fore-baſis of the ſame, to preſs it down. But you muſt note that all ſuch Muſcles as ariſe from below upwards, receive branches from the recurrent, but eſpecially thoſe who open and ſhut the Griſle *Arytenoides*. But the ſite, temper, connexion, and uſe of the Throttle may eaſily be known by that we have ſaid before: Although it be a thing very full of difficulty to ſearch out and demonſtrate all the conditions of the organical parts, by reaſon of the diverſity of their compoſition. Wherefore henceforward concerning the ſubſtance, temper, and other circumſtances of ſuch parts as we ſhall omit, you may have recourſe to thoſe things which we have written in the Demonſtration of the ſimple and ſimilar parts, of which theſe organical are compoſed; as if any ſhould ask, of what temper the *Larinx* is, you ſhall anſwer, of a cold, dry, hot, and moiſt, becauſe it conſiſts both of

The *Epiglottis*, or After-Tongue.

a griſly and fleſhy ſubſtance. He which reckons up all the parts of the Mouth, muſt not omit that griſly and membranous body which ariſes from the roots of the Tongue, which that it might be more quick for motion, that is, whereby it might be more eaſily erected and depreſſed (for thoſe things which are more ſoft do continually ſlide away, but thoſe which are too hard cannot be bended) it was convenient it ſhould be neither too hard, nor too ſoft, that it might be erected whileſt we breath, but depreſſed when we ſwallow. It is a principal inſtrument of the Voice, for it cannot be well articulated unleſs the way were ſtrait. Therefore it ſtraitens that way, and the paſſage of the griſles of the Throttle, but eſpecially the *Arytenoides*; it is always moiſt by a certain Native and Inbred Humidity; wherefore, if it happen to be dried by a Fever, or any other like accident, the Speech is taken away. It is bound on both ſides by the common membrane of the Mouth to the ſides of the *Arytenoides* even to the back-part thereof, that ſo like a Cover it may open and ſhut the orifice of the Throttle, that none of the meat and drink in ſwallowing may

Of potable things ſomewhat always falls upon the Lungs.

fall into the Weazon, in ſuch abundance as may hinder the egreſs and regreſs of the air. For we muſt not think that this body doth ſo cloſely ſhut the orifice of the Throttle, but that ſome ſmall quantity of moiſture always runs down by the inner ſides, as the walls thereof, to moiſten the Lungs; otherwiſe *Eclegmaes* ſhould be of no uſe in the diſeaſes of the Cheſt. And becauſe that this little body is partaker of voluntary motion, therefore according to the opinion of ſome there-

there are four Muſcles beſtowed upon it, two which may open it, and two that ſhut it, on each ſide one. The opening Muſcles deſcend from the root of the bone *Hyoides*, and in their inſertion, growing into one, they are terminated in the root of this body, that is, the *Epiglottis* in the back part thereof. The ſhutting Muſcles (in thoſe Creatures where they are found) ariſe on the inſide between the Coat and Griſle thereof. Truly I could never obſerve and find theſe four Muſcles in a man, though I have diligently and earneſtly ſought for them, but I have always obſerved them in Beaſts. Therefore ſome have boldly affirmed that this little body in ſwallowing lies not upon the orifice of the Throttle, unleſs when it is preſſed down by the heavineſs of ſuch things as are to be ſwallowed; but that at all other times by reaſon of the continual breathing it ſtands upright, the Throttle being open. There remain as yet to be conſidered, two ſmall boſoms or cavities, or rather fiſſures which Nature hath hollowed in the very Throttle under the *Epiglottis*, on each ſide one, that if by chance any of the meat or drink ſhould fall, or ſlip aſide in the *Larinx*, it might be there ſtaid and retained. Beſide that, the Air too violently entering, ſhould be in ſome ſort broken by theſe clifts or chinks, no otherwiſe then the bloud and ſpirit entering into the heart through the *Auriculæ*, or Ears thereof.

The Muſcles of the *Epiglottis*.

The uſe of the cavities or fiſſures of the Throttle.

CHAP. XVI.

Of the Neck and the parts thereof.

FIrſt we will define what the Neck is, then proſecute the parts thereof, as well proper as common, eſpecially thoſe of which we have not as yet treated. For it were ſuperfluous to ſpeak any more of the Skin, the fleſhy Pannicle, the Veins, Arteries, Nerves, Gullet, Weazon and Muſcles aſcending and deſcending to the parts into which they are inſerted alongſt the Neck; wherefore you muſt not expect, that we ſhould ſay any thing of the Neck, more than to deſcribe the *Vertebræ* or Rack-bones, being the proper parts thereof, and the Ligaments, as well thoſe proper to the Neck, as thoſe which it hath in common with the head; and laſtly, the Muſcles, as well thoſe it hath in common with the Head and Cheſt, as thoſe of its own. Therefore the Neck is nothing elſe than a part of the Head, which is contained between the Nowl-bone and the firſt *Vertebra* of the back. First in the Neck, the *Vertebraes* muſt be conſidered, and we muſt ſhew what they have proper and peculiar, and what common amongſt themſelves, that we may the more eaſily ſhew the original and inſertion of the Muſcles growing out of them and ending in them. The Neck conſiſts of ſeven *Vertebræ*, or Rack-bones; in which you muſt conſider their proper body; and then the holes by which the Spinal-marrow paſſes; thirdly, the *Apophyſes* or proceſſes of the *Vertebra*; fourthly, the holes through which the Nerves are diſſeminated into other parts from the Spinal marrow, and beſides the perforations of the tranſverſe productions by which the Veins and Arteries, which we call *Cervicales*, aſcend alongſt the Neck; and laſtly, the connexion of theſe ſame *Vertebræ*, or Rack-bones. For the firſt, By the body of the *Vertebra*, we underſtand the fore-part thereof upon which the Gullet lies. For the hole, that is not always the largeſt in thoſe *Vertebræ* which are nigheſt the Head; but it is always encompaſſed with the body of the *Vertebræ*, and beſides with three ſorts of proceſſes, except in the firſt Rack-bone, that is right, tranſverſe and oblique. By right, we underſtand thoſe extuberancies in the Rack-bones of the Neck which are hollowed directly in the upper part of them, and riſe up creſted on each ſide to ſuſtain and receive the baſis of the Rack-bone which is ſet upon it. By the oblique proceſſes, we underſtand the bunchings out by which theſe Rack-bones are mutually knit together by *Ginglymos*; theſe are ſeated between the tranſverſe proceſſes. By the tranſverſe, we underſtand the protuberations next the body, which divide the *Vertebra* or Rack-bone in a ſtraight line. Theſe proceſſes are perforated, that they may give way to the before deſcribed Veins and Arteries, which entering the Spinal marrow by the holes of the Nerves nouriſh the Rack-bones and parts belonging to them. Beſides, you muſt note, that the perforations of the Rack-bones of the Neck, by which the Nerves proceed from the Spinal marrow to the outward parts, are under the tranſverſe proceſs, that is growing or made by the upper and lower *Vertebra*, contrary to all other which are in the reſt of the Rack-bones. For the connexion of the Rack-bone, you muſt know, that all the *Vertebræ* of the Spine have ſix connexions, two in their own bodies, and four in their oblique proceſſes. By the two firſt connexions they are ſo mutually articulated in their own bodies, that each are joined with other both above and below. But by the four other by their oblique aſcendent and deſcendent proceſſes on each ſide two, they are ſo mutually inarticulate, that as the fourth Rack-bone of the Neck by its oblique aſcendent proceſſes, is received of the deſcendent proceſſes of the third Rack-bone, ſo it receives the oblique aſcendent proceſſes of the firſt, by its oblique deſcendents, for always the oblique aſcendents are received, and the deſcendents receive. Yet we muſt except the firſt Rack-bone of the Neck which is contained with four connexions by his lower oblique proceſſes, and by its upper by which it receives the oblique proceſſes of the Nowl-bone, and of the ſecond Rack-bone. The ſecond *Vertebra*, or Rack-bone, muſt alſo be excepted, which is holden by five connexions, that is to ſay, four by its oblique proceſſes, and the fifth by its own body, by which it is knit to the body of the third *Vertebra*. But we muſt note, that whereas Nature hath not given a Spine to the firſt Rack-bone, yet it hath given it a certain bunch or extuberancy in ſtead thereof; in like manner, ſeeing it makes no common paſſage with the ſecond *Vertebra*, for the paſſing forth of the Nerve, it is perforated at its ſides of the body, and it is made very thin on the fore-ſide, as if it were without body, that it might receive the fore-proceſs raiſed in the upper body of the ſecond Rack-bone, which *Hippocrates* calls the Tooth, to which the principal Ligament of the Head is faſtned, which deſcends within from the hind-part of the Head under the *Apophyſes Clinoides*, or proceſſes of the Wedge-bone.

What the Neck is.

What to be conſidered in the *Vertebræ* of the Neck.

Which be the right proceſſes of the *Vertebræ*.

Which the Oblique.

Which the Tranſverſe.

The connexions of the *Vertebræ* of the Neck.

The Proceſs called the Tooth.

And

By what articulation the head is bended backwards and forwards.

And by this articulation the head is bended forwards and backwards, as it is moved to the ſides by the articulation of the firſt Rack-bone with the ſecond. That proceſs is bound by two ligaments, the firſt of which being greater and broader is external, comprehending in the compaſs thereof all the upper articulation, aſcending from the Rack-bones to the Head, or rather deſcending from the Head to them, as any other Ligament going from one bone to another. The other is the ſtronger, and alſo encompaſſes the articulation mixing it ſelf with the Griſle, which by its interpoſition binds together all the Rack-bones, the firſt excepted, as you may ſee in pulling aſunder the Rack-bones of a Swine; and the whole Spine, or Rack-bone is tied together, and compoſed throughout with ſuch Ligaments.

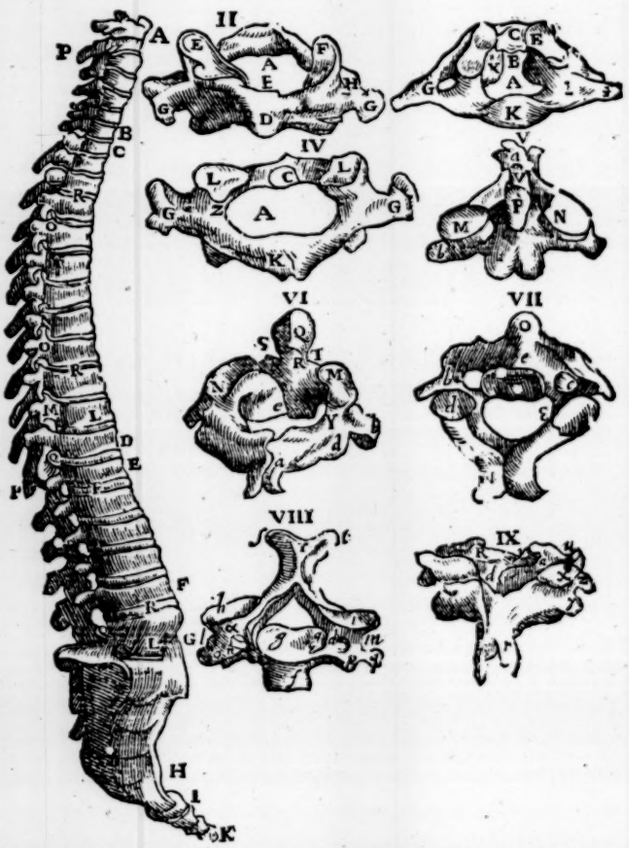
FIG. 1



The *Vertebræ* of the Holy-bone.

The Holy-bone is compoſed of four *Vertebræ* (or rather of five or ſix, as in the Figure above) beſides the Rump-bone, it receives, and holds faſt the *Oſſa Ilium*, or Hanch-bones, and is as a Baſis to all the Rack-bones placed above it, whereby it comes to paſs that the Rack-bones from the Head to the Holy-bone grow ſtill thicker, becauſe that which ſupports ought to be bigger than that which is ſupported. There is a certain moiſture, tough and fatty, put between the Rack-bones, as alſo in other joints to make them glib and ſlippery, that ſo they may the better move. Whileſt this motion is made, the Rack-bones part one from another.

The

The commodities or uſes of the Spine are ſaid to be four. The firſt is, That it is as it were, the ſeat and foundation of the compoſure and conſtruction of the whole body, as the Carcaſs is in a Ship. The ſecond, That it is a way or paſſage for the marrow. The third is, Becauſe it contains and preſerves the ſame. The fourth is, That it ſerves for a Wall or Bulwark to the entrails, which lie and reſt upon it on the inſide. And, becauſe we have fallen into mention of Ligaments, it will not be amiſs to inſert in this place that which ought to be known of them. Firſt therefore, we will declare what a Ligament is, then explain the divers acceptions thereof; and laſtly, proſecute their differences. The manifold uſes of the Back-bone.

Therefore a Ligament is nothing elſe than a ſimple part of Mans Body, next to a Bone and Griſle the moſt terreſtrial, and which moſt uſually ariſes from the one or other of them either mediately or immediately, and in the like manner ends in one of them, or in a Muſcle, or in ſome other part; whereby it comes to paſs, that a Ligament is without bloud, dry, hard, cold, and without ſenſe, like the parts from whence it ariſes, although it reſemble a Nerve in whiteneſs and conſiſtence, but that it is ſomewhat harder. What a Ligament is. Why it is without ſenſe.

A Ligament is taken either generally, or more particularly; in general, for every part of the body, which ties one part to another, in which ſenſe the skin may be called a Ligament, becauſe it contains all the inner parts in one union. So the *Peritonæum* comprehending all the natural parts, and binding them to the Back-bone: ſo the Membrane inveſting the Ribs, (that is, the *Pleura*) containing all the Vital parts; thus the Membranes of the Brain, the Nerves, Veins, Arteries, Muſcles, Membranes; and laſtly, all ſuch parts of the Body which bind together, and contain other, may be called Ligaments, becauſe they bind one part to another; as the Nerves annex the whole Body to the Brain, the Arteries faſten it to the Heart, and the Veins to the Liver. But to conclude, the name of a Ligament more particularly taken, ſignifies that part of the Body which we have deſcribed a little before. What parts may be called Ligaments in a general ſignification.

The differences of Ligaments are many, for ſome are membranous and thin; others broad, otherſome thick and round, ſome hard, ſome ſoft, ſome great, ſome little, ſome wholly griſly, others of a middle conſiſtence between a Bone and Griſle, according to the nature of the motion of the parts which they bind together in quickneſs, vehemency, and ſlowneſs. We will ſhew the other differences of Ligaments, as they ſhall preſent themſelves in diſſection. The differences of Ligaments properly ſo called.

CHAP. XVII.

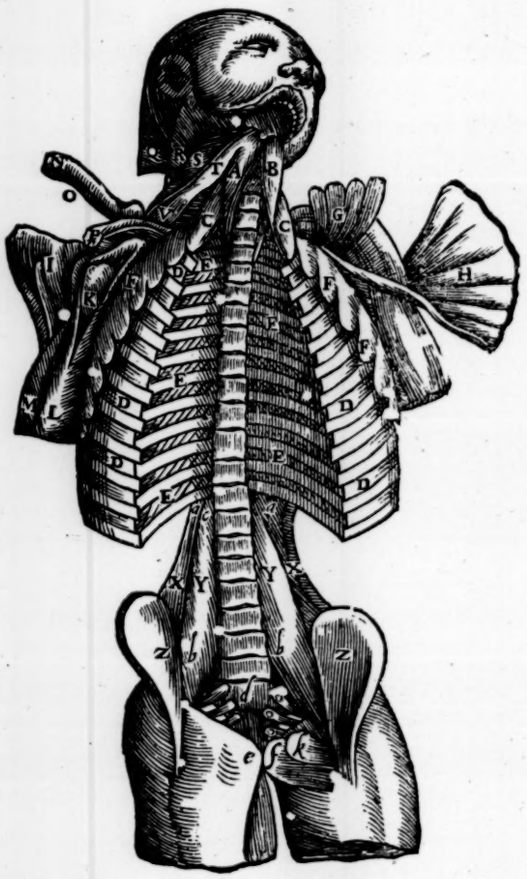
Of the Muſcles of the Neck.

THe Muſcles of the Neck, as well proper as common, are in number twenty, or elſe twenty two, that is, ten or eleven on each ſide; of which, ſeven onely move the Head, or the firſt *Vertebra* with the Head; the other three or four, the neck it ſelf. Of the ſeven which move the Head, and with the head the firſt *Vertebra*, ſome extend and erect it, others bend and decline it, others move it obliquely, but all of them together in a ſucceſſive motion move it circularly: and the like judgment may be of the Muſcles of the Neck. Their number

But before I can come to the deſcription of their original and inſertion, I muſt admoniſh thee, that the two Muſcles of the Shoulder-blade muſt firſt be taken away by diſſection; that is, the *Trapezius* or Table-muſcle, and the *Rhomboides*, or Square-muſcle; whoſe original and inſertion that we may the better demonſtrate, (or rather the action by which we ſeek that original and inſertion) they muſt be pulled up, beginning at their inſertion, which is at the Shoulder-blade (as ſhall be ſhewed in the proper place, turning them up towards their original, that is, to the Spine. Beſides, the leſs *Rhomboides*, the hinder and upper (called alſo the *Dentatus* or toothed-Muſcle) muſt be raiſed from its oriignal, which is at the three lower Rack-bones of the Neck and the firſt of the Back, and turned up to its inſertion, which is at three ſpaces of the lower ribs nigh to the hind and upper angle of the Shoulder-blade, as ſhall be ſhewed in fit place hereafter. Theſe Muſcles thus raiſed up, the four Muſcles which erect and extend the Head, muſt be taken away, and then thoſe two which move it obliquely; and laſtly, one which bends or declines: for thus Anatomical order requires. Yet, if you think good, you may, not hurting the other, firſt of all cut away that which is called the *Maſtoides*, which declines or bends the Head. For theſe four which lift up and extend the Head, the firſt from the figure of the Spleen is called the *Splenius*, it aſcends from the five upper ſpines of the Back, and the four lower of the Neck, and is obliquely inſerted at the back-part of the Head, and the Mamillary proceſs, whence you may raiſe it towards its original. The ſecond by reaſon of its compoſure is called *Complexus*; this paſſing from the third, fourth, and fifth tranſverſe proceſs of the Back, and often from the firſt of the Neck: aſcends directly to the back-part of the Head, encompaſſing the lower and ſide-part of the Neck, you may eaſily take it up, if you begin at the ſpine, and ſo go forward to the tranſverſe proceſſes and mamillary proceſſes of the Nowl-bone. This *Complexus* may be divided into two or three Muſcles, but that with ſome difficulty, by reaſon of its folded texture. The third and fourth, which be two of the eight little Muſcles, being four on each ſide, do aſcend ſomewhat obliquely, the firſt truly from the whole ſide of the ſecond *Vertebra*. The ſecond from the whole ſide of the proceſs of the firſt *Vertebra*, which it hath in ſtead of a Spine; they aſcend to the back-part of the Head, juſt againſt the Spine; theſe two Muſcles by the conſent of all Anatomiſts, are called right or direct Muſcles, onely moving the head, theſe truly muſt not be plucked from the places of their original, nor inſertion, but onely bound by a ſtring put under them, that ſo they may be the more eaſily ſhewed. On each ſide follow two oblique Muſcles, one whereof onely moves the Head; the other primarily the firſt *Vertebra*, but ſecondarily and by accident the Head it ſelf. For the firſt, contrary to the The *Splenius*. The *Complexus*. The *Recti*, or two right Muſcles.

opinion of ſome, it ariſes from the tranſverſe proceſs of the firſt Rack-bone, and then is inſerted, above the inſertion of the firſt right Muſcle: the which in like manner you muſt lift up, by ſomething put underneath it, but not ſeparate it. The other entering forth of the Spine of the ſecond *Vertebra*, is inſerted at the proceſs of the firſt, contrary to the original of the precedent, although ſome think otherwiſe. It will be convenient in the like manner, onely to lift up this with a ſtring, and not pluck him from its place, that ſo you may ſee how all theſe make a perfect triangle. The action of this Muſcle is contrary to the action of the precedent, as the contrariety of its original and inſertion ſhew.

The Fourth Figure of the Muſcles. This Figure ſheweth the cavities of the middle and lower Bellies, the Bowels being taken out, but moſt part of the Bones and Muſcles remaining.



AB *The firſt Muſcle bending the neck, called* Longus.
C C *The ſecond bender of the neck, called* Scalenus.
DDDD *The outward* intercoſtal *Muſcles.*
EEEE *The inner* intercoſtal *Muſcles.*
FFF *The ſecond Muſcle of the Cheſt, called* ſerratus major.
G *The firſt Muſcle of the Shoulder-blade, called* ſerratus minor, *ſeparated from his original.*
H *The firſt Muſcle of the Arm called* Pectoralis, *ſeparated from his original.*
I *The ſecond Muſcle of the Arm, called* Deltoides.
K *The Bone of the Arm without fleſh.*
L *The firſt Muſcle of the Cubit, called* Biceps.
M *The ſecond Muſcle of the Cubit called* Brachicus.
N *The Clavicle, or Collar-bone, bent backward.*
O *The firſt Muſcle of the Cheſt, called* Subclavius.
P *The upper proceſs of the Shoulder-blade.*
Q *The firſt Muſcle of the Head, called* obliquus inferior.
R *The ſecond Muſcle of the Head, called* Complexus.
S *The fourth Muſcle of the Shoulder-blade, called* Levator.
TV *The two Bellies of the fourth Muſcle of the bone* Hyois. XX aa *The fifth Muſcle of the back whoſe original is at* aa. YY bb cc *The ſixth Muſcle of the Thigh, called* Pſoæ, *whoſe original is at* cc, *and tendon at* bb. ZZ *The ſeventh Muſcle of the thigh.* d *The Holy-bone.* ooo *The holes of the Holy-bone, out of which the Nerves do iſſue.* e *A portion of the fifth Muſcle of the thigh ariſing frrm the Share-bone.* f *The Share-bone bared.* k *The nineth Muſcle of the thigh or the firſt* circumactor.

Which may be truly called the proper Muſcle of the Neck.

Wherefore when the firſt oblique moves the Head obliquely forward, the ſecond pulls it back by the firſt *Vertebra*; this, with his aſſociate of the other ſide, may be truly termed the proper Muſcles of the Neck, becauſe they belong to no other part; whereas it is contrary in other Muſcles. But we muſt note, that the Head (according to *Galen*'s opinion) hath two motions, one directly forwards and backwards, as appears in beckning it forwards, and caſting it backwards; the other circular.

The two motions of the Head.

The firſt in *Galen*'s opinion is performed by the firſt *Vertebra* moved upon the ſecond; the ſecond by the Head moved upon the firſt *Vertebra*; for which he is reproved by the later Anatomiſts, who teach that the Head cannot be turned round, or circularly upon the firſt *Vertebra*, without putting it out of joint.

The *Maſtoidtus.*

For the laſt which bends the Head, it aſcends from the upper and ſide-part of the *Sternon*, and the next part of the clavicle, obliquely to the *Apophyſis Maſtoides*, or mamillary proceſs of the hind part of the Head, whence it is called the *Maſtoideus*. You may divide this by reaſon of its manifold original rather into two, than into three Muſcles. But it had been better that the Head might have been moved every way, equally backwards and to the right and left ſides; but thus it would often have been ſtrained to our great damage and danger of life; neither could there have been ſuch facility of motion without a looſneſs of the joint. Therefore Nature had rather beſtow upon the Head an harmleſs faculty of fewer motions, than one furniſhed with more variety, but with a great deal more uncertainty and danger. Wherefore it hath made this juncture not lax or looſe, but ſtiff and ſtrong.

After

After the ſhewing of theſe Muſcles, we muſt come to three or four of the Neck, of which number, two (which ſome reduce to one) extend, another bends, and the laſt moves ſide ways; and all of them with a motion ſucceeding each other turn it about, as we ſaid of the Muſcles of the Head. The firſt of theſe which extend, taking its original from the ſix tranſverſe proceſſes of the ſix upper Rack-bones of the Back or rather from the root of the oblique, aſcends directly to the Spine of the ſecond *Vertebra* of the Neck, and the oblique proceſs thereof; ſome ſome call it the *Tranſverſarius*; that is, the tranſverſe Muſcle. This, if you deſire to take it away, it is beſt firſt to ſeparate it from the Spine, then to turn it upwards to the tranſverſe proceſſes; unleſs you had rather draw it a little from its Partner and Companion, in that place where their originals are diſtinct, ſeeing it is the laſt and next to the Bones. The *Tranſverſarius.*

The Fifth Figure of the Muſcles. In which ſome Muſcles of the Head, Cheſt, Arms, and Shoulder-blade are deſcribed.

I *The proceſs of the Shoulder-blade, called the top of the Shoulder.*

O *The fourth Muſcle of the Arm, or* the greater round Muſcle, *to which* Fallopius *his right Muſcle is adjoined, which ſome call the* leſſer round Muſcle.

Q Q *The ſixth Muſcle of the Arm, or the upper* Blade-rider.

X *The ſecond Muſcle of the ſhoulder-blade, or the* Levator, *or Heaver.*

Z *The ſecond Muſcle of the Cheſt, or the* greater Saw-muſcle.

Y *The fifth Muſcle of the Cheſt, or Muſcle called* Sacro-lumbus.

α β *His place wherein he cleaveth faſt to the longeſt muſcle of the back.*

γ γ *The tendons of the Muſcle obliquely inſerted into the Ribs.*

Δ Δ *The firſt pair of the Muſcles of the head, or the ſplinters.*

Ch 8 9 *Their length, whoſe beginning is at* 8, *and inſertion at* 9.

10 11 *The ſides of this Muſcle.*

12 *That diſtance where they depart one from the other.*

13 *The two Muſcles called* Complexi, *near their inſertion.*

Φ *The ſecond Muſcle of the back, or the* Longeſt *Muſcle.*

Ω *The fourth Muſcle of the Back, or the* Semi-ſpinatus.

δ *The Shoulder-blade bare.*

ρ *A part of the tranſverſe Muſcle of the* Abdomen.

Marvel not if you find not this diſtinction of their original ſo plain and manifeſt, for it is commonly obſcure. For the Muſcle *Spinatus*, as it moſt commonly comes to paſs, ariſing from the roots of the ſeven upper Spines of the Back, and the laſt of the neck, is inſerted into other Spines of the Neck, ſo that it might eaſily be confounded with the former by *Galen*. The third bends the Neck, and ariſing within from the Body of the five upper *Vertebræ* of the Back (though with a very obſcure original, ſpecially in lean Bodies) it aſcends under the Gullet alongſt the Neck, even to the Nowl-bone, into whoſe inner part it is obſcurely inſerted. Wherefore it is likely that it helps not onely to bend the Neck but alſo the Head. This Muſcle is made of oblique Fibers proceeding from the body of the *Vertebræ*, all the way it paſſes to the tranſverſe proceſſes of the other *Vertebra*. But it ſeems with its co-partner which is oppoſite to it, to make a certain hollow path upon the bodies of the *Vertebræ*, to the Gullet, and it is called the Long Muſcle. The fourth and laſt, which we ſaid moves the Neck to one ſide, is called *Scalenus* from the figure thereof; it aſcends from the hinder and upper part of the firſt rib of the Cheſt, inſerting it ſelf into all the tranſverſe proceſſes of the Neck by its Fibers, which as it were for the ſame purpoſe, it hath ſufficiently long, that it may faſten it ſelf from the furtheſt and loweſt proceſs of the Neck into the firſt or higheſt thereof. The paſſage of the Nerves through this to the Arm makes this Muſcle ſeem double, or divided into two. For The *Spinatus.* The *Longus.* The *Scalenus.*

the Veins and Arteries pertaining to the Neck, they have been declared in the proper Chapters of the diſtribution of the Veſſels; it remains that you note, All theſe Muſcles receive Nerves from the *Vertebræ*, whence they ariſe.

ε *His upper end under the fourth Muſcle of the Neck.*

CHAP. XVIII.

Of the Muſcles of the Cheſt and Loins.

WE muſt now ſpeak of the Muſcles both of the Cheſt which ſerve for reſpiration, as alſo of the Loins. But firſt we muſt know that the hind part of the Cheſt, called the *Metaphrenum*, or Back, conſiſts of twelve *Vertebræ*, the Loins of five, all which differ not from the *Vertebræ* of the Neck, but that they are thicker in their bodies than theſe of the Neck; neither are they leſſer in holes, neither have they their tranſverſe proceſſes perforated or parted in two, as the Rack-bones of the Neck have. Beſides, each of theſe Rack-bones alone by it ſelf, on each ſide in the lower part thereof, makes a hole, through which a Nerve hath paſſage from the Spinal-marrow to the adjacent parts; when on the contrary in the *Vertebræ* of the Neck, ſuch holes or paſſages are not made, but by meeting together of two of them. In what the *Vertebræ* of the Neck and Loins agree and diſagree.

Concerning the proceſſes of the Rack-bones of the Cheſt, whether tranſverſe, right or oblique they differ nothing from theſe of the Neck (I mean even to the tenth) but that the tranſverſe ſeeing they are not perforated, as we ſaid before, do as it were ſuſtain the Ribs, being ſtraitly bound to them with ſtrong Ligaments both proper and common; but after the tenth *Vertebra* of the Back, the two other of the Back, and all thoſe of the Loins are different, not onely from thoſe of the Neck, but alſo from the ten firſt of the Back, by reaſon of their oblique proceſſes, becauſe from the eleventh (which is received, as well by that which is above it, as that under it, for the ſtrength of the whole Back, and the eaſier bending thereof without fear of fracture or diſlocation) the above-mentioned proceſſes of the lower Rack-bones, which were wont to receive, are received; as, on the contrary, they receive, which are wont to be received. They differ beſides from all the fore-mentioned, by reaſon of their Spines, becauſe from the eleventh they by little and little do look upwards, contrary to the former.

But if any ask how the tenth *Vertebra* of the Back may be termed the midſt of the Spine, ſeeing the whole Spine conſiſts of twenty four *Vertebræ?* He may know that this may be true, as thus; If the ſix Bones of the Holy-bone, and the fourth of the Rump (being more griſly than bony) be numbred amongſt the Bones of the Spine; for then from the ſetting on of the head to the eleventh Rack-bone of the Back are ſeventeen in number, and ſo many from thence downwards. How the tenth *Vertebra* of the Back, may be ſaid to be the middle of the Spine.

But let us return to the Muſcles of the Cheſt ſerving for reſpiration. Firſt you muſt know that theſe Muſcles are fourſcore and nine, that is, on each ſide forty four, alike in ſtrength, thickneſs, ſite, and action; and one beſides in the midſt which they call the *Diaphragma*, or Midriff. Of theſe forty four, there are twenty two which dilate the Cheſt in drawing in the breath; that is, the *Sub-clavius*, The number of the Muſcles of the Cheſt. The Muſcles dilating the Cheſt.

clavius, the *Dentatus*, or *Serratus major* in the opinion of ſome, both the *Rhomboides* or *Serrati poſtici*; the oblique aſcendent of the lower Belly, the eleven *Intercoſtales*, and the ſix *Intercartilaginei externi*.

The Muſcles contracting the Cheſt.

On the contrary, as many contract the Breſt in expiration; to wit, the *Sacrolumbus*, the oblique deſcendent, the Right and Tranſverſe of the lower Belly, the inner Triangular, the ſix *Intercartilaginei*, and the eleven inner *Intercoſtales*. Of theſe twenty two dilating the cheſt, the firſt from the ſite is called the *Subclavius*, for it deſcends obliquely from the inner and fore-part of the *Clavicula* or Coller-bone, into the Griſle of the firſt Rib, even to the *Sternon*, and dilates it. The ſecond is the *Serratus major*, the greater Saw-muſcle ariſing according to the opinion of ſome from the whole *Baſis* of the Shoulder-blade on the inſide, and it is tranſverſly inſerted into the nine upper Ribs, producing certain toothed, or Saw-like proceſſes, running further to the Bones of the Rib than to the Spaces between them, or Intercoſtal Muſcles, whereupon it hath the name of the Saw-muſcle; yet ſome have referred this Muſcle to them of the Shoulder-blade. The third deſcends from the three lower Spines of the Neck, and the firſt of the Back, by means of a membranous and moſt thin ligament, into the three or four upper Ribs, running further into their Spaces or Intercoſtal Muſcles, than into the Ribs themſelves, whereupon it is called *Serratus poſterior & ſuperior*, that is, the hinder Saw-muſcle. The fourth in like manner aſcends by means of a membranous and thin ligament from the three upper Spines of the Loins, and the two laſt of the Cheſt, or Back, into three or four of the lower, or laſt of the Baſtard-ribs, ſent forth further into them or their Bones, than into the Intercoſtal Muſcles poſſeſſing the ſpaces between them, wherefore it is called *Serratus poſterior & inferior*, the hinder and lower Saw-muſcle. Moreover theſe two laſt Muſcles have been called by a common name from their figure the *Rhomboides*, that is, the ſquare Muſcles. The fifth which we ſaid was the aſcendent of the *Epigaſtrium*, hath already been ſufficiently deſcribed in his place. The eleven *Intercoſtales externi*, or external Intercoſtal muſcles deſcend obliquely from the back part of the lower ſide of the upper Rib, into the fore part of the upper ſide of the Rib lying next under, after a quite contrary manner to the ſix *Intercartilaginei*, who having like original and inſertion amongſt the Griſles, as the Intercoſtal amongſt the Ribs, deſcend obliquely from the fore-part backwards. And thus much of the Muſcles dilating the Cheſt in inſpiration.

The *Subclavius* is the firſt of the Muſcles dilating the Cheſt.

Serratus major.

Serratus poſterior and *Superior.*

The oblique aſcendent of the lower Belly.

The eleven *Intercoſtales externi.*

Six Intercartilaginei.

But the firſt of the other Muſcles, being as many in number, which contract the Cheſt in expiration, ariſing from the Holy-bone, and the oblique proceſſes of the Loins, aſcends (firmly and confuſedly adhering with the *Muſculus ſacer*, or Holy-muſcle, which we ſhall deſcribe hereafter) to the roots of the twelve Ribs, imparting in the aſcent a ſmall tendon to each of them, by which it draws theſe Ribs towards the tranſverſe proceſſes; and by reaſon of its original, it is called *Sacrolumbus*, that is, the Holy-loin-Muſcle.

The *Sacrolumbus* the firſt of thoſe which contract the Cheſt.

The oblique deſcendent, the right and tranſverſe of the *Epigaſtrium.*

The ſecond, third, and fourth, which we ſaid were the oblique deſcendent, right, and tranſverſe of the *Epigaſtrium*, have been formerly deſcribed in their place.

Triangulus Muſculus.

But, by the way, you muſt note that theſe three Muſcles of the *Epigaſtrium*, help expiration rather by accident than of themſelves, to wit, by driving back the Midriff towards the Lungs by the entrails, which alſo they force upwards, by drawing the parts into which they are inſerted towards their original. The fifth, which we call the *Triangulus*, or Triangular, may be called the *Compreſſor* of the Griſles, which proceeding from the inner-ſides of the *Sternon*, goes to all the Griſles of the true Ribs; this is more apparent under the *Sternon* in Beaſts than in Men, though it be not very obſcure in them neither.

Intercoſtales interni.

For the internal Intercoſtal Muſcles, in my judgment, they ariſe, from the lower ſides of the upper Rib, and deſcending obliquely from the fore-part backwards, are inſerted into the upper ſide of the rib next under it; ſo that they may follow the production of the Fibers of the external *Intercartilaginei*; as the ſix Internal *Intercartilaginei*, follow the ſite of the external Intercoſtal, proceeding from behind forwards; wherefore as well the Intercoſtal, as the *Intercartilaginei*, every where interſect each other, after the ſimilitude of the Letter X. I know ſome have written that the Internal Muſcles (whether Intercoſtal or *Intercartilaginei*) aſcend from the upper ſide of the lower Rib, forwards and backwards.

Intercartilaginei interni.

Muſcles always receive their Nerves in their heads.

But if this were true, it would follow, that theſe Muſcles admitted their Nerves in their Tail, and not in their Head, ſeeing the Nerve always goes under the Rib, and not above it,

The Midriff.

The laſt Muſcle of the Cheſt, that is, the *Diaphragma*, or Midriff, is ſufficiently deſcribed before; wherefore it remains, we deſcribe the Muſcles of the Loins. Theſe are ſix in number, on each ſide three, equal in thickneſs, ſtrength, and ſituation; one of theſe bends, and the other two extend the Loins; it is called by reaſon of the figure, the *Triangulus* or Triangular, which bends the Loins; it aſcends from a great part of the hind-ſide of the haunch-bone into the tranſverſe proceſſes of the loins, and the laſt of the Cheſt, on the in-ſide, for which cauſe it is made of Fibers, ſhort, long, and indifferent, anſwering to the nearneſs or diſtance of the ſaid proceſſes. The firſt of the extenders is called *Semi-ſpinatus*, becauſe even to the middle of its body it takes the original from the Spines of the Holy-bones and Loins, this with its oblique Fibers aſcends from all the ſaid Spines to the tranſverſe proceſſes, as well of the Loins as Cheſt. The other is called *Sacer*, the Holy-muſcle, becauſe it takes its original from the Holy-bone, or the ſides thereof; it aſcends with its oblique Fibers to the Spines of the Loins, and of the eleven lower Rack-bones of the Cheſt.

The Muſcles of the Loins. They are three pair.

Triangulus.

Semi-ſpinatus.

Sacer.

CHAP. XIX.

Of the Muſcles of the Shoulder-blade.

NOw we muſt deſcribe the Muſcles of the extreme parts, and firſt of the Arm, taking our beginning from thoſe of the Shoulder-blade. But firſt, that we may the better underſtand their deſcription, we muſt obſerve the nature and condition of the Shoulder-blade.

There-

Therefore the Blade-bone on that part which lies next unto the Ribs is ſomewhat hollowed; wherefore on the other ſide it ſomewhat bunches out. It hath two Ribs, one above, another below; by the upper, is meant nothing elſe than a border or right line, which looking towards the Temples is extended from the exterior angle thereof under the Collar-bone even to the proceſs *Coracoides* which this Rib produces in the end thereof: By the lower, the under-ſide which lies towards the lower belly and the ſhort Ribs. The deſcription of the Blade bone, or Shoulder-blade.

Beſides, in this Shoulder-blade we obſerve the Baſis, Head, and Spine. By the *Baſis* we underſtand the broader part of the Shoulder-blade, which looks towards the Back-bone. By the Head we underſtand the narrower part thereof, in which it receives the head of the Arm in a cavity, indifferently hollow, which it produces both by it ſelf, as alſo by certain Griſles which there faſtned, encompaſs that cavity. This kind of cavity is called *Glene*. The Baſis of the Blades. The head of the Shoulder-blade.

This receives and contains the Bone of the Arm by a certain ſtrong ligament encompaſſing and ſtrengthening the Joint, which kind of ligament is common to all other Joints: this ligament ariſes from the bottom of the cavity of the Shoulder-blade, and circularly encompaſſes the whole Joint, faſtning it ſelf to the head of the Arm; there are alſo other ligaments beſide this, which encompaſs and ſtrengthen this articulation. By the Spine is meant a proceſs, which ariſing by little and little upon the gibbous part of the blade, from the *baſis* thereof where it was low and depreſt, becomes higher until it ends in the *Acromion* or upper part thereof. Nature hath made two productions in this Bone (that is to ſay, the *Acromion* from the Spine, and the *Coracoides* from the upper ſide) for the ſtrengthening of the articulation of the Arm and Shoulder-blade, that is, leſt the Arm ſhould be eaſily ſtrained upward or forwards; beſides, it is faſtned to the clavicle by the proceſs *Acromion*. The Spine of the Blade. The proceſſes. *Acromion* and *Coracoides*. The Muſcles of the Shoulder-blade.

The Muſcles which move the Shoulder-blade are ſix in number, of which four are proper, and two common. The firſt of the four proper ſeated in the fore-part, aſcends from the bones of five or ſix of the upper Ribs to the *Coracoides*, which it draws forwards, and is called *Serratus minor*, *i.e.* the leſſer Saw-muſcle; which that you may plainly ſhew, it is fit you pull the pectoral Muſcle from the Collar-bone, almoſt to the middle of the *Sternon*. The other firſt oppoſite againſt it is placed on the fore-ſide, and draws its original from the three lower ſpines of the Neck, and the three upper of the Cheſt, from whence it extends it ſelf, and ends into all the griſly *baſis* of the Shoulder-blade, drawing it backwards; It is called the *Rhomboides*. The third from its Action is called the *Levator*, or the Heaver, or lifter up, ſeated in the upper part, it deſcends from the tranſverſe proceſſes of the four firſt *Vertebræ* of the Neck into the upper angle and ſpine of the Blade. The fourth called *Trapezius* or the Table-muſcle, is ſeated in the back-part, and is membranous at the original, but preſently becomes fleſhy: it ariſes from almoſt all the back part of the head, from all the ſpines of the Neck, and the eight upper *Vertebræ* of the Cheſt, and then is inſerted by his nervous part, almoſt into the whole baſis of the blade, extending it ſelf above the Muſcle thereof, even to the midſt of the Spine, where being fleſhy it is inſerted even to the *Acromion*, the upper part of the Clavicle, and in ſome ſort to the upper rib. This Muſcle hath a three-fold action, by reaſon of its triple original. The firſt is to draw the Shoulder-blade towards its original, that is, to the Nowl and Spine of the Neck; the other is to draw it towards the Back, becauſe of the contraction of the middle or tranſverſe Fibers, which lead it directly thither; and the other to draw it downwards by reaſon of the original it hath from the fifth, ſixth, ſeventh, and eighth Spine of the *Vertebræ* of the Cheſt. *Serratus minor*. *Rhomboides*. *Levator*. *Trapezius*.

But we muſt note that theſe divers actions are not performed by this Muſcle, by the aſſiſtance of one onely Nerve, but by more, which come into it by the Spinal marrow, by the holes of the *Vertebræ* as well of the Neck as the Cheſt, from whence it takes the original. For the two other which are the common Muſcles of the Blade, and Arm, or Shoulder, we will deſcribe them with the Muſcles of the Shoulder, or Arm: for one of theſe which is called the *Latiſſimus*, that is, the broadeſt, aſcends from the Holy-bone to the Shoulder-blade and Arm. *Latiſſimus*.

The other, named the *Pectoralis*, comes from the *Sternon* and Collar-bone to the Shoulder-blade and Arm. *Pectoralis*.

CHAP. XX.

The deſcription of the Hand taken in general.

NOw it befits us to deſcribe in order the Muſcles of the Arm; but firſt we muſt know what it is that we call the Arm. But ſeeing that cannot fitly be underſtood, unleſs we know what the hand is, ſeeing that the Arm is a part of the Hand, therefore firſt we muſt define what a Hand is, and then divide it into its parts. Therefore the hand is taken two manner of ways, that is, generally and ſpecially.

The Hand generally taken, ſignifies all that which is contained from the joining of the Arm to the Shoulder-blade, even to the ends of the fingers. But in particular it ſignifies onely that which is comprehended from the furtheſt bones of the cubit, or the beginning of the wriſt, to the very fingers ends. What is meant by the Hand in general.

Therefore the hand in general is an inſtrument of inſtruments, made for to take up and hold any thing. It is compoſed of three great parts, that is, of the Arm, Cubit, and Hand, vulgarly and properly ſo called; but the hand taken thus in particular is again divided in three other parts, the *Carpus* or *Brachiale*, the Wriſt; the *Metacarpium* or *Poſtbrachiale*, the After-wriſt, and the Fingers: all theſe parts (ſeeing each of them are not onely organical parts, but alſo parts of organical parts) are compoſed of all, or certainly of the moſt of the ſimilar parts; that is, of both the Skins, the fleſhy Pannicle, the fat Veins, Arteries, Nerves, Muſcles, or Fleſh, Coats both common and proper, Bones, Griſles and Ligaments: all which we will deſcribe in their order.

But

The differences of the hand from the ſite thereof.

But firſt I think good to admoniſh you of the differences of the hand taken from the ſite thereof, and theſe differences are ſix in number, the fore, the hind, the internal, the external, the upper and lower ſide, or part thereof.

By the fore, we mean that part which looks directly from the Thumb to the Shoulder; by the hind, we underſtand the part oppoſite to it, which from the little finger looks towards the baſis of the Shoulder-blade. By the inſide, we ſignifie that part which lies next to the ſides of the body, when the Hand retains it natural ſite; by the outſide, the part oppoſite to it. The upper and lower ſide you may know by the very naming thereof.

Why the hand is divided into ſo many Fingers.

The Hand properly ſo called, is divided into five Fingers, that ſo it may hold and take up bodies; of all figure, as round, triangular, ſquare, and the like, and gather up the leaſt bodies with the Fingers ends, as Needles, Pins, and ſuch like.

Why the nails are added to the ſoft fleſh of the Fingers.

Nature hath beſtowed two Hands upon us, that ſo they may help each other, each moving to each ſide. But for the taking up and holding of ſmall bodies, it was fit that the Fingers of their own nature ſoft, ſhould be armed with Nails, that conſiſting of ſoft fleſh and a hard nail, they might ſerve for all actions; for the nail is a ſtay to the ſoft fleſh, which otherwiſe would turn away in meeting with an hard body; the uſe of the Nails is to ſcratch, ſhave, and pull off the skin, to rend, pinch, and pluck aſunder ſmall bodies. They have not bony hardneſs, that ſo they might not break but bend.

Why the nails grow continually.

Yet other Creatures have hard Nails to ſerve them in ſtead of Weapons. Their figure is round, becauſe ſuch a figure is leſs obnoxious to external injuries; and, by reaſon they are ſubject to wearing, they grow continually.

Nature hath placed fleſh on the inner and ſide part of the Fingers, ſo to preſs more ſtraitly the things they once take hold of; ſo, that beholding them cloſe together we can hold Water that it may not run out. The length of the Fingers is unequal, that when they are opened and ſtretched forth, they make as it were, a circular figure; for ſo it comes to paſs, that the hand can hold all bodies, but eſpecially round.

It remains that we proſecute the diſtribution of the Veins, Arteries, and Sinews, which run over all the parts of the Hand taken in general and particular, whereby we may more commodiouſly hereafter handle all the proper parts thereof.

CHAP. XXI.

The diſtribution of the Subclavian Vein, and firſt of the Cephalica *vr* Humeraria.

TWo large Veins deſcend from the Subclavian, the one from the lower ſide, the other from the higher. Yet ſometimes, and moſt uſually, both theſe proceed from the ſame common orifice, as in men of a low ſtature in the Arm. The one of theſe is called the *Axillaris*, the other the *Humeraria* or *Cephalick*; therefore this *Cephalick* paſſing forth of the *Subclavian* runs ſuperficially along the fore-ſide, between the Muſcle *Deltoides*, and the tendon of the pectoral Muſcle, and deſcends in the midſt between the common Coat of the Muſcles and the fleſhy Pannicle, even to the bending of the cubit, where in lean bodies it is plainly to be ſeen, whereas in fat bodies it is hardly to be perceived, being as it were buried in abundance of fat. This Vein having in its deſcent ſent forth ſome ſmall branches, both to the skin, as alſo to certain Muſcles over which it runs, is divided into two, a little above the outward protuberation of the Arm. One of the branches into which it is divided deſcending obliquely to the fore-part of the cubit, a little below the bending of the cubit, it meets and is united with the like branch in the ſame place, as ſhall be ſhewn hereafter.

The Cephalick Vein.

The Median Vein.

How by opening the Median Vein you may draw more or leſs bloud from the Head or Liver.

That which ariſes from this concourſe, is called the Median Vein, becauſe it ariſes from two branches, and is ſeated between them. They uſually open this Median Vein in the diſeaſes of the Head and Liver, which require Phlebotomy; but if it ſhall not be ſufficiently manifeſt, when you judge it muſt be opened, for a general evacuation of the whole body; you may cut one of theſe branches by whoſe concourſe it is made, which you ſhall think the fitter, and becauſe each branch draws from the next parts, according to the ſtraightneſs of the Fibers, rather than from the oppoſite ſide; if you would evacuate the Head and Liver equally by opening either of theſe branches, it is convenient that opening that branch (for example) which comes from the Cephalick, you preſently lay your Thumb upon it, until you ſuppoſe you have drawn a juſt quantity of bloud from the Liver by the *Baſilica* or Liver-vein; which done, you may take off your Thumb and ſuffer the bloud to follow freely, by the open branch of the Cephalick, until you have drawn as much bloud as you ſhall judge requiſite, otherwiſe you will draw it but from one part, to wit, the Head. So you ſhall evacuate it onely from the Liver, if you open the branch which comes from the *Baſilica*, and concurs to the generation of the Median.

Moreover, when there is need to open the *Baſilica*, and it ſhall be no where conſpicuous, the Cephalick or Median being eaſie to be diſcerned at the ſame time, you may in ſtead thereof open the Median, or if it be not to be found, the Cephalick, preſſing but the trunk thereof with your Thumb, as we ſaid before, leſt the Head ſhould be evacuated in ſtead of the Liver. You may do the ſame in the *Baſilica*, if when there ſhall be neceſſity to open the Cephalick, it ſhall not appear. Moſt of thoſe which at this day open a Vein, in ſtead of the Median, open that branch of the *Baſilica* which aſcends together with the Cephalick to make the Median. But you muſt underſtand that the Median deſcends between the two bones of the cubit, even to the end thereof; and then divided into many branches, it is at length ſpent on the back of the hand behind the Thumb, the fore and middle Fingers, or the After-wriſt. Sometimes it runs back into the following branch, and

and then at the Wriſt it departs from it, to be beſtowed upon the fore-mentioned parts. The other branch of the Cephalick, which we may call the fore and outward Cephalick, deſcending directly down to the midſt of the Wand, thence wanders overthwart into the hind part of the Arm, where increaſed with a branch from the *Baſilica*, it is diſtributed over all the back of the hand, which with the Median it nouriſheth. But the branches of theſe Veins do ſo run through the fore-named parts, that by the way they yield them neceſſary proviſion.

CHAP. XXII.

The Deſcription of the Axillary Vein.

THe Axillary ariſing at the inſertion of the pectoral muſcle, or a little higher, after it hath produced the two *Thoracicæ*, it is divided under the tendon of that Muſcle into two fair branches, that is to ſay, into the inner deep Axillary, and the skin or outward Axillary. The deep or inner having ſtill for his Companion in his deſcent, the Axillary Artery, and the Nerves of the third conjugation, after it hath produced the ſmall external muſculous of the Arm, it goes into the bending of the elbow, where running ſomewhat deep with the Artery and Nerve into the Muſcles of the cubit, it is divided into three other branches, of which one deſcending with the Wand, ſlides under the ring into the inner ſide of the hand, and hath beſtowed two ſmall branches on the Thumb, two others on the fore, and one upon the middle finger, ſo that all of them aſcend by the ſides of theſe fingers, the other deſcending with the Artery, as the former alongſt the cubit ſends branches to the reſt of the fingers, like as the former. The third goes on the fore-ſide between the two bones even to the wriſt, and the ſquare Muſcle. The axillary is divided into the deep Axillary, and outward Axillary

But you muſt note that the Veins of which we now treat, do not onely make theſe diviſions mentioned by us, but infinite others beſides, as well in the parts which they go to, as alſo in the inner Muſcles of the hand which they nouriſh.

And thus much of the internal and deep axillary Vein. For the external or skin-axillary (which firſt appears under the skin, eſpecially in lean bodies, a little above the inward production of the arm) it is divided in that place into two branches, the one whereof deſcending to the bending of the Arm meets, and is united with the Cephalick branch, ſooner or later, that ſo it may produce the Median, as we formerly mentioned.

The other branch having ſent forth many ſhoots of a different length and thickneſs, as well into the skin, as into the other neighbouring parts, deſcending alongſt the lower ſide of the bone of the cubit, properly ſo called, is at length ſpent upon the fore and outward Cephalick branch, which we ſaid deſcended alongſt the Wand; and thus united, they run over all the hand, where in the right hand, between the middle and fore-finger, they make the *Salvatella*; but in the left, in the ſame place they produce the *Splenitica*. The *Salvatella* and *Splenitica*.

But always remember, (if in diſſection you find any thing otherwiſe than we have delivered it) that the diſtribution of the Veſſels is ſo various, (eſpecially in the hands) that there can no certain rule be delivered thereof.

CHAP. XXIII.

The Diſtribution of the Axillary Artery.

THe Axillary Artery from the firſt original, which is preſently after the the two *Thoracicæ* deſcending between the Muſcle called *Biceps*, or the two-headed Muſcle, and the *Brachicus*, with the deep Axillary Vein, diſtributes a large branch amongſt the outward Muſcles of the Arm, which extend the cubit, and is ſpent in the external Muſcles of the ſame, which ariſe without from the productions of the Arm.

And this is called the *Ramus Muſculus* or muſculous branch, as alſo the Vein that accompanies this Artery. Then this Artery when it comes to the bending of the Cubit, thruſting it ſelf into the Muſcles bending the Fingers, communicates certain branches to the parts pertaining to the de-articulation of the Cubit with the Shoulder, and other parts there ſituate, as it did in the upper parts, by which it deſcended hither. Verily it may be a general Rule, that every Veſſel ſends or beſtows certain portions thereof by the way to all the parts by which it paſſes. But if you ſhould ask, why I have not proſecuted theſe productions? I would anſwer, I never intended to handle other then large and fair branches of Veſſels, by raſh inciſion of which, there may happen danger of death or a diſeaſe. For it would be both an infinite and needleſs buſineſs to handle all the divarications of the Veins, Arteries, and Nerves. Therefore this Artery ſunk into theſe Muſcles, when it comes almoſt to the midſt of the Cubit; preſently, or a little after it is divided into two large branches, the one of which alongſt the Wand, and the other alongſt the Cubit, is carried into the hand on the inſide under the Ring. For both theſe branches are diſtributed and ſpent upon the hand after the ſame manner as the branches of the internal axillary Vein, that is, having ſent by the way ſome little ſhoots into the parts by which they paſs, at the length the branch which deſcends by the Wand of the remainder thereof, beſtows two ſprigs upon the Thumb, on each ſide one, and two in like manner on the fore-finger, and one on the middle; the other which runs alongſt the Ell, performs the like office to the little and the middle or Ring-finger, as you may ſee by diſſection. An Anatomical Axiom.

CHAP.

CHAP. XXIV.

Of the Nerves of the Neck, Back, and Arm.

The 7 pair of Nerves of the Neck.

NOw we ſhould handle the ſinews of the Arm, but becauſe theſe proceed from the Nerves of the Neck and Back; I think it fit therefore to ſpeak ſomething of them in the firſt place.

The firſt pair.

Therefore from the Neck there proceeds ſeven pair of Nerves, the firſt of which proceeds from the Nowl-bone, and the firſt *Vertebra* of the Neck; as alſo of the firſt pair of the Back from the laſt *Vertebra* of the Neck, and the firſt of the Cheſt. But all theſe Nerves, divided into two or more branches of the firſt pair (that is to ſay, on each ſide) go, the one to the ſmall right Muſcle, aſcending from the firſt Rack-bone of the Neck to the Nowl-bone, the other to the long Muſcle on the fore-ſide of the Neck.

The ſecond pair.

The branches of the ſecond pair are diſtributed, ſome with a portion which they receive from the third pair over all the skin of the head; the two others go as well to the Muſcles, which are from the ſecond *Vertebra* to the back-part of the head; and from the ſame to the firſt *Vertebræ*, as alſo to the long Muſcle before-mentioned.

The third pair.

One of the third pair of ſinews is communicated to the Head, as we ſaid before, but others to the Muſcles which extend, or erect the Head and the Neck; there is alſo one of theſe diſtributed into the neighbouring ſide-Muſcle and part of the long.

The fourth pair.

The Nerves of the fourth pair go, one to the Muſcles as well of the Neck as the Head, and to the broad Muſcle; the other, after it hath ſent ſome portion thereof into the long Muſcle and the ſide-

The fifth pair.

Muſcles of the Neck; it deſcends with a portion of the fifth and ſixth pair to the Midriff. One of the branches of the fifth pair is beſtowed on the hind Muſcles of the Neck and Head, the other upon the long-Muſcle and Midriff; the third is communicated to the *Levatores* or Heaving-Muſcles of the Arm and Shoulder.

The ſixth pair.

One of the Nerves of the ſixth pair goes to the hind-Muſcles of the Neck and Head, another to the Midriff, the third with a portion of the ſeventh pair of the Neck, and of the firſt and ſecond of the Cheſt go to the Arms, and heaving-Muſcles of the Shoulder-blade.

The ſeventh pair.

One of the branches of the ſeventh pair runs to the broad-Muſcle, and to the neighbouring Muſcles both of the Neck and Head; another, increaſed with a portion of the fifth and ſixth pair of the Neck, and a third joined to the ſecond and third pair of the Cheſt deſcending into the Arm, go to the Hand.

But you muſt note that the Muſcles which take their original from many *Vertebræ*, whether from above downwards, or from below upwards, admit Nerves not onely from the *Vertebræ* from whence they take their original, but alſo from them which they come near in their deſcent, or aſcent.

The 12 pair of Nerves of the cheſt.

There paſs twelve Conjugations of Nerves from the Rack-bones of the Cheſt.

The firſt pair.

The firſt entering forth from between the laſt Rack-bone of the Neck and the firſt of the Cheſt, is divided (that is, on each ſide each Nerve from his ſide) into two or more portions, as alſo all the reſt. Therefore the branches of this firſt Conjugation go ſome of them to the Arms, as we ſaid before, others to the Muſcles, as well theſe of the Cheſt, as others ariſing there, or running that way.

The ſecond pair.

The branches of the ſecond Conjugation are diſtributed to the ſame parts, that theſe of the firſt were.

The other pairs.

But the branches of all the other Conjugations even to the twelfth, are communicated, ſome to the intercoſtal Muſcles running within under the true ribs even to the *Sternon*, and under the Baſtard-ribs even to the right and long Muſcles; and the coſtal Nerves of the ſixth Conjugation are augmented by meeting theſe intercoſtal branches by the way as they deſcend by the roots of the Ribs. Other particles of the ſaid Nerves are communicated to the Muſcles as well of the Cheſt as Spine, as the ſame Muſcles paſs forth, or run alongſt by the *Vertebræ*, from whence theſe Nerves have either their original or paſſage forth.

The Nerves which are carried to the Arms.

Having thus therefore ſhewed the original of the ſinews of the Arm, it remains that we ſhew their number and diſtribution.

Their number is five or ſix; proceeding from the fifth, ſixth, and ſeventh *Vertebra* of the Neck, and the firſt and ſecond of the Cheſt. The firſt of which not mixed with any other from the fifth *Vertebra* of the Neck, goes to the Muſcle *Deltoides*, and the skin which covers it.

The other four or five when they have mutually embraced each other, not onely from their firſt original, but even to the ſhoulder, where they free themſelves from this convolution, are diſtributed after the following manner.

The firſt and ſecond deſcending to the Muſcle mentioned a little before, and thence ſometimes even to the Hand, is by the way communicated to the Muſcle *Biceps*, and then under the ſaid Muſcle it meets, and is joined with the third Nerve. Thirdly, It is communicated with the longeſt Muſcle of the cubit, in the bending whereof it is divided into two branches deſcending alongſt the two bones of the cubit, until at laſt born up by the fleſhy pannicle it is ſpent upon the skin and inner ſide of the hand.

The third lower than this, is firſt united with the ſecond, under the Muſcle *Biceps*, and then ſtraightway ſeparated from it, it ſends a portion thereof to the Arm which lies under it, and to the skin thereof; laſtly, at the bending of the cubit on the fore-ſide, it is mingled with the fifth pair.

The fourth the largeſt of all the reſt, coming down below the third branch under the *Biceps* with the internal Axillary Vein and Artery, is turned towards the outward and back-part of the Arm, there to communicate it ſelf to the Muſcles extending the cubit, and alſo to the inner skin

of

of the arm, and the exterior of the cubit; the remainder of this branch when in its deſcent it hath arrived at the joynt of the cubit, below the bending thereof it is divided into two branches, the one whereof deſcending alongſt the cubit, is ſpent on the outſide of the wriſt; the other aſſociating the wand, is on the outſide in like manner in two branches, beſtowed upon the thumb, and in as many upon the fore-finger, and by a fifth upon the middle finger, though more obſcurely.

The fifth branch being alſo lower than the reſt, ſliding between the muſcles bending and extending the cubit, when it comes behind the inner protuberation of the cubit (in which place we ſaid before the third branch meets with this) it is communicated to the internal muſcles of the ſame, and then divided into three portions, one of which on the outſide alongſt the middle of the cubit, goes in two ſprigs to the little finger, and ſo many to the middle finger, and one to the ring-finger; the other two, the one without, and the other within the ring, go to the hand: where after each of them hath beſtowed what was requiſite on the muſcles of the hand, they are waſted into other five ſmall portions, of which theſe which are from that portion which deſcends without the ring, ſend two ſprigs to the little, two to the fore, and one to the middle finger, but thoſe which come from that which paſſes under the ring, by ſuch a diſtribution communicates it ſelf to other fingers, as two ſprigs to the thumb, two to the fore, and one to the middle-finger. The ſixth the loweſt, and laſt, runs between the skin and fleſhy pannicle, by the inner protuberation of the arm, and then is ſpent upon the skin of the cubit.

CHAP. XXV.

The deſcription of the Bone of the Arm, and the muſcles which move it.

BEcauſe we cannot perfectly demonſtrate the original of the muſcles of the arm, (eſpecially of the two arm-muſcles) not knowing the deſcription of this bone; firſt therefore we will deſcribe it, then return to the original of the muſcles ariſing from thence. The bone of the arm is the greateſt of all the bones in the body, except the thigh-bone; it is round, hollow and filled with marrow, with a great appendix, or head, on the top thereof, having an indifferent neck, to which it is knit by *Symphyſis*, for appendices are no otherwiſe united to their bones. In the lower part thereof it hath two proceſſes, or protuberations, one on the foreſide, another on the hind, between which ſwellings there is a cavity like to half the compaſs of a wheel, about which the cubit is moved. The extremity of this cavity ends in two holes, of which one is the more external, the other more internal: Theſe cavities receive the heads of the cubit, that is, the fore, or internal, receives the fore proceſs when the arm is bended inwards; but the external or hinder, the exterior as it is extended.

The greatneſs and figure. The appendix of the arm. The proceſſes of the arm.

For the head of the arm, it hath a double connexion, the one with its own neck by *Symphyſis*; that is, a natural union of the bones without any motion; the other with the lightly ingraven cavity of the ſhoulder-blade, which we call *Glene*, by that kind of de-articulation which is called *Arthrodia*: This connexion is made firm and ſtable by the muſcles deſcending into the arm from the ſhoulder-blade, as alſo by the proper ligaments deſcending from the circle and brow of the cavity of the *Acromion* and *Coracoides* to this head of the arm; this ſame head of the arm is, as it were, more cleft and open on the inner-ſide, than on the foreſide, that ſo it may give way to one of the ligaments coming from the ſhoulder-blade to the muſcle *Biceps*. Foraſmuch as belongs to the lower end of the bone of the arm (which we ſaid hath two proceſſes;) we may ſay that it is faſtened to the bones of the cubit by two ſorts of articulation; that is, by *Ginglymos*, with the Ell or proper bone of the cubit; and by *Arthrodia*, with the *Radius*, or Wand, which in a lightly ingraved cavity receives the fore proceſs of the arm, and is turned about it for the motion of the hand. The hinder proceſs is chiefly added for the ſafety and preſervation of the veins, arteries and nerves.

Theſe things thus ſhown, it is worth our labour to know the figure of the arm it ſelf, as it lies between the fore-mentioned appendices and proceſſes; that, in the caſe of a fracture, we may know how conveniently to reſtore it; therefore firſt we muſt underſtand, that this bone is ſomewhat bended and hollowed on the inſide under the cleft of the head thereof, but bunching out on the out and fore-ſide.

The figure of the arm.

Wherefore ſeeing it muſt be moveable forwards and backwards, upwards and downwards, Nature for the performance of ſo many motions hath furniſhed it with eight muſcles, which are ſix proper and two common with the ſhoulder-blade. Of which number, two move it forwards, two backwards, two upwards, two downwards. Which muſt not be underſtood ſo, as that theſe two muſcles ſhould move it directly forwards, inclining neither upwards nor downwards; and the other two ſhould move it ſo upwards, as it ſhould incline neither forwards nor backwards; but thus, That it cannot be moved neither to this nor that part, unleſs by the help and proper action of this, or that muſcle. Thus therefore, if the pectoral with his aſſociate perform their duty; or action, the arm is always moved forwards, as it is lifted up by the action of the *Deltoides*, and his companion, and ſo of the reſt.

The eight muſcles thereof.

But to come to the original and inſertion of theſe muſcles; the one of theſe two which move the arm forwards called by reaſon of his original, the Pectoral, ariſing from more than half of the Collar-bone; and almoſt all the *Sternon*, and the ſixth, ſeventh and eighth rib, goes up and faſtens it ſelf to the *Coracoides*, by a membrane or a membranous tendon ſufficiently ſtrong (for which cauſe it is ſaid to be common to the ſhoulder and arm) and it goes into the arm between the muſcles *Deltoides* and *Biceps* with a ſtrong tendon compoſed of fibers croſſing each other, of which ſome deſcend from the Collar-bone, and the upper part of the *Sternon*, others aſcend from the lower original hereof; that is, from the ſixth, ſeventh and eighth ribs; and although the action of this muſcle be diverſe by

The original and inſertion of the pectoral muſcle.

reaſon of the diverſity of its fibers ariſing from divers places, yet always it draws the arm forwards, whether it be moved upwards, downwards, or to the breaſt; the other which is his companion, deſcends from the whole lip or brow of the ſimous, or hollow part of the blade, which it fills in the fore-part of the arm near the head thereof. For the two *Levatores*, or the lifters up of the arm, the
The *Deltoides.* firſt named *Deltoides*, deſcends almoſt from half the clavicle, the proceſs *Acromion*, and all the ſpine of the ſhoulder-blade into the fore-ſide of the arm, the breadth of four fingers below the joynt. It hath divers actions according to the diverſity of the fibers, as alſo every muſcle hath; yet howſoever it is contracted, whether by the fibers from the clavicle alone, or by the ſpinal alone, or by both at once, it always lifts and heaves the arm upwards. The other which is his Aſſociate deſcends from the gibbous part of the ſhoulder-blade, contained between the upper rib thereof, and the
The *Epomis*, or *Scapularis.* ſpine between the proceſſes *Acromion* and *Coracoides*, to the neck of the arm; and this we will call the *Epomis* or *Scapularis*; that is, the ſhoulder-muſcle. But the firſt and larger of the two muſcles, which draw the arm backwards, ariſes from the greateſt part of the utter lip of the gibbous part of the ſhoulder-blade, which is under the ſpine thereof, and lying upon the blade it ſelf, it goes into the hind-part of the arm above the neck thereof. The other which is contiguous to it, and his partner in working, but leſſer, paſſes from the upper and exterior part of the lower rib of the ſhoulder-blade, and thence, as it were, in ſome ſort extending it ſelf upon the gibbous part thereof, near unto that rib, it goes into the arm. This muſcle ſeems to be the ſame with the former, being fleſhy without, even above the top of the ſhoulder. One and the leſſer of theſe two which draw downwards, enters out from the ſtait line of the lower rib of the blade, and goes into the lower part of the arm about the neck thereof. The other called the *Latiſſimus*, or broadeſt, aſcends from the ſpines of the holy-bone of the loins, and often alſo from the nine lower of the cheſt, by the lower corner of the ſhoulder-blade into which it is inſerted by a membranous tendon, as alſo it is into the inner part of the arm near the neck by another ſtrong tendon; whereupon this muſcle is called a common muſcle of the ſhoulder and arm. But when this muſcle happens to be wounded, the arm cannot eaſily be ſtretched forth, or lifted up.

nal marrow, where it iſſueth out of the brain, 1 2 3, &c. *Thirty pair of nerves ariſing from the ſpinal marrow are here noted by their Char. that is to ſay, ſeven of the neck, twelve of the cheſt, five of the loins, and ſix of the holy-bone.* b *The thicker branch of the ſecond nerve divided into two parts.* c *Branches of the the third nerve ſprinkled here and there.* d *Nerves from the third pair to the thumb, the fore-finger and the middle-finger.* ee *The fourth nerve of the arm.* f *The paſſage hereof through the inſide of the ſhoulder.* g *A tripartition of this branch where it toucheth the cubit.* hh *A branch diſtributed from the fourth nerve to the outward skin of the cubit.* i *The upper branch of the diviſion of the fourth nerve.* kk *A branch of* i, *reaching it to the outſide of the hand.* ll *The lower branch of the diviſion of the fourth nerve paſſing through the back-ſide of the cubit.* m *The fifth nerve of the arm.* n *Branches of this nerve diſperſed here and there.* oo *A branch of the fifth nerve, reaching to the inſide of the hand and the fingers.* p *A ſurcle of the branch* o, *derived to the outſide of the hand and fingers,* q q *The ſixth nerve of the arm and the courſe thereof under the skin.* r r *The intercoſtal nerves there cut off where they are together with the ribs reflected forward.* ſ ſ *Branches on each ſide running backward.* t t *Nerves attaining unto the cheſt.* u u *The commixtion of the nerves* r r *with the deſcending branch of the ſixth conjugation of the brain.* xx *Nerves from the loins led unto this place.* y *A branch going to the teſticles here cut off.* z *A nerve reaching to the firſt muſcle of the thigh.* c *The firſt nerves of the leg.* α β *A ſurcle of the former nerve derived to the skin at* α, *and inſerted into the muſcles at* β γ, *the ſecond nerve of the leg.* δ δ δ *A nerve from the former, allowed unto the skin as low as to the foot, and paſſing along the inſide of the leg.* ε *A branch of the ſecond nerve running unto the muſcles.* ζ *The third nerve of the leg.* η *A ſurcle thereof unto the skin.* θ *Another ſurcle unto the muſcles.* ι ι *The fourth nerve of the leg.* κ κ *The* anterior *propagation of the nerves proceeding from the holy-bone.* λ *The end of the ſpinal marrow.* μ *A branch from the fourth nerve inſerted into the muſcles ariſing from the* Coxendix, *or hip-bone.* ν *Another branch going to the skin of the thigh on the back-ſide.* ξ *A propagation derived to the fourth muſcle of the leg, and to the skin of the knee.* o o *Nerves attaining to the heads of the muſcles of the foot.* π ρ *The diviſion of the fourth crural nerve into two trunks* σ *a branch from the trunk* ϖ *diſperſed into the outward skin of the leg.* τ *A ſurcle of the trunk* ϖ, *derived to the muſcles.* υ *Another ſurcle to the skin of the leg on the fore-ſide.* Φ *A branch of the trunk* ρ, *to the skin of the inſide of the leg, and of the foot,* χ *A ſurcle of the trunk* ρ, *to the hind-moſt skin of the leg.* ψ *A branch of the whole trunk* ρ, *led along to the forward part of the leg and the foot.* ω *The deſcent of the trunk* ρ *into the foot.*

CHAP. XXVI.

The deſcription of the Bones of the Cubit and the Muſcles moving them.

AFter theſe Muſcles, follow thoſe which bend and extend the Cubit, but becauſe their inſertion cannot be fitly demonſtrated, unleſs the bones of the cubit be firſt deſcribed; therefore firſt of all, we will delineate the bones themſelves. But verily, leſt this doubtful word *Cubit* ſhould cauſe obſcurity; firſt, we muſt note, that it hath a threefold ſignification, for oft-times it is uſed for all that part of the hand which lies between the arm and wriſt, oft-times for the lower bone of this part, ſometimes for the upper part of this bone, which is turned within the orb, or cavity of the arm (no otherwiſe than a cord in the wheel of a Pulley) and this is called the *Olecranon*. Here truly we uſe this word *Cubit* in the firſt ſignification. Wherefore, we ſay, the cubit is compoſed of two bones, the one of which we call the *Radius*, or Wand, or the leſſer *Focile* of the arm; the other we properly call the Cubit, or Ell. Theſe two bones ſtick together at their ends being firmly bound together by ſtrong ligaments; but the middle-parts of them are a pretty way diſtant from each other, and chiefly towards their lower ends, for the better ſituation and paſſage of the muſcles and veſſels from the inner ſide to the exterior, as ſhall be ſhewed in fit place. The wand hath two *Epiphyſes*, or Appendices, the one at the upper end, the other at the lower. The upper is round and hallowed on the ſurface like a Baſon, it receives the fore proceſs of the bone of the arm, bound to the ſame by ſtrong ligaments, deſcending as well from the proceſs of the arm, as the *Olecranon* into the circumjacent parts of this appendix of the wand. This connexion is made for this uſe, that we may turn our hand upwards and downwards by the cubit turned and twined about this proceſs. But the lower appendix of this wand is hollowed on the inſide, that ſo it might more commodiouſly receive the bones of the wriſt; but gibbous without, that it might be ſafer: Now this wand is ſofter and thicker at the lower end, but leſſer and harder above, where on the inſide it hath a ſwelling out, whereby to receive the muſcle *Biceps*: Beſides, on the out-ſide of the middle thereof it is ſomewhat gibbous and round, ſo to become more ſafe from the injuries of external bodies; but it is hollowed or bended on the inſide, for the better taking and holding any thing in the hand. But that ſide which which lies next to the Ell is flatted for the fitter original and ſeat of the Muſcles; laſtly, it is ſeated upon the bone of the Cubit, or Ell, juſt againſt the thumb. But the Ell, or bone of the cubit properly and particularly ſo called, hath in like manner two appendices, the one above, the other beneath. The upper, which alſo is the greater, is fitted to the orb of the arm in which it goes to and again for the extenſion and bending of the arm, no otherwiſe than a rope runs in a pulley, but that it turns not abſolutely and perfectly round, which is cauſed by the two proceſſes of unequal bigneſs, the which are therefore ſtayed in the holes or cavities of the bone of the arm, the greater proceſs which we called *Olecranon* is letted by the exterior hole, that ſo the extenſion of the arm can be no further, but the leſſer proceſs by the inner hole, makes the bending thereof the leſs perfect. The compoſure of theſe bones is by *Ginglymos*, and it is ſtrengthned not only by common ligaments coming from the muſcles, which move the bones themſelves, but alſo by proper liga-

The appendices of the bone of the cubit.

ments, deſcending from the proceſſes of the arm and the lips of the holes and cavities ſtanding about the appendix of the cubit. The other lower and leſſer appendix is in ſome ſort hollow on the inſide for the fitter receiving the bones of the wriſt, but the outſide is round, and ends in a point, which is called by the Greeks *Styloides*. But now this Ell (contrary in this to the wand) is thicker towards the arm, but ſlenderer towards the wriſt. And beſides, in the thicker part thereof, it is hollowed or bended towards the inſide, and in the ſame place is gibbous or bunching forth on the outſide: but it is round and ſtrait, unleſs on that ſide which lies next the wand: For the reſt, it is hollow and full of marrow like the wand. The ſite of the *Radius*, or wand, is oblique, but that of the cubit or ell, is right, that the arm might be the better and more eaſily moved; becauſe the motion by which the arm is extended and bended, is according to a right line, but that by which the inſide of the hand is turned upwards and downwards, is performed obliquely and circularly. Wherefore it was expedient, that the wand ſhould be oblique, and the cubit ſtrait; for the cubit-bone is appointed for to extend and bend the arm, but the wand to perform the wheeling and turning about thereof; and this is the cauſe that it was fitting, there ſhould be a different connexion of theſe bones with the arm. Theſe things were fitting to be ſpoken concerning the nature of theſe bones, that in the cure of fractures we may work the more ſafely and happily, taking indication from that which is agreeable to nature: Wherefore now it remains, that we come to the deſcription of the muſcles which are ſeated in the arm, the cubit-bone or ell. Theſe are four in number, two extending it, and two bending it. The firſt of the benders is called *Biceps*, by reaſon of its two heads, the one whereof deſcends from the *Coracoides*, the other from the lip of the cavity of the ſhoulder-blade by the fiſſure or cleft of the head of the bone of the arm. Theſe two heads under the neck of this arm becoming fleſhy, are firmly united at the belly and midſt of the arm, and thus united, are at the length implanted by a ſtrong tendon to the inner protuberation of the wand. The other is called the *Brachiæus*, by reaſon of the ſtrait coherence thereof with the bone of the arm; this faſtened under the *Biceps*, deſcends obliquely on the back and upper part of the bone of the arm into the top of the wand and the inner ſide of the ell. But the firſt of the extenders is called the *Longus*, or long-muſcle; this deſcends from the lower rib of the ſhoulder, and cleaving to the bone of the arm, goes thither (faſtened, and as it were always ſtraitly joyned with his fellow-muſcle, ſpecially near the cubit) wherefore you ſhall preſently hear. The other, termed the *Brevis*, or ſhort muſcle, being the companion of the long, deſcends on the hind-part of the neck of the bone of the arm, as it were growing to, and lying under the former long-muſcle, ſo that making one common broad tendon outwardly fleſhy, inwardly nervous, they are inſerted into the *Olecranum*, ſo by mutual aſſiſtance to extend the cubit.

CHAP. XXVII.

The Deſcription of the Bones of the Wriſt, After-wriſt and Fingers.

What the hand properly ſo called is.

WE ſaid before, that the hand taken more particularly, and properly, is divided into the wriſt, after-wriſt, and fingers; and that the hand in this ſignification is bounded by the ends of the bones of the cubit and fingers. All the parts of the wriſt, which it hath common with the after-wriſt, have been already alſo plentifully explained: This only remains to be noted, that the skin as well of the hands as of the feet, is of a middle nature between pure fleſh, and pure skin; no otherwiſe than that which covers the forehead, but that this which covers the palms of the hands, and ſoles of the feet, is unmoveable: But it is moſt thick, eſpecially on the feet, leſt it ſhould be eaſily offended by continual going. Beſides the common parts, the wriſt is compoſed of eight ſmall bones mutually knit together in a certain order, and by *Diarthroſis* with the two bones of the cubit, but mutually and amongſt themſelves by *Synarthroſis*, by interpoſition of griſtles and ligaments as well common, that is, coming from the muſcles, as proper, deſcending always from the upper to the lower. But theſe ſame bones are ſome leſs than otherſome; beſides, they are hard, and without marrow, gibbous on the outſide for the ſecurity and comelineſs of the hand, but hollow on the inſide for to give way to the tendons going into the fingers. Theſe bones are diſpoſed in two ranks, the firſt rank contains only three, but the ſecond five. The three of the firſt rank are thus arrayed, or placed, that one of them may receive the appendix *Styloides*, of the cubit; the other the ell and the wand together; and the third may be received by the wand. But three of the five bones of the ſecond order ſuſtain the four bones of the after-wriſt, and are knit to the ſame by *Synarthroſis*; after which manner of connexion they are joyned to the bones of the firſt rank; the fourth ſuſtains the firſt bone of the thumb, to which alſo it is co-articulate by *Synarthroſis*; the fifth and laſt is ſeated on the inſide againſt the ell, chiefly above that bone of the firſt order, which receives the appendix *Styloides* of the cubit: This is leaſt and weakeſt of them by reaſon of its griſtly ſubſtance, which makes the ring with certain ligaments running from one of the inner ſides of the wriſt to the other.

What the *Annulus* or ring is.

This ring is placed there, as well for the preſervation of the ſinews, veins and arteries paſſing under it (leſt when we lean upon our hand and wriſt, theſe parts ſhould be hurt by compreſſion) as alſo for the commodity of the action of the muſcles bending the finger, which in the performance of their action and the contracting themſelves, might deform the hand by their paſſing forth of the cavity of the wriſt. For what attraction ſoever is made by ſtrings, if it be free, and not hindred, is according to a ſtrait line.

The bones of the after-wriſt.

Now follow the bones of the ſecond part of the hand, or of the after-wriſt. Theſe are four in number, gibbous without, but arched within, or hollow in the middle; for, hence is the palm of the

the hand, or certainly the greater part thereof; their ends next the fingers are somewhat remote from each other, that in these clifts the muscles *Interosses* might find a place and seat. But these ends have each an appendix, as you may perceive in the Sceleton of a Child. But you must note, that by the first bone of the wrist, or after-wrist, we mean that which is in the fore-side of the hand, that is to say, that in the wrist which lies under the thumb, and that in the after-wrist, which is seated under the fore-finger, as those which keep in order the fingers; which exceed the rest in necessity and dignity.

The Figure of the Bones of the Hand. The first sheweth the inside of the right-hand, and the second shews the back-side of the same.

BC *The two bones of the thumb.*
DEF 1 2 *The three bones of the fore-finger which are the same in the other fingers.*
M 1 2 *A little bone sometimes fastned outwardly at the joynt of the eighth bone of the wrist.*
N 1 *A process of the eighth bone of the wrist, swelling out into the ball of the hand.*
O 1 *A process of the fifth bone of the wrist, from which a ligament proceeds.* P 2 *An appendix of the bones of the wrist, by which they are articulated to the after-wrist.* Q 2 *Another appendix which with its head entereth into the cavity of the finger.* R 1 2 *The space between the bones of the after-wrist.* S 1 2 *Two little seed-bones set on the inside and outside of the first joynt.* T 1 *Two seed-bones in the first of the four-fingers.* V V 1 *One seed-bone in the second and third joynt of the fingers.*

After these follow the fifteen bones of the fingers; that is, three in each, which are hollow and fistulous, full of a thin and liquid marrow, and not of gross and thick, as in the arm and thigh, They are outwardly gibbous, but inwardly hollow and flat for the fitter seat of the tendons ascending alongst the fingers on the inside even to the upper joynt. The which that Nature might the better strengthen and preserve, it hath produced from the lips of the inner cavities of these bones a membranous and strong ligament, which running over-thwart from one side to the other, doth so straitly close the tendons to their bones, that they cannot go forth of their places, or incline to either side. They are connexed on the out-side, that they might be more fit to hold any thing. But for the first bones of the four fingers and thumb, four are joyned together with so many bones of the after-wrist by *Synarthrosis*, for the bones of the after-wrist are moved by no manifest motion; the fifth is knit to the second rank of the bones of the wrist, therefore that bone cannot be attributed to the after-wrist, as some have written, seeing it hath manifest motion and is knit by *Diarthrosis*, but the bones of the after-wrist are only fastned by *Synarthrosis*. For the second and third rank of bones of the fingers, they are knit the second to the first, and the third to the second by *Diarthrosis* and *Arthrodia*, because, besides the manifest motion they have, they receive each other by a superficiary cavity; as those of the first rank, the bones of the after-wrist; and those of the second rank, them of the first; and those of the third, them of the second. And all the bones of the fingers are larger and thicker at their basis, but smaller towards the ends; and they are bound by ligaments especially proper, which (as we said formerly) descend from the first to the second; so that the last bones, seeing they have not to whom to communicate their nerves, make and produce nails thereof: Wherefore the nails are generated by the fibers of the ligaments, and the excrement of the tendons which are terminated at the bottom of the nails. Now remain the *Ossa Sesamoidea*, or seed-bones: These are nineteen in number in the inner joynts of each of the hands, and as many in each foot, *viz.* Two in the first joynt of the four fingers, and in the second of the thumb, and one in each of the rest. For the inner side of the joynts, you may for the most part observe one in each of them; yet in the second joynt of the thumb there be two above the two tendons, which are somewhat gristly.

The bones of the fingers.

Whence the nails are generated.

The *Ossa Sesamoidea*, or seed-bones.

They are made for this use, that they may firm and strengthen the joynts, so that the bones of the fingers may not be turned awry, or thrust forth of their places by strong and violent motions, as it sometimes happens in the whirlbone of the knee. They are called *Sesamoidea*, from the resemblance they have to the seed of *Sesamum*, which is somewhat long and flat.

Their use.

CHAP. XXVIII.

Of the Muſcles, which ſeated in the cubit, move the Wand, and with it the hand.

The muſcles of the cubit.

NOw we muſt deſcribe the muſcles of the formerly deſcribed parts; that is, thoſe which are ſeated in the cubit, which are carried to the inſide of the hand, and thoſe which are called the *Interoſſes*. Now the muſcles of the cubit are fourteen, ſeven external, and ſeven internal; two of the ſeven external do primarily twine or turn up the Wand; and ſecondarily, or by accident, turn the palm of the hand upwards, whereupon they have called them *ſupinatores*, or turnes up of the hand; two extend the wriſt, whereupon they are named *Carpi-tenſores*, or the wriſt-extenders; two the fingers, whence they are ſtiled *Digitum-tenſores*, or finger-ſtretchers; to conclude, the ſeventh and laſt is termed *Abductor*, or *Obliquator externus*.

The *Supinatores.*

The *Carpitenſores.*

The *Digitumtenſores.*

The *Obliquator externus.*

The firſt of the two *Supinatores* is called the long, or longeſt, becauſe it deſcends from the outſide of the arm above the proceſſes thereof, and is inſerted by a round and ſtrong tendon into the lower appendix. The other deſcends obliquely from the outward and upper proceſs of the arm, and is inſerted at the third part of the wand by a membranous and fleſhy tendon before, and on the inſide thereof. The upper of the two extenders of the wriſt, deſcending above the wand from the external and upper proceſs of the arm, is inſerted by two tendons into the firſt and ſecond bone of the after-wriſt, which ſuſtain the fore and middle-fingers.

The firſt of the *Supinatores.*

The ſecond.

The upper of the *Carpitenſores.*

The lower.

The other and lower, deſcending from the ſame place as the former, above the cubit, is inſerted into the fourth bone of the after-wriſt which bears up the little-finger. Theſe muſcles whilſt they move alone, that is, each with his Antagoniſt, to wit, the wriſt-benders, they move obliquely, upwards or downwards, the whole hand properly ſo called. The firſt and greater of the extenders of the fingers, or finger-ſtretchers, ariſing from the *Olecranum*, or bone of the cubit, deſcends ſuperficiarily between the two bones of the cubit even to the wriſt, in which place it is divided into four tendons, which paſſing under the ring ſeated there, end (each diſtinguiſhed by a common ligament above the bone of the after-wriſt) in the laſt joynts of the four fingers, adhering nevertheleſs firmly to the bones, which are above theſe joynts.

The greater of the *Digitumtenſores.*

The leſſer.

The other, which is the leſſer, ariſing almoſt in the middle of the wand, goes obliquely to the thumb, into which it is inſerted by two tendons: The one thicker, which is inſerted into the root thereof, and draws it from the other fingers; the other ſlenderer continued even to the upper joynt thereof, and by its action extending the thumb.

The *Obliquator* or *Abductor externus.*

The ſeventh, which is the *Abductor* or *Obliquator*, is ſeated at the hind-part of the hand; that is, towards the little finger: We have often found this divided into two, yea verily we have found it trifide, or divided into three, this year in three or four bodies; one portion thereof went to the lower ſide of the ring-finger with two tendons, the other in like manner to the middle and fore-fingers, and the third to the thumb.

And for all that it is thus divided, yet ſome have taken and accounted it for one muſcle, becauſe it hath one original and action, which is, to draw the fingers backwards; ſome have added to this the extender of the thumb, by reaſon of their common original; and thus of four muſcles they have made one, divided into ſeven tendons, diſtributed, as is formerly ſhewed. But when the *Obliquator* of the ring-finger is wanting, as it often happens, the extender of the finger ſupplies that defect by certain productions of tendinous ſtrings. But ſome alſo have written, that this muſcle which we ſaid hath ſeven tendons, is only a production of the deep fore-muſcle, which ſhould be ſent through the ſpace between the bones of the cubit; yet I had rather make it a muſcle of it ſelf, by reaſon of its ſtrait adheſion with the bones of the arm and wand. And let thus much ſuffice for the external muſcles of the cubit, which you may comprehend in the number of ſeven, as we have done; or in ſix, if you take away one of the four; or in nine, if you had rather reſolve it into four with *Galen*; or in eight, if you divide this muſcle only into three. For in very deed the *Abductor* or *Obliquator* of the ring-finger is not often found in men.

The muſcles of the inner part of the cubit.

Now muſt we come to the inner muſcles of the cubit, the firſt of which compaſſes the skin of the palm of the hand, whence it is called the *Palmaris*. The ſecond and third joyned by the communion of their action turn down or prone the wand, and conſequently the hand, ſo that the palm looks towards the feet, whereupon they are called *Pronatores*.

The fourth and fifth joyned alſo in affinity of action bend the wriſt, wherefore they are named *Carpi-flexores*, wriſt-benders. The ſixth and ſeventh are appointed to bend the firſt, ſecond, and third joynts of the fingers, wherefore they are termed *Digitum-flexores*, *Finger-benders*. For their original; the *Palmaris*, the leaſt and uppermoſt of them all, deſcends fleſhy from the hind-proceſs of the inner arm, and a little after ending in a long ſlender tendon, it is ſpent in the skin of the palm of the hand even to the roots of the finger. For it was neceſſary that the skin ſhould ſtraitly cohere with the ſubjacent parts, not only for the fitter taking or comprehenſion of any thing, leſt that skin in holding ſhould be wrinkled and drawn away from the palm and fingers, and ſo be an impediment; but beſides, that the hand might have a more exact ſenſe to diſtinguiſh of hot, cold, moiſt, dry, ſmooth, equal, rough, ſoft, hard, great, little, and ſuch other qualities.

The *Palmaris.*

The *Pronatores.*

Then follow the two *Pronatores*, of which one called the round, comes obliquely from the inner ſide of the hind-proceſs of the arm almoſt to the middle of the wand, to which it adheres by a membranous and fleſhy tendon, even to the place appointed for inſertion. The other, ſquare three or four fingers broad, yet ſomewhat ſlender, ſeated within under all the muſcles which deſcend on the inſide to the wriſt or fingers, upon the ends of the bones of the cubit, aſcends tranſverſe from below the ell, unto the top of the wand, where it ends in a membranous tendon. Both the *Carpi-flexores*, or wriſt-benders, ariſe from the hind, but inner proceſs, and deſcend obliquely, (the one

The *Carpi-flexores.*

more

more, or leſs than the other) the one alongſt the ell, but the other alongſt the wand; and that which deſcends alongſt the ell, is inſerted into the eighth bone of the wriſt, which we ſaid made part of the ring; the other which follows the wand is inſerted with his greater part into the bone of the wriſt, and with the reſt into the firſt bone of the after-wriſt which ſuſtains the fore-finger.

Now remain the *Digitum-flexores*, or finger-benders, which becauſe they lye upon one another, the upper is called the *Sublimis*, but the lower the *Profundus*. The *Sublimis*, or upper, ariſing from the inner part of the hind proceſs of the arm, and from the upper part of the ell and wand, deſcends between the two bones of the cubit, even to the wriſt and ring; divided into four tendons it is inſerted into the ſecond de-articulation of the four fingers, which it bends by the force of this his proper inſertion; as alſo the firſt, as well by the power of the common ligament, as by certain fibers coming from it, which it ſends thither by the way in its paſſage. But theſe four tendons near unto this their inſertion are divided into two, ſo to give paſſage and add ſtrength to the tendons of the deep muſcles deſcending into the third and laſt joynt of the fingers. *The Digitum-flexores.* *The Sublimis Digitum-flexor.*

But this ſame *Profundus* or deep muſcle ariſing from the upper and inner parts of the ell and wand, deſcends between theſe two bones under the *Sublimis*, alſo undivided even to the wriſt, where it is divided into five tendons which it brings forth under the common ligament, and the diviſions of the tendons of the *Sublimis* even to the laſt joynt of the fingers, which they bend, by this their proper inſertion, as alſo of the bones of the firſt and ſecond joynts of the fingers by the means of the common ligament and fibrous productions which they beſtow upon them by the way. Beſides theſe fore-mentioned, there is ſeen alſo a certain membranous ligament which engirts the tendons in the compaſs of the fingers. *The Profundus Digitum-flexor.*

CHAP. XXXIX.

Of the Muſcles of the inſide of the Hand.

THE muſcles of the inſide of the hand are ſeven in number; the firſt is called *Thenar*, becauſe it makes the greater part of the palm; the ſecond from the ſite is called the *Hypothenar*; the third the external *Abductor* of the thumb. The four other are called by reaſon of their figure the *Lumbrici*, or wormy-muſcles, or the *Abductores*, or drawers of the four fingers to the thumb. Now the firſt, called *Thenar*, thicker than the reſt, ariſes from all the bones of the after-wriſt, taking its beginning from that bone which bears up the ring-finger, whence aſcending alongſt the vital line even to the end thereof at the firſt bone of the after-wriſt ſuſtaining the fore-finger, it is at length inſerted into the laſt joynt of the thumb by the longeſt fibers, but by the middle and ſhorteſt fibers almoſt into all the inner parts of the firſt bones of two joynts, and by reaſon of this, the thumb is drawn to the other fingers, and from them again by his lower original. *The number of the muſcles of the inſide of the hand.* *The Thenar.*

Some divide this muſcle into three, by reaſon of his diverſe actions, making the firſt to ariſe from the root of the bone of the after-wriſt which bears up the ring-finger; but the other from that middle bone of the after-wriſt which ſuſtains the middle-finger; but of the third, from the upper end of that bone which under-props the fore-finger; and that the inſertion of them all, is, as we formerly mentioned. But the former opinion likes me better, both for ſhunning confuſion, and abbreviating the doctrine of the number of muſcles.

The *Hypothenar* ariſes from the fourth bone of the after-wriſt, and that bone of the wriſt which ſuſtains it, and then with its longeſt fibers, it is inſerted into the ſecond joynt of the ring-finger, and by the ſhorteſt into the firſt, through which occaſion, as alſo in reſpect of its two-fold action, ſome have divided it into two, that the one of them might lead it from the reſt, and the other might draw it to the thumb. *The Hypothenar.*

The third the external *Abductor* of thumb, deſcends from the firſt bone of the after-wriſt, into the firſt and ſecond joynt of the thumb; wherefore ſome have divided it into two. The *Lumbrici*, or four external *Abductores*, of the fore-fingers, ariſe from a membrane, inveſting and binding together the tendons of the *Digitum-flexores*, or finger-benders, and at length on the ſides towards the thumb even by a ſmall tendon, running even to the ſecond joynt of the four-fingers. *The external Abductor of the thumb.* *The Lumbrici.*

Now the *Interoſſes* of the after-wriſt, remain to be ſpoken of; theſe are ſix, two in each of the ſpaces between the fingers, one internal, the other external, of which the internal deſcending with oblique fibers from the ſide of the firſt bone of the after-wriſt, goes alſo into the ſides of the fingers, that ſo it may the more cloſely bind together the bones of the after-wriſt, whoſe action is manifeſted, when we thruſt our fingers into a ſtrait glove, or when we bend our hand. Some think that it helps alſo the drawing of the fingers towards the thumb. The external aſcends alſo by oblique fibers from the ſides of the ſecond bone of the after-wriſt, to the firſt joynts of the fingers, interſecting the internal, which we now deſcribed after the manner of the letter X, for to extend the palm of the hand, and help the drawing away of the fingers of the thumb. *The Interoſſei.*

Here concluding the deſcription of the muſcles of the whole hand taken in general, you ſhall note that they are thirty nine in number, that is, eight appointed to move the arm; four ſet to move the cubit, in general; ſeven ſeated on the out-ſide of the cubit, and as many on the inſide in the ſame cubit, moving the wand, and with it the hand; ſeven on the inſide of the hand: And laſtly, the ſix *Interoſſes*. Some increaſe this number, ſaying, there are nine on the external part of the cubit, and eleven on the inſide of the hand. *The number of the muſcles of the whole taken in general.*

CHAP.

CHAP. XXX.

A deſcription of the Leg taken in general.

After the hand follows the deſcription of the leg. Wherefore to take away all doubtfulneſs, we will firſt define the leg; then divide it into the parts more and leſs compound; thirdly, we will proſecute all things common to all theſe parts; fourthly, thoſe which are peculiar to each; and then, God willing, we will give an end to our Anatomy.

The diverſe acception of the leg. The thigh. The leg or ſhank. The foot.

Now this word *Crus*, or Leg, is uſed two manner of ways, that is, either generally or ſpecially, and ſpecially again after two ſorts, that is, either abſolutely and ſimply ſo, or with an adjunct. It is ſimply taken for all that which is between the knee and foot. But with an adjunct for the greater bone thereof. But the leg taken in general, is the inſtrument of going, containing all whatſoever is from the hips, to the very ends of the toes. It is divided into three great parts, that is to ſay, the thigh, the leg, or ſhank, and the foot. By the thigh, we mean, that which lies between the hip and the knee. By the leg, properly ſo called, or ſhank, that which is contained between the knee and the foot. By the foot, all from thence to the ends of the toes.

The diviſion of the foot. The inſtep. The top of the foot. The toes.

Again, they divide the foot into three parts; that is, the *Tarſus* or inſtep, the *Pedion* or top of the foot, and the *Digiti pedum*, or toes. We underſtand by the inſtep, that which is contained in the firſt ſeven bones, which anſwers in proportion to the wriſt of the hand. By the top of the foot, that which is comprehended in the five following bones, which is anſwerable to the after-wriſt. That which remains, we call the toes. But becauſe all theſe parts have other common and proper parts, we will only follow the diſtribution of the veins, arteries and nerves; ſeeing we have ſufficiently explained the reſt, when we deſcribed the containing parts of the body in general.

CHAP. XXXI.

A deſcription of the Crural-vein.

The beginning of the crural-vein. The two branches thereof.

The Crural-vein begins then, when the hollow-vein, paſſing forth of the *Peritonæum*. and ſtretched to the hanch-bone, and the ſides of the *Pubis* in the groin, is firſt divided into two large branches, the one of which deſcends on the inſide, alongſt the bones of the whole leg, together with the artery and nerve; the other runs down outwardly and ſuperficially alongſt the leg, between the fat lying under the skin, and the muſcles even to the foot, and is ſpent in the skin thereof. This, becauſe it is always apparent and manifeſt, is called properly by the Greeks *Sapheia*, but commonly *Saphena*.

By what veins the matter cauſing thoſe tumors called *Bubones* flow down.

This vein, by the way, preſently at its original is divided into two branches, the one internal, the other external; of which the internal is ſpent upon the *Bubones*, and other glandules of that place and the skin, and by this branch come the defluxions called *Bubones*; the other branch is waſted in the fore and utter skin of the upper part of the thigh; then a little lower, that is, about the breadth of three or four fingers, it is gathered again into one branch made of many little ones, which is ſpent in the fore and hind-skin of this thigh. Thirdly, a little below the middle of the thigh, it is again divided into two other branches, of which the one goes into the skin on the fore-ſide, and the other on the hind-ſide. Fourthly, it is diſtributed by two other ſmall ſprigs into the skin, on the four and hind part of the knee; which often-times are not found, eſpecially when the *Poplitea*, or ham-vein, is ſomewhat larger than ordinary. Fifthly, a little below the knee, it produces two other branches, lying upon each other in their paſſage out into the fore and hind-skin of that place. You muſt note, that branch which runs into the skin of the hind-part, is carried by certain other ſprigs, which it produces into a branch of the *Poplitea* paſſing forth of the two twin-muſcles. Sixthly, in the bigger part of the calf of the leg, it is divided into two other branches, which in like manner are diſtributed into the skin, as well in the fore-ſide as the back-ſide of the leg.

Where, and in what diſeaſes, the *Sapheia* muſt be opened.

At length, after many diviſions, which for brevity ſake I omit, when it arrives at the fore and inner ſide of the ankle (where it is commonly opened in the diſeaſes of the parts below the midriff which require blood-letting) it is parted into two other branches, the leſſer of which deſcends to the heel; the other in many ſprigs is ſpent upon the skin of all the upper and lower parts of the foot and toes.

To what places, and by how manifold diviſions the internal branch of the crural vein goes. *Iſchiadica vena.* *Muſcula vena.* *Poplitea vena.*

The ſecond branch of this crural-vein, which we ſaid deſcends within together with the artery and nerve, even into the foot, is divided; firſt, piercing ſomewhat deep in, it produces four divarications; one internal, deſcending below the original of the *Saphia*, into the muſcle called *Obturator externus*, and into certain other external muſcles. The three other run outwardly, the firſt towards the huckle-bone, by which the *Iſchias* is made, the two other into the four muſcles of the thigh, neither are theſe ſprigs far remote from one another. Secondly, all that branch is divided into two other branches, the one above, the other below, an artery always accompanying it; the lower of which is ſpent upon many of the hinder-muſcles of the thigh ending nigh the ham. The upper, beſides, that it beſtows many branches upon the fore and inner-muſcles of the thigh; deſcending to the ham, it produces the *Poplitea*, or ham-vein, made ſometimes of two branches, the one proceeding from above, and the other from below. This *Poplitea* deſcending by the bending of the ham, is ſpent one while upon the skin of the calf of the leg, another while upon the knee; otherwhiles increaſed with branches of the *Sapheia*, it goes on the out-ſide of the ankle to the skin, on the upper-ſide of the foot, and ſometimes on the lower.

Thirdly, a little below the original of the ham-vein, and under the bending of the knee, it brings

brings forth the *Suralis*, which is beſtowed upon the muſcle of the *Sura*, or calf of the leg, and upon the skin of the inner ſide thereof, and of the foot, continued ſometimes even to the inner part of the great toe. *Suralis vna.*

Fourthly, under the head of the hinder appendix of the bones of the leg, it produces between theſe two bones, another vein, which nouriſhing the fore-muſcle of the leg, is conſumed upon the foot.

Fifthly and laſtly, it brings forth the *Iſchiadica major*, or greater *Iſchias*, which is divided into two branches of an unequal bigneſs; the larger whereof, from his original deſcending alongſt the inner part of the leg-bone, inſinuates it ſelf under the muſcles of the calf, between this and the heel, into the ſole of the foot, upon which it is waſted, divided into ten ſmall ſprigs, two for each toe; the other being the leſſer deſcending alongſt the *Perone*, or ſhin-bone, is conſumed between it and the heel, yet ſometimes it is produced, not only even to the muſcle the *Abductor* of the toes, but alſo by five ſurcles, even to the fourth toe, and the ſides of the middle toe. *Iſchiadica major.*

CHAP. XXXII.

The Diſtribution of the Crural Artery.

THe Crural Artery ariſing from the ſame place whence the Crural vein proceeded, and deſcending with the internal Crural Vein, is diſtributed as followeth:

Firſt, into the muſcle of the thigh, which ſpreading it ſelf through the muſcles thereof meets with the utmoſt *hypogaſtrica*, deſcending with the vein through the common hole of the huckle and ſhare-bone, and is joyned with it *Arteria muſcula.*

Secondly, when it arrives at the ham, between the *Condyles*, or proceſſes of the leg, it ſends two branches into the knee.

Thirdly, a little after it produces another branch, which it ſends to the exterior muſcles of the leg; and when it arrives at the middle of the leg, it is divided into two branches, between the Twin-muſcles and *Soleus*, the one internal, the other external; the internal, ſome ſurcles communicated by the way to the parts by which it paſſes, but ſpecially to the joynt of the ankle, ſtretches it ſelf over the ſole of the foot, between the lower extremity thereof and heel; whither when it arrives, it is divaricated into five ſurcles, of which it beſtows two on the great toe, two on the next, and one on the middle toe. The external deſcending in like manner to the ſole of the foot, between the *Fibula* and the heel, beſides other ſprigs, which it may ſpread by the way, it produces one without on the joynt of the ankle, another in the muſcle, the *Abductor* of the toes; to the wriſt and back of the foot. But the remainder is divided into five portions, of which two are ſent to the fourth, and two to the little toe, and one to the middle.

CHAP. XXXIII.

Of the Nerves of the Loins, Holy-bone and Thigh.

THere ariſe five Conjugations of Nerves from the Loins, divided into external and internal branches; the external are diſſeminated into the *Rachitæ*, or chin-muſcles, the muſcles *Semiſpinatus* and *Sacer*, and skin lying over them. The internal are ſent into the oblique aſcendent and tranſverſe-muſcle of the lower belly, into the *Peritonæum*, into the loin and cheſt-muſcles ariſing there, but after a different manner; for ſome are abſolutely carried thither, as the nerves of the firſt conjugation of the loins, and oftentimes alſo of the ſecond, but that ſometimes they ſend a ſmall ſprig to the teſticles, when the coſtal have ſent none thither; but ſome lower are partly diſtributed there, and partly ſent ſome other way; for the greater portions, firſt united amongſt themſelves, then preſently with the portion of thoſe of the holy-bone, go into the thigh, as we ſhall ſhew in the diſtribution of the nerves of the holy-bone. The five conjugations of the nerves of the loins. Where the teſticles have their nerves.

Now from the holy-bone, proceed ſix conjugations of nerves, reckoning that for the firſt which proceeds from the laſt *Vertebra* of the loins, and firſt of the Holy-bone, and that the ſixth which proceeds from the loweſt part of the holy-bone, and the firſt of the Rump. Theſe Conjugations of nerves are divided into external and internal branches. The conjugation of the nerves proceeding through the holy-bone.

The leſſer external paſſing forth by the external and hinder holes of the holy-bone, are diſtributed into the parts properly belonging thereto, to wit, the muſcles and skin thereof; for every nerve by the Law of Nature, firſt and always yields to the neighbouring parts, that which is needful, then preſently to others as much as it can. An Anatomical axiom.

Wherefore if thou wouldſt know whence each part hath his veſſels at the next hand, that is, the veins, arteries, and nerves, thou muſt remember the ſite of each part, and the courſe of the veſſels, and to conſider this, that the veins and arteries, as ſpeedily and conveniently as they can, inſinuate themſelves into the parts, ſometimes at the head or beginning, ſomewhiles by the middle or extremes thereof, as there is occaſion.

But a nerve principally enters a muſcle at the head thereof, or at leaſt not far from thence, but never by the tail, whereby it may eaſily be underſtood by what branch of each vein, artery, and nerves, each part may have nouriſhment, life and ſenſe. The other internal branches of the foreſaid conjugations go, eſpecially the four uppermoſt united from their original with the three lowermoſt of the loins, into all the legs, as you ſhall preſently hear. But the two lower are conſumed upon the muſcles called *Levatores Ani*, the *Sphincter*-muſcle of the ſame place; beſides,

upon

upon the muſcles of the yard, and neck of the bladder in men, but in women upon the neck of the womb and bladder.

For theſe parts admit another in their bottom from the coſtal nerve, being of the ſixth conjugation of the brain: Theſe thus conſidered, let us come to the nerves of the thigh, which (as we ſaid) from their firſt original, as it were compacted and compoſed of the greater portion of the three inner and lower branches of the loins, and the four upper of the holy-bone, are divided in the thigh into four branches, of which the firſt and higher deſcending from above the *Peritonæum*, to the little *Trochanter*, is waſted upon the inward and ſuperficiary muſcles of the thigh, and the skin which covers them a little above the thigh.

The ſecond, deſcending with the crural vein and artery by the groin, is divided into two branches like as the vein, the one internal, the other external; of which the internal deſcending with the vein and artery is ſent into the inner and deep muſcles of the thigh, ending above the knee. But the external deſcending ſuperficially with the *Saphæa*, even into the foot, gives branches by the way to the skin which covers it.

The third ſeated under theſe former, paſſing by the hole common to the ſhare and hanch-bone, ſends certain branches to the groins, to the muſcles called *Obturatores*, to the *Tricipites*, and ſometimes to the muſcles of the yard, and ends at the midſt of the thigh.

The fourth, which is the thickeſt, ſolideſt, and hardeſt of all the nerves in the body, deſcending wholly from the productions of the holy-bone, and deſcending outwardly, between the lower part of the ſame bone, and the *Os Ilium*, or hanch-bone to the thigh, beſtows certain ſprigs to the hind-muſcles thereof proceeding from the protuberation of the *Iſchium*, or huckle-bone, and in like ſort it gives other ſome to the skin of the buttocks, and alſo to the skin covering the forementioned muſcles.

A little after, it is parted into two branches deſcending undivided even to the bending of the knee, they both are communicated by divers ſurcles of the muſcles of the leg; yet ſo as the leſſer produces another branch from the reſt of the portion thereof deſcending on the fore-part of the leg, alongſt the ſhin-bone unto the top of the foot, where it is divided into ten ſurcles ſcarce apparent to the ſight, two running to each of the toes. The other greater, deſcending in like manner in the remainder of its portion by the hind-part of the leg into the ſole of the foot, caſts it ſelf with the veins and arteries between the heel and leg bone, where firſt divided into two branches, each of which preſently parted into five, ſend two ſprigs to the ſides of the toes. And theſe are the moſt notable and neceſſary diſtributions of the veſſels and nerves; we purpoſely omit others which are infinite, and of which the knowledg is impertinent.

CHAP. XXXIV.

Of the proper parts of the Thigh.

HAving explained the common parts of the leg in general: Now we muſt come to the proper, beginning at the thigh. The proper parts of the thigh, are muſcles, bones and ligaments. But becauſe the demonſtration of the muſcles is ſomewhat difficult, if we be ignorant of the deſcription of the bones from whence they ariſe, and into which they are inſerted; therefore we judg it worth our labour, firſt to ſhew the bones, and the dearticulation of theſe of the thigh; beginning with thoſe bones which are knit with the upper part of the holy-bone.

Of how many bones the *Oſſa Ilium* conſiſt.

And they are two in number, on each ſide one, commonly called the *Oſſa Ilium*; each of theſe is compoſed of three bones; of which one is the upper, another the lower and anterior, and the third the middle, and after a manner the poſterior. The upper by a particular name is called the *Os Ilium*, the hanch-bone, and it is the largeſt and biggeſt, having a griſtly Appendix in the compaſs thereof, even to the connexion it hath with the other neighbouring bones, whoſe upper part we term the right line thereof; but the *baſis*, which is adjoyned to it by *Symphyſis*, we call the lip, or brow thereof, becauſe it ſtands both ſomewhat out and in, after the manner of the brow.

What the *Os Ilium* ſtrictly taken is.

What the line, lip, brow and rib of the *Os Ilium* are.

But that which lies between the *baſis* and ſtrait line, we name the Rib; this ſame upper bone hath two hollow ſuperficies, the one internal, the other external. The connexion thereof by *Symphyſis*, is twofold, the one with the upper part of the holly-bone; the other, with that bone we called the middle, and after ſome ſort the poſterior; which taking its beginning from the narrower part of the *Os Ilium*, makes that cavity in which the head of the thigh is received; this cavity the *Greeks* call *Cotyle*, the *Latins Acetabulum*, and it is ended by the ſide of the hole common to it, and the ſhare-bone; this middle, and in ſome ſort poſterior-bone, is called properly and particularly the *Os Iſchii*, or huckle-bone, and contains nothing elſe but the fore-mentioned cavity; but, that on the hinder and lower part thereof, it brings forth a proceſs, which adjoyns it ſelf to the ſhare-bone at the lower part of the common hole, in which place it appears very rough and unequal, and it is called the Tuberoſity of the huckle-bone, at whoſe extremity alſo it brings forth a little head ſomewhat reſembling the proceſs of the lower jaw called *Corone*.

The *Os Iſchium*, or huckle-bone.

The third bone named *Os pubis*, or the ſhare-bone, ſtretches it ſelf even to the higheſt part of the *Pecten*, where meeting with the like bone of the other ſide, it is united to it by *Symphyſis*, after which manner alſo, all theſe three bones are united. It is reported, that this bone opens in women in their travel, yet hitherto I can find no certainty thereof.

The *Os pubis* or ſhare-bone.

You may perceive a manifeſt ſeparation of theſe three bones in the *Sceleton* of a child; for in thoſe who are of more years, the griſtles which run between theſe connexions turn into bones.

Now follows the thigh-bone, the biggeſt of all the bones of the body; it is round, and ſo bended, that it is gibbous on the exterior and fore-part thereof, that ſo it might be the ſafer from

The deſcription of the thigh-bone.

external

external injuries; but on the hind and inner part, it is hollow, or sinous, like to the back of an Ass, whereby the Muscles might have a more commodius original and insertion.

That sinous part a little below the midst thereof, is divided into two lines, the one whereof goes to the internal tuberosity, the other to the external of the lower appendix of the same thigh. These are chiefly to be observed, because the oblique fibers of the vast muscles, thence take their original.

Besides, this bone hath two appendices in the ends thereof, as easily appears in a childs thigh; the upper appendix makes the round head of the thigh it self, which (as every other appendix) seated upon a long neck, is received in the cavity of the hanch-bone, by *Enarthrosis*; it is stayed and fastned there by two sorts of ligaments, of which the one is common, proceeding from the muscles, which descend from above, about the neck thereof; the other is proper, which is two-fold, that is, one membranous and broad, proceeding from the whole cavity of the orb, or cup, descending about all the head of the thigh, above the neck thereof; the other thick and round, descending from the second cavity of the *Cotyle* it self, which is extended, even to the common hole at the top of the head thereof. The two Appendices of the thigh-bone.

Besides, under this head, that bone hath two processes, the one great and thick, the other little and short. The two processes of the thigh-bone make the two *Trochanters*.

The greater seated in the hind-part, is called the great *Trochanter*; the lesser situate in the inner part, is named the little *Trochanter*.

But you must note, that the greater *Trochanter*, on the higher and hind-part thereof, which looks towards the head of this bone, makes a certain small *sinus*, or bosom, into which the Twin-muscles and others, whereof we shall hereafter speak, are implanted; we must also consider the multitude of holes encompassing this neck, between the head and the two *Trochanters*; which yield a passage to the vessels, that is, the veins, arteries and nerves, into the marrow of the bone it self, whence the marrow it self becomes partaker of sense, especially on that part which is covered with a coat, and the bone lives and is nourished. Whence the marrow becomes partaker of sense.

The Figure of the Thigh Bone.

The other Appendix of the thigh, that is, the lower, is the greateſt and thickeſt; riſing, as it were, with two heads, which are divided by two cavities, the one ſuperficiary, and on the foreſide, whereby it receives the whirl-bone of the knee; the other deep, and on the back-part, by which it receives the griſtly, and, as it were, bony-ligaments, proceeding from the eminency, which is ſeen, between the two cavities of the upper Appendix of the bone of the Leg, which *Hippocrates lib. de Fracturis*, calls in his tongue *Diaphyſis*.

CHAP. XXV.

Of the Muſcles moving the thigh.

Their number. THE muſcles of the thigh are juſt fourteen in number; that is, two bend it, whereupon they are called *Flexores*, or benders; three extend it, whereupon they are called *Tenſores*, extenders; three move it inwards, driving the knee outwards, and drawing the heel inwards, as when we croſs our legs; yet ſome make theſe three one, and call it the *Triceps*, or three-headed muſcle. Six ſpread it abroad, and dilate it, as happens in the act of Venery.

Four of theſe are called *Gemini*, or Twins, by reaſon of the ſimilitude of their thickneſs, original inſertion, and action; the two other are called *Obturatores*, becauſe they ſtop the hole which is common to the ſhare and back-bone.

The two *Flexores.* Now one of the two *Flexores*, being round, deſcends on the inſide with fibers of an unequal length from all the tranſverſe proceſſes of the loins, above the hind-commiſſure of the hanch and ſhare-bones, and is inſerted into the little *Trochanter*; the other broader and larger from the original paſſes forth of the whole lip, and inner brow of the hanch-bone, and filling the inner cavity thereof, is inſerted above the fore-part of the head of the thigh, into the little *Trochanter* by a thick tendon, which it with the fellow muſcle lately deſcribed, produces even from the fleſhy part thereof, wherefore you need to take no great pains in drawing, or plucking them away.

The three *Tenſores.* The three *Tenſores*, or Extenders, make the buttocks, of which the firſt being the thicker, larger, and external, ariſing from the rump, the holy-bone, and more than half of the exterior and hinder lip of the hanch-bone, is inſerted by oblique fibers, ſome four fingers breadth from the great *Trochanter* at the right-line, which we ſaid, reſembled an Aſſes back.

The ſecond, which is the middle in bigneſs and ſite, deſcends from the reſt of the hip, and from the fore and outward rib of the hanch-bone, and, above the midſt of the bone, is inſerted into the upper part of the great *Trochanter*, by a triangular inſertion above the upper and exterior part thereof.

The third being leſſer, ſhorter and thinner, lying hid under theſe former, proceeds from the middle of the external ſurface of the hanch-bone; and then is inſerted into the greater part of the right line of the great *Trochanter*.

Theſe three muſcles have a great and large original, but a narrow inſertion, as it were, by oblique fibers.

Three *Intromoventes.* Then follow thoſe three muſcles which move the thighs inwards, ſtraiten and croſs them, ſo that the knee ſtands forwards, or outwards, but the heel is drawn inwards, as you may underſtand by their inſertion, although ſome think otherwiſe. But theſe three muſcles by their original, partly fleſhy, and partly membranous, ariſe from the upper and fore-part of the circumference of the ſhare-bone, and thence are inſerted into the hind-line of the huckle-bone, ſome higher than otherſome; for the leſſer and ſhorter ſtays at the roots of the little *Trochanter*, the middle deſcends a little deeper, the third with the longeſt of his fibers, deſcends even to the midſt of the line.

This, if it be ſo, that is, theſe muſcles proceeding from the fore and upper part, to be inſerted into the hinder-line of the huckle-bone, whilſt they alone perform their action, and draw the thighs together, they will turn them outwards, juſt ſo as when we put them a-croſs, but they will not draw one heel to another, and put the heel outwards, for ſuch like motion is performed by the inner vaſt muſcle of the thigh, moving the leg. Now follow the ſix which move the buttocks.

The movers of the buttocks. The firſt and higher of the *Quadragemini*, or the four Twin-muſcles, paſſes forth of the commiſſure of the holy-bone, with the bone of the rump, or rather, from the loweſt extream of the holy-bone, and thence it is inſerted into the cavity of the great *Trochanter* by a tendon of a ſufficient largeneſs.

The ſecond proceeding from the hollow part, or fiſſure, which is between the extremity of the huckle-bone, and the tuberoſity or ſwelling out of the ſame, is inſerted in like manner into the cavity of the great *Trochanter*.

The third aſcends from the inner part of the ſwelling out of the huckle-bone, a little above, between the two *Trochanters*, into the cavity of the greater of them.

The fourth and laſt, the loweſt and broadeſt of them all, proceeds from all the exterior protuberancy of the huckle-bone, and thence is inſerted into the great *Trochanter*, and theſe four muſcles lie hid under the thick and more eminent part of the buttocks; wherefore, that you may the better ſhew them, they muſt be turned up towards their original.

The two *Obturatores.* The two *Obturatores* remain to be ſpoken of, that is, the internal and external, both which ariſe from the circuit and circumference of the hole which they ſtop, which, as we ſaid, is common to the ſhare and huckle-bone, but the internal aſcends to the exterior root of the great *Trochanter*, by

by the middle fiſſure between the upper part of the protuberancy of the huckle-bone, and the ſpine which ſtands up in the hinder baſis of the hanch-bone.

But the external proceeds from the exterior cavity, and the middle ſpace between the tuberoſity of the huckle-bone, and cavity thereof, and is inſerted into the lower part into the cavity of the great *Trochanter*, together with the *Quadragemini*.

If you would plainly ſee the exterior *Obturator*, you muſt either cut off the beginning of the three-headed muſcle, or handſomely pluck it away, and then extend it, and turn it up; the internal is eaſily diſcerned when the bladder is taken away.

CHAP. XXXVI.

Of the Bones of the Leg or Shank.

THoſe which would deſcribe the muſcles of the leg, ought firſt to deſcribe the bones thereof, beginning at the *Rotula*, or whirl-bone of the knee. What the *Patella* or whirl-bone of the knee is.

This bone is griſtly on the out-ſide, and round in compaſs, but on the inner and middle part after ſome ſort gibbous, but ſomewhat flatted at the ſides, that ſo it may be fitlier applied to the joynt of the knee, and fitted within the anterior cavity of the two appendices of the thigh, and the upper and fore-moſt of the leg.

The uſe thereof is to ſtrengthen the joynt of the knee, and to hold the leg at his due extent, ſo that it may not be bended ſo far forwards, as it is backwards. The uſe thereof.

The bones of the leg are two; the one thicker, called by the particular and proper name, the *Os Tibiæ*, or leg-bone; the other which is leſſer, is termed *Perone*, or *Fibula*, but commonly the leſſer *focile*, (and in Engliſh it may be termed the ſhin-bone) The thicker being hollow and marrowy, is ſeated in the inner part of the leg, having two proceſſes, the one bigger, the other leſs. What, and how many bones the leg hath. The leg bone.

The bigger ſeated on the upper-part of the bone, and conjoyned to it by *Symphyſis*, makes two ſuperficial and ſide cavities disjoyned by an indifferent riſing; wherefore this bone is connext to the bone of the thigh by *Ginglymos*. For in the cavities thereof it receives the lower and hinder protuberances of the appendix of the thigh-bone, but the middle eminency thereof, is received by it between the two protuberances thereof.

This joynt is ſtrengthned, not only by the force of the tendons, or muſcles ending there, but alſo of three ſtrong ligaments; of which, one proceeds from all the external; another from all the internal parts of that connexion; the third, which we out of *Hippocrates*, called *Diaphyſis*, from the diſtance or ſpace between them. The other proceſs of the leg-bone, which we called the leſs, ſeated in the lower part thereof, makes, as it were, a double cavity, whereby it receives the *Aſtragalus*, or paſtern-bone; but on the inſide it makes the ankle, as the *Perone* makes it without: Between theſe ankles the *Aſtragalus* is received on the ſides, and turned as the nut in a Croſs-bow, as often as there is need to bend or extend the foot. Beſides, this ſame leg-bone, being triangular, hath three eminencies made in the ſhape of an Aſſes back; the ſharper deſcends alongſt the fore-part, called by the Greeks *Anticnemion*; the ſecond reſides on the inner-part; and the third on the outer: All theſe muſt be diligently obſerved, and chiefly, that on the fore-part; becauſe it is as a guide and rule to a Chirurgeon in the well-ſetting of a broken leg. What *Diaphyſis* is. The *Perone*, or ſhin-bone, is ſeated, as it were, on the out-ſide, and as behind the leg-bone; it hath alſo two appendices hollow on the inſide, but gibbous on the out. This bone by the upper of theſe is faſtned and inſerted under the inner, and in ſome ſort the hinder appendix of the leg-bone, ſo that it is in no ſort articulated with the thigh, but ſerves only inſtead of a leaning-ſtock. But by the lower, this ſame bone is not only received in the loweſt part of the leg, or ankle, or paſtern-bone, but alſo receives part thereof, which is joyned on the ſame ſide with the heel, eſpecially then when we bend our foot outwards. The *Perone*, *fibula*, or ſhin-bone.

This bone is faſtned to the fore-mentioned bones by *Synarthroſis*, but bound by ſtrong ligaments proceeding from the ſame bones, and mutually ſent from one to another, or, if you had rather, from the upper into the lower, as we ſaid in the arm. But this ſame *fibula*, or ſhin-bone is alſo triangular, having three lines; of which one ſtands outwards, and another on the foreſide, and the third behind.

CHAP. XXXVII.

Of the Muſcles of the Legs.

ALL the motions of the leg, are performed by eleven muſcles, of which there be ſix on the fore-ſide, and five on the hind. But of theſe, ſome move the leg only, as thoſe which take their original from the bone of the thigh; others truly move the leg, but with the thigh, as thoſe which ariſe above the thigh, that is, from the hanch, huckle and ſhare-bones. Their number.

The firſt of theſe on the fore-ſide, called the long, but commonly the *Sutorius* (or Tailor-muſcle, by reaſon of its action) it ariſes from the lower and fore-extremity of the ſpine or appendix of the hanch-bone, and deſcending obliquely above the other muſcles, is inſerted by a large and membranous tendon, in the fore and inner part of the leg under the knee; the action thereof is to croſs the legs, but being firſt bended by the muſcles preſently to be treated of, it helps alſo the three-headed muſcle in the performance of the fore-mentioned action. The *Longus*.

The ſecond of theſe four muſcles is termed the *Membranoſus*, or membranous, becauſe it is wholly ſuch, unleſs at the original where it deſcends fleſhy from the root and baſis of the above-mentioned ſpine of the hanch-bone, and that obliquely with its membranous and broad tendon The *Membranoſus*.

(mixed with the common coat of the muſcle) into the outward part of the leg, which it moves outwards, as alſo the thigh with the four twin-muſcles; for, as we have in another place obſerved, of two oblique motions concurring in one, is made a right motion; and beſides, almoſt all the motions of the body are thus performed; the muſcles which perform ſuch motions are placed and oppoſed in an oblique ſite, as may be perceived by the motions and ſite of the muſcles of the hand taken in general.

The *Rectus.* The third, called the *Rectus*, or Right (becauſe it deſcends above the *Crureus*, alongſt the right fore-line of the thigh, between the two vaſt muſcles) comes forth between the extremity of the appendix of the hanch-bone and cavity thereof, with a very ſtrong ligament, and then is inſerted into the fore-part of the leg, paſſing over the midſt of the whirl-bone of the knee; it extends the leg, with the three following, but by accident it may help the bending of the thigh.

The two *vaſti.* The fourth and fifth are called *Vaſti*, vaſt or huge muſcles, by reaſon of their largeneſs, the one of theſe is internal, the other external: They both ariſe with right fibers, from their original, but with oblique at their inſertion, by reaſon whereof they both ſeem to have a compound action from a right and oblique motion; the right helping for the extenſion of the leg, but the oblique to draw one knee to another, or to disjoyn both the knees; the internal comes by its right fibers from the root of the little *Trochanter*, but by its oblique from the inner deſcendent line of the thigh. The external paſſes forth by its right fibers from the root of the great *Trochanter*, but by the oblique from the external deſcendent line of the ſame bone. But all theſe fibers are in certain places ſo mixed with the *Crureus*, that they cannot be ſeparated unleſs you violate the one of them; they go into the leg (each on his ſide) above the whirlbone of the knee alongſt the ſides of the right muſcle, with which it makes an unſeparable tendon, as you ſhall preſently hear.

The *Crureus.* The ſixth and laſt of theſe fore-muſcles called *Crureus*, or thigh-muſcle (by reaſon of the ſtrait and firm adheſion, which it hath with the thigh-bone, which is by ſome called *Crus*) from the ſpace between the two *Trochanters* deſcends under the right muſcles, and two vaſt muſcles into the fore-part of the thigh, even to the whirl-bone of the knee. But we muſt note, that theſe four laſt muſcles make a common thick and broad tendon, with which they cover the *Patella*, or whirl-bone, and all the fore dearticulation of the knee, that they cannot be ſeparated without tearing; wherefore we muſt think, that this tendon ſerves the knee for a ligament: Now all theſe muſcles performing their action together, extend the leg. The five hind-muſcles follow to be ſpoken of; of which three ariſe from the tuberoſity of the huckle-bone, going into the inner part, the fourth from the middle of the *Pubis* called *Biceps*, that is, the two-headed muſcle into the outſide of the Leg. Of the internal, one paſſing from the fore-mentioned

The three internal. tuberoſity, deſcends ligamentous even into the midſt of the thigh, and then becoming fleſhy, is inſerted by its tendon, after the manner we formerly mentioned.

The other being ſlender, paſſing forth alſo from the ſame place, with its tendon, is inſerted with the tendon of the long-muſcle, and ends in the inner part of the leg, which with its companion, it draws inwardly, and brings to the other, which ſame thing it performs in the thigh, by the help of the three-headed muſcle.

The third being the inner, or hinder, deſcends from the middle part of the ſhare-bone, with a broad and ſlender ligament, and is inſerted with a round tendon, into the inner part of the leg after the manner of the fore-mentioned.

The *Biceps*, or two-headed muſcle. The fourth called *Biceps* takes one of the two heads, of which it conſiſts, from the laſt mentioned tuberoſity, the other from the outer line of the thigh, but is inſerted into the external part of the leg, as we formerly ſaid.

The *Popliteus* or ham-muſcle. The fifth and laſt called the *Popliteus* deſcends obliquely fleſhy from the external condyle or knot of the thigh, into the inner and hinder part of the leg, at the joyning thereof to the ſhin-bone; the action thereof is, to draw the leg, after a manner inwards.

CHAP. XXXVIII.

Of the Bones of the Foot.

THe order of Anatomy requires, that we now proſecute the muſcles moving the foot; but becauſe we ſhould in vain deliver their inſertion, the diſpoſition and condition of the bones of the foot not being firſt known, therefore it firſt behoves us, to ſet forth their deſcription. Therefore the bones of the foot are ſix and twenty in number, diſtinguiſhed into three ranks; that is, the bones of the *Tarſus*, or inſtep, are ſeven; thoſe of the *Pedium*, the after-wriſt, or back of the foot five; and thoſe of the toes, fourteen. Of the ſeven bones of the inſtep, there are four named, and three unnamed. The firſt of the named immediately following the bones of the leg, is called *Aſtragalus*, the paſtern or ankle bone. This hath three connexions, one, as we ſaid before, in the upper and broader part, with the bones of the leg, of which it is received; the other in the lower and hind-part, by which it receives the upper and inner proceſs of the bone of the heel; the third on the fore-ſide, by which it is received in the cavity of the *Os Naviculare*, or *Scaphoides*, that is, the boat-like bone. By the firſt connexion the foot is extended and bended; by the ſecond it is moved with the heel to the ſides: The two firſt connexions are by *Diarthroſis*, the laſt by *Synarthroſis*. But it is ſtrengthned by ſtrong and broad ligaments, deſcending and aſcending from one bone into another; alſo they are ſtrengthned by membranes, muſcles and tendons, deſcending to the foot, above and under theſe joynts. But this bone hath three proceſſes, as three feet, faſtned to the bone of the heel; of which the firſt and leaſt is under the out-ankle; the bigger (which *Galen* ſaith, makes a round head, faſtned on a long neck) looks towards the fore-part of the foot, over againſt the great toe, and the next toe to it; the middlemoſt is at the heel, behind the leg-bone.

Their number. The bones of the inſtep. The *Aſtragalus* its three connexions and their uſe.

Its three proceſſes.

I paſs over in ſilence many other things; as, the ſmoothneſs and aſperity, or roughneſs of the bone, which I had rather you ſhould learn by ocular Inſpection, than by Book. The ſecond bone lying under this is called the *Calcaneum*, or heel-bone, being the biggeſt of all the bones of the foot, upon which all the body relies when we go. It hath two upper proceſſes, the one great, the other little. The great is received in the hind and outer proceſs of the *Aſtragalus*; the leſſer is received on the inſide in the third proceſs of the ſame bone, the which we ſaid had a round head faſtned to a long neck. Beſides, it is round on the hind-part, and much diſ-joyned from the leg-bone, but on the fore and longer part, it is knit by *Synarthroſis* to the die-bone, whoſe lower and inner part it ſeems to receive; the ſuperficies thereof is wholly unequal, and riſing up with many ſwellings. On the inner ſide, it makes, as it were, a channel, ſo to give way, as well to the veſſels as tendons going to the ſole of the foot and toes. Laſtly, we muſt conſider the holes by which the veſſels paſs into that bone to give it nouriſhment; by reaſon of which veſſels the fracture of this heel-bone, is very dangerous, becauſe of the preſſing and contuſion of the veſſels; as *Hippocrates* ſhews. For the ligaments of this heel, or heel-bone, they are ſuch, as thoſe of the *Aſtragalus*, to wit, tendons, membranes and ligaments properly ſo called, coming from one bone to another. The third bone of the foot is named *Scaphoides*, or Boat-like, from the reſemblance it hath to a Boat, for on that part which looks towards the Paſtern-bone, it is hollow; but on that part which is next the three *Innominata*, or nameleſs bones (which it ſuſtains, and of which it is received, as it in the cavity thereof receives the head of the *Aſtragalus*) it is gibbous like the bottom of a Boat The connexions thereof are by *Synarthroſis*, and they are ſtrengthned by the fore-mentioned ligaments: This ſame bone is arched on the upper part, but ſomewhat hollowed or flatted below; the inner part ends in a point, like the prow of a ſhip, but the outer obtuſe like the ſtern of a ſhip. The fourth bone of thoſe which have names, is called *Cuboides*, from the reſemblance of a Die; although that ſimilitude be very obſcure. On the fore-part it ſuſtains the toes, which by a certain proportion to the fingers of the hand, may be called the ring and little toes; but it is ſuſtained on the hind-part, with the back-part of the heel; on the inner ſide it is joyned with the Boat-like bone, and that nameleſs bone which ſuſtains the middle toe; on the out-ſide it produces a riſing like the back of an Aſs, which on the lower part is extended tranſverſly all the length thereof; at the two ſides of this eminency, or riſing, there are two ſmall cavities, in form of a channel.

The firſt and the greater of the *Oſſa innominata*, or nameleſs bones, ſuſtains the great toe; the leſſer and ſecond, the next toe thereto; the third and middle in bigneſs, the middle toe. Theſe three bones are arched on their upper part, but ſomewhat hollowed below. They are knit to the three fore-mentioned bones by *Synarthroſis*, of which they are received; but on the hind-part with the Boat-like bone which they receive. Now we muſt come to the bones of the ſecond rank, that is, of the *Pedium*, or back of the foot; theſe are five in number, bearing up the five bones of the toes. They are ſomewhat gibbous on the upper part, but hollow below; each of them hath two proceſſes at the end thereof, by the lower and firſt of which they receive the three nameleſs and die-bone, but by the upper made into a round head, they are received of the firſt bones of the toes. Their connexions, whether with the toes, or bones of the inſtep, are by *Synarthroſis*. The ligaments as well proper as common are ſuch, as we ſaid of the former. The bones of the third order now remain to be ſpoken of, which, we ſaid, makes the toes; and they are fourteen, two of the greater toe, but three of each of the other toes. The firſt is ſomewhat longiſh, but the reſt are very ſhort, except that of the great toe, all of them on the upper ſide are round and convex; but on the lower ſomewhat hollow, and plain-wiſe, that the tendons which bend them, may paſs more ſtaitly and ſafely without inclining to either ſide, even to their furtheſt joynts; although ſuch paſſages are much helped by the membranous and common ligament, which riſing from the ſides of theſe bones, involves theſe tendons, as we mentioned in the fingers. To conclude, each of theſe bones, the laſt excepted, have a double connexion by *Diarthroſis*, they are all unequal in their bigneſs, that is, thick at their beginning (where they receive the heads of the precedent bones, upon which they move as a door upon the hinges) and ſo they grow ſmaller towards the ends; but by their ends, they are received of the following bones: At their ends they riſe into two eminencies on their ſides, diſtinguiſhed by a cavity between them, through which occaſion they are far thicker at their ends, than in their middle. The Ligaments by which their connexions are faſtned, are ſuch as the former. The *Oſſa ſeſamoidea* or ſeed-bones of the feet, are like in number and ſite to thoſe of the hands. But this is to be noted, that thoſe ſeed-bones which are in the firſt Articulation are ſomewhat bigger than the reſt, and they are round and longiſh on the out-ſide, but ſmooth and hollow on the inſide, ſeated between two cavities, encompaſſed by three riſings, of which two are on the ſides, and the third in the midſt of the extremity of the firſt bone of the *Pedium*, which chiefly bears up the great toe. To conclude, before we come to ſpeak of the Muſcles, we muſt obſerve, that the foot was made for two commodities. The firſt is, to ſtay and bear the whole body, when we ſtand, for which cauſe Nature ſet not the great toe contrary to the other, as it placed the thumb on the hand. The other is for apprehenſion, or taking hold of; wherefore Nature framed and made the foot, and theſe moveable and joynted in the toes, as in the fingers of the hand. Beſides alſo, for that we muſt go upon our feet, Nature hath made them in ſome places hollow on the lower ſide, and in other ſome plain in a triangular figure, that ſo our feet may carry us over every ſoil, plain, mountainous, equal and unequal, through all parts of the world.

CHAP.

CHAP. XXXIX.

Of the Muſcles moving the Foot.

THe muſcles of the leg moving the foot are abſolutely nine, three in the fore-part, and ſix in the hind. Two of three fore-muſcles bend the foot, when they joyntly perform their action; but when ſeverally, each draws it to his ſide; the third chiefly extends the toes, for otherwhiles it ſeems by its ſlenderer and longer tendon (which exceeds not that bone of the *Pedium*, which ſuſtains the little toe) to help alſo to bend the foot. Their number.

The firſt is called *Peronæus*, becauſe it deſcends alongſt the bone *Perone*. The other the *Tibiæus anticus*, for that it deſcends along the *Os Tibiæ*, or bone of the leg. The third from its action is called the *Digitum-tenſor*, or Toe-ſtretcher. For their original, the *Peronæus* which ſeems to have two heads, deſcends from the upper appendix of the *Perone*, or ſhin-bone by its firſt head, but by the other from the middle of the ſame bone from the fore-ſide into the hind, as the ſuperficies ſhews which paſſes between the fore and outward line of the ſaid bone; but after it arrives at the lower and hinder appendix of the ſame bone, behind the outer ankle, it produces two tendons, which by the guidance of the ligaments, as well proper as common, go the thicker under the ſole of the foot, ending in the die-bone, and that bone of the *Pedium* which ſuſtains the great toe; the leſſer goes on the out-ſide to the die-bone; and the laſt and leaſt bone of the *Pedium* which bears up the little toe, ſometimes a ſlender portion thereof is produced even to the ſide of the little toe, extending and drawing it from the reſt. *Muſculus Peronæus.*

The *Tibiæus anticus* or fore-leg muſcle proceeding from the upper and outer appendix of the leg-bone deſcends above the ſurface of the ſame bone, which is between the four and outer-line to which it adheres, as alſo to that ſurface even to the midſt, from which place it produces one tendon, which deſcending on the fore and loweſt part, ends on the out-ſide into two of the nameleſs bones, that is, into the firſt which is the thicker, and into the middle-moſt; but beſides, by a ſlender portion thereof, it is extended into the firſt and greater bone of the *Pedium*, ſo to extend the great toe, drawing it inwards to the other foot. And this muſcle with the precedent bends the foot, if they both perform their parts at once; but if ſeverally, each draws the foot towards his ſide. *Tibiæus anticus.*

The third, which is the *Digitum-tenſor*, or Toe-ſtretcher, is twofold; the one takes its original from the top of the leg, and running alongſt the ſhin-bone, and paſſing under the ring, carries it ſelf into the foot, in which it ends by five tendons going to all the joynts of the toes, and by a ſixth at that bone of the *Pedium* which ſuſtains the little toe, whereby (as we formerly ſaid) it helps the bending of the foot. The other deſcends into the midſt of the ſhin-bone, and ſomewhat faſtned thereto, by one tendon paſſing under the ring, it goes to the great toe. But you muſt note, that all theſe tendons have nervous, ligamentous, and fleſhy fibers ſo ſeparated from each other, that they can equally alone perform their function, as if they were more diſtinct muſcles. And we muſt think the ſame of the reſt which have diſtinct tendons preſently from their fleſhy part. The Toe-ſtretcher is two-fold.

The ſix hind-muſcles follow: of which the two firſt are called the *Gemelli*, or Twins, by reaſon of the ſimilitude of their thickneſs, original, inſertion and action. The third is called the *Plantaris*, becauſe it is ſpent upon the ſole of the foot, as the *Palmaris* upon the palm of the hand. The fourth is termed the *Soleus*, or ſole-muſcle, by reaſon of the reſemblance it hath to the fiſh of that name. The fifth the *Tibiæus poſticus*, or hind-leg muſcle, which deſcends alongſt the back-part of the leg-bone. The ſixth and laſt the *Digitum-flexor*, or Toe-bender, equivalent to the deep muſcle of the hand. Some make but one muſcle of this, and the *Tibiæus poſticus*, which produces three tendons; others had rather make three, as thus, that one ſhould be the *Tibiæus*, the other the bender of four toes, the third the bender of the great toe. The ſix hind muſcles.

Now for the two *Gemilli*, or Twins, the one is internal, the other external; the internal paſſes forth from the root of the inner Condyle of the thigh; but the external from the external Gondyle; and from this their original preſently becoming fleſhy, eſpecially on the out-ſide, they meet together a little after in their fleſhy parts, and with the *Soleus* they make the thick and great tendon at the midſt of the leg, which from thence is inſerted into the back-part of the heel; in this very tendon, breed painful kibes. The action thereof is, to help our going by putting forth the foot, whilſt it draws the heel towards its original. The two *Gemelli* or Twin-muſcles. In what place the kibes breed.

The *Plantaris* the leaſt and ſlendereſt of them all, paſſes forth fleſhy from the outward head of the leg-bone, and from thence the ſpace of ſome four fingers breadth it ends in a ſtrong and ſlender tendon, which it ſends between the twin and ſole muſcles to the ſole of the foot, there to produce a membrane which covers the ſole of the foot, and a muſcle equivalent to the upper bender of the hand. The *Plantaris.*

The *Soleus*, or ſole-muſcle, the thickeſt of them all, and ſeated under the Twin-muſcles, deſcends from the Commiſſure of the leg and ſhin-bones, and about the midſt of the leg, after it hath mixed his tendon with that of the twin-muſcles, it runs into the foreſaid place that it may extend the foot for the foreſaid uſe. The *Soleus.*

The *Tibiæus poſticus* deſcends from the hinder appendix of the leg and ſhin-bones, and adhering to them almoſt as far as they go, by a ſtrong tendon, being, as it were, bony at the end thereof it is inſerted into the Boat-like bone, and the two firſt nameleſs bones; ſo to help the oblique extenſion of the foot. The *Tibiæus poſticus.*

The laſt being the *Digitum-flexor*, or Toe-bender, is two-fold; for one ariſes from the leg-bone, in that place where the *Poplitæus* ends, and inſerted into that ſame bone, it goes even to the back-ſide of the inner ankle, and from thence into the joynts of four of the toes. The other draws his original from almoſt the middle of the ſhin-bone, and ſomewhat inſerted into it, it goes by the The *Digitum-flexor* twofold.

heel and paſtern-bone to the great toe, mixed with the precedent; their action is to bend the firſt joynt of the toes, rather by the force of the common ligament, than by the ſmall portion of the tendon which ends there. But it is their action to bend the laſt dearticulation of the toes by their proper inſertion.

CHAP. XL.

Of the Muſcles moving the toes of the Feet.

Their number.

NOw follow the muſcles moving the toes; theſe are eight in number, one on the upper, and ſeven on the lower ſide. The firſt proceeds from the paſtern, heel, and die-bones below the external ankle, or the ligament of theſe bones with the leg-bone; and obliquely ſtretched to the top of the foot, is parted into five ſmall tendons to the ſides of the five toes, ſo to draw them outwards towards it original, whereupon it is called the *Abductor* of the toes, and alſo *Pedioſus*, becauſe it is ſtretched over the *Pedium*, or back of the foot.

The *Abductor* of the toes or *Pedioſus*.

The *Flexor ſuperior*.

The firſt of the ſeven of the lower ſide called the *Flexor ſuperior*, or upper-bender, ariſes from the heel; and ſtretched alongſt the foot under the ſtrong membrane (which from the heel is ſtraitly faſtned to the extremity of the bones of the *Pedium*, to ſtrengthen the parts contained under it) is inſerted by four tendons, at the ſecond joynt of the four toes which it bends. Here you muſt note, that near the inſertion thereof, this muſcle divides it ſelf, like that muſcle of the hand which is called *Sublimis*, that ſo it may give way to the deep, which (as we ſaid) deſcends alongſt the fingers, to which a certain common membranous ligament adjoyns it ſelf, which involves and faſtens it to the bone all alongſt the lower part of the fingers, even to the laſt dearticulation.

The muſcle equivalent to the *Thenar*.

The ſecond equivalent to that muſcle of the hand which is called *Thenar*, ſeated on the inner ſide of the foot, ariſes from the inner and hollow part of the heel and paſtern-bones, and ends in the ſide, and inner part of the great toe, which it draws from the reſt inwards: This may be divided into two or three muſcles, as the *Thenar* of the hand, to draw the great toe to the reſt, as much as need requires, juſt as we ſaid of the hand. The third anſwerable to that of the hand which is named the *Hypothenar*, paſſes from the outer part of the heel, and aſcending by the ſides of the foot, it is in like manner inſerted into the ſide of the little toe, ſo to draw it from the reſt; to which ſame action, a certain fleſh contained under the ſole of the feet may ſerve, which is ſtretched even to theſe toes, that alſo it may ſerve to hollow the foot.

The four *Lumbrici*.

The four *Lumbrici*, or wormy-muſcles follow next, which from the membrane of the deep toe-bender, are inſerted into the inner and ſide part of the four toes, ſo to draw them inwards by a motion contrary to that which is performed by the *Pedioſus*.

The deſcription of the upper and lower *Interoſſes*.

The *Interoſſes* or bone-bound muſcles of the *Pedium* or back of the foot, remain to be ſpoken of: Theſe are eight in number, four above and as many below, different in their original, inſextion and action: For the upper, becauſe they draw the foot outwards with the *Pedioſus*, ariſe from the fore and inner part of that bone of the *Pedium*, which bears up the little toe (and ſo alſo the reſt each in its order) are inſerted into the outward and fore-part of the following bone. The lower, on the contrary, paſs from the four and outer part of that bone of the *Pedium*, which bears up the great toe (and ſo each of the reſt in its order) but are inſerted into the inner and upper part of the following bone, ſo with the wormy-muſcles to draw it inwards, or to hollow the foot outwards, or to flat the foot, as we ſaid of the *Interoſſes* of the hand.

An Epitome, or brief recital of the bones of a mans Body.

The bones of the skull fourteen.

THe whole head which hath the leaſt, conſiſts of ſixty bones; but that which hath moſt, of ſixty three; that is, fourteen of the *Cranium* or skull, fourteen or ſeventeen of the face, and thirty two teeth: Of the bones of the skull there be eight containing, and ſix contained; the containing are, the *Os frontis*, or forehead-bone, the nowl-bone, the two bones of the *Synciput*, the two ſtony-bones, the wedg-bone, and the ſive-like or ſpongy-bone. But the contained are ſix, ſhut up in the cavity of the ears, the anvil, hammer and ſtirrop.

The bones of the face fifteen.

For the bones of the face, there are ſix within or about the orb of the eye, that is, on each ſide three; two bones of the noſe, two leſſer jaw-bones, and two bigger, which are always in beaſts ſeen diſtinguiſhed by a manifeſt difference, but it is ſo rare in men, that I have not found it as yet; therefore theſe only are diſtinguiſhed by manifeſt difference, two which contain all the upper teeth, the two inner of the palate, the two of the lower jaw in children; and laſt of all the *Os Criſtæ*, whence the middle griſtle or partition of the noſe ariſes.

The teeth thirty two.

The two and thirty teeth are equally diſtributed in the upper and lower jaws; and of theſe there be eight ſhearers, four fangs or dog-teeth, and twenty grinders.

The bone *Hyoides*.

And there is another bone at the root of the tongue called *Os Hyoides*, always compoſed of three bones, ſometimes of four.

The bones of the ſpine thirty four.

Now follow the bones of the ſpine, or back-bone, which are juſt four and thirty, that is, ſeven of the neck, twelve of the cheſt, five of the loins, ſix of the holy-bone, and four of the rump. Beſides, there are two bones of the throat, or collar-bones.

Two collar-bones.

The ribs twenty four.

The ribs are twenty four, that is, fourteen true, and ten baſtard ribs.

The bones of the *Sternon* three.

The bones of *Sternon*, or breaſt-bone moſt frequently three, otherwhiles ſeven, as ſometimes in young bodies.

The bones of the whole arm ſixty two.

Hence coming to the arm there are reckoned ſixty two, beginning with the ſhoulder-blade; as

there

there are two ſhoulder-blades, two arm-bones, four bones of the cubit, that is, two ell-bones, and two wands, ſixteen of the wriſt, eight of the after-wriſt, and thirty of the fingers; into this number alſo come the *Seſamoidea*, or ſeed-bones, of which ſome are internal, and theſe always twelve at the leaſt, although ſometimes there may be more found, a great part of which rather merit the name of griſtles, than bones; there are others external, if we believe *Sylvius*.

The firſt ſheweth the fore-part of the Sceleton of a man, &c.

The Declaration of theſe three Figures put into one.

A 3 *The coronal ſuture called in Greek* στεφανιαία.

B 2 3 *The ſuture like the letter* λ, *called* λαμβδοειδὴς.

C 2 *The ſagittal ſure called* ὀβελιαῖα.

D 2 3 *The ſcale-like* Conjunction *called* λεπιδοειδὴς.

α 2 3 Os verticis, *or* Syncipitis, *the bone of the* Synciput, *called* Os βρέγματος.

1 3 *The forehead bone, that is* μετώπη.

γ 2 3 *The bone of the nowl or* ἰνίς.

δ 2 3 *The bones of the temples or* μεθιαφῶν.

ε 3 *An appendix in the temple-bone like a bodkin*, σπιλοειδὴς.

ζ 1 2 3 *A proceſs in the temple-bone like the teat of a dug, called therefore* Mammillaris *and* μαστοειδὴς.

E 2 3 *The wedg-bone*, σφηνοειδὲς.

η 3 *The ſtony part of the ſkull.*

θ 3 *A proceſs of the wedg-bone much like the wing a Bat, and therefore called* πτερυγοειδὴς.

Now remain the bones of the leg, which (if we reckon the *Oſſa Ilium*, on each ſide three, as in young bodies it is fit it ſhould) they are ſixty ſix, beſides the ſeed-bones, that is to ſay, two hannch-bones, two ſhare-bones, two huckle-bones, two thigh-bones, two whirl-bones of the knees, four of the leg, that is, two leg-bones, and two ſhin-bones. Fourteen of the inſtep, as two heel, two paſtern, boat-like, two die, and ſix nameleſs bones. Ten of the *Pedium*, or back of the foot, that is, five in each foot, and twenty eight of the toes; and as many ſeed-bones in the feet, as the hands enjoy. But I have thought good to add theſe Figures for the better underſtanding of what hath been ſpoken hereof. The bones of the whole leg ſixty ſix.

The

The ſecond and third Figure ſheweth the brck-ſide of the Sceleton. and the lateral part of the Sceleton.

F 1 2 3, *The yoke-bone,* ζύγπμα. G 1 3 *The lower jaw.* IKLMN 1 2 3 *The back or the ſpine* ῥαχίς. *From* I *to* K *the neck,* τραχηλος. *From* K *to* L *the rack-bones of the cheſt. From* L *to* M *the rack-bones of the loins. From* M *to* N *the holy-bone,* ἱερὸν. N *The rump-bone,* κόκκυξ. O 1 3 *The breaſt-bone,* στέρνον. P 1 3 *The ſword-like griſtle of the breaſt,* ξιφοειδὴς. *Char.* 1 3, *as far as to* 12, *in all, three Tables, ſhew the twelve ribs of the cheſt,* πλευραί. Q 1 *The clavicles or collar-bones,* κλεῖδες. R 1 2 3 *The ſhoulder-blade,* ὠμοπλάτες. λ 1 2 3 *The upper pooceſs of the ſhoulder-blade, or the top of the ſhoulder, called* ἀκρώμιον. μ 1 3 *The lower proceſs of the ſhoulder-blade, called* ἀγκωνοειδὴς. S 1 2 *The bone of the arm, called* Humerus, *and* βραχίων. TV 1 2 3. *The cubit* πῆχυς. X 1 2 3 *The wand, or the upper bone of the cubit, called* κερκὶς. Y 1 2 3 *The ell or lower-bone of the cubit, called* πῆχυς. ν 3 *The proceſs of the cubit,* ὠλένοκρανον. ξ 1 3 *The proceſs like a bodkin, or probe, called* στυλοειδὴς. ZZ 1 2 3 *The wriſt,* καρπός. ΓΓ 1 3 *The after-wriſt,* μετακάρπιον. ΔΔΔ 1 *The fingers* δάκτυλοι. Θ 1 2 3 *The bones joyned to the ſides of the holy-bone, on each ſide diſtinguiſhed, as it were, into three parts.* ο 1 2 3 *The firſt part called the hanch-bone,* Os Ilium, λαγόνων. ϖ 1 2 3 *The ſecond part of the bone of the* Coxendix, ἰσχίον. ρ 1 2 3 *The third part of the ſhare-bone,* Os pubis, ἴβυς. σ 1 2 3. *A griſtle going between the conjunction of the ſhare-bones.* Λ 1 2 3 *The thigh,* μηρὸς. τ 1 2 3 *The greater outward proceſs of the thigh called* Rotator, τροχαντὴρ μέγας. υ 1 2 3. *His leſſer and inner proceſs.* Ξ 1 2 3 *The whirl-bone of the knee,* Patella Rotutula, ἐπιμύλις. Π Σ 1 2 3 *The leg,* κνήμη. Φ 1 2 3 *The inner and greater bone of the leg,* περόνιον. Ψ 1 2 3 *The utter and ſmaller bone of the leg, called the Brace-bone,* Fibula, περόνη. Φ 1 2 3 *The proceſs of the leg, or the inner ankle, called* Malleolus internus. X 1 2 *The proceſs of the brace of the outward ankle, both of them are called in Greek* σφυρὸν. Ω 1 2 3 *The bone called the Cock-all,* Talus, ba liſta, Os ἀστράγαλος. a 2 *The heel* Calx, πτέρνα. *b* 1 3 *The bone called* Os Naviculares, σκαφοειδὲς. cc 1 2 3 *The wriſt of the foot called* Tarſus, *conſiſting of four bones,* ταρσὸς. d e f 1 2 3 *Three inner bones of the wriſt of the foot called by ſome* χαλκοειδῆ. g 1 2 3 *The utter bone of the wriſt of the foot like a Die, called* κυβοειδὲς. h h 1 2 3 *The after-wriſt of the feet called* Pedium, *by ſome* μεταταρσος. ii 2 3 *The toes of the foot.* k 1 2 3 *The ſeed bones of the foot, called* officula ſeſamina, σησαμοειδῆ.

This

This Figure ſheweth the Sceleton *of the bones and griſtles of a Woman, that it may appear all her bones are in proportion leſſer than the bones of a man. But in this Figure, only thoſe parts are marked with letters wherein a Woman differeth from a Man in her bones and griſtles.*

A *The ſagittal ſuture deſcending into the noſe, and dividing the forehead-bone, which is ſometimes found in women, very rarely in men, but always in infants.*

BB *The cheſt ſomewhat depreſſed before, becauſe of the paps.*

CC *The collar bones not ſo much crooked as in men, nor intorted ſo much upward.*

D *The breaſt-bone perforated ſometimes with a hole much like the form of a heart, through which the veins do run outward, from the mammillary veins unto the paps.*

E *The griſtles of the ribs, which in women are ſomewhat bony, becauſe of the weight of the dugs.*

F *A part of the back reflected, or bent backward above the loins.*

G G *The compaſs of the hanch-bones running more outward, for the womb to reſt upon, when a woman is with child.*

HH *The lower proceſſes of the ſhare-bones, bearing outward, that the cavity marked with* K, *might be larger.*

I *The Anterior commiſſure or conjunction of the ſhare-bones filled up with a thick griſtle, that in the birth they might better yield ſomewhat for natures neceſſity.*

K *A great and large cavity circumſcribed by the bones of the Coxendix and the holy-bone.*

L *The rump or* coccyx, *curved backward to give way in the time of the birth.*

M *The thigh bones by reaſon of the largeneſs of the foreſaid cavity, have a greater diſtance betwixt them above, whence alſo it is that Womens thighs are thicker than Mens.*

CHAP. XLII.

An Epitome of the names and kinds of compoſure of the Bones.

BEcauſe it is as neceſſary for a Chirurgeon to know the manner of ſetting and repairing broken bones, as to put them in their places when they are diſlocated, or out of joynt; but ſeeing neither of them can be underſtood when the natural connexion of the bones is not known; I have thought it a work worth my labour, briefly to ſet down, by what and how many means the bones are mutually knit and faſtned together. The univerſal compoſure and ſtructure of all the bones in a mans body is called by the Greeks *Sceletos*. But all the bones are compoſed after two ſorts, that is, by *Arthroſis*, an Articulation or joynt, and by *Symphyſis* a natural uniting or joyning together. There are many other kinds of both theſe ſorts. For there are two kinds of Articulation, that is, *Diarthroſis*, or De-articulation, and *Synarthroſis*, or Co-articulation; which differ as thus, De-articulation is a compoſition of the bones with a manifeſt and viſible motion; Co-articulation hath a motion of the bones, yet not ſo manifeſt, but more obſcure. But theſe two, do again admit a ſubdiviſion into other kinds. For *Diarthroſis*, contains under it *Enarthroſis*, *Arthrodia*, and *Ginglymos*. Now *Enarthroſis* or Inarticulation is a kind of Dearticulation, in which a deep cavity receives a thick and long head, ſuch a compoſition hath the thigh-bone with the huckle-bone.

What the *Sceletos* is.

Two ſorts of Articulation.

What *Diarthroſis* and *Synarthroſis* are.

Three ſorts of *Diarthroſis*.

What *Enarthroſis* is.

Arthrodia is when a lightly engraven cavity admits a ſmall and ſhort head; ſuch a connexion is that of the arm-bone with the ſhoulder-blade; of the firſt *Vertebra* with the ſecond. The Greeks have diſtinguiſhed by proper names theſe two kinds of cavities and heads; for they call the thick and long head *Cephale*, that is, a head abſolutely; but the leſſer they term *Corone*, or *Coronon*, which the Latins call *Capitulum*, a little head. But they call a deep cavity *Cotyle*, and a ſuperficiary one *Glene*. The third ſort called *Ginglymos*, is when the bones mutually receive, and are received one of another; as when there is a cavity in one bone, which receives the head of the oppoſite bone, and alſo the ſame bone hath a head which may be received in the cavity of the oppoſite bone; ſuch a compoſure is in the cubit-knee, that is in the connexion of the thigh-bone. And thus much of Dearticulation and the three kinds thereof.

What *Arthrodia*.

What *Cephale* is.

What *Cotyle* is.

What *Glene* is.

What *Ginglymos*.

Synarthroſis, or Coarticulation, another kind of juncture, hath alſo three kinds thereof (*Gal. lib. de Oſſibus*) to wit, *Sutura*, *Gomphoſis* and *Harmonia*.

Three kinds of *Synarthroſis*.

Suture

What a *Suture* is.
What *Gomphoſis* is.
What *Harmonia* is.

Suture is a compoſition of the bones after the manner of ſewing things together, example whereof appears in the bones of the skull. *Gomphoſis* is when one bone is faſtened in another as a pin is faſtened in a hole, after which manner the teeth are faſtened in their ſockets in both the jaws. *Harmony* is when the bones are compoſed by the interpoſition of a ſimple line, after which manner many bones of the noſe and face are joyned together.

Hitherto we have ſpoken of the firſt conſtruction of the bones by articulation and the kinds thereof; now it follows we treat of *Symphyſis*.

What *Symphyſis* is.

Symphyſis or growing together, as we formerly ſaid, is nothing elſe, than natural union of the bones; ſuch union is made two manner of ways, that is, either by interpoſition of no other thing; after which ſort, in ſucceſs of time the bones of the lower jaw grow together, which formerly in children were manifeſtly diſtinguiſhed, or by the mediation of ſome *medium*; but that happens three manner of ways, by interpoſition of three ſeveral *Media*, as firſt of a griſtle, which kind of union the Greeks call *Syncondroſis*, after which manner the ſhare-bones grow together, and alſo ſome *Appendices* in young bodies; ſecondly, of a ligament, and it is named by the Grecians *Synneuroſis*, the name of a nerve being taken in the largeſt ſenſe; for ſometimes it is uſed for a tendon, otherwhiles for a ligament, otherwhiles for a nerve, properly ſo called, and which is the author of ſenſe and motion. But this *Symphyſis*, or union, hath place by *Synneuroſis*, or interpoſition of a nerve, in certain bones of the *Sternon* and hanch.

Syncondroſis.

Synneuroſis. The things ſignified by the word *Nerve.*

Synſarcoſis.

Thirdly, the bones grow into one by interpoſition of fleſh, called in Greek *Synſarcoſis*; thus the fleſh of the gums faſtens the teeth, and makes them immoveable. But if ſome be leſs pleaſed with this diviſion, by reaſon of the obſcurities in which it ſeems to be involved, this following expreſſion comes into my mind, which I was firſt admoniſhed of by *German Cortin* Doctor of Phyſick, which if you well obſerve it, is both blameleſs and more eaſie for your underſtanding.

An Epitome or brief recital of all the Muſcles of mans body.

As I have formerly reckoned up the bones, ſo here, I have decreed to recite the muſcles of mans body. Wherefore in the face we firſt meet with the broad or skin-muſcle ariſing from the fleſhy pannicle, and covering the whole neck, and almoſt all the face. Then follow four pertaining to the upper eye-lids. In the orbs of the eyes lie fourteen, that is, ſeven in each orb, of which four are called right, two oblique, and one pyramidal. Then ſucceed four of the noſe, two external, on each ſide one, and two internal; theſe draw it together, and the other open it. After theſe come the ten muſcles of the lower jaw, of which two are called the *Crotaphitæ*, or temporal; two *Maſſeteres* or grinders; two round (which ſeem to me rather to pertain to the lips, than to this jaw;) two little ones hid in the mouth, ariſing from the winged proceſs of the wedg-bone; two openers of the mouth being nervous or tendinous in their midſt. Then follow the eight muſcles of the lips, that is, four of the upper, and as many of the lower, ſhutting and opening the mouth. The tongue with his ten muſcles hid, as it were, in the den of the mouth. Wherefore the muſcles of the whole face are fifty one. In the four part of the neck are found the muſcles of the bone *Hyoides* and throttle: Now eight muſcles hold the bone *Hyoides* as equally ballanced; of which there are two upper ariſing from the chin, two on the ſides from the proceſs *Styloides*, perforated in their midſt, through which the two openers of the mouth in that part nervous do paſs; two ariſe from the *Sternon*, and laſtly, two from the upper rib of the ſhoulder-blade to the *Coracoides*, which alſo in their midſt are nervous, in which place the two *Maſtoidei* lye upon them.

The bones which as pillars ſuſtain the Fabrick of the whole Body; are either

- *United mutually by* Symphyſis, *or union; by which they are ſo conjoyned that there is no diſſimilar, nor heterogeneous body, at leaſt which may be diſcerned, interpoſed between them. Such union appears in the two bones of the lower jaw at the chin, in the bones of the* Sternon, *the hanch with the huckle-bones, and the ſhare-bones between themſelves; of this union there are no more kinds, for by this it cometh to paſs, that the bones which were more and diſtinct meet together by interpoſition of one* Medium, *to wit, a griſtle, which now indeed, is no griſtle, but is turned into a bone.*
- *Or Conjoyned by that which they call* Arthrodia, *or Articulation, as when they ſo concur and are bound together, that ſome Heterogeneous ſubſtance may be noted betwixt them, but the bones thus compoſed are knit two manner of ways; that is,*
  - *Either more looſly as by* Diarthroſis *that is a kind of Articulation not very ſtrait, as by which it might have opportunity to perform diverſe motions: Of this Compoſition or Articulation of bones there are three kinds; as,*
    - Enarthroſis, *when the head of a bone is wholly received in the cavity of another, and hid therein, as the thigh-bone is joyned with the huckle-bone.*
    - Arthrodia, *when in a lightly engraven and not much depreſſed cavity the head of another bone is not wholly hid, but onely received in part thereof; ſo that, unleſs Nature had otherwiſe provided a ſufficient receptacle for the head of this bone (as by the ligaments of the neighbouring muſcles) it would otherwiſe have been in perpetual danger of diſlocation. Thus the arm-bone is faſtened to the ſhoulder-blade.*
    - Ginglymos, *when the bones mutually receive each other; ſuch like compoſition hath the cubit and arm-bone.*
  - *Or more ſtraitly, as by* Synarthroſis *when the bones are more ſtraitly knit, ſo that they can perform no motions in the body. Of this Articulation there are alſo three kinds, that is,*
    - Gomphyſis, *as when one bone ſo receives another as a pin is faſtned in the hole made by a piercer; thus the teeth are faſtned in the jaws.*
    - Sutura, *like a Saw, or teeth of a Comb; as the bones of the skull are mutually knit together; or as Scales, or Tiles are laid, after which manner the ſtony-bones are faſtned to thoſe of the* Sinciput.
    - Harmonia, *which is by interpoſition of a ſimple-line, which parts bones abutting one upon another, as the bones of the noſe.*

The

The Throttle compoſed of three griſtles hath eighteen or twenty muſcles; of which ſix or eight are common, and twelve proper; Of the common there are two above, two below, and two at the ſides of the firſt griſtle; to which we may add thoſe two which ſerve for the opening of the *Epiglottis*, which are always found in great four-footed Beaſts for to preſs down the *Epiglottis*. The eighteen muſcles of the *Larinx*.

The proper are twelve, which almoſt all of them come from the ſecond griſtle, ſo to be inſerted into the firſt and third, of which ſome are before, others behind the *Thyroides*. Beſides, theſe are the *Maſtoidei* which bend the head.

But in the back part of the neck there are twelve muſcles alſo appointed for to move the head, ſo that in all there are fourteen muſcles ſerving for the motion of the head, the two fore *Maſtoidei*, and the twelve hind-muſcles, that is to ſay, the two *Splenii*, two *Complexi*, four right, and ſo many oblique, which are very ſhort, ſo that they paſs not beyond the firſt and ſecond *vertebra*. The head is moved by fourteen muſcles.

The neck hath eight muſcles, of which two are called the long, lying before upon the bodies of the *Vertebræ*; the two *Scaleni*, whichare at the ſides; the two *Spinati*, which run alongſt the ſpine; the two tranſverſe, which go to the tranſverſe proceſs of the cheſt. The eight muſcles of the neck.

The cheſt hath eighty one muſcles, of which ſome are on the fore-part, ſome on the hind, others on the ſides; they are all combined and coupled together, except the midriff. Now of theſe there are the two *Subclavii*; the two great ſaw-muſcles which proceed from the baſis of the ſhoulder-blade; the four little *Rhomboides*, or ſquare-muſcles, that is, two above, and two below; the two *Sacrolumbi*, the two binders of the griſtles within the cheſt. The muſcles of the cheſt eighty one.

Beſides, there are twenty and two external, and as many internal intercoſtal muſcles, twenty four *Intercartilaginei*, that is, twelve external, and as many internal; ſo that the intercoſtal, and *Intercartilaginei*, are ſixty eight, which with the twelve before mentioned, make the numbr of eighty muſcles. Add to theſe the midriff being without an aſſociate, and you ſhall have the number formerly mentioned, to wit, eighty one. But alſo, if you will add to theſe the muſcles of the lower belly, I will not much gain-ſay it, becauſe by accident they help inſpiration and exſpiration.

Wherefore of the eight muſcles of the *Epigaſtrium*, there are four oblique, of which two are deſcendent, and ſo many aſcendent; two right, to which you may add the two aſſiſting or pyramidal muſcles which come from the ſhare-bone, if it pleaſe you to ſeparate them from the head of the right muſcles. The eight muſcles of the lower-belly.

There are ſix or eight Muſcles of the Loins, of which two bend the Loins, which are the triangular; the two *Semiſpinati*; two *Sacri*; two are in the midſt of the back, which for that cauſe we may call the *Rachitæ*, or Chine-muſcles. Now, that hereafter we may ſeverally and diſtinctly ſet down the muſcles of the extreme parts, we will come to the privities. The ſix or eight of the loins.

Where for the uſe of the teſticles, there are two muſcles called the *Cremaſteres*, or hanging-muſcles. At the root of the yard, or *Peritonæum*, there are four others, partly for the commodious paſſing of the urin and ſeed, and partly for erecting the yard. The *Sphincter*-muſcle is ſeated at the neck of the bladder. The two cremaſters of the teſticles.

At the end of the right gut are three muſcles, two *Levatores Ani*, or lifters up of the fundament, and one *Sphincter* or ſhutting-muſcle. Now let us proſecute the muſcles of the extremities or limbs. But it will be ſufficient to mention only the muſcles of one ſide, becauſe ſeeing theſe parts of the body are double, thoſe things which are ſaid of the one may be applied to the other. The three of the fundament.

Wherefore the muſcles of the arm, beginning with theſe of the ſhoulder-blade, at the leaſt, are forty two, for there are four of the ſhoulder-blade: Of the arm properly or particularly ſo called, ſeven or eight; and there are three, four or five proper muſcles of the cubit; that is, appointed for the performance of the motions thereof; in the inner part of the cubit are ſeven, and as many in the outer; but thoſe of the hand are reckoned thirteen at leaſt. The muſcles of the arm in general forty two.

The four of the ſhoulder-blade are the *Trapezius*, reſembling a Monks Cowl, which moves it upwards and downwards, and draws it backwards; the ſecond is the *Levator*, or lifter up; the third the great *Rhomboides* lying under the *Trapezius*; the fourth, the leſſer ſaw-muſcle, which is inſerted into the *Caracoides*. The arm is moved forwards, backwards, upwards, downwards and circularly.

The pectoral muſcle ariſing from the clavicle, breaſt-bone, and neighbouring ribs, draw it forwards; the *Humilis*, or low-muſcle, coming from the lower-rib of the ſhoulder-blade draws it backwards; the *Deltoides* upwards, and the *Latiſſimus* downwards, and ſomewhat backwards. But the three ſeated about the ſhoulder-blade move it about, or circularly.

The *Epomis* or *Scapularis* upwards; the *Superſcapularis*, which may ſeem two, backwards and downwards; the *Subſcapularis* which is in the cavity of the ſhoulder-blade, forwards, ſo that by a certain viciſſitude and ſucceſſion of action, they move it circularly. Two muſcles bend the cubit, the one named *Biceps*, or two-headed, and the other *Brachiæus* or the arm-muſcle; but one, two or three muſcles extend it; for, if you have reſpect to the original, this muſcle hath two or three heads, but one only inſertion.

In the inſide of the cubit are ſeven muſcles, one *Palmaris*, two wriſt-benders, two *Pronatores*, one ſquare, another in ſome ſort round; two finger-benders, and one *Abductor*, or drawer aſide. Theſe fourteen internal and external muſcles of the cubit, do not indeed move the cubit, but only ſeated there move the wand, and with it the hand. Theſe are the thirteen muſcles of the hand; the *Thenar* which may not only be divided into two, but into ſix, not only by the divers actions it performs, but alſo by the branches divided by a manifeſt ſpace between them; the ſecond is called the *Hypothenar*, which lies under the little finger, as the *Thenar* doth under the thumb; the third is the *Abductor* of the thumb; then follow the four *Lumbrici* and ſix *Interoſſes*, although eight may be obſerved.

The whole leg hath at the leaſt fifty muſcles, for we reckon there are fourteen muſcles in the thigh, there are eleven made for the uſe of the leg; there are nine ſeated in the leg, three before, and ſix behind, which ſerve for the uſe of the foot and toes; in the foot are ſeated ſixteen. Therefore of the fourteen muſcles ſerving the thigh to bend it, one called the *Lumbaris*, the other ariſing from the cavity of the hanch-bone; but the three which make the buttocks and the *Triceps* or three-headed The muſcles of the leg in general fifty.

headed muſcle, (which if you pleaſe, you may divide into three) extend it. Beſides theſe, the four twin-muſcles, and two *Obturatores*, of which the one is internal, and the other external, turn the thigh about. The leg hath eleven; that is, the long, the membranous, the four *Poſtici*, or hind-muſcles (three of which come from the huckle-bone, but the other from the commiſſure of the ſhare-bone) the right, the two vaſt, the *Cruræus* or leg-muſcle, and the *Popliteus*, or ham-muſcle. Theſe ſeated in the leg for the uſe of the foot and toes, are three fore, and ſix hind-muſcles: Two of the fore bend the foot, one of which is called the *Tibiæus anticus*, the other *Peronæus*, which you may divide into two. The third the bender of the toes, although it alſo partly bend the foot, to which alſo the bender of the thumb may be revoked. One of the hind is the toe-bender, others extend the foot; and are in this order: Two twins, one *Plantaris*, one *Soleus*, one *Tibiæus poſticus*, and the great bender of the toes, to which may be revoked the bender of the thumb. Of the ſixteen ſeated in the foot, one is above, ſeated on the back of the foot, which we call the *Abductor* of the toes; another, in the ſole of the foot; to wit, the little bender of the toes, which goes to the ſecond joynt of the toes alongſt the inſide of the foot; the other lends his help to the great toe, which you call the *Abductor* of the thumb, another is ſeated on the outſide for the uſe of the little toe. To theſe are added the four *Lumbrici*, beſides the eight *Interoſſes*, or if you had rather ten. And thus much may ſuffice for the enumeration of the muſcles.

The Figure of the muſcles, when the Skin with its Veins, the Fat, and all the fleſhy membranes are taken away; that part of the fleſhy Membrane excepted, which takes upon it the nature of a muſcle, as being conjoyned with the muſcles.

a *The muſcle of the fore-head.*
b *the temporal muſcle.*
c *the muſcle ſhutting the eye-lid.*
d *the muſcle opening the wings of the noſe.*
e *the fore-part of the yoke-bone.*
f *the muſcle of the upper lip, tending to the noſe.*
g *the beginning of the maſſeter or grinding muſcle.*
h *the broad muſcle conſiſting of a fleſhy membrane.*
i k *the beginning thereof which riſes immediately from the collar-bone, and the top of the ſhoulder.*
l *that part thereof which bends forwards to* l.
m *the muſcle which lifts up the arm.*
n *the pectoral muſcle.*
o *the membranous part of this muſcle which is joyned to the nervous part of the firſt muſcle of the* Abdomen, *or belly.*
q q *the fleſhy portion thereof, from the ſixth and ſeventh ribs, and the inſertion thereof.*
r *the muſcle drawing down the arm.*
ſ *the oblique deſcending muſcle of the lower belly.*
t t t *the inſertion of the great ſaw-muſcle.*
u u *the* Linea alba, *or white-line, at which the two oblique deſcendent muſcles meet, covering the whole belly.* x *the yard, the ſkin being taken away.* y *the veſſels of ſeed.*

α *the teſticles wrapped in the fleſhy membrane.* β *the fore-muſcle bending the cubit.* γ γ *the hind muſcle bending the cubit.* δ *the muſcle extending the cubit.* ε *the two-headed muſcle extending the wriſt.* ζ *the muſcle producing the broad tendon on the back of the hand.* ζ *his tendon.* η *the muſcle turning up the wand.* θ *the upper muſcle flatting the wand.* ι *the ſecond of the arm-benders, whoſe beginning is* κ *and tendon* λ. ο *a portion of the muſcle, whereof one part yields tendons to the wriſt, the other to the thumb.* ϖ *the fleſhleſs articulation of the thumb.* ρ *a muſcle inſerted into the wriſt, lying near to the following muſcle.* σ *a muſcle divided into two tendons, the one whereof is inſerted into the firſt joynt of the thumb, the other into the following.* τ *the firſt muſcle of the thigh, whoſe head is at* υ, *and tendon at* Φ, *and inſertion at* χ. ψ *the end of the ſecond muſcle of the thigh.* ω *the end of the third muſcle of the thigh.* 1 *the ſixth muſcle of the leg; his beginning at* 2, *almoſt wholly membranous at* 3 .4 *the ninth muſcle of the leg.* 5 *the eighth of the leg.* 6 *a portion of the ſixth and ſeventh of the thigh.* 7 *the glandules of the groins.* 8 *the eighth of the thigh.* 9 *the ſecond of the leg.* 11 *the innermoſt of the ankle.* 12 *the ſixth muſcle of the foot, his original* 13. 14 *and* 15 *the ſeventh of the foot.* 16 *the tendon of the muſcle lifting up the great toe.* 17 *the muſcles extending the four other toes.* 18 *the abductor of the great toe,* 19 *a tranſverſe ligament.* 20 *a tendon of the ninth muſcle of the foot.* 21 *the firſt muſcle.* 22 *the fourth muſcle of the foot.* 23 *the tendon of the third muſcle.* 24 *a muſcle bending the third bone of the four leſſer toes.*

The end of the ſixth Book.

BOOK VII.

Of TUMORS *against* NATURE *in General.*

CHAP. I.

What a Tumour against Nature, vulgarly called an Impoſtume, is; and what be the differences thereof.

IN Impoſthume, commonly ſo called, is an affect againſt Nature, compoſed and made of three kind of Diſeaſes; diſtemperature, ill Conformation, and Solution of Continuity, concurring to the hindering or hurting of the Action. An humour, or any other matter, anſwering in proportion to a humour, aboliſhing, weakning, or depraving of the office, or function of that part or body in which it reſides, cauſeth it. What an Impoſtume vulgarly ſo called is. The material cauſes of Impoſtumes, or unnatural tumours.

The differences of Impoſtumes are commonly drawn from five things, Quantity, Matter, Accidents, the Nature of the part, which they affect or poſſeſs; and laſtly, their efficient cauſes. I have thought good for the better underſtanding of them, to deſcribe them in this following Scheme.

A Table of the differences of Tumors.

The differences of Impoſtumes are drawn principally from five things; that is,

- *From their Quantity, by reaſon whereof* Impoſtumes *are called*
  - *Great, which are comprehended under the General name of Phlegmons, which happen in the fleſhy parts, by* Galen, lib. de Tumor. contra Naturam, & lib. 2. ad Glauconem.
  - *Indifferent, or of the middle ſort, as* Fellons.
  - *Small, as thoſe which* Avicen *calls* Bothores, i.e. *Puſhes and Puſtules, all kind of Scabs and Leproſies; and laſtly, all ſmall breakings out.*
- *From their Accidents, as*
  - *Colour, from whence Impoſtumes are named, white, red, pale, yellow, blue or black, and ſo of any other colour.*
  - *Pain, hardneſs, ſoftneſs, and ſuch like; from whence they are ſaid to be painful, not painful hard, ſoft, and ſo of the reſt.*
- *From the matter, of which they are cauſed and made, which is either*
  - *Natural,*
    - *Hot, and that either*
      - *Sanguin, from whence a true* Phlegmon.
      - *Cholerick, from whence a true* Eryſipelas.
    - *Cold, and that either*
      - *Phlegmatick, from whence a true* Oedema.
      - *Melancholick, from whence a perfect* Scirrhus.
  - *Or,*
  - *Not Natural, which hath exceeded the limits of its natural goodneſs, from whence illegitimate Tumours, therefore*
    - *of a ſanguine humour,*
      - *Carbuncles, Gangrenes, eating-Ulcers, Sphacels are cauſed.*
    - *of a cholerick humour,*
      - *Of the groſſer, the eating* Herpes; *of the ſubtiler, the* Herpes miliaris *is made.*
    - *of a phlegmatick humour.*
      - *Watery and flatulent Impoſtumes, the Kings-evil, knots and all phlegmatick ſwellings and excreſcences.*
    - *of a melancholick humour.*
      - *The exquiſite or perfect* Scirrhus, *hardneſſes, and all ſort of cancerous Tumors.*
- *From the condition and nature of the parts which they poſſeſs, from whence the* Ophthalmia, *that is, a Phlegmon of the eyes.* Parotis, *a tumour near the ears.* Paronychia, *or a Whitlow, at the roots of the nails; and ſo of the reſt.*
- *From the efficient cauſes, or rather the manner of doing. For ſome Impoſtumes are ſaid to be made by defluxions, others by congeſtion; thoſe are commonly hot, and the other commonly cold, as it ſhall more manifeſtly appear by the following chapter.*

CHAP. II.

Of the general cauſes of Tumours.

THere are two general Cauſes of Impoſtumes, Fluxion, and Congeſtion: Defluxions are occaſioned, either by the part ſending, or receiving; the part ſending diſcharges it ſelf of the humours, becauſe the expulſive faculty reſident in that part is provoked to expel them; moved thereto, either by the troubleſomneſs of their Quantity or Quality. The part receiving, draws and receives occaſion of heat, pain, weakneſs, (whether natural or accidental) openneſs of the paſſages, and lower ſituation. After what manner tumours againſt Nature are chiefly made.

The cauſes of heat, in what part ſoever it be, are commonly three, as, all immoderate motion (under which frictions are alſo contained;) external heat, either, from Fire, or Sun; and the uſe of acrid Meats and Medicins. The cauſes of Heat.

The cauſes of Pain are four, the firſt is a ſudden and violent invaſion of ſome intemperate thing, by means of the four firſt qualities; the ſecond is, ſolution of continuity, by a Wound, Luxation, Fracture, Contuſion, or Diſtenſion; the third, is the exquiſit ſenſe of the part, for you feel no pain in cutting a bone, or expoſing it to cold or heat; the fourth is, the attention, as it were, of the Animal Faculty; for the mind, diverted from the actual cauſe of pain, is leſs troubled, or ſenſible of it. Four cauſes of Pain.

Two cauſes of weakneſs.

A part is weak, either by its Nature, or by ſome Accident: by its Nature, as the Glandules and the Emunctories of the principal parts; by Accident, as if ſome diſtemper, bitter pain, or great defluxion have ſeized upon it, and wearied it, for ſo the ſtrength is weakned, and the paſſages dilated. And the lowneſs of ſite yields opportunity for the falling down of humours.

Two cauſes of congeſtion.

The cauſes of congeſtion are two principally, as the weakneſs of the concoctive faculty, which reſides in the part, (by which the aſſimilation into the ſubſtance of the part of the nouriſhment flowing to it, is fruſtrated) and the weakneſs of the expulſive faculty; for, whileſt the part cannot expel ſuperfluities, their quantity continually increaſes.

And thus often times cold Impoſtumes, have their original from a groſs and tough humour, and ſo are more difficult to cure.

Laſtly, All the cauſes of Impoſtumes may be reduced to three; that is, the primitive or external; the antecedent or internal; and the conjunct or containing: as we will hereafter treat more at large.

CHAP. III.

The ſigns of Impoſthumes or Tumours in general.

The principal ſigns of tumours are drawn from the eſſence of the part.

BEfore we undertake the cure of Tumors, it is expedient to know their kinds and differences, which knowledge muſt be drawn from their proper ſigns, the ſame way, as in other Diſeaſes. But becauſe the proper and principal ſigns of tumours are drawn from the eſſence of the part they poſſeſs, we muſt firſt know the parts, and then conſider what their eſſence and compoſition are.

We are taught both by Skill in Anatomy, and the obſervation of the depraved Function, eſpecially when the affected part is one of thoſe which lie hid in the Body; for we know whether or no the external parts are affected with a Tumour againſt Nature, by comparing that with his Natural, which is contrary. For comparing the ſound part with the diſeaſed, we ſhall eaſily judge whether it be ſwollen or no.

But becauſe it is not ſufficient for a Chirurgeon only to know theſe general ſigns (which are known even to the vulgar) he muſt attentively obſerve ſuch as are more proper and near. And theſe are drawn from the difference of the matter and humours, of which the tumours conſiſt.

Lib. 2. ad Glauc. & 13. Method.

For this, *Galen* teaches, That all differences of Tumours ariſe from the nature and condition of the matter which flows down and generates the Tumour; alſo they are known by ſuch accidents as happen to them, as colour, heat, hardneſs, ſoftneſs, pain, tenſion, reſiſtance.

The proper ſigns of a ſanguin tumour, of a phlegmatick, of a melancholick, of a cholerick.

Wherefore pain, heat, redneſs, and tenſion, indicate a ſanguine humour; coldneſs, ſoftneſs, and no great pain, Phlegm; tenſion, hardneſs, the livid colour of the part, and a pricking pain by fits, Melancholy; and yelloviſh and pale colour, biting pain without hardneſs of the part, Choler.

The knowledge of tumors by their motion and exacerbation. *Lib. 2. Epidem.*

And beſides, Impoſtumes have their periods and exacerbations following the nature and motion of the humours of which they are generated. Wherefore by the motion and fits it will be no difficult matter to know the kind of the humor; for as in the Spring, ſo in the Morning the bloud is in motion; as in the Summer, ſo in the midſt of the Day, Choler; as in Autumn, ſo in the Evening, Melancholy; as in Winter, ſo in the Night the exacerbation of Phlegm are moſt predominant. For *Hippocrates* and *Galen* teach, that the Year hath Circuits of Diſeaſes, ſo that the ſame proportion of the exceſs and motion of humours, which is in the Four Seaſons of the Year, is alſo in the Four Quarters of each Day.

The begining of an Impoſtume. The increaſe. The ſtate.

Impoſtumes which are curable have Four Times; their beginning, increaſe, ſtate, and declination; and we muſt alter our Medicins according to the variety of theſe Times. We know the beginning by the firſt ſwelling of the part; The increaſe, when the ſwelling, pain and other accidents do manifeſtly increaſe and enlarge themſelves; The ſtate when the foreſaid ſymptoms increaſe no more, but each of them, becauſe at their height, remain in their ſtate immoveable, unleſs the very matter of the tumour degenerate, and change it ſelf into another kind of humour; The Declination, when the ſwelling, pain, fever, reſtleſsneſs, are leſſened. And from hence the Chirurgeon may preſage what the end of the tumour may be; for tumours are commonly terminated four manner of ways, if ſo be that the motion of the humours cauſing them be not intercepted, or they without ſome manifeſt cauſe do flow back into the body.

Therefore firſt they are terminated by inſenſible tranſpiration or reſolution; ſecondly, by ſuppuration when the matter is digeſted and ripened; thirdly, by induration, when it degenerates into a Scirrhus, the thinner part of the humour being diſſolved; the fourth, which is the worſt of all, by a Corruption and Gangrene of the part, which is, when overcome with violence, or the abundance or quality of the humour, or both, it comes to that diſtemper, that it loſes its proper action.

The ſigns of a tumor to be terminated by reſolution.

It is beſt to terminate a tumour by reſolution, and the worſt by corruption; ſuppuration and induration are between both, although that is far better than this. The ſigns by which the Chirurgeons may preſage that an Impoſtume may be terminated by reſolving, are the remiſſion or ſlacking of the ſwelling, pain, pulſation, tenſion, heat, and all other accidents, and the unaccuſtomed livelineſs and itching of the part; and hot Impoſtumes are commonly thus terminated, becauſe the hot humour is eaſily reſolved, by reaſon of its ſubtilty.

The ſigns of ſuppuration.

Signs of ſuppuration are the intenſion or increaſe of pain, heat, ſwelling, pulſation, and the fever; for according to *Hippocrates*, Pain and the Fever are greater when the matter is ſuppurating, than when it is ſuppurated.

The Chirurgeon muſt be very attentive to know and obſerve when ſuppuration is made, for the purulent matter oft-times lies hid (as *Hippocrates* ſaith) by reaſon of the thickneſs of the part lying above or over it.

The ſigns of an Impoſtume degenerating into a Scirrhous hardneſs, are the diminution of the

tumour

tumour and hardneſs remaining in the part. The cauſes of the hardneſs not going away with the ſwelling, are the weakneſs of Nature, the groſsneſs and toughneſs of the humour, and unskilfulneſs of the Chirurgeon, who by too long uſing reſolving things hath occaſioned, that the more ſubtil part of the humour being diſſolved, the reſt of the groſſer nature like earthy dregs remains concrete in the part. For ſo Potters Veſſels dried in the Sun, grow hard. But the unskilful Chirurgeon may occaſion a Scirrhous hardneſs by another means, as by condenſating the skin, and incraſſating the humours by too much uſe of repercuſſives. But you may perceive an Impoſtume to degenerate into a Gangrene thus, if the accidents of heat, redneſs, pulſation and tenſion ſhall be more intenſe than they are wont to be in ſuppuration, if the pain preſently ceaſe without any manifeſt cauſe; if the part wax livid or black; and laſtly, if it ſtink.

The ſigns and cauſes of a tumor terminated in a Scirrhus.

The ſigns of a Gangrene at hand.

But we ſhall treat of this more at large when we come to treat of the Gangrene and *Sphacelus*. A ſudden diminution of the tumour, and that without manifeſt cauſe, is a ſign of the matter fallen back, and turned into the body again, which may be occaſioned by the immoderate uſe of refrigerating things. And ſometimes much flatulency mixed with the matter, although there be no fault in thoſe things which were applied.

Of diſappearance of a tumor, and the ſigns thereof.

Fevers and many other malign Symptoms; as Swoundings and Convulſion, by tranſlation of the matter to the noble parts, follow this flowing back of the humour into the body.

CHAP. IV.

Of the Prognoſtick in Impoſtumes.

TUmors ariſing from a melancholy, phlegmatick, groſs, tough, or viſcous humour, ask a longer time for their cure, than thoſe which are of bloud or choler. And they are more difficultly cured which are of humours not natural, than thoſe which are of humours yet contained in the bounds of Nature.

Cold tumors require a longer cure.

For thoſe humours which are rebellious, offend rather in quality than in quantity, and undergo the divers forms of things diſſenting from Nature, which are joined by no ſimilitude or affinity with things Natural, as Suet, Poultis, Honey, the dregs of Oil and Wine; yea and of ſolid bodies, as Stone, Sand, Coal, Straws; and ſometimes of living things, as Worms, Serpents, and the like Monſters.

Tumors made of matter nor natural, are more difficultly cured.

The tumours which poſſeſs the inner parts and noble entrails, are more dangerous and deadly, as alſo thoſe which are in the joints, or near to them. And theſe tumors which ſeize upon great Veſſels, as Veins, Arteries, and Nerves, for fear of great effuſion of bloud, waſting of the ſpirits and convulſion. So Impoſtumes of a monſtrous bigneſs are often deadly by reaſon of the great reſolution of the ſpirits cauſed by their opening. Thoſe which degenerate into a *Scirrhus*, are of long continuance and hard to cure, as alſo thoſe which are in hydropick, leprous, ſcabby and corrupt bodies, for they often turn into malign and ill-conditioned Ulcers.

Hippo. Aph. 8. ſect. 6.

CHAP. V.

Of the general Cure of Tumors againſt Nature.

THere be three things to be obſerved in the cure of Impoſtumes. The firſt is the eſſence thereof; the ſecond, the quality of the humour cauſing the Impoſtume; the third, the temper of the part affected. The firſt Indication drawn from the Eſſence, that is, from the greatneſs or ſmalneſs of the Tumor, varies the manner of curing, for the Medicins muſt be increaſed or diminiſhed according to the greatneſs of the Tumor. The ſecond, taken from the nature of the humour alſo changes our counſel, for a *Phlegmon* muſt be otherwiſe cured than an *Eryſipelas* and an *Oedema*, than a *Scirrhus*; and a ſimple Tumor, otherwiſe than a compound. And alſo you muſt cure after another manner a Tumor coming of an humour not natural, than that which is of a natural humour; and otherwiſe that which is made by congeſtion, than that which is made by defluxion. The third Indication is taken from the part in which the Tumor reſides; by the nature of the part we underſtand its temperature, conformation, ſite, faculty, and function.

What muſt be conſidered in undertaking the cure of tumors.

What we muſt underſtand by the nature of the part.

The temperature indicates that ſome Medicins are convenient for the fleſhy parts, as thoſe which are more moiſt; others for the nervous, as more dry; for you muſt apply ſome things to the Eye, and others to the Throat; one ſort of things to theſe parts which by reaſon of their rarity are eaſily ſubject to defluxion, another to thoſe parts which by their denſity are not obnoxious to it.

But we muſt have good regard to the ſite of the part, as if it have any connexion with the great Veſſels, and if it be fit to pour forth the matter and humour when it is ſuppurated.

Galen by the name of Faculty underſtands the uſe and ſenſe of the part. This hath a manifold indication in curing, for ſome parts are principal, as the Brain, Heart, and Liver; for their vertue is communicated to the whole body by the Nerves, Arteries, and Veins.

What we muſt underſtand by the faculty of the part.

Others truly are not principal, but yet ſo neceſſary that none can live without them, as the Stomach. Some are endued with a moſt quick ſenſe, as the Eye, the Membranes, Nerves, and Tendons; wherefore they cannot endure acrid and biting Medicins. Having called to mind theſe indications, the indication will be perfected by theſe three following intentions, as if we conſider the humour flowing down, or which is ready to flow; the conjunct matter, that is, the humour impact in the part; the correction of accidents; yet ſo that we always have care of that which is moſt urgent and of the cauſe. Therefore firſt repercuſſives muſt be applied for the antecedent matter, ſtrong or weak, having regard to the Tumour as it is then, onely excepting ſix conditions of Tumors; the

What we muſt conſider in performing the Cure.

What things diſſwade us from uſing repercuſſives.

firſt is, if the matter of the tumour be venenate: the ſecond, if it be a critical abſceſs: the third, if the defluxion be near the noble parts: the fourth, if the matter be groſs, tough, and viſcid: the fifth, when the matter lies far in, that is, flows by the Veins which lies more deep: the ſixth, when it lies in the Glandules. But if the whole body be plethorick, a convenient diet, Purging, and Phlebotomy, muſt be appointed, frictions and bathes muſt be uſed. Ill humours are amended by diet and purging. If the weakneſs of the part receiving draw on a defluxion, it muſt be ſtrengthened.

If the part be inferiour in its ſite, let the Patient be ſo ſeated, or laid, that the part receiving, as much as may be, may be the higher. If pain be the cauſe of defluxion, we muſt aſſwage it by things mitigating it. If the thinneſs, or lightneſs of the humour cauſe a defluxion, it muſt be inſpiſſate by Meats and Medicins. But for the matter contained in the part, becauſe it is againſt Nature, it requires to be evacuate by reſolving things, as Cataplaſms, Ointments, Fomentations, Cupping-glaſſes; or by evacuation, as by ſcarifying, or ſuppurating things, as by ripening and opening the Impoſtume. Laſtly, For the conjunct accidents, as the Fever, Pain, and ſuch like, they muſt be mitigated by aſſwaging, mollifying and relaxing Medicins, as I ſhall ſhew more at large hereafter.

CHAP. VI.

Of the four principal and general Tumours, and of other Impoſtumes which may be reduced to them.

What tumors may be reduced to a Phlegmon. Which to an *Eryſipelas*. Which to an *Oedema*.

THE principal and chief Tumours which the abundance of humours generate, are four; a *Phlegmon*, *Eryſipelas*, *Oedema*, and *Scirrhus*: innumerable others may be reduced to theſe, diſtinguiſhed by divers names according to the various condition of the efficient cauſe and parts receiving. Wherefore a *Phygethlum*, *Phyma*, Fellon, Carbuncle, Inflammation of the Eyes, Squincy, *Bubo*, and laſtly, all ſorts of hot and moiſt tumours may be reduced to a Phlegmon. The *Herpes miliaris*, the eating *Herpes*, Ring-worms, and Tetters, and all Impoſtumes brought forth by choler, are contained under an *Eryſipelas*. *Atheromata*, *Steatomata*, *Melicerides*, the *Teſtudo* or *Talpa*, *Ganglion*, Knots, Kings-Evils, Wens, Watery Ruptures, the *Aſcites* and *Leucophlegmatia* may be reduced to an *Oedema*, as alſo all flatulent tumours, which the abundance of corrupt Phlegm produces.

Which to a *Scirrhus*.

In the kindred of the *Scirrhus* are reckoned a Cancer, Leproſie, Warts, Corns, a *Thymus*, a *Varix*, *Morphew* black and white, and other Impoſtumes ariſing from a Melancholy humour.

Now we will treat of theſe Tumors in particular, beginning with a Phlegmon.

CHAP. VII.

Of a Phlegmon.

What a true Phlegmon is. A Phlegmon one thing, and a phlegmonous Tumour another.

A Phlegmon is a general name for all Impoſtumes, which the abundance of inflamed bloud produces. That is called a true Phlegmon, which is made of laudable bloud, offending onely in quantity. But a Baſtard Phlegmon, or a phlegmonous Impoſtume hath ſome other, and proper name; as a Carbuncle, Fellon, Gangrene, Sphacel, and the like malign Puſtules. So when there is a conflux of divers humors into one tumor, divers kinds of phlegmonous Impoſtumes called by divers names, according to the more abundant humour, ariſe; as if a ſmall portion of Phlegm ſhall be mixed with a greater quantity of bloud, it ſhall be called an *Oedematous Phlegmon*; but if, on the contrary, the quantity of phlegm be the greater, it ſhall be named a phlegmonous *Oedema*, and ſo of the reſt; always naming the tumour, from that which is predominant in it.

Therefore we muſt obſerve that all differences of ſuch tumours ariſe from that, either becauſe the bloud cauſing it offends only in quantity; which if it do, it cauſes that tumor which is properly called a Phlegmon; if in quality, it makes a phlegmonous tumour, becauſe the matter thereof is much departed from the goodneſs of bloud.

But bloud is ſaid to offend in quantity, either by admixture of ſome other matter, as Phlegm, Choler, or Melancholy, from whence proceed *Oedematous*, *Eryſipelous*, and *Scirrhous* Phlegmons; or by corruption of its proper ſubſtance, from whence Carbuncles and all kinds of Gangrenes; or by concretion, and when Nature is diſappointed of its attempted and hoped for ſuppuration, either by default of the Air, or Patient, or by the errour of the Phyſician; and hence oft-times happen *Atheromaes*, *Steatomaes*, and *Melicerides*. Although theſe things be ſet down by the Ancients, of the ſimple and ſimilar matter of the true Phlegmon; yet you muſt know, that in truth there is no Impoſtume, whoſe matter exquiſitely ſhews the Nature of one, and that ſimple humour, without all admixture of any other matter; for all humours are mixed together with the bloud yet from the plenty of bloud predominating, they are called Sanguine, as if they were of bloud alone.

Wherefore if any tumours reſemble the nature of one ſimple humour, truly they are not of any natural humour, but from ſome humour which is corrupt, vitiated and offending in quality; for ſo bloud by aduſtion degenerates into Choler and Melancholy.

Gal. lib. de Tumoribus, &c. ad Glauc. Hippoc. lib. de Vuln. cap. Gal. lib. de Tumor. præter naturam.

Therefore a true Phlegmon is defined by *Galen*; A tumor againſt Nature, of laudable bloud, flowing into any part in too great a quantity.

This tumour, though moſt commonly it be in the fleſh, yet ſometimes it happens in the Bones, as *Hippocrates* and *Galen* witneſs.

A Phlegmon is made and generated thus: when bloud flows into any part, in too great a quantity; firſt the greater Veins and Arteries of the part affected are filled, then the middle, and laſtly, the ſmalleſt and capillary; ſo from thoſe thus diſtended, the bloud ſweats out of the pores and ſmall paſſages like dew, and with this the void ſpaces which are between the ſimilar parts are

firſt

firſt filled, and then with the ſame bloud all the adjacent parts are filled, but eſpecially the fleſh, as that which is moſt fit to receive defluxions, by reaſon of the ſpongious rarity of its ſubſtance; but then the nerves, tendons, membranes, and ligaments, are likewiſe ſtuffed full; whereupon a Tumour muſt neceſſarily follow, by reaſon of the repletion which exceeds the bounds of Nature; and from hence alſo are Tenſion and Reſiſtance; and pain alſo happens at the ſame time, both by reaſon of the tenſion and preternatural heat.

The cauſe of a beating pain in a Phlegmon

And there is a manifeſt pulſation in the part, ſpecially whileſt it ſuppurates, becauſe the Veins, Arteries, and Nerves, are much, being they are not onely heated within by the influx of the fervid humour, but preſſed without by the adjacent parts. Therefore ſeeing the pain comes to all the foreſaid parts becauſe they are too immoderately heated and preſſed, the Arteries, which are in the perpetual motion of their *ſyſtole & diaſtole*, whileſt they are dilated, ſtrike upon the other inflamed parts, whereupon proceeds that beating pain.

Hereunto add; The Arteries, then filled with more copious and hot bloud, have greater need to ſeek refrigeration by drawing in the encompaſſing air; wherefore they muſt as of neceſſity, have a conflict with the neighbouring parts which are ſwollen and pained. Therefore from hence is that pulſation in a Phlegmon which is defined by *Galen*, An agitation of the Arteries, painful and ſenſible to the Patient himſelf; for otherwiſe as long as we are in health, we do not perceive the pulſation of the Arteries. *Com. ad Aph. 21. Sect. 7.*

Wherefore theſe two cauſes of pulſation, or a pulſifick pain in a Phlegmon, are worthy to be obſerved, that is, the heat and abundance of bloud contained in the Veſſels and Arteries (which more frequently than their wont incite the Arteries to motion, that is, to their *ſyſtole* and *diaſtole*) and the compreſſion and ſtraitning of the ſaid Arteries, by reaſon of the repletion and diſtention of the adjacent parts, by whoſe occaſion the parts afflicted and beaten by the trembling and frequent pulſation of Arteries are in pain.

Another kind of Pulſation in a Phlegmon.

Hence they commonly ſay, that in the part affected with a Phlegmon, they feel, as it were, the ſenſe or ſtroke of a Mallet or Hammer ſmiting upon it. But alſo, beſides this pulſation of the Arteries, there is, as it were, another pulſation with itching from the humours whileſt they putrefie, and ſuppurate, by the permixtion, motion, and agitation of vapours thereupon ariſing.

The cauſe of heat in a Phlegmon is bloud, which whileſt it flows more plentifully into the part, is as it were, trodden or thruſt down, and cauſes obſtruction, from whence neceſſarily follows a prohibition of tranſpiration and putrefaction of the bloud, by reaſon of the preternatural heat. But the Phlegmon looks red by reaſon of the bloud contained in it, becauſe the humour predominant in the part ſhines through the skin.

CHAP. VIII.

Of the Cauſes and Signs of a Phlegmon.

The Primitive cauſes of a Phlegmon. The Antecedent and Conjunct.

THE Cauſes of a Phlegmon are of three kinds; for ſome are primitive, ſome antecedent, and ſome conjunct. Primitive are falls, contuſions, immoderate labour, frictions, application of acrid ointments, burnings, long ſtaying, or labouring in the hot Sun, a diet inconſiderate, and which breeds much bloud. The antecedent Cauſes are, the great abundance of bloud, too plentifully flowing in the Veins. The conjunct, the collection or gathering together of bloud impact in any part.

The ſigns of a Phlegmon.

The ſigns of a Phlegmon are, ſwelling, tenſion, reſiſtance, feveriſh heat, pain, pulſation, (eſpecially while it ſuppurates) redneſs, and others, by which the abundance of bloud is ſignified.

And a little Phlegmon is often terminated by reſolution, but a great one by ſuppuration; and ſometimes it ends in a Scirrhus, or a tumour like a Scirrhus; but otherwhiles in a Gangrene, that is, when the faculty and native ſtrength of the part affected, is over-whelmed by the greatneſs of the defluxion, as it is reported by *Galen*. The Chirurgeon ought to conſider all theſe things, that he may apply and vary ſuch Medicins as are convenient for the nature of the Patient, and for the time and condition of the part affected. *Gal. de Tum.*

CHAP. IX.

Of the Cure of a true Phlegmon.

What kind of Diet muſt be preſcribed in a Phlegmon.

THE Chirurgeon in the cure of a true Phlegmon muſt propoſe to himſelf four intentions. The firſt of Diet; This, becauſe a Phlegmon is a hot affect and cauſes a Fever, muſt be ordained of refrigerative and humecting things, with the convenient uſe of the ſix things Not-natural, that is, Air, Meat and Drink, Motion and Reſt, Sleep and Waking, Repletion and inanition, and laſtly, the paſſions of the mind. Therefore let him make choice of that air which is pure and clear, not too moiſt, for fear of defluxion, but ſomewhat cool; let him command Meats which are moderately cool and moiſt, ſhunning ſuch as generate bloud too plentifully, ſuch will be Broths not too fat, ſeaſoned with a little Borage, Lettuce, Sorrel, and Succory: let him be forbidden the uſe of all Spices, and alſo of Garlick and Onions, and all things which heat the bloud, as are all fatty and ſweet things, as thoſe which eaſily take fire. Let the Patient drink ſmall Wine, and much allayed with Water: or, if the Fever be vehement, the Water of the Decoction of Licoris, Barly, ſweet Almonds, or Water and Sugar; always having regard to the ſtrength, age, and cuſtom of the Patient.

For if he be of that age, or have ſo led his life that he cannot want the uſe of Wine, let him uſe it, but altogether moderately. Reſt muſt be commanded; for all bodies wax hot by motion, but let him chiefly have a care that he do not exerciſe the part poſſeſſed by the Phlegmon for fear of a new defluxion. Let his ſleep be moderate; neither, if he have a full body, let him ſleep by day, eſpecially preſently after meat. Let him have his belly ſoluble, if not by Nature, then by Art, as by the frequent uſe of Clyſters and Suppoſitories. Let him avoid all vehement perturbations of mind; as hate, anger, brawling; let him wholly abſtain from Venery.

How to divert the defluxion of humours.

This manner of diet thus preſcribed, we muſt come to the ſecond ſcope, that is, the diverſion of the defluxion, which is performed by taking away its cauſe, that is, the fulneſs and illneſs of the humours. Both which we may amend by purging and bloud-letting, if the ſtrength and age of the Patient permit.

The pain muſt be aſſwaged.

But if the part receiving be weak, it muſt be ſtrengthened with thoſe things which by their aſtriction amend the openneſs of the paſſages, the violence of the humour being drawn away by Cupping-glaſſes, Frictions, Ligatures. But if pain trouble the part, which is often the occaſion of defluxion, it muſt be mitigated by Medicins aſſwaging pain.

The third ſcope is, to overcome the Conjunct Cauſe. That we may attain to this, we muſt enter into the conſideration of the tumour, according to its times, that is, the beginning, increaſe, ſtate, and declination. For from hence the indications of variety of Medicins muſt be drawn. For in the beginning we uſe repercuſſives to drive away the matter of the Phlegmon flowing down, as the White of an Egg, Oxycrate, the Juices or Waters of Houſleek, Plantain, Roſes, Cataplaſms of Henbane, Pomgranate, Pills, Balauſties, Bole Armenick, *Terra ſigillata*, Oyl of Roſes, Quinces, Myrtils, Poppies.

When we muſt uſe repercuſſives.

Of theſe ſimples variety of compound Medicins ariſes. This may be the form of a Cataplaſm. ℞ *far. hordei* ʒ ij. *ſucci ſemper-vivi plantag. an.* ʒ iij. *pul. malicorii, balauſtiorum & roſar. an.* ʒ ij. *ol. myrtill. & roſar. an.* ʒ i. *fiat Cataplaſma.* Another, ℞ *Plantag. ſolani, hyoſcyam. an. m.* ij. *caudæ equin. tapſi barb. centinodiæ, an. m.* i. *coquantur perfectè in oxycrato, piſſentur, trajiciantur, addendo pulveris myrtil. nuc. cupreſſi. & roſ. rub. an.* ʒ iij. *farin. fab.* ʒ ij. *olei roſar. & cydon. an.* ʒ i ſs. mix them and make a Cataplaſm to the form of a liquid Pultis. And you may uſe this liniment, by dipping linen clothes in it, and applying to the part; ℞ *ol. nymph. & roſar. an.* ʒ iij. *aq. roſ. ſolani & plantag. an.* ʒ ij. *aceti* ʒ iij. *albumin. ovorum n.* iij. *fiat linimentum.* Alſo *ung. roſatum & ung. album, camphor. Raſis* are good to apply to it, as in like manner, *Emp. Diacalcitheos* diſſolved in Vinegar, and Oyl of Roſes and alſo *Populeon* may be uſed. In the increaſe, you muſt have care of the humour flowing down, and of that which already impacted in the part, did formerly fall down. Therefore repercuſſives muſt be tempered and mixed with diſcuſſing Medicins, but ſo, that they may carry the chief ſway, as, ℞ *Fol. malvæ, abſinth. plantag. an. m.* iij. *coquantur in oxycrato, contundantur, trajectis add. farinæ fabarum & hordei an.* ʒ i. *pul. roſar. rub. & Abſinth. an.* ʒ i. *ol. roſar. & chamæm. an.* ʒ. i. *fiat Cataplaſma ad formam Pultis ſatis liquidæ.* Another, ℞ *farinæ hord.* ʒ iij. *farinæ ſem. lini & fænugræci. an.* ʒ i. *coquantur in aqua communi addendo ſub. finem pul. myrtil. roſar. & chamæm. an.* ʒ ſs. *axungiæ anſeris & olei roſar. an.* ʒ i. *miſce, fiat Cataplaſma.*

What local Medicins we muſt uſe in the increaſe.

What in the ſtate.

But in the ſtate, the repercuſſives and diſcuſſives ought to be alike with ſome anodyns, or mitigating Medicins, if it be painful, as, ℞ *Rad. Altheæ* ʒ iv. *malvæ, parietar. an. m.* ij. *coquantur ſub cineribus, addendo farin. fabar. & lentium an.* ʒ ij. *pulveris cham. & meliloti an.* ʒ ß. *olei cham. & roſar. an.* ʒ i. *axungiæ gal.* ʒ ij. *fiat Cataplaſma.* Another, ℞ *Micæ panis triticei aquâ calidâ macerati* ℔ ß. *pulveris roſar. rub. & abſinth. ana* ʒ vj. *olei aneth. & mellis com. an.* ʒ ij. *Miſce omnia ſimul & fiat Cataplaſma ad formam Pultis ſatis liquidæ*; which is of chief uſe when there is pain.

What in the declination.

But when the violence of pain and other ſymptoms are aſſwaged, it is likely that the Phlegmon is come to determination. Wherefore then we muſt uſe more powerful and ſtrong diſcuſſives, and onely then; beginning with the more gentle, leſt the ſubtiler part of the humour being diſſolved, the groſſer, remaining in the part, ſhould grow hard, as, ℞ *Mal. biſmal. an. m.* iij. *coquantur, addendo farinæ hordei* ʒ ij. *mellis com.* ʒ i. *ol. chamæm. & melilot. an.* ʒ ß. *fiat Cataplaſma.* Or, ℞ *Rad. cum Brion. & Cucumer. agreſt. an.* ʒ ij. *florum chamæm. & melilot. ana m.* iij. *coquantur in hydromelite addendo farinæ, ſem. lini, & fænugræc. an.* ʒ ij. *ol. aneth. axungiæ anſer. & anat. an.* ʒ i. *fiat Cataplaſma.* And this Plaiſter following may here find place:

℞ *Diachyl. mag.* ʒ ij. *Empl. de melilot.* ʒ i. *olei aneth. & chamæmel.* ʒ ß. diſſolve them all together and make a Medicin for your uſe. Or, ℞ *Empl. de mucag. & oxycr. an.* ʒ ij. *Empl. Diachyl. Ireat.* ʒ i. *olei liliorum & chamæmel. quantum ſatis eſt*, and make thereof a ſoft Emplaiſter.

The correction of the accidents.

The fourth ſcope of curing a Phlegmon conſiſts in correction of the accidents which accompany it; of which, Pain is the principal.

The diſcommodities of pain.

Wherefore the Chirurgeon muſt be diligent to aſſwage it; for beſides, that it weakens the ſtrength, and debilitates and depraves the function, it alſo cauſes defluxions by drawing the bloud and ſpirits to the part affected.

Medicins aſſwaging pain.

According to the variety of Pain there muſt be variety of Medicins, as, ℞ *Micæ panis albi in lacte tepido macerati* ℔ ſs. *vitell. ovorum* iij. *ol. roſar.* ʒ ij. *croci* ʒ ß. *fiat Cataplaſma.* Or, ℞ *Florum chamæm. & melil. an. p.* iij. *farinæ ſem. lini, & fænugræc. an.* ʒ i. *fiat Cataplaſma Pultis ſatis liquidæ.* Or, ℞ *Mucagin. rad. altheæ & fænugr. an.* ʒ iij. *ol. roſar. & aneth. an.* ʒ i. *farin. ſem. lini. quantum ſatis, ut inde formetur Cataplaſma ſatis molle.*

Narcotick Medicins.

But if the pain remain, and yield not to theſe remedies, we muſt flie to ſtronger; making of Narcoticks or Stupefactives, but with care leſt we benum or dead the part; as, ℞ *Fol. hyoſcyami & papav. ſub. cineribus coctorum an.* ʒ iij. *adipis ſuillæ & ol. roſ. an* ʒ. i. *croci* ʒ ij. *fiat Cataplaſma:* or, ℞ *Fol. cicutæ & ſolani furioſi, an.* ʒ iv. *coquantur ſub cineribus, piſſentur, & trajiciantur addendo unguent. popul. & ol. roſar. an* ʒ i. *farin. fænugræc. quantum ſatis erit, ut inde formetur Cataplaſma ad formam Pultis liquidæ.*

CHAP.

CHAP. V.

The Cure of an ulcerated Phlegmon.

BUt it often happens that the humour is ſo impact in the part, that it cannot be repreſſed, and ſo groſs, that it cannot be diſcuſſed; which we may know by the greatneſs of the heat and ſwelling, by the bitterneſs of the pricking pain, the fever, and pulſation, and heavineſs. The ſigns of a Phlegmon turning to an Abſceſs.

Wherefore laying aſide all hope of diſcuſſing, we muſt come to the Suppuratives. For which purpoſe *Galen* foments the ſwollen part with Water or Oyl being Warm, or with both of them; and then applies this following Cataplaſm. *Lib. 2. ad Glau. cap. 7.*

℞ *Farinæ triticivel micæ panis* ℥ iv. *ol. com.* ℥ iij. *aquæ com. quantum ſufficit. fiat Cataplaſma.* Or, ℞ *Rad. lilior. alb. & althææ, an.* ℥ iij. *fol. malvæ parietar. & ſenecionis, ana. m.* i. *coquantur in hydromelite, piſſentur trajectis adde farin. ſem. lini* ℥ ij. *axungiæ ſuillæ, ol. liliorum, an.* ℥ ß. *fiat Cataplaſma.* Or, ℞ *Malvæ, biſmalv. violar. an. m.* i. *caricarum ping. n.* x. *paſſul.* ℥ ij. *coquantur in aq. com. tuſis, & trajectis, adde mellis com.* ℥ ij. *ung. baſilicon. & butyri recent. ana* ℥ i. *fiat cataplaſma.* You may profitably uſe for the ſame purpoſe, *Empl. Diachylon magnum*, or *Baſilicon.* Or, ℞ *Empl. Diachyl. mag.* ℥ iij. *ung. baſilicon.* ℥ i. *ol. liliorum* ℥ ß. Of theſe mixed together make a Medicin for the foreſaid uſe. Suppurative Medicins.

When the heat, pain, fever, and other accidents ſhall remit, when the tumour hath a ſharp head, when by the preſſing of your finger you find the humour to flow, as it were, to and fro, then you may know that it is ripe. The ſigns of *Pus*, or matter

Wherefore without any further delay the tumor muſt be opened, leſt the matter too long ſhut up, corrode the adjacent parts, and the Ulcer become ſinuous and fiſtulous.

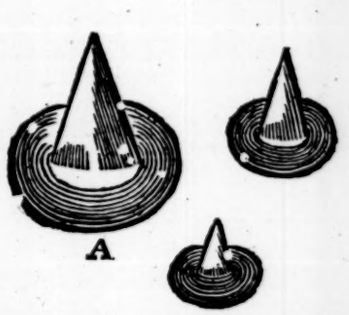
For this uſually happens, eſpecially then, when the matter is venenate or malign, or when the ſwelling is near a Joint, or at the Fundament, or ſuch like hot and moiſt places.

For by the decree of *Hippocrates* we ſhould anticipate the maturation of ſuch Tumours by opening. *Hip. lib. de Fiſtula.*

They may be opened with an Inciſion-knife, or Cauſtick, and that either actual, or potential. For if the Patient ſhall be heartleſs and leſs confident, ſo that he either cannot, or will not endure any Inſtrument, you muſt make way for the matter by a Potential Cautery. You may alſo do the buſineſs by another ſlight, as thus:

Thruſt the point of a ſharp Knife or Lancet through a braſs Counter, that it may ſtand faſt in the midſt thereof; then cover it diligently with ſome Emplaiſter or Cataplaſm, that neither the Patient nor ſtanders by perceive the deceit: then laying on the Plaiſter, as if that you would make a paſſage for the matter by that means; but when you have fitted the point to the part where it is fit to open the Tumor, ſo guide the Counter with your fingers, that you may preſently make an impreſſion into the Tumor ſufficient for excluding the matter. I have here expreſſed three delineations of ſuch Inſtruments, that you may uſe theſe, either bigger, leſſer, or indifferent, as occaſion ſhall ſerve.

B *Counters with the points of Knives or Lancets put through them.*

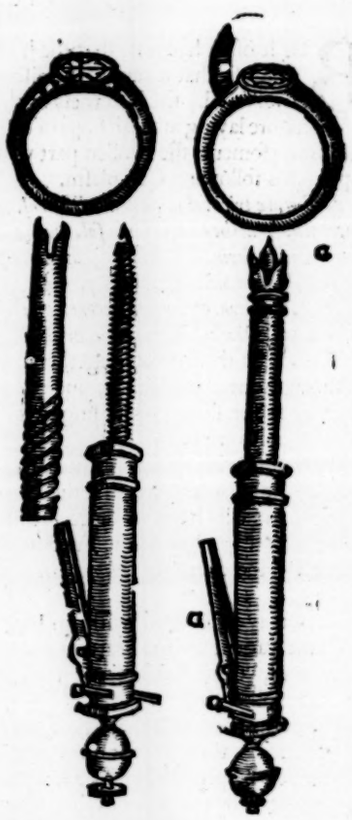


A *Shews the Counter or piece of Silver.*
B *Shews the point of the Lancet.*

But there are ſeven things which muſt be diligently conſidered in opening all ſorts of Impoſtumes. The firſt is, That you put your Knife to that part of the Abſceſs which is the ſofter, and yields to the impreſſion of your fingers, and where it riſes into a head or point. The ſecond is, That you make choice of that place for diſſection which is the loweſt, that ſo the contained impurity may the more readily flow out, and not ſtay in the paſſage. The third is, That it be made according to the wrinkles of the skin, and the right Fibers of the Muſcles lying next under the skin. The fourth is, That you turn your Knife from the larger Veſſels and Nerves worth ſpeaking of. The fifth is, That the matter contained in them be not evacuated too abundantly at once in great Abſceſſes, leſt thereby the ſtrength be dejected, the ſpirits being much waſted together with the unprofitable humour. The ſixth is, That the affected part be handled as gently as you can. The ſeventh is, That after the opening, when the matter is evacuated, the Abſceſs be cleanſed, filled with fleſh, and laſtly, conſolidated and cicatrized. But ſeeing that commonly after ſuch ſections ſome part of the Tumour remains, all the contained humour being not wholly ſuppurated, the Chirurgeon may perceive that this is an implicit affect, that is, a Tumour and Ulcer. But the Cure thereof muſt be ſo, that you take away the Tumour before the Ulcer; for the Ulcer cannot be healed before the part be reſtored to its nature. Therefore the Suppuratives formerly preſcribed muſt be uſed, and the Ulcer muſt be dreſſed for two or three days with this following Medicin. What the cure muſt be after the opening of the abſceſs.

Other

Other Inſtruments for opening Abſceſſes.



Rings in which little Knives lie hid, fit for to open Abſceſſes.

The Delineation of a Trunk or hollow Inſtrument going with a Spring.

A *Shews the thicker Pipe.*
B *Shews another, which enters and is faſtned in the other by a Screw.*
C *The point of the Inſtrument looking out.*
D *The ſpring which forces the Inſtrument.*

Deterſive Medicins.

℞. *Vitellum unius ovi, terebinth. Venetæ, & ol. Roſar. an.* ℥ ß, *fiat medicamentum.* Then you muſt ſeek to cleanſe it by this following Medicin.

unguentum de Apio.

℞ *Mellis roſar.* ℥ i. *Syrupi roſar. & tereb. Venet. an.* ℥ i ß. *far. hordei* ℥ ij. *fiat medicamentum ad uſum.* For this very purpoſe there is a ſingular Deterſive made of *Apium* or Smallage, of which this is the deſcription.

℞ *Succi apii, plantag. beton. an.* ℥ i. *Mellis commun.* ℥ v. *terebinth. Venet.* ℥ iv. *farin. Hordei & Orobi, an.* ʒ ij. *pulveris Aloes, rad. Ireos florent. myrrhæ, an.* ℥ i. *coquatur mel cum ſuccis, quibus conſumptis addantur farinæ, & pulveres, & miſceantur omnia ad formam unguenti.* But if you would cleanſe it more powerfully, you may uſe *Unguentum Apoſtolorum*, or *Unguentum Aureum* and *Ægyptiacum* mixed according to the ſcope you conceive in your minds; when the Ulcer ſhall ſeem ſufficiently cleanſed, it ſhall be filled with fleſh, and cicatrized after the manner we ſhall declare in the proper treatiſe of the Cure of Ulcers.

CHAP. XI.

Of Fevers and the Cures of thoſe Fevers which accompany Phlegmons.

The Fever of a Phlegmon. What a Fever is.

AMongſt the *Symptoms* which moſt uſually accompany Phlegmons, and afflict all the body of the Patient, Fevers are the chief; that is, hot and dry diſtempers kindled in the heart, and thence by the Arteries ſent over all the body; yet thoſe which uſually follow this kind of Tumours, are *Ephemeræ*, that is, Diary, unputrid *Synochi*; of whoſe nature and order of Cure I will here briefly relate what I have learnt from my Maſters, that is, Doctors of Phyſick, as I have been converſant with them in the practice of my Art.

What an *Ephemera*, or Diary is.

The *Ephemera*, or Diary [that is, of one day] is a hot and dry diſtemperature kindled in the vital ſpirits. It hath that name, becauſe by its own nature it tarries not above the ſpace of one day, or twenty four hours, by reaſon it is kindled in a ſubtile eaſily diſſipable matter.

The cauſes thereof.

The efficient cauſes of this Fever are wearineſs, hunger, and drunkenneſs, anger, fury, ſorrow, watching, great and piercing cold, Aduſtion, Bathes, and manner of living inclining more to heat then ordinary; applying, uſing or drinking of acrid Medicins, as Poiſons, or of hot Meats, or drinks; to conclude, all the efficient cauſes common to all Fevers, putrefaction onely excepted, which properly appertains to putrid Fevers.

Aphoriſm 55. *lib.* 4.

For a *Bubo* alſo, which is a Phlegmon of the Glandules, cauſes a Diary, as *Hippocrates* ſhews. All Fevers proceeding from the Tumours of the Glandules are evil, the Diary excepted. Which *Aphoriſm* muſt be underſtood warily and with that diſtinction which *Galen* gives in his Commentary, where he ſaith; It is not onely to be underſtood of Tumours riſing in the Glandules without occaſion, that is, without any evident and manifeſt cauſe; for otherwiſe Fevers that thence take their

original, though not Diary, yet are not all evil, as we learn by Buboes in Children, and the venereous Buboes, which happen without inflammation or corruption of the Liver; for ſuch commonly have no malign Fever accompanying them, which thing is worthy a Chirurgeons obſervation.

The common ſigns of a Diary are, a moderate and vaporous heat feeling gentle to the hand, a Pulſe ſwift and frequent, ſometimes great and ſtrong, as when the Diary is cauſed by anger; ſometimes little, if the Fever proceed from ſorrow, hunger, cold, crudity; for other reſpects equal and ordinary. The ſigns of a Diary.

The moſt certain ſigns are, if the Fever come upon one not by little and little, but ſuddenly, and that from external and evident cauſe; no loathing of Meat, no cauſleſs wearineſs, no deep ſleep, yawning, great pain, reſtleſsneſs, ſhaking, nor cold going before; and laſtly, no other troubleſom ſymptom preceding. We here make no mention of the Urin, becauſe moſt frequently they reſemble the Urins of ſound bodies; for in ſo ſhort a time as Diaries endure, there cannot ſo great a perturbation be raiſed in the bloud that there may be ſigns thereof found in the Urine. A Diary is ended in one fit, which by the proper nature of this Fever laſts but one day, although ſometimes otherwiſe it is extended to three or four days ſpace; and then it eaſily degenerates into a Putrid, eſpecially any errour of the Patient, Phyſician, or thoſe which attend him, concurring therewith, or if the external things be not rightly fitted. Why in a Diary the Urin is like to thoſe in health.

This Fever is terminated either by inſenſible tranſpiration, or by the moiſture of the skin, or by a ſweat natural, gentle, and not ill ſmelling; to this Diary we may refer the unputrid *Synochus* generated of bloud not putrid, but onely heated beyond meaſure. For uſually there ariſes a great heat over all the body, by means of the bloud immoderately heated; whence the Veins become more tumid, the Face appears fiery, the Eyes red and burning, the Breath hot, and to conclude, the whole habit of the body more full, by reaſon of that ebullition of the bloud, and the diffuſion of the vapours thence ariſing over all the body: Whence it is that this kind of *Synochus* may be called a vaporous Fever. To this Children are incident; as alſo all ſanguin bodies, which have no ill humours. The cure of this and the *Ephemera*, or Diary is the ſame; becauſe it may ſcarce ſeem different from the *Ephemera* in any other thing, than that it may be prolonged for three or four days. Wherefore whatſoever we ſhall ſay for the cure of the *Ephemera*, may be applied to the *Synochus*, bloud-letting excepted, which in an unputrid *Synochus* is very neceſſary. The unputrid *Synochus*.

Now the cure of a Diary-Fever conſiſts in the decent uſe of things Not natural, contrary to the cauſe of a diſeaſe; wherefore Baths of warm and natural Water are very profitable, ſo that the Patient be not Plethorick, nor ſtuffed with excrements, nor obnoxious to Catarrhs and Defluxions, becauſe a Catarrh is eaſily cauſed and augmented by the humours diffuſed and diſſolved by the heat of a Bath; therefore in this caſe we muſt eſchew frictions, and anointing with warm oil, which things notwithſtanding, are thought very uſeful in theſe kind of Fevers, eſpecially when they have their original from extreme labour, by attriction of the skin, or a *Bubo*. Let this be a general rule, that to every Cauſe whence this Fever proceeded, you oppoſe the contrary for a remedy; as to labour, reſt; to watching, ſleep; to anger and ſorrow, grateful ſociety of Friends, and all things repleniſhed with pleaſant good will; and to a *Bubo*, the proper cure thereof. The cure of a Diary Fever.

Wine moderately tempered with Water according to the cuſtom of the ſick Patient, is good and profitable in all cauſes of this Fever, except he be pained in his head, or that the Fever drew its original from anger, or a *Bubo*; for in this laſt caſe eſpecially, the Patient muſt abſtain wholly from Wine, until the inflammation come to the ſtate, and begins to decline. This kind of Fever often troubles Infants; and then you muſt preſcribe ſuch Medicins to their Nurſes, as if they were ſick, that ſo by this means their Milk may become Medicinable. Alſo it will be good to put the Infant himſelf into a Bath of natural and warm Water, and preſently after the Bath to anoint the ridg of the Back and Breſt with Oil of Violets. But if a Phlegmon poſſeſs any inward part, or otherwiſe by its nature be great, or ſeated near any principal Bowel, ſo that it may continually ſend from it either a putrid matter or exhalation to the heart, and not onely affect it by a quality of preternatural heat by the continuity of the parts, thence will ariſe the putrid *Synochus*, if the bloud by contagion putrefying in the greater Veſſels, conſiſts of one equal mixture of the four humours. This Fever is thus chiefly known: it hath no exacerbations, or remiſſions, but much leſs intermiſſions; it is extended beyond the ſpace of twenty four hours, neither doth it then end in vomit, ſweat, moiſture, or by little and little inſenſible tranſpiration, after the manner of intermitting Fevers or Agues; but remains conſtant, until it leaves the Patient for altogether: it commonly happens not, unleſs to thoſe of a good temper and complexion, which abound with much bloud, and that tempered by an equal mixture of the four humours. It commonly endures not long, becauſe the bloud by ſome peculiar putrefaction degenerating into Choler or Melancholy, will preſently bring forth another kind of Fever, to wit, a Tertian or continued Quartan. The uſe of Wine in a Diary. How a putrid *Synochus* is cauſed.

The cure of this Fever (as I have heard of moſt learned Phyſitians) chiefly conſiſts in bloud-letting. For by letting of bloud the fulneſs is diminiſhed, and therefore the obſtruction is taken away, and laſtly the putrefaction. And ſeeing that in this kind of Fever there is not onely a fault of the matter, by the putrefaction of the bloud, but alſo of the Temper by exceſs of heat; certainly Phlebotomy helps not onely, as we ſaid, the putrefaction, but alſo the hot diſtemper. For the bloud in which all the heat of the creature is contained, whileſt it is taken away, the acrid and fuliginous excrements exhale and vaniſh away with it, which kept in, increaſe the Feveriſh heat. Moreover the Veins, to ſhun emptineſs, which Nature abhors, are filled with much cold air in ſtead of the hot bloud which was drawn away, which follows a cooling of the habit of the whole body, yea, and many by means of Phlebotomy have their Bellies looſed, and ſweat, both which are much to be deſired in this kind of Fever. Phlebotomy neceſſary in a putrid *Synochus*.

This moved the ancient Phyſicians to write, that we muſt draw bloud in this diſeaſe, even to the fainting of the Patient. What benefit we may reap by drawing bloud even to fainting.

Yet

Yet becauſe thus, not a few have poured out their lives together with their bloud, it will be better and ſafer to divide the evacuations, and draw ſo much bloud at ſeveral times, as the greatneſs of the diſeaſe ſhall require, and the ſtrength of the Patient may bear.

Why we muſt give a Clyſter preſently after bloud-letting.

When you have drawn the bloud, forthwith inject an emollient and refrigerative Clyſter; leſt that the Veins emptied by Phlebotomy may draw into them the impurity of the Guts; but thoſe Clyſters which cool too much, rather bind the belly than looſe it. The following day the Morbifick matter muſt be partly evacuated by a gentle Purge, as a bole of *Caſſia*, or *Catholicon*; then muſt you appoint Syrups which have not onely a refrigerative quality, but alſo to reſiſt putrefaction, ſuch as the Syrup of Limmons, Berberies, of the Juice of Citrons, of Pomegranats, Sorrel and Vinegar; let his diet be abſolutely cooling and humecting, and alſo ſlender; for the native heat much debilitated by drawing of great quantity of bloud cannot equal a full diet. Therefore it ſhall ſuffice to feed the Patient with Chicken and Veal Broths made with cooling Herbs; as Sorrel, Lettuce, and Purſlan. Let his drink be Barly Water, Syrrup of Violets mixed with ſome pretty quantity of boiled Water, *Julepum Alexandrinum*, eſpecially if he be troubled with ſcouring or laſk. But the Phyſitian muſt chiefly have regard to the fourth day: for if then there appear any ſigns of concoction in the excrethe *Criſis* muſt be expected on the ſeventh day, and that either by a looſeneſs of the belly, or an abundance of Urin, by Vomits, Sweats, or Bleeding Therefore we muſt then do nothing but commit the whole buſineſs to Nature.

When Syrrups profitable in this caſe.

Why a ſlender Diet muſt be uſed after letting much bloud.

When drinking of Water is permitted in a putrid *Synochus*.

But for drinking cold Water, which is ſo much commended by *Galen* in this kind of Fever, it is not to be ſuffered before there appear ſigns of concoction; moreover in the declining of the Diſeaſe, the uſe of Wine will not be unprofitable to help forwards Sweats.

CHAP. XII.

Of an Eryſipelas, *or Inflammation.*

The definition of an *Eryſipelas*.

HAving declared the cure of a Phlegmon, cauſed by laudable bloud; we muſt now treat of thoſe Tumors which acknowledge Choler the material cauſe of their generation, by reaſon of that affinity which intercedes between Choler and Bloud. Therefore the Tumors cauſed by natural Choler, are called *Eryſipelata*, or Inflammations; theſe contain a great heat in them, which chiefly poſſeſſes the skin, as alſo oftentimes ſome portion of the fleſh lying under it. For they are made by moſt thin and ſubtle bloud (which upon any occaſion of inflammation eaſily becomes Cholerick) or by bloud and Choler, hotter then is requiſite, and ſometimes of choler mixed with an acrid ſerous humour.

Gal. cap. 2. lib. 14. Meth. med. & 2. ad Glauc.

That which is made by ſincere and pure choler, is called by *Galen*, a true and perfect *Eryſipelas*. But there ariſe three differences of *Eryſipelaes*, by the admixture of choler with the three other kinds of humours. For if it being predominant be mixed with bloud, it ſhall be termed *Eryſipelas Phlegmonodes*; if with Phlegm, *Eryſipelas œdematodes*; if with Melancholy, *Eryſipelas Scirrhodes*. So that the former and ſubſtantive word ſhews the humour bearing dominion, but the latter or adjective that which is inferiour in mixture. But if they concur in equal quantity, there will be thereupon made *Eryſipelas Phlegmone*, *Eryſipelas œdema*, *Eryſipelas ſcirrhus*.

Two kinds of *Eryſipelaes*.

Galen acknowledges two kinds of *Eryſipelaes*, one ſimple and without an ulcer, the other ulcerated. For choler drawn and ſevered from the warmneſs of the bloud, running by its ſubtilty and acrimony unto the skin, ulcerates it; but reſtrained by the gentle heat of the bloud, as a bridle, it is hindered from piercing to the top of the skin, and makes a tumour without an ulcer. But of unnatural choler are cauſed many other kinds of cholerick tumors, as the *Herpes*, *Exedens*, and *Miliaris*: and laſtly, all ſorts of tumors which come between the *Herpes* and *Cancer*. You may know *Eryſipelas* chiefly by three ſigns, as by their colour, which is yellowith red; by their quick ſliding back into the body at the leaſt compreſſion of the skin, the cauſe of which is the ſubtlety of the humour and the outward ſite of it under the skin, (whereupon by ſome *Eryſipelas* is called a Diſeaſe of the Skin;) laſtly, by the number of the Symptoms, as Heat, Pulſation, Pain. The heat of an *Eryſipelas* is far greater than that of a Phlegmon, but the pulſation is much leſs; for as the heat of the bloud is not ſo great as that of choler, ſo it far exceeds choler in quantity and thickneſs; which may cauſe compreſſion and obſtruction of the adjacent Muſcle.

Gal. lib. 2. ad Glauc. Hip. Apho. 79. Sect. 7. Aph. 25. Sect. 16. Aph. 43. Sect. 3.

For Choler eaſily diſſipable by reaſon of its ſubtlety quickly vaniſhes, neither doth it ſuffer it ſelf to be long contained in the empty ſpaces between the Muſcles; neither doth an *Eryſipelas* agree with a Phlegmon in the propriety of the pain. For that of an *Eryſipelas* is pricking and biting without tenſion or heavineſs; yet the primitive, antecedent, and conjunct cauſes are alike of both the tumors. Although an *Eryſipelas* may be incident to all parts, yet principally it aſſails the Face, by reaſon of the rarity of the skin of that place, and the lightneſs of the cholerick humour flying upwards. It is ill when an *Eryſipelas* comes upon a wound or ulcer, and although it may come to ſuppuration, yet it is not good; for it ſhews that there is obſtruction by the admixture of a groſs humour, whence there is ſome danger of eroſion in the parts next under the skin.

It is good when *Eryſipelas* comes from within outwards, but ill when from without it retires inward. But if an *Eryſipelas* poſſeſs the Womb it is deadly, and in like manner if it ſpread too far over the face, by reaſon of the ſympathy of the membranes of the Brain.

CHAP.

CHAP. XIII.

Of the Cure of an Eryſipelas.

FOr the cure of an *Eryſipelas* we muſt procure two things, to wit, Evacuation and Refrigeration. But becauſe here is more need of cooling, than in a Phlegmon, the chief ſcope muſt be for Refrigeration. Which being done, the contained matter muſt be taken away and evacuated with moderately reſolving Medicines. We muſt do four things to attain unto theſe forementioned ends. Firſt of all, we muſt appoint a convenient manner of Diet, in the uſe of the ſix things not natural; that is, we muſt incraſſate, refrigerate, and moiſten, as much as the nature of the Diſeaſe and Patient will ſuffer, much more than in a Phlegmon; then we will evacuate the antecedent matter by opening a Vein, and by Medicines purging choler; and that by cutting the Cephalick Vein, if there be a portion of the bloud mixed with choler, if the *Eryſipelas* poſſeſs the face, and if it be ſpread much over it. *Gal.* 14. *Meth.* Four things to be performed in curing an *Eryſipelas.*

But if it ſhall invade another part, although it ſhall proceed of pure choler, Phlebotomy will not be ſo neceſſary, becauſe the bloud which is as a bridle to the Choler being taken away, there may be danger, leſt it become more fierce; yet if the body be plethorick, it will be expedient to let bloud, becauſe this, as *Galen* teacheth, is oft-times the cauſe of an *Eryſipelas*. It will be expedient to give a Clyſter of refrigerating and humecting things before you open a Vein; but it belongs to a learned and prudent Phyſitian to preſcribe Medicines purging choler. In what *Eryſipelas* it is convenient to let bloud, in what not.

The third care muſt be taken for Topick, or local Medicins, which in the beginning and increaſe muſt be cold and moiſt, without any either drineſs or aſtriction, becauſe the more acrid matter by uſe of aſtringent things being driven in, would ulcerate and fret the adjacent particle. What Topick Medicins are fit to be uſed in the beginning of an *Eryſipelas.*

Galen and *Avicen* much commend this kind of remedy; Take fair Water ℥ vj. of the ſharpeſt Vinegar ℥ i, make an Oxycrate, in which you may wet linnen clothes and apply to the affected part and the circumjacent places, and renew them often. Or, ℞ *Succi ſolani, plantag. & ſempervivi, an.* ℥ ij. *aceti* ℥ ß. *Mucaginis ſem. Pſyllii* ℥ ij. *ſucci hyoſcyami* ℥ i. *Miſce.* But if it the *Eryſipelas* be upon the face, you muſt uſe the Medicin following,

℞ *Unguent. Roſ.* ℥ iv. *ſucci plantagin. & ſempervivi, an.* ℥ i. *trochiſc. de Camphora* ℥ ß, *aceti parum*; let them be mixed together and make a liniment. But if the heat and pain be intolerable, we muſt come to narcotick Medicins. As, ℞ *Succi hyoſcyami, ſolani, cicutæ, an.* ℥ i. *album ovorum n* ij. *aceti* ℥ ß, *opii & Camphor. an. gra.* iv. *croci* ϑ ß, *Mucaginis ſem. pſyll. & fænigr. extractæ in aq. roſ. & plantag. an* ℥ i. *o!. de papav.* ℥ ij. *fiat linimentum, addendo ung. refrigerantis Gal. comphor. q. ſatis ſit.* Yet we muſt not uſe ſuch like Medicins too long, leſt they cauſe an extinction of the native heat and mortification of the part.

Wherefore ſuch Narcotick Medicins muſt be uſed with regard of place, time, and ſuch other circumſtances. Therefore we may three manner of ways underſtand when to deſiſt from uſing Narcotick or Stupefactive Medicins. The firſt is when the Patient in the affected part feels not ſo much heat, pricking and pain, as before. The ſecond is, when the part feels more gentle to the touch than before. The third, when the fiery and pallid colour begins by little and little to wax livid and black; for then muſt we abſtain from Narcotick, and uſe reſolving and ſtrengthening things, whereby the part may be revived and ſtrengthened by recalling the native heat; As, ℞ *Farinæ hordei & Orobi, an.* ℥ ij. *farinæ ſem. lini* ℥ i ß, *coquantur in Hydromelite vel oxycrato, addendo pulv. roſarum & chamæmel, an.* ℥ ß. *ol. anethi & chamæm. an.* ℥ i. *fiat cataplaſma.* Or you may uſe this following fomentation, ℞ *Rad. Altheæ* ℥ ij. *fol. malvæ, biſmal. pariet. abſinthii, ſalviæ, an.* m. i. *flor. chamæm. meliloti, roſar. rub. an.* m. ij. *coquantur in æquis partibus vini & aquæ, & fiat fotus cum ſpongia.* After the fomentation, you may apply an Emplaiſter of *Diachylon Ireatum*, or *Diapalma* diſſolved in Oyl of Chamomile and Melilote, and ſuch other like. The fourth Intention which is of the correction of accidents, we will perform by thoſe means which we mentioned in curing a Phlegmon, by varying the medicaments, according to the judgment of him which undertakes the Cure. What caution muſt be had in the uſe of Narcotick Medicins. Reſolving and ſtrengthening Medicins.

CHAP. XIV.

Of the Herpes; *that is, Tetters, or Ring-worms, or ſuch like.*

HErpes is a tumour cauſed by pure choler ſeparated from the reſt of the humours, that is carried by its natural lightneſs and tenuity even to the outer or ſcarf-skin, and is diffuſed over the ſurface hereof. *Galen* makes three ſorts of this tumour. For if perfect choler of an indifferent ſubſtance, that is, not very thick, cauſe this tumour, then the ſimple *Herpes* is generated, obtaining the name of the *Genus*; but if the humour be not ſo thin, but compounded with ſome ſmall mixture of Phlegm, it will raiſe little bliſters over the skin like to the ſeeds of Millet, whence it was that the Ancients called this Tumour the *Herpes Miliaris*. But if it have any admixture of Melancholy, it will be an *Herpes exedens*, terrible by reaſon of the eroſion, or eating into the Skin and Muſcles lying under it. What a *Herpes* is, what be the kinds thereof. *Gal. 2. ad Glauconem.* What the *Herpes miliaris* is. What the *exedens.*

There are abſolutely three intentions of curing; The firſt is to appoint a Diet juſt like that we mentioned in the cure of an *Eryſipelas*; The ſecond is to evacuate the antecedent cauſe, by Medicins purging the peccant humour, for which purpoſe oft-times Clyſters will ſuffice, eſpecially if the Patient be ſomewhat eaſie by Nature, and if the Urin flow according to your deſire; for by this a great part of the humour may be carried into the bladder; The third ſhall be to take away the conjunct cauſe by Local Medicins ordained for the ſwelling and ulcer: Therefore the Chirurgeon Three intentions in curing *Herpes.*

A rule for healing Ulcers conjoined with tumours.

rurgion ſhall have regard to two things, that is, the reſolving of the tumour, and the drying up of the Ulcer; for every Ulcer requires drying, which can never be attained unto, unleſs the ſwelling be taken away. Therefore becauſe the chiefeſt care muſt be to take away the tumour, which if it be performed, there can be no hope to heal the ulcer; he ſhall lay this kind of medicine to diſſolve and dry, as, ℞ *Ceruſæ & tuthiæ prepar. an.* ℥ j. *ol. roſ. & adipis capon. an.* ℥ ij. *corticis pini uſti, & loci* ʒ ſ, *ceræ quantum ſatis, fiat unguentum.* Or, ℞ *Farin. hord. & lent. an.* ℥ ij. *coquantur in decocto corticis mali granati, balauſt. plantag. addendo pulveris roſar. rub. abſinth. an.* ʒ ſ, *olei Myrtillor. & mellis com. an.* ℥ vj. *fiat unguentum, ut artis eſt.* But for an *Herpes Miliaris* theſe muſt chiefly be uſed, ℞ *Pulv. gallarum, malicurii, balauſt. boli armeni an.* ʒ i. *aquæ roſ.* ℥ iij. *aceti acerrimi* ʒ i. *axungiæ anſer. & olei Myrtillor. an.* ℥ i ſ, *terebinth.* ʒ i. *fiat unguentum ad uſum.* I have often found moſt certain help in *unguentum emulatum cum Mercurio*, for it kills the Puſtules, and partly waſtes the humour contained in them. Yet if the Ulcer not yet neither yields, but every day diffuſes it ſelf further and further, you ſhall touch the edges and lips thereof with ſome acrid medicin, as *Aqua fortis*, Oil of Vitriol, or ſuch like, for by this kind of remedy, I have oft-times healed fretting Ulcers, which ſeemed altogether incurable.

The force of *unguentum emulatum cum Mercurio.*

Medicines fit for reſtraining eating and ſpreading Ulcers.

CHAP. XV.

Of Fevers, which happen upon Eryſipelous Tumors.

A vulgar deſcription of an intermitting Tertian Fever.

AS Fevers ſometimes happen upon Inflammations, and Eryſipelaes, which favour of the humour whereof they proceed, that is, Choler: Therefore ſeeing it is peculiar to Choler, to move every third day, it is no marvail if great Inflammations bring with them Tertian Fevers, or Agues, which have their Fit every third day; for it is called an Intermitting Tertian which comes every other day.

The cauſes of Tertian Fevers.

The primitive cauſes in general are ſtrong exerciſes, eſpecially in the hot Sun, the uſe of heating and drying either Meats or Medicins, great abſtinence joined with great labour, care, ſorrow; the antecedent cauſes are the plenty of choler in the body, and hot and dry diſtemperature either of the whole Body, or of the Liver onely: the conjunct cauſe is the putrefaction of the cholerick humour lying in ſome plenty without the greater Veſſels, in the habit of the Body.

The ſigns of an intermitting Tertian.

The Signs, a ſhaking or ſhivering, like as when we have made water in a cold Winter morning, a great pricking, ſtretching or ſtiffneſs, as if there were pins thruſt into us over all our bodies, by reaſon of the acrimony of the cholerick humour driven uncertainly and violently over all the body, and the ſenſible membranous and nervous particles at the beginning of the Fit; then preſently the heat becomes acrid, the Fever kindled like a Fire in dry Straw; the Pulſe is great, quick and equal, the Tongue dry, the Urine yellowiſh, red and thin. The Symptoms are watchings, thirſt, talking idly, anger, diſquietneſs and toſſing the body at the leaſt noiſe or whiſpering. Theſe Fevers are terminated by great Sweats. They are incident to cholerick young Men, ſuch as are lean, and in Summer; after the Fit oft-times follow cholerick Vomiting and yellowiſh Stools. After the Fit there follows an abſolute intermiſſion retaining no reliques of the Fever, until the approach of the following Fit, becauſe all the cholerick matter by the force of that Fit and Nature, is eaſily caſt out of the body, by reaſon of its natural levity and facility; whereas in Quotidians there is no ſuch thing, as which after the Fit always leave in the body a ſenſe and feeling of a certain inequality by reaſon of the ſtubbornneſs of the Phlegmatick humour and dulneſs to motion. The Fit commonly uſes to endure 4,5,or 6 hours, although at ſome time it may be extended to 8 or 10. This Fever is ended at 7 Fits, and uſually is not dangerous, unleſs there be ſome errour committed by the Phyſitian, Patient, or ſuch as attend him. Tertians in Summer are ſhorter, in Winter longer.

The Symptoms.

Why Tertians have an abſolute ceſſation of the Fever at the end of each fit.

Wherefore the beginning of the Fit is accompanied with ſtiffneſs, or ſtretching, the ſtate with ſweat, whereupon, if the Noſe, Lips, or Mouth, break forth into pimples, or ſcabs, it is a ſign of the end of the Fever, and of the power of nature which is able to drive the conjunct cauſe of the diſeaſe from the center to the habit of the body; yet theſe pimples appear not in the declining of all Tertians, but onely then, when the cholerick humour cauſing the Fever ſhall reſide in the Stomach, or is driven thither from ſome other part of the firſt region of the Liver. For hence the ſubtler portion thereof, carried by the continuation of the inner Coat to the Mouth and Noſe, by its acrimony eaſily cauſes Pimples in theſe places. The Cure is performed by Diet, and Pharmacy.

The diet of ſuch as have a Tertian

Therefore let the Diet be ſo ordered for the ſix things not natural, that it may incline to refrigeration and humectation, as much as the digeſtive faculty will permit, as Lettuce, Sorrel, Gourds, Cucumbers, Mallows, Barly, Creams, Wine much allaid with Water, thin, ſmall, and that ſparingly, and not before ſigns of concoction ſhall appear in the Urine; for at the beginning he may not uſe Wine, nor in the declining, but with theſe conditions which we have preſcribed.

When ſuch as have a Tertian may uſe Wine.

The time of feeding the Patient.

But for the time of feeding the Patient, on that day the Fit is expected, he muſt eat nothing for three hours before the Fit, leſt the Aguiſh heat lighting on ſuch Meats as yet crude, may corrupt and putrifie them; whence the matter of the Fever may be increaſed, (becauſe it is as proper to that heat to corrupt all things, as to the native to preſerve and vindicate from putrefaction) the Fit lengthened, and Nature called away from the concoction and excretion of the Morbifick humour; yet we may temper the ſeverity of this Law by having regard to the ſtrength of the Patient; for it will be convenient to feed a weak Patient not onely before the Fit, but alſo in the Fit it ſelf; but that onely ſparingly, leſt the ſtrength ſhould be too much impaired.

When to purge the Patient.

Now for Pharmacy; It muſt be conſidered, whether the ſtrength of the Patient be ſufficient, if the humours abound; for then you may preſcribe *Diaprunum ſimplex*, *Caſſia* newly extracted, the decoction of Violets, of Citrin Myrobalanes, Syrups of Violets, Roſes, of Pomegranats and Vinegar. But if the powers of the Patient languiſh, he muſt not onely not be purged, but alſo muſt not draw bloud

bloud too plenteouſly, becauſe Cholerick men ſoon faint, by reaſon of the facile and eaſie diſſipation of the ſubtile humors and ſpirits; beſides, ſuch as are ſubject to Tertian Fevers do not commonly abound with bloud, unleſs it be with cholerick bloud, which muſt rather be renewed, or amended by cooling and humecting things, than evacuated. Yea verily, when it is both commodious and neceſſary to evacuate the body, it may be attempted with far more ſafety by ſuch things as work by inſenſible tranſpiration, which provoke Sweats, Vomit, or Urin, by reaſon of the ſubtlety of the cholerick humour, than by any other. Alſo the frequent uſe of emollient Clyſters made with a decoction of Prunes, Jujubes, Violets, Bran and Barley, will profit much. If the Patient fall into a *Delirium*, or talk idlely by reaſon of the heat and drineſs of the head, with a particular exceſs of the cholerick humor, the head muſt be cooled by applying to the Temples and Fore-head, and putting into the Noſe Oil of Violets, Roſes, or Womans Milk. Let the feet and legs be bathed in fair and warm Water, and the ſoles of the feet be anointed with Oil of Violets, and ſuch like.

In the declining, a Bath made of the branches of Vines, the leaves of Willows, Lettuce, and other refrigerating things boiled in fair Water, may be profitably uſed three hours after meat eaten ſparingly.

When the time is fit to uſe a Bath.

But I would have you ſo to underſtand the Declination, or declining, not of one particular Fit, but of the Diſeaſe in general, that the humours already concocted, allured to the skin by the warmneſs of the Bath, may more eaſily and readily breath forth: he which otherwiſe ordains a Bath at the beginning of the Diſeaſe, will cauſe a conſtipation in the skin and habit of the body, by drawing thither the humours peradventure tough and groſs, no evacuation going before.

What kinds of evacuations are moſt fit in a Tertian.

Alſo it will be good after general purgations to cauſe ſweat by drinking White Wine, thin and well tempered with Water; but Urin by a decoction of Smallage and Dill. Certainly Sweat is very laudable in every putrid Fever, becauſe it evacuates the conjunct matter of the Diſeaſe, but chiefly in a Tertian, by reaſon that choler by its inbred levity eaſily takes that way, and by its ſubtlety is eaſily reſolved into ſweat. But that the ſweat may be laudable it is fit it be upon a critical day, and be fore-ſhewed by ſigns of concoction agreeable to the time and manner of the Diſeaſe. Sweats when as they flow more ſlowly are forwarded by things taken inwardly and applied outwardly; by things taken inwardly, as with white Wine, with a decoction of Figs, Raiſins ſtoned, Graſs, Roots, and the like opening things; but by things outwardly applied, and Sponges dipped in a decoction of hot Herbs (as Roſemary, Thyme, Lavender, Marjerom, and the like) applied to the Groins, Armholes, and Ridge of the Back.

Sudorificks;

You may for the ſame purpoſe, fill two Swines bladders with the ſame decoction, or elſe Stone-bottles, and put them to the feet, ſides, and between the thighs. Then let this be the bound of Sweating, when the Patient begins to wax cold, that is, when the Sweat feels no more hot, but cold.

When bloud muſt be let.

But by the conſent of all, bloud muſt not be letten after the third Fit, but preſently at the beginning of the Fever, according to the opinion and preſcription of *Galen*; for ſeeing this Fever for the moſt part is terminated at ſeven Fits, if you ſtay until the third Fit be paſt, the Fever will now be come to its State; but *Hippocrates* forbids us to move any thing in the ſtate, leſt Nature then buſied in concocting the Diſeaſe, be called from its begun enterpriſe.

Aphor. 29. Sect. 2.

CHAP. XVI.

Of an Oedema, *or cold Phlegmatick Tumor.*

HItherto we have treated of hot Tumors, now we muſt ſpeak of cold; Cold Tumors are onely two, an *Oedema*, and a *Scirrhus*. And for all that *Hippocrates* and the Ancients uſed the the word *Oedema* for all ſorts of Tumors in general; yet by *Galen* and thoſe Phyſicians which ſucceeded him, it hath been drawn from that large and general ſignification, to a more ſtrait and ſpecial, onely to deſign a certain *ſpecies* or kind of Tumor.

Gal. lib. de tum. præter natur.

What an *Oedema* is.

Wherefore an *Oedema* is a ſoft, lax, and painleſs Tumor, cauſed by collection of a Phlegmatick humour.

The differences of *Oedema*.

The Ancients made eight differences of Tumors proceeding of Phlegm: The firſt they termed a true and lawful *Oedema* proceeding from natural Phlegm; from unnatural Phlegm by admixtion of another humour they would have three ſorts of Tumors to ariſe; as that, by mixture of bloud, ſhould be made an *Oedema Phlegmonodes*, and ſo of the reſt.

By how many ways Phlegm becomes not natural.

Beſides, when they perceived natural Phlegm either puffed up by flatulency, or to flow with a wateriſh moiſture, they called ſome *Oedemaes* flatulent, others wateriſh; but alſo when they ſaw this ſame Phlegm often to turn into a certain Plaiſter-like ſubſtance, they thought that hence proceeded another kind of *Oedema*, which they expreſſed one while by the name of *Atheroma*, another while by *Steatoma*, and ſometimes by *Melicerides*, as laſtly, they called that kind of *Oedema* which is cauſed by putrid and corrupt Phlegm, *Scrophule*. For we muſt obſerve that Phlegm ſometimes is natural, and offends onely in quantity; whence the true *Oedema* proceeds: otherwhiles it is not natural, and it becomes not natural, either by admixtion of a ſtrange ſubſtance, as Bloud, Choler, or Melancholy, whence ariſe the three kinds of *Oedemaes* noted formerly by the way; or by the putridneſs and corruptions of its proper ſubſtance, whence the *Strumæ* and *Scrophulæ* proceed; or by concretion, whence Kernels and all kinds of Wens, *Ganglia*, and Knots; or by reſolution, whence all flatulent and wateriſh Tumors, as the *Hydrocele*, *Pneumatocele*, and all kinds of Dropſies.

The Cauſes.

The cauſes of all *Oedemaes* are the defluxion of a Phlegmatick, or flatulent humour into any part, or the congeſtion of the ſame made by little and little in any part, by reaſon of the imbecillity thereof in concocting the nouriſhment, and expelling the excrement.

The Signs.

The ſigns are a colour whitiſh and like unto the skin, a ſoft Tumor, rare and lax by reaſon of the plentiful

plentiful moiſture with which it abounds, and without pain, by reaſon this humour infers no ſenſe of heat, nor manifeſt cold; when you preſs it with your finger the print thereof remains, becauſe of the groſsneſs of the humour and ſlowneſs to motion. *Oedemaes* breed rather in Winter than in Summer, becauſe Winter is fitter to heap up Phlegm; they chiefly poſſeſs the Nervous and Glandulous parts, becauſe they are bloudleſs, and ſo cold and more fit by reaſon of their looſneſs to receive a defluxion; for the ſame cauſe, bodies full of ill humours, ancient, and not excerciſed, are chiefly troubled with this kind of Tumor.

The Prognoſticks.

How *Oedemaes* are terminated.

An *Oedema* is terminated ſometimes by reſolution, but oftner by concretion; ſeldomer by ſuppuration, by reaſon of the ſmall quantity of heat in that humour.

A Symptomatical *Oedema*, as that which follows upon a Dropſie, or Conſumption, admits no cure unleſs the Diſeaſe be firſt taken away.

The intentions of curing *Oedemaes*.

The general cure is placed in two things, that is, in evacuation of the conjunct, and matter prohibiting the generation of the antecedent. We attain to both, chiefly by four means.

The firſt truly by ordaining a fit manner of living and preſcribing moderation in the uſe of the ſix things not natural. Wherefore we muſt make choice of ſuch air as is hot, dry, and ſubtle; we muſt preſcribe Wine of a middle Nature for his drink, let the Bread be well baked, let meats be appointed which may generate good bloud, and theſe rather roſted than boiled. Let all fruits be forbidden, as alſo Broths and Milk-meats; let him eat ſuch Fiſh as are taken in Stony Rivers; the Patient ſhall obſerve mediocrity in feeding, but principally ſobriety in drinking, for fear of crudities; after meat let him uſe digeſtive Powders, or common Dridge Powder; if his belly be not naturally looſe, let it be made ſo by Art.

The Diet.

Exerciſe.

Let the Patient uſe exerciſe before meat, ſo by little and little to ſpend this humour, and reſtore the native heat. Let him ſleep little, becauſe much ſleep breedeth cold humours; let him avoid grief and ſadneſs. And if he be of a weak body, let him abſtain from Venery, leſt by another weakning by the uſe of Venery added to his preſent infirmity, he fall into an incurable coldneſs, from whence a greater meaſure of crudity will ariſe. Otherwiſe, if the body be ſtrong and luſty, by ſuch exerciſes, and the moderate uſe of Venery, it will be the more dried and heated.

What to be obſerved in the uſe of Venery.

For ſo that ſentence of *Hippocrates* is to be underſtood; That Venery is a cure for Phlegmatick Diſeaſes, as *Galen* in his Commentaries tells us. The Phyſician may perform the ſecond intention by turning his counſel to that part, from whence the Spring of Phlegmatick humour flows. For if the infirmity ariſe from the Stomach, or from any other part, the part from whence it comes muſt be ſtrengthened; if from the whole habit of the body, let attenuating, penetrating, and opening Medicins be preſcribed. We perform the third intention by evacuating the humour impact in the part with local Medicins varied according to the four times of the Tumor.

6. Epid. ſect. 5. ſen. 23.

Lib. 2. ad Glaue. cap. 3.

A Rowler.

For *Galen*, in the beginning and increaſe, preſcribeth a fomentation of *Oxyceratum* uſed with a Sponge. But if ſo be that the *Oedema* be upon the Arm or Leg, a repelling Rowler is very good, that is, ſuch an one as is brought from below upwards. So theſe Medicins following are very fit for the ſame purpoſe, ℞ *Lixivii ex cineribus ſarmentorum, & caulium, an.* ℥ iv. *Tartari & Aluminis an.* ℥ ſ. *aceti* ℥ ij. mix all together and make a decoction, wherein wet Sponges and foment the place. Alſo you may uſe the following Cataplaſm, ℞ *Farinæ hordei* ℥ iv. *coquantur in Lixivio communi, addendo pulveris nucis cupreſſi, corticum granatorum, balauſti, an* ℥ i. *Myrrhæ, Aloes, alum. an.* ℥ ſ. *olei Myrtill.* ℥ ij. *fiat Cataplaſma.* In the ſtate and declination, you muſt uſe drying and reſolving Medicins, as, *Nucum cupreſſi, granat. ſumach. balauſti, an.* ℥ i. *Salviæ, origan. calament. Hyſſopi, meliſſæ, an. m.* i. *abſinthii, plantag. caudæ equ. tapſ. barb. centinod. an. m. ſſ. alum. tartar. & ſalis com. an.* ℥ i. *coquantur cum lixivio*; foment it with a Sponge, then preſently apply this following Cataplaſm. ℞ *Rad. Brioniæ* ℥ ij. *abſinth. plantag. centin. chamæm. meliloti peleg. an. m. ſſ. coquantur in hydromelite, piſtentur, trajiciantur, addendo pulveris roſ. rub. chamæm. melil. an.* ℥ i. *fiat Cataplaſma.*

What caution to be had in application of Emplaiſters.

Laſtly, You may here with good ſucceſs uſe reſolving Emplaiſters and Ointments, firſt heating, or chafing the part by friction or fomentations, as well moiſt as dry; otherwiſe Emplaiſters will ſcarcely do their duty, by reaſon of the great coldneſs of the part, being not ſufficient of it ſelf to aſſimilate the nouriſhment, or to expel the ſuperfluous and unprofitable humour. Let a fomentation be made with white Wine, in which Sage, Roſemary, Thyme, Lavender, Chamomile and Melilot flowers, red Roſes, Orris roots, *Stœchas*, and ſuch like have been boiled, with a little Vinegar added thereunto. Quench hot Bricks in the ſame decoction, and apply them wrapped in linnen cloths to the affected part, for ſo vapours will breath forth, which hath an attenuating, piercing, reſolving and ſtrengthening faculty. But you may, in ſtead of the Bricks, fitly apply Hogs or Ox bladders, filled half full with the foreſaid decoction, and that hot. The frictions muſt be made of hot linnen cloths, for ſo the native heat together with the bloud and ſpirits is recalled to the part, and fuliginous humours contained under the skin are reſolved, whereby the ſtrength of the part is in ſome part recovered.

CHAP. XVII.

Of the Cure of flatulent and Wateriſh Tumours.

In what place Flatulencies may be gathered.

I Formerly declared that not onely flatulent and wateriſh Tumors were comprehended under this word *Oedema*, but alſo ſuch as are bred of congealed Phlegm, as *Atheromata*, *Steatomata*, and *Melicerides*, Flatulent or windy Tumors are cauſed by vapour and wind kept in or contained ſometimes under the skin, ſomewhiles under the Membranes, as the *Perioſteum* and *Pericranium*, whereupon enſues cruel torment by reaſon of the diſtention of thoſe parts which are indued with moſt exquiſit ſenſe. Sometimes the Entrails, as the Stomach and Guts are ſwollen and ſtretched out with wind, as in a Tympany.

They

They in this differ from a true and legitimate *Oedema*, that when you lay your finger upon them and take it off again, there remains no ſign of the preſſure thereof, becauſe they are diſtent by vapour and not by humour, for the vapour being preſſed returns ſpeedily again, as you may perceive by balls or bladders filled with wind. In what flatulent tumours differ from a true *Oedema*.

The cauſe of ſuch tumours is the weakneſs of the native heat, not being able eaſily to reſolve and waſte the Phlegm by which the windy Tumours are raiſed: for ſo the morning Sun (which in ſome ſort reſembles our native heat) cannot reſolve the miſts diſperſed in the air; which at noon it eaſily reſolves into pure air. Alſo after the ſame manner our weaker heat ſtirs up vapours from that Phlegm it could not diſſolve, which vapours are the matter of inflammations, or ſwellings. But oft-times although the native heat be ſufficiently powerful, yet becauſe the humour lieth deep, or is kept by the thickneſs of ſome Membrane, Tendon, or Ligament, the ſtirred up vapour cannot exhale, whereby it comes to paſs, that increaſed by little and little it cauſes a Tumour. The cauſes of flatulent tumours.

The ſigns of ſuch a Tumour are a certain renitency or reſiſtance, perceived by preſſing it with your finger; and ſometimes a noiſe, as if you ſmite upon a Drum, eſpecially if much wind be contained therein, ſuch as are often gathered together in the hollowneſs of the belly, and in the ſpaces between the larger Muſcles. The Tumour is neither red, nor hot, but rather cold and white, as in an *Oedema*. It often poſſeſſeth the joints, and eſpecially the knees, and it is very difficult to be reſolved. If ſuch flatulency be gathered together in the Guts, it cauſeth the Wind Colick, in which ſometimes the diſtenſion is ſo great, that Death enſues by reaſon of the renting or tearing the Coats of the Guts. The ſigns of ſuch tumours.

CHAP. XVIII.

Of the Cure of a flatulent and wateriſh Tumour.

WE ſhall chiefly and principally cure flatulent and wateriſh Tumours by three means. Firſt, by the ſame diet which we preſcribed in an *Oedema*; then by ſtrengthening the parts appointed for concoction, as the Stomach and Liver, chiefly by the temperate uſe of Aromatick things, as *Diacuminum*, *Diacalamentha*, *Aromaticum*, *Caryophyllatum*, *Aromaticum Roſatum*, and the like, to be preſcribed according to the good liking of the Phyſitian which over-ſees the Cure; laſtly by taking away of the conjunct matter by hot, drying, and attenuating Medicins which they call Carminative, that ſo the part being rarified, the humour and flatulency therein may be diſcuſſed and diſſipated. But remedies of this nature muſt be varied according to the variety of the parts; for ſome things are fit to be applied to the Stomach, others to the Guts, others to the Joints, and others to the fleſhy parts: for the Colick you muſt inject carminative Clyſters, let reſolving *Sacculi* or Bags be applied, and Cupping-glaſſes faſtened to the Navel; if an outward part be affected, we uſe fomentations, liniments, chiefly if pain torment, as alſo Cataplaſms and Emplaiſters, as ℞ *Florum chamæm. melil. roriſmarini, roſar. rub. an. p.* i. *abſinthii* ij. *hyſſopi, an.* m. let them be boiled in Lye, adding a little Vinegar for a fomentation to be uſed with Sponges. Diet. Things ſtrengthening the parts. Medicins evacuating the conjunct matter.

Galen foments the part with Roſe-vinegar and a little Salt put thereto, and would have a Sponge dipped therein to lie ſomewhat long upon the part, ℞ *Olei chamæm. aneth. rut. & liliorum, an.* ℥ ß. *ceræ albæ* ℥ vj. *aq. vitæ* ℥ i. let them all be mixed together and make a liniment, with which anoint the part after the fomentation. ℞ *Farinæ fabar. orobi, an.* ℥ iij. *coquantur in decoctio pulegii, origani, calamenth. ſalviæ, addita pulverum chamæm. & melilot. an. m.* ß. *furfur farinæ. fab. & orobi, an.* ℥ ij. *coquantur cum lixivio communi, addendo terebinth.* ℥ iij. *oleor. aneth. & rut. an.* ℥ ij. make an emplaiſter for the foreſaid uſe. *Galen*'s fomentation.

The Emplaiſter of *Vigo*, with *Mercury*, and without, is very good for the ſame purpoſe. But you muſt note, that ſuch Medicins muſt be applied to the part actually hot, and the ſame heat muſt be contained and renewed by putting about it linen Clothes, Bricks, Bottles, and ſuch like hot things.

The humour and flatulency which were kept ſhut up in the part being reſolved, the part muſt be ſtrengthened, leſt now and then it receive or generate the like matter. That may be done by the following fomentation and cataplaſm. ℞ *Nucum cupreſſi, corticum granat. ſumach. berberis, balauſt. an.* ℥ i. *caudæ equin. arnogloſſ. tupſi barb. abſinth. ſalviæ, roriſm. lavendul. m. ſſ. flor. chamæm. melil. roſar. anthos. an. p.* i. *alum. ſalis com. an.* ℥ i. *bulliant omnia in æquis partibus aquæ fabrorum & vini auſteri*, make bags for a fomentation, or uſe the decoction for the ſame purpoſe with a Sponge. ℞ *Farinæ fab. hordei & lupin. an.* ℥ ij. *terebinth. commun.* ℥ iv. *pulv. radicis ireos, maſtic. an.* ℥ ß. *mellis com.* ℥ ij. ß. of the aforeſaid Decoction as much as ſhall ſuffice, ſo to make a Cataplaſm to the form of a Poultis liquid enough; let it be applied hot to the affected part having uſed the fomentation before. Corroborating Medicins.

The ſigns of a wateriſh tumour are the ſame as of a flatulent; but over and beſides it ſhines and at the preſſing with your Fingers, there is heard a noiſe of murmur as of a bladder half filled with Water. The ſigns of a wateriſh tumour.

Therefore the wateriſh tumour if it ſhall not yield to the fore-mentioned reſolving Medicins, the way muſt be opened with an Inciſion-Knife, after the ſame manner, as we mentioned in a Phlegmon. For often-times this kind of remedy muſt be neceſſarily uſed, not onely by reaſon of the contumacy of the humour which gives no place to the reſolving Medicins, but alſo becauſe it is ſhut up in its proper ciſt or bag, the thickneſs of which fruſtrates the force of the reſolving Medicins, neither ſuffers it to penetrate into the humour. As I ſome years ago found by experience in a Maid of 7 years old; which troubled with a *Hydrocele*, or wateriſh Rupture, to whom, when I had raſhly applied to diſſolve it with reſolving Medicins of all ſorts, at length I was forced to open it with my knife, not only to evacuate the contained matter, but alſo that I might pluck out the bag, which unleſs it were cut up by the root, would be a mean to cauſe a relapſe. *John Altine* Doctor of Phyſick called me to this buſineſs. *James Guillemeau* the Kings Chirurgeon over-ſaw the Cure. Why a wateriſh tumour muſt be opened with an inſtrument. A Hiſtory.

CHAP. XIX.

Of an Atheroma, Steatoma, and Meliceris.

In what an *Atheroma*, *Steatoma*, and *Meliceris* differ.

ALthough theſe tumours may be thought to be comprehended under one *genus* with the other *Oedematous* tumours, yet they differ as thus; that is, their matter is ſhut up in its bladder, or bag, as it were in a peculiar Cell. But their difference amongſt themſelves is thus; the matter of the *Steatoma*, as the name ſignifieth, is like unto Tallow [for Στεαρ in *Greek* ſignifieth Tallow or Seam] yet it oft-times is found ſtuffed with other divers hard bodies, ſtony, bony, or callous, like unto the claws an Hen. For *Philoxenus* reports that he ſometimes ſaw Flies in a *Steatoma* at the opening thereof, and ſuch other like things wholly diſſenting from the common matter of Tumours. The matter contained in an *Atheroma*, is like to pap, with which they feed little Children. A *Meliceris* contains matter reſembling Honey in colour and conſiſtence; theſe tumours appear and riſe without any inflammation going before them. Thus you ſhall know theſe tumours, a *Steatoma* is harder than the other two, neither yields it to the preſſure of your finger; but when it once yields, it doth not ſpeedily and eaſily return to its former Figure, becauſe the matter is more groſs; it is of the ſame colour as the skin, without pain, and of a longiſh Figure. The *Meliceris* yields to the touch, as being a looſe and ſoft body, and as it is eaſily diſpoſed and diffuſed, ſo it quickly returns to its former place and tumour. It differs from the *Atheroma* in figure and ſubſtance. For it is more globous and of a ſubtiler and more ſhining matter, beſides alſo it takes up a large ſpace, and is more obſequious to the touch, and, for the reſt, without pain. As for the manual operation of the Chirurgeon in their cure, it ſeems to be of no great conſequence of what ſort the matter is, whether reſembling Tallow, Honey, or Pap, for there is one ſimple manner of operation, which is, that you pluck away the contained humour, as alſo the receptacle in which it is contained. Yet you muſt note ſuch tumours, ſometimes as it were hanging in the ſurface of the skin, are eaſily to be moved this way, and that way; but otherſome again deeper faſtned firmly cohere with the adjacent bodies, and theſe require an exquiſite hand, and alſo induſtry, for fear of a great flux of bloud and convulſion by cutting a Vein. There are many other kinds of tumours, as the *Teſtudo* or Mole, the *Nata*, the *Glandula*, *Nodus*, *Botium*, *Lupia*, which as in matter (for they are all of a thick, clammy, and viſcous Phlegmatick humour) ſo alſo in kind they agree with an *Atheroma*, *Steatoma*, and *Meliceris*. But alſo in theſe for the moſt part, when they are opened you may ſee bodies of all ſorts far different from the common matter of tumours, as Stones, Chalk, Sand, Coals, Snails, Straws, or Awns of Corn, Hey, Horn, Hairs, Fleſh, both hard and ſpongeous, Griſles, Bones, whole Creatures as well living as dead.

Of Chirurgery to be uſed to theſe tumours.

What the cauſe may be, that we ſometimes find *Inſecta* in theſe tumours.

The generation of which things (by the corruption and alteration of humours) ſhall not make us much to admire it, if we conſider, that as Nature, of all Seeds and Elements of the whole great World, hath made Man, the Microcoſm or little World, that he might be, as it were the lively Image of that greater World; ſo in him, it being never idle in us, would have all the kinds of all motions and actions to ſhew themſelves, as long as matter for generation is not wanting. But becauſe there is little, or rather no mention of theſe tumours amongſt the Ancients, we will briefly ſhew the opinions of the later Writers concerning them.

What the *Teſtudo* or *Talpa* is.

Now they ſay, the *Teſtudo* is a tumour contrary to Nature, ſoft, diffuſed, vaulted or arched like a Tortois, ſometimes it ariſes in the head in form of a Mole, and then it is called a Mole.

What the *Nata* is.

The *Nata* is a great and fleſhy tumour, not in ſhape unlike a Melon, or rather the fleſh of a mans Buttocks, whence it may ſeem to have had the name, unleſs we had rather ſay, It had it, becauſe it more uſually breeds upon the buttocks, than upon any other part of the body.

What a *Glandula*.

The *Glandula* takes it denomination from an Acorn, called *Glans* in Latine, the which it ſomewhat reſembles in the compaſs and form of the tumour; or elſe becauſe it moſt commonly breeds in the Glandules or Emunctories of Mans body.

What *Nodus*.

The *Nodus*, or knot, is a round tumour, hard and immoveable, named from a rope tied on a knot. *Guido Cauliacenſis* affirms Knots commonly to grow into nervous bodies; but at this time they more uſually ariſe on the bones of ſuch as have the French Diſeaſe.

CHAP. XX.

Of the Cure of Lupiæ, *that is, Wens, or Ganglions.*

What a *Ganglion* is.

A Wen or *Ganglion*, is a tumour ſometimes hard, ſometimes ſoft, yet always round, uſing to breed in dry, hard, and nervous parts. And ſeeing that ſome of the tumours mentioned before in the former Chapter, ſtick immoveable to the part to which they grow, becauſe they are contained in no ciſt, or bag; otherſome are moved up and down by the touch of your Fingers, becauſe they are contained in a bag or bladder; it commonly comes to paſs that Wens have their bladder wherein to contain them; and therefore we think fit, the rather more freely and particularly to treat of their Cure, becauſe they are more difficultly cured, eſpecially where they are inveterate and of long ſtanding.

The cauſes.

The primitive cauſes of theſe are dull blows, fallings from high places, ſtrains, and other ſuch like occaſions. But the antecedent and conjunct cauſes are the ſame with thoſe of an *Atheroma*, *Meliceris*, and *Steatoma*.

Signs.

The deſcription formerly ſet down, will furniſh you with the ſigns by which you may know when they are preſent; certainly from very ſmall beginnings they grow by little and little to a

great

great bigneſs, in the ſpace of ſix or ſeven years, ſome of them yield much to the touch, and almoſt all of them are without pain.

You may hinder ſuch as are beginning and firſt growing from increaſe, by ſomewhat a ſtrong and frequent rubbing with your fingers. For ſo their bag or bladder, together with the skin, wax thin, and the contained humour grows hot, is attenuated, and reſolved. But if ſo you nothing prevail, you muſt lie upon them with your whole hand, or a flatted piece of Wood, as heavy as you can, until ſuch time as the ciſt, or bag, be broken by your impreſſion; Then apply and ſtrongly bind unto it a Plate of Lead, rubbed over with Quickſilver; for I have many times found by experience, that it hath a wonderful force to reſolve and waſte the ſubject humour. But if the Wen be in ſuch a place in which you can make no ſtrong impreſſion, as in the Face, Cheſt, Belly, and Throat, let there be applied an Emplaiſter which hath a reſolving force, ſuch as this following hath: ℞ *Gummi ammon. bdellii. galban. an.* ʒ iij. *liqueſiant in aceto, & trajiciantur per ſetaceum, addendo olei liliorum & lauri, an.* ʒ i. *aqu. vitæ parum, pulveris ireos, ſalis ammon. ſulphur. vivi, vitrioli Romani, an.* ʒ ß. Let them be incorporated together, and make an Emplaiſter according to Art. But if the Tumor cannot be thus reſolved, it muſt be opened with a Knife, or Cautery. And after the Eſchar is removed, and the bag waſted by *Ægyptiacum*, *Mercury*, and the like, the ulcer muſt be cleanſed, repleniſhed with Fleſh, and cicatrized.

Their Cure at the beginning.

Plates of Lead rubbed with Quickſilver.

A reſolving Plaiſter.

Things to waſte or conſume the bag.

Sometimes Wens grow to ſo great a maſs that they cannot be cured by the deſcribed remedies, wherefore they muſt be taken away by the root, by your Hand and Inſtrument, if ſo be that there be no danger by reaſon of their greatneſs, and ſo that they adhere not too cloſely to the adjacent parts, and if they be not too nigh to the greater Veins and Arteries, for it will be better in ſuch a cauſe to let them alone. This ſhall be your way to cut them off, or take them away. A ſmall Inciſion muſt be made, even to the bladder or bag, by which thruſt in a Probe of a fingers thickneſs, hollowed in the midſt, round at the end, and as long as need ſhall require; then draw it many times about between the skin and the bag, even to the root of the Wen, that ſo the skin may be divided long ways, then it will be requiſite to make another Inciſion overthwart, ſo that they may interſect each other like a Croſs; then preſently draw the skin from the bladder, from the corners of the Wen towards the root, and that with your finger covered with a fine linnen cloth, or elſe with a Razor, if need require.

The manner to take away Wens.

But you muſt obſerve, that in a Wen there are always certain Veſſels which are ſmall in the beginning, but much increaſed in proceſs of time, according to the increaſe of the Wen, whereof they are, as it were, the roots; wherefore if any *Hæmorrhagie*, or flux of bloud happen, let it be ſtopped by binding the Veſſels at their heads and roots, or make a ſtrait ligature at the roots of the Wen, with a piece of Whipcord, or with a many times doubled thred, and let the ends hang forth until it fall away of its own accord. Neither will it be ſufficient to have cut away all this Tumor, but alſo it will be fit to cut away a portion of the skin, wherewith the tumor was covered, and onely to leave ſo much as ſhall ſuffice to cover the part; then with a Needle and Thred draw together the lips of the inciſion, but in the interim let tents be put into the bottom of the ulcer until it be perfectly cleanſed, and the reſt of the Cure be Workman-like performed, even to the cicatrizing thereof.

A Hiſtory.

The Chirurgeon *Collo*, and I, uſing this method, in the preſence of Maſter Dr. *Violanius* the Kings Phyſician, took away a Wen from Martial *Collard* the Maior of *Burbon*, it hanged at his neck, as big as a Mans head, and it weighed eight pounds; which made it ſo troubleſom and burdenſom to him, that he was forced to carry it bound up in a Towel as in a Scrip.

What Wens to be cured by ligature.

Which dangerous to cure.

Verily, if theſe kind of Tumors have a ſlender root and broad top, they muſt be ſtraitly tied, and ſo cut off, But it is very difficult and full of dangerous chance, to take away ſuch Wens as are ſeated in the Neck near unto the Jugular Veins, thoſe under the Arm-holes, in the Groins, and ſuch as are under the Ham; by reaſon of the deadly force of ſuch ſymptoms as may thence ariſe. We can onely conjecture, not certainly ſay, what kind of matter may be contained in them. We can onely know of what ſort it is, when by inciſion it is preſented to our ſight. Yet in ſuch as are very hard, and do much reſiſt the Touch, there are often found matters, which in conſiſtence may be reſembled to little Stones or Pebles.

A Hiſtory.

The matter of a Wen is ſometimes taken for a *Cancer*.

I being on a time called to open the body of a great Lady, found in one of her Breſts a body which might equal the bigneſs of an Hens Egg, hard, and compact like a rough Peble; it was held, whileſt ſhe lived, both by the Phyſicians and the Chirurgeons, to be a *Cancer*, becauſe this hardneſs was very painful to her when it was but gently preſſed down.

Another Hiſtory.

How you may know a Wen from a *Cancer*.

But alſo ſome few years agon, I, being called to the Cure of a very honeſt Woman, which was troubled with the ſame diſeaſe, ſtrongly withſtood the Phyſicians and Chirurgeons, affirming it to be a *Cancer*, for the tumor had taken no deep root, the habit of the part was not changed from the native colour, the Veins about it were not ſwollen, neither was there any other convincing ſign of a *Cancer*. For this ſame Woman had her Courſes at their due and uſual time, and was well-liking, and had a good colour in her face and body, was free from all ſort of pain, unleſs when you preſſed down the part affected. Beſides, thenceforward the Tumor grew not at all, no other evil accident befel her, yea verily ſhe lives merrily, and well both in body and mind.

CHAP. XXI.

Of a Ganglion *more particularly ſo called.*

What a *Ganglion* properly ſo called is.

The cauſes.

THere are alſo certain ſmall Tumors of the kind of *Dupiæ*, or Wens, which grow on divers parts of the body, but chiefly on the wriſts of the hands, and ankles of the feet, being called by a more particular name *Ganglia*; they appear on the top of the skin, neither do they ever lie deep. The cauſe of them is either the imbecillity of a nerve or tendon, got by wreſting, extenſion, a blow, labour, or other ſuch like cauſe. Through which occaſion the alimentary juice which

flowed to theſe parts, ſeeing it can neither be concocted, nor aſſimilated into the proper ſubſtance, is converted into an humour of the like nature cold, and groſs, which in continuance of time heaping it ſelf up by little and little about the Fibers, and the very ſubſtance of the tendon concretes into a tumor.

What *Ganglia* may not be cured with Iron Inſtruments.

It is not fit to uſe any Iron Inſtrument to theſe *Ganglia* which poſſeſs the tendons and joints, but onely apply *Ammoniacum* and *Galbanum* diſſolved in Vinegar and *Aqua Vitæ:* as, ℞ *Gummi ammon. & ſagapeni in aqua vitæ diſſolutorum, an.* ʒ i. *coquantur ſuper cineres calidos ad formam emplaſtri, ſub finem adde ſulphuris vivi ſubtiliter pulveriſati* ʒ ß. *fiat empl. ad uſum.* Alſo the Emplaiſter of *Vigo* with double *Mercury* would be good for the ſame purpoſe.

The tumor ſoftned by theſe remedies, muſt be wrought, rubbed, or preſſed, ſo long, until the bladder or bag be broken under your finger, which I have divers times done; then it will be expedient preſently to apply and bind hard thereunto a plate of Lead rubbed with Quickſilver, which may waſte and conſume the remainder of the tumor.

Sometimes there are *Ganglia* ſeen hanging by a ſmall root, as it were a ſtring; wherefore they muſt be tied with a ſtring at the root, and every day twitched harder and harder, till ſuch time as they fall off. The reſt of the cure may be eaſily performed by the common rules of Art.

CHAP. XXII.

Of the Strumæ *or* Scrophulæ, *that is, the Kings Evil.*

What the *Scrophulæ* or Kings Evil is.

THe *Scrophulæ* are œdematous tumors ariſing in the glandulous parts, as the Breſts, Arm-holes Groins, but chiefly in the glandules of the neck. They appear either one or many, according to the quantity of that matter from whence they proceed, commonly contained in their proper ciſt, a bag, as *Atheromaes*, *Steatomaes*, and *Melicerides* are.

Their material cauſe. How they differ from other glandulous tumors.

They are made of a groſs, cold, viſcid, and phlegmatick matter with ſome admixture of Melancholy. They differ from other glandulous tumors; firſt in number, for moſt uſually there appear many of them united together, ſpringing from ſomewhat a deeper root than glandulous tumors do; ſome of them are moveable, otherſome woven with the neighbouring nerves, remaining unremoveable.

Ganglia appear fewer in number, and are without pain; but *Scrophulæ* often-times are painful, eſpecially when they wax hot by putrefaction; ſo that ſometimes they degenerate into cancerous Ulcers, not to be touched by Inſtruments nor acrid Medicins.

Phlegmatick, melancholick, and gluttonous perſons, and ſuch as are accuſtomed to feed on cold and moiſt nouriſhments, as fiſh and cold water, and lead a ſedentary and idle life, are ſubject to the *Scrophulæ*.

Their cure by Diet.

They are cured by a moſt ſlender Diet, for ſo the native heat by want of nouriſhment turned upon the material cauſe of ſuch like tumors, waſtes it.

Emollient and reſolving Medicins.

And they are cured by purging off the ſuperfluous humours, and alſo by application of emollient reſolving and ſuppurating Topick Medicins, after this following manner. ℞ *Mucaginis alth. fænugr. & ficum ping. an.* ʒ ij. *olei liliorum, & chamæm. an.* ʒ i. *pinguedinis anſeris & axungiæ porci* ʒ ß. *Terebinth. Ven.* ʒ i ß. *ammoniaci, & galbani in aceto diſſolutorum, an.* ʒ i. *ceræ novæ quantum ſatis, fiat cerotum ſecundum artem ad modum Diachyli magni.*

The Ointment for the *French* Diſeaſe, and the Emplaiſter of *Vigo* with *Mercury*, are excellent for this purpoſe, eſpecially, if we continue ſo long until the Patient come to Salivation, for ſo nature will disburden it ſelf of the humour generating the *Scrophulæ*, which I have ſometimes tried with happy ſucceſs. ℞ *Emplaſtri diachyl. alb. & mag. ceroti æſopi deſcriptionis Philagrii, an.* ʒ ij. *Terebinth. claræ* ʒ i. *olei liliorum parum, fiat emplaſtrum ſatis molle.* But if the *Scrophulæ* cannot by this means be reſolved,

Suppuratives.

but, as it oft-times happens, tend to ſuppuration, you muſt uſe Suppuratives, as ℞ *Rad. alth. & lilior. an.* ʒ iij. *coquantur in aqua communi, piſtentur, trajectis adde capitum alliorum ſub cineribus coctorum* ʒ iij. *olei liliorum, & ping. anſeris & anatis, an.* ʒ i. ß. *farinæ ſeminis lini quantum ſatis; formetur cataplaſma.*

A Note to be obſerved in opening *Scrophulous* tumors.

Here we muſt admoniſh the Chirurgeon that he open not the *Scrophulæ*, before that all the contained humour be fully and perfectly turned into *pus*, or matter, otherwiſe the reſidue of the humour will remain crude, and will ſcarce in a long time be brought to maturation; which precept muſt be principally obſerved in the *Scrophulæ*, and alſo ſometimes in other abſceſſes, which come to ſuppuration.

Natural heat the cauſe of ſuppuration.

For we muſt not, as ſoon as any portion of the contained humours appear converted into *pus*, procure and haſten the apertion. For that portion of the ſuppurated humour cauſes the reſt ſooner to turn into *pus*, which you may obſerve in inanimate bodies. For fruits which begin to periſh and rot, unleſs we preſently cut away the putrifying part, the reſidue quickly becomes rotten: there is alſo another reaſon, the native heat is the efficient cauſe of ſuppuration; it therefore (the Sore being opened) diminiſhed and weakned by reaſon of the diſſipation of the ſpirits, evacuated together with the humour, will cauſe the remaining portion of the humour not to ſuppurate, or that very hardly, and with much difficulty. Yet if the tumefied part be ſubject, by its own nature, to corruption and putrefaction, as the Fundament; if the contained matter be malign, or critical, it will be far better to haſten the apertion.

The Chirurgical manner of curing *Scrophulæ*.

There is alſo another way of curing the *Scrophulæ*, which is performed by the hand. For ſuch as are in the neck, and have no deep roots, by making Inciſion through the skin, are pulled and cut away from thoſe parts with which they were intangled. But in the performance of this work, we take eſpecial care that we do not violate or hurt with our inſtrument the Jugular Veins, the ſleepy Arteries, or recurrent Nerves. If at any time there be danger of any great efflux of bloud, after they are plucked from the skin, they muſt be tied at their roots, by thruſting through a needle and thred, and then by binding the thred ſtrait on both ſides, that ſo bound they may fall off by themſelves by little without any danger. The remainder of the Cure may be performed according to the common rules of Art.

CHAP.

CHAP. XXIII.

Of the Fever which happens upon an œdematous Tumour.

HAving ſhewed all the differences of œdematous Tumors, it remains, that we briefly treat of the Symptomatical Fever, which is ſometimes ſeen to happen upon them. This therefore retaining the motion of the humour by which it is made, is commonly of that kind, which they name intermitting Quotidians. Now the fit of a Quotidian comes every day, and in that repetition continues the ſpace of eighteen hours; the reſidue of the day it hath manifeſt intermiſſion. How an intermitting Quotidian happens upon œdematous tumors.

The primitive cauſes of this Fever, are the coldneſs and humidity of the air encompaſſing us, the long uſe of cold meats and drinks, and of all ſuch things as are eaſily corrupted, as Summer Fruits, crude Fiſhes, and laſtly, the omiſſion of our accuſtomed exerciſe. The cauſe of a Quotidian Fever.

The antecedent cauſes are, a great repletion of humors, and theſe eſpecially phlegmatick. The conjunct cauſe is Phlegm putrefying in the habit of the body, and firſt region thereof without the great Veins.

The ſigns of this Fever are drawn from three things; as firſt Natural, for this Fever or Ague chiefly ſeizes upon thoſe which are of a cold and moiſt temper, as Old Men, Women, Children, Eunuchs, becauſe they have abundance of Phlegm; and it invades Old Men by its own nature, becauſe their native heat being weak, they cannot convert their meats, then taken in a ſmall quantity, into laudable bloud, and the ſubſtance of the parts. But it takes children by accident, not of it ſelf, and their own nature, for Children are hot and moiſt; but by reaſon of their voracity or greedineſs, and their violent, inordinate, and continual motion after their plentiful feeding, they heap up a great quantity of crude humours, fit matter for this Fever, whereby it comes to paſs, that fat children are chiefly troubled with this kind of Fever, becauſe they have the paſſages of their bodies ſtrait and ſtopped, or becauſe they are ſubject to Worms, they are troubled with pain, by corruption of their meat; whence ariſeth a hot diſtemper by putrefaction, and the elevation of putrid vapours, by which the heart being moleſted, is eaſily taken by this kind of Fever. The Signs. How children come to be ſubject to Quotidian Fevers.

From things not Natural, the ſigns of this Fever are thus drawn. It chiefly takes one in Winter, and the Spring, in a cold and moiſt region, in a ſedentary and idle life, by the uſe of meats, not onely cold and moiſt, but alſo hot and dry, if they be devoured in ſuch plenty, that they overwhelm the native heat.

For thus Wine, although it be by faculty and Nature hot and dry, yet taken too immoderately, it accumulates phlegmatick humours, and cauſes cold Diſeaſes. Therefore Drunkenneſs, Gluttony, Crudity, Baths, and Exerciſes preſently after meat, being they draw the meat as yet crude into the Body and Veins; and to conclude, all things cauſing much phlegm in us, may beget a Quotidian Fever. But by things contrary to Nature, becauſe this Fever uſually follows cold Diſeaſes, the Center, Circumference and Habit of the Body being refrigerated. How phlegmatick humors happen to be generated by hot and dry meats.

The ſymptoms of this Fever are, the pain of the mouth of the Stomach, becauſe that phlegm is commonly heaped up in this place, whence follows a vomiting or caſting up of phlegm; the Face looks pale, and the mouth is without any thirſt, often-times in the fit it ſelf; becauſe the Stomach flowing with phlegm, the watery and thinner portion thereof continually flows up into the mouth and tongue, by the continuity of the inner coat of the ventricle common to the gullet and mouth. The Symptoms of Quotidians.

It takes one with coldneſs of the extreme parts, a ſmall and deep pulſe, which notwithſtanding in the vigour of the Fit, becomes more ſtrong, great, full, and quick. Juſt after the ſame manner, as the heat of this Fever at the firſt touch appears mild, gentle, moiſt, and vaporous; but at the length it is felt more acrid, no otherwiſe than fire kindled in green wood, which is ſmall, weak, and ſmoky at the firſt; but at length when the moiſture, being overcome, doth no more hinder its action, it burns and flames freely. The manner of the pulſe and heat in a Quotidian.

The Patients are freed from their fits with ſmall ſweats, which at the firſt Fits break forth very ſparingly, but more plentifully when the *Criſis* is at hand; the Urin at the firſt is pale and thick, and ſometimes thin, that is, when there is obſtruction. But when the matter is concoct, as in the ſtate, it is red: if at the beginning of the Fit they caſt up any quantity of phlegm by vomit, and that Fit be determinated in a plentiful ſweat, it ſhews the Fever will not long laſt; for it argues the ſtrength of Nature, the yielding and tenuity of the matter flying up, and the excretion of the conjunct cauſe of the Fever. Critical Sweats. The Urin.

A Quotidian Fever is commonly long, becauſe the Phlegmatick humor being cold and moiſt by Nature, is heavy and unapt for motion; neither is it without fear of a greater Diſeaſe, becauſe oft-times it changes into a burning or Quartan Fever, eſpecially if it be bred of ſalt Phlegm, for ſaltneſs hath affinity with bitterneſs, wherefore by aduſtion it eaſily degenerates into it, ſo that, it need not ſeem very ſtrange if ſalt phlegm by aduſtion turn into choler, or melancholy. Thoſe who recover of a Quotidian Fever, have their digeſtive faculty very weak; wherefore they muſt not be nouriſhed with ſtore of meats, nor with ſuch as are hard to digeſt. In a Quotidian, the whole body is filled with crude humors, whereby it comes to paſs, that this Fever oft-times laſts ſixty days. But have a care you be not deceived, and take a double Tertian for a Quotidian, becauſe it takes the Patient every day as a Quotidian doth. Verily it will be very eaſie to diſtinguiſh theſe Fevers by the kind of the humour, and the propriety of the ſymptoms and accidents; beſides, Quotidian commonly take one in the evening, or the midſt of the night, as then when our bodies are refrigerated by the coldneſs of the air cauſed by the abſence of the Sun. Wherefore then the cold humours are moved in us, which were bridled a little before by the preſence and heat of the Sun. But, on the contrary, double Tertians take one about Noon. The ſhortneſs and gentleneſs of the Fit, the plentiful ſweat breaking forth, the matter being concocted, cauſes us to think the Quotidian ſhort and ſalutary. Why Quotidians are oft-times long. Into what Diſeaſes a Quartan uſually changes. How to diſtinguiſh a Quotidian from a double Tertian.

The Cure is performed by two means; to wit, Diet, and Pharmacy. Let the Diet be ſlender and attenuating, let the Patient breathe in a clear air moderately hot and dry; let his meats be Diet.

bread

bread well baked, Cock or Chicken broths, in which have been boiled the roots of Parſley, Sorrel and the like.

When the uſe of ſpiced and ſalted meats are fit.

Neither at ſometimes will the uſe of hot meats, as thoſe which are ſpiced and ſalted, be unprofitable, eſpecially to ſuch as have their ſtomach and liver much cooled. Let him eat Chickens, Mutton, Partridge, and ſmall Birds, River-fiſhes, and ſuch as live in ſtony Waters, fried or boiled, rear Eggs, and ſuch like. Theſe Fruits are alſo good for him, Raiſins, ſtewed Prunes, Almonds and Dates. Let his drink be ſmall white Wine mixed with boiled Water. Moderate Exerciſes will be good, as alſo frictions of the whole Body: Sleep taken at a fitting time, and proportioned to waking, ſo that the time of Sleep fall not upon the time of the Fit, for then it hurts very much, for calling the heat to the inner parts, it doubles the raging of the feveriſh heat inwardly in the Bowels.

When Sleep is hurtful.

For the Paſſions of the Mind, the Patient muſt be merry, and comforted with a hope ſhortly to recover his health. It ſeems not amiſs to ſome, at the coming of the Fit to put the feet and legs into hot Water, in which Chamomil, Dill, Melilot, Marjerom, Sage, and Roſemary have been boiled.

Medicins.

The Medicins ſhall be ſuch Syrups as are called digeſtive and aperitive, as Syrup of Wormwood, Mints, of the five opening Roots, *Oxymel* with a decoction of Chamomil, Calamint, Melilot, Dill and the like, or with common decoctions. The Purgatives ſhall be *Diaphœnicon*, *Electuarium*, *Diacarthami*, *Hiera picra*, Agarick, Turbith, of which you ſhall make Potions with the Waters of Mints, Balm, Hyſſop, Sage, Fennel, Endive, or the like; *Pilulæ aureæ* are alſo good. Theſe Purgatives ſhall ſometimes be given in form of a Bole with Sugar, as the Phyſitian being preſent ſhall think moſt fit and agreeable to the nature of the Patient.

Care muſt be had of the Stomach. Vomits.

About the ſtate of the Diſeaſe, you muſt have a care of the Stomach, and principally of the mouth thereof, as being the chief ſeat of Phlegm; wherefore it will be good to anoint it every other day with Oil of Chamomil mixed with a little white Wine, as alſo to unlade it by taking a Vomit of the Juice of Radiſh, and much *Oxymel*, or with the decoction of the Seeds and Roots of *Aſarum* and Chamomil; and Syrup of Vinegar will be very good, eſpecially at the beginning of the Fit, when Nature and the humours begin to move; for an inveterate Quotidian, though you can cure it by no other remedy, nothing is thought to conduce ſo much as one dram of old Treacle taken with Sugar in form of a Bole, or to drink it diſſolved in *Aqua vitæ*.

The uſe of Treacle in an inveterate Quotidian.

CHAP. XXIV.

Of a Scirrhus, *or an hard Tumor proceeding of Melancholy.*

What a true and legitimate *Scirrhus* is. What an illegitimate *Scirrhus* is.

HAving ſhewed the nature of Tumors cauſed by Bloud, Choler, and Phlegm, it remains we ſpeak of theſe, which are bred of a Melancholick humour: of theſe there are ſaid to be four differences. The firſt is of a true and legitimate *Scirrhus*, that is, of an hard Tumor endued with little ſenſe, and ſo commonly without pain, generated of a natural melancholick humour. The ſecond is, of an illegitimate *Scirrhus*, that is of an hard Tumor inſenſible, and without pain, of a melancholick humour concrete by too much reſolving and refrigerating. The third is of a cancrous *Scirrhus* bred by the corruption and aduſtion of the melancholick humour. The fourth of a phlegmonous, Eryſipelous or Oedematous *Scirrhus*, cauſed by Melancholy mixed with ſome other humor. The cauſe of all theſe kinds of Tumors is a groſs, tough, and tenacious humor concrete in any part. But the generation of ſuch a humor in the body happens either of an ill and irregular diet, or of the unnatural affects of the Liver or Spleen, as obſtruction; or by ſuppreſſion of the *Hæmorrhoids*, or Courſes.

The Signs.

The ſigns are hardneſs, renitency, a blackiſh colour, and a dilation of the Veins of the affected part with blackiſhneſs, by reaſon of the abundance of the groſs humour. The illegitimate, or baſtard *Scirrhus* which is wholly without pain and ſenſe, and alſo the cancerous, admit no cure; and the true legitimate ſcarce yield to any.

Prognoſtick.

Thoſe which are brought to ſuppuration, eaſily turn into Cancers and Fiſtulaes; theſe tumors though in the beginning they appear little, yet in proceſs of time they grow to a great bigneſs.

CHAP. XXV.

Of the Cure of a Scirrhus.

Diet.

THe Cure of a *Scirrhus* chiefly conſiſts of three heads. Firſt, The Phyſician ſhall preſcribe a convenient Diet, that is, ſober and moderate feeding, tending to humidity, and indifferent heat; for his manner of life, let it be quiet and free from all perturbation of anger, grief and ſadneſs, as alſo abhorring the uſe of Venery. The ſecond is placed in the evacuation of the antecedent matter, as by Phlebotomy, if need require, and by purging, by procuring the *Hæmorrhoids* in men, and the Courſes in Women; let Purgations be preſcribed of *Diacatholicon*, *Hiera*, *Diaſenna*, Polypody, *Epithymum*, according to the mind of the learned Phyſician. The third conſiſts in the convenient uſe of Topick Medicins, that is, emollient at the beginning, and then preſently reſolving, or rather ſuch as are mixed both of reſolving and emollient faculties, as *Galen* teaches; for by the uſe of onely emollient things there is danger of putrefaction, and a *Cancer*; and onely of reſolving there is fear of concretion, the ſubtiler part being reſolved, and the groſſer ſubſiding.

Lib. 2. ad. Glauconem.

Emollients.

The emollient ſhall be thus: ℞ *Rad. althæ. lib. ſ. rad. liliorum* ℥ iij. *coquantur in aqua com. piſtentur, trajiciantur per ſetaceum, addendo olei chamæm. & lilior. an.* ℥ ij. *æſipi humid.* ℥ ſ. *emplaſtri diachyl. alb. cum oleo liliorum diſſoluti* ℥ iij. *ceræ albæ quantum ſit ſatis, fiat cerotum.* Or, ℞ *Gummi ammoniaci, galb. bdellii, ſtyracis liquidæ in aceto diſſolutorum, an.* ℥ i. *diachyl. mag.* ℥ i. ſ. *olei liliorum, & axungiæ anſeris.*

anſeris, an. ℥ i. *ceroti æſip. deſcriptione Philagr.* ℥ ij. *liqueſcant omnia ſimul, ceræ quantum ſit ſatis, ut inde fiat cerotum ſatis molle.* When you have ſufficiently uſed emollient things, fume the tumour with ſtrong Vinegar and *Aqua Vitæ* poured upon a piece of a Milſtone, Flint, or Brick, heated very hot; for ſo the mollified humour will be rarified, attenuated, and reſolved; then ſome while after renew your emollients, and then again apply your reſolvers to waſte that which remains, which could not be performed together, and at once; for thus *Galen* healed a Scirrhus in *Circilius* his Son. Goats dung is very good to diſcuſs Scirrhous tumours; but the Emplaiſter of *Vigo* with a double of *Mercury* is effectual above the reſt, as that which mollifies, reſolves, and waſtes, all tumours of this kind.

Lib. ad Glauc. The efficacy of the Empl. of *Vigo* with *Mercury.*

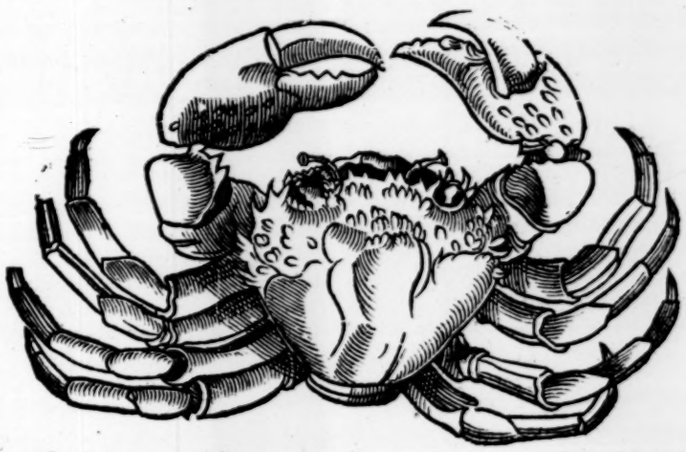
CHAP. XXVI.

Of a Cancer *already generated.*

A *Cancer* is an hard tumour rough and unequal, round, immoveable, of an aſh or livid colour, horrid by reaſon of the Veins on every ſide, ſwollen with black bloud, and ſpread abroad to the ſimilitude of the ſtretched-out legs and claws of a Crab. It is a tumour hard to be known at the firſt, as that which ſcarce equals the bigneſs of a Chick, or *Cicer:* after a little time it will come to the greatneſs of a Haſel-nut, unleſs peradventure provoked by ſomewhat too acrid Medicins

What a *Cancer* is.

The Figure of the Crab, *called* Cancer *in Latine.*



it ſuddenly increaſe; being grown bigger, according to the meaſure of the increaſe, it torments the Patient with pricking pain, with acrid heat, the groſs bloud reſiding in the Veins growing hot, and inferring a ſenſe like the pricking of Needles, from which notwithſtanding the Patient hath oft-times ſome reſt. But becauſe this kind of tumour by the Veins extended and ſpread about it like claws and feet, being of a livid and aſh-colour, aſſociated with a roughneſs of the skin and tenacity of the humour, repreſents, as it were, the toothed claws of the Crab, therefore I thought it not amiſs to inſert (as before) the Figure of the Crab, that ſo the reaſon both of the name and thing might be more perſpicuous.

The nature of the pain.

The reaſon of the name.

CHAP. XXVII.

Of the Cauſes, Kinds, and Prognoſticks of a Cancer.

HEre we acknowledge two Cauſes of a *Cancer*, the antecedent and conjunct. The antecedent cauſe depends upon the default of irregular diet, generating and heaping up groſs and feculent bloud; by the morbifick affection of the Liver diſpoſed to the generation of that bloud, by the infirmity or weakneſs of the Spleen in attracting and purging the bloud, by the ſuppreſſion of the Courſes, or Hæmorrhoids, or any ſuch accuſtomed evacuation. The conjunct cauſe is that groſs and melancholick humour ſticking and ſhut in the affected part, as in a ſtrait. That melancholick bloud which is more mild and leſs malign, onely increaſed by a degree of more fervid heat, breeds a not ulcerated *Cancer*, but the more malign and acrid cauſes, an ulcerated. For ſo the humour which generateth Carbuncles, when it hath acquired great heat, acrimony, and malignity, corrodes, and ulcerates the part upon which it alights. A *Cancer* is made more fierce and raging by meats inflaming the bloud, by perturbations of the mind, anger, heat, and Medicins too acrid, oily, and emplaſtick, unfitly applied, both for time and place.

The cauſes of a *Cancer.*

The cauſes of a not ulcerated *Cancer.*

Amongſt the ſorts or kinds of *Cancers*, there be two chiefly eminent, that is, the ulcerated or manifeſt *Cancer*, and the not ulcerated or occult. But of *Cancers* ſome poſſeſs the internal parts, as the Guts, Womb, Fundament; others the external, as the Breſts; alſo there is a recent, or late bred *Cancer*, and alſo an inveterate one. There is one ſmall, another great, one raging and malign, another more mild. Every *Cancer* is held almoſt incurable, or very difficult to be cured, for it is a Diſeaſe altogether malign, to wit, a particular Leproſie. Therefore, ſaith *Actius*, a *Cancer* is not eaſily ſtaid, until it hath eaten even to the innermoſt of the part which it poſſeſſes. It invades Women

The ſorts and differences of *Cancers.*

Actius lib. 6. The parts moſt ſubject to *Cancers.*

Women more frequently than Men, and thoſe parts which are lax, rare, fungous, and glandulous, and therefore opportune to receive a defluxion of a groſs humour, ſuch are the Breſts, and all the emunctories of the noble parts. When it poſſeſſes the Breſt it often cauſes inflammation to the Armholes, and ſends the ſwelling ever to the glandules thereof, whereupon the Patients do complain that a pricking pain even pierces to their hearts. But this ſame pain alſo runs to the clavicles, and even to the inner ſide of the ſhoulder-blades and blades. When it is increaſed, and covers the noble parts, it admits no cure but by the hand; but in decayed bodies, whoſe ſtrength fail, eſpecially if the *Cancers* be inveterate, we muſt not attempt the Cure, neither with Inſtrument, nor with Fire, neither by too acrid Medins, as potential Cauteries; but we muſt onely ſeek to keep them from growing more violent, and from ſpreading further, by gentle Medicins, and a palliative Cure. For thus, many troubled with a *Cancer*, have attained even to old age. Therefore *Hippocrates* admoniſhes us, that it is better not to cure occult or hidden *Cancers*, for the Patients cured (ſaith he) do quickly die, but ſuch as are not cured live longer.

What *Cancers* one muſt not undertake truly to cure.

CHAP. XXVIII.

Of the Cure of a Cancer *beginning, and not yet ulcerated.*

A *Cancer* beginning, is oft hindered from increaſing, before it faſten its roots; but when it hath once increaſed, it admits no cure but by iron, as that which contemns by reaſon of the malignity and contumacy, the force of all Medicins. *Galen* affirms he cured a *Cancer* not ulcerated. Now that Cure is performed by Medicins, purging Melancholy; by Phlebotomy, when the ſtrength and age of the Patient may well endure it; by ſhunning all things which may breed ill and fæculent bloud. The diſtemper of the Liver muſt firſt be corrected, the Spleen, as alſo the part affected; in Men the Hæmorrhoides, in Women their Courſes muſt be procured.

Lib. 2. ad Glauc.

Therefore thick and muddy Wines, Vinegar, brown Bread, cold Herbs, old Cheeſe, old and ſalted Fleſh, Beef, Veniſon, Goat, Hare, Garlick, Onions and Muſtard; and laſtly, all acrid, acid, and other ſalt things, which may by any means incraſſate the bloud, and inflame the humours, muſt be eſchewed. A cooling and humecting diet muſt be preſcribed; Faſting eſchewed, as alſo Watchings; immoderate Labours, Sorrow, Cares, and Mournings; let him uſe Ptiſans, and in his Broths boil Mallows, Spinace, Lettuce, Sorrel, Purſlain, Succory, Hops, Violets, Borrage and the four cold ſeeds. But let him feed on Mutton, Veal, Kid, Capon, Pullet, young Hares, Partridges, Fiſhes of Stony Rivers, rear Eggs; and uſe white Wine but moderately for his drink.

Diet.

The part affected with the *Cancer* muſt be gently handled, and not over-burdened by over-hard or heavy things, or by too ſolid or fat Emplaiſters; on the contrary, gentle and mitigating Medicins muſt be uſed; applying alſo at certain times ſuch things as reſiſt venom, or poiſon, as Treacle and Mithridate. Aſſes Milk is exceeding fit to aſſwage the acrimony of the cancerous humour. Therefore it muſt not onely be taken inwardly, but alſo applied outwardly to the cancerous Ulcer, making thereof a fomentation.

How to handle the cancerous part.
Antidotes.
Aſſes Milk.

CHAP. XXIX.

Of the Cure of an ulcerated Cancer.

AN Ulcerated *Cancer* hath many ſigns common with that which is not ulcerated, as the roundneſs of the tumour, the inequality, roughneſs, and pain; to the judgment of the eye the tumour ſeems ſoft, but it is hard to the touch; the Ulcer is filthy, with lips, thick, ſwollen, hard, knotty, turned out, and ſtanding up, having a horrid aſpect, and caſting forth ichorous, filthy, and Carion-like filth, ſometimes black, ſometimes mixed with rotten filth, and otherwhiles with much bloud. This kind of Ulcer is malign, rebellious and untractable, as that which contemns mild remedies, and becomes more fierce by acrid and ſtrong; the pain, fever, and all the ſymptoms being increaſed, from whence the powers are dejected, the waſting and conſumption of the body follows, and laſtly, death. Yet if it be ſmall, and in a part which may ſuffer amputation, the body being firſt purged, and bloud drawn, the ſtrength of the Patient not diſſuading, it will be convenient to uſe the hand, and to take hold of, and cut away whatſoever is corrupt, even to the quick, that no fear of contagion may remain or be left behind. The amputation finiſhed, the bloud muſt not be preſently ſtopped, but permitted to flow out in ſome meaſure, yea verily preſſed forth all about it, that ſo the Veins ſwollen with black and melancholy bloud may be disburdened. When you have taken a ſufficient quantity of bloud, the place muſt be ſeared with an actual cautery. For that will ſtrengthen the part affected, draw forth the venenate quality, and alſo ſtay the defluxion. Then muſt you apply mitigating Medicins, and procure the falling away of the Eſchar. To conclude, that which remains muſt be performed according to the cure of other Ulcers. Now we know and underſtand, that all the *Cancer* is cut away, and all the malignity thereof extinct, when the Ulcer caſts forth laudable matter, when that good fleſh begins to grow by little and little, like to the grains of a Pomegranate, the pricking pain, and all the ſymptoms being aſſuaged. Yet the cure of an ulcerated *Cancer* which ſhall poſſeſs the lips, may be more happily and mildly performed, no cauſtick Medicin being applied after ſection, ſo alſo that ſcarce any deformity will be left when it is cicatrized. Which new and never formerly tried, or written of way, as far as I know, I found and performed in a man of fifty years old. Doctor *John Altine*, a moſt learned Phyſitian being called to Counſel, *James Guillemeau*, and Maſter *Euſtachius* the King's Chi-

The Signs.

How and where a *Cancer* may be cut away.
What to be obſerved in cutting away a *Cancer*.
The benefit of applying a cautery after amputation of the *Cancer*.
Signs that a *Cancer* is well taken away.

Chirurgeons, and *John le Jeune* the Duke of *Guiſe* his moſt worthy Chirurgeon being preſent.

A new and obſervable way of taking away a *Cancer* from the lip.

The way is this; The *Cancer* muſt be thruſt through the lips on both ſides, above and below with a needle and thred, that ſo you may rule and govern the *Cancer* with your left hand, by the benefit of the thred (leſt any portion thereof ſhould ſcape the inſtrument in cutting) and then with your Sizers in the right hand, you may cut it off all at once; yet it muſt be ſo done, that ſome ſubſtance of the inner part of the lip which is next to the teeth may remain (if ſo be that the *Cancer* be not grown quite through) which may ſerve, as it were, for a foundation to generate fleſh to fill up the hollowneſs again. Then when it hath bled ſufficiently, the ſides and brinks of the Wound muſt be ſcarified on the right and left ſides, within and without, with ſomewhat a deep ſcarification, that ſo (when we would draw together the ſides and lips of the Wound, by that manner of ſtitching which is uſed in an hare-lip) we may have the fleſh more pliant and tractable to the needle and thred. The reſidue of the Cure muſt be performed juſt after the ſame manner as we uſe in hare-lips, of which we ſhall treat hereafter.

CHAP. XXX.

Of the Topick Medicins to be applied to an ulcerated and not ulcerated Cancer.

Repelling Medicins.

WE at the beginning uſe repercuſſive Medicins, ſuch as are the juices of Nightſhade, Plantain, Henbane, Lettuce, Sorrel, Houſleek, Water, Lentil, or Ducks-meat, Knot-graſs, Pomegranates, and the like. Alſo *oleum roſarum Omphacinum*, the powders of Sumach, Berberies, Litharge, Ceruſe, Burnt-lead, *Tutia*, Quick-ſilver, and the like. Of which you may compoſe Fomentations, Liniments, Ointments, Cataplaſms, Emplaiſters. *Emplaſtrum Diacalcitheos* diſſolved with juice of Nightſhade, and Oil of Roſes is very fit for not ulcerated *Cancers*. *Pompholix*, or *Tutia* waſhed in juice of Nightſhade, or Plantain, is very good for ulcerated *Cancers*. Beſides, this following Medicin is very commendable.

℞ *Litharg. & ceruſ. an.* ℥ i. *terantur in mortario plumb. cum oleo roſar. donec reducantur ad conſiſtentiam linimenti vel unguenti*; and there may be uſe of a reſolving and repercuſſive Ointment, as, ℞ *plumbi uſti loti pomphol. thuris an.* ʒ ij. ℈ *abſinth. pontic.* ʒ ℈. *olei roſarum* ℥ iij. *ceræ* ʒ vj. *ſucci ſolani, quantum ſufficit ad unguenti craſſitudinem.* They very much commend *Theodoricks* Emplaiſter to aſſwage the pain of ulcerated *Cancers*.

Theodoricks Emplaiſters.

℞ *Olei roſ. ceræ alb. an.* ʒ ij. ℈. *ſucci granat. & ſolani, an* ʒ ij. *ceruſæ lotæ* ℥ i. *plumbi uſti, loti, & tuthiæ præpar. an.* ℥ ℈. *thuris maſtich. an.* ʒ ij. *fiat empl. molle.* This following Ointment I have often uſed with good ſucceſs.

℞ *Theriac. veter.* ʒ i. *ſucci cancrorum* ℥ ß. *ſucci lactucæ & olei roſar. an.* ℥ i. ß. *vitel. ovorum ſub cinerib. cocti.* ij. *camphor.* ʒ ß. *piſtentur omnia in mortario plumb. & fiat unguentum.*

℞ *Spum. argent. axungiæ porci recentis ceræ alb. an.* ℔ ß. *olei boni* ℥ viij. *vitel. ovorum aſſat.* iv. *fiat ununguent. ſervetur uſui.* And when you will uſe it, mix it with a little Ointment of Roſes. I have alſo mitigated great pain by applying Leaches to an ulcerated *Cancer*, in that part where the torment was moſt vehement, by disburdening the part of ſome portion of the malign humour; which ſame thing I have done by application of young Whelps, or Pigeons, or Chickens, cut long-ways, and preſently applied to the ulcer, and now and then changed as ſoon as their heat ſeems diſſolved; and others applied for their natural heat in an Anodyne or mitigating Medicin. *John Baptiſta Theodoſius* in his Epiſtles writes, that a cataplaſm of the herb *Eryſimum*, or Cadlock, being beaten, is very good to be applied to a *Cancer* not ulcerated; but if the *Cancer* be ulcerated, he boils this ſame herb in *Hydromel*, and ſo by injection and lotions cleanſes the ulcer and mitigates the pain. If the *Cancer* affect the Womb, the Patient feels the pricking of the pain in the groin above the *pecten*, and in the Kidneys, and is often troubled with a difficulty of making water; but when it is ulcerated, it pours forth filth, or matter, exceeding ſtinking and carion-like, and that in great plenty, the filthy vapour of which carried up to the heart, and brain, cauſes often ſwounding. Now to mitigate the pains of ſuch like places, the following Medicins are of good uſe.

Leaches.

The application of Whelps, Chickens, &c.

Epiſt. 21.

The Eſtate of *Eryſimum*.

The ſigns of the *Cancer* in the Womb.

℞ *Mucag. ſemin. lini, fœnugr. extracti. in aqua roſar. & plantaginis quod ſatis eſt.* Of this being warm make a Fomentation.

℞ *Rad. Althææ* ℔ ß. *coquatur in hydromelite, piſtetur & trajiciatur, addendo ol. roſar. parum, fiat Cataplaſma.* Alſo you ſhall make divers peſſaries according to the different kind of pain; alſo make injections of the juice of Plantain, Knot-graſs, Lettuce, Purſlain, mixed together, and agitated or laboured in a Leaden Mortar with a little Oil of Roſes; for this kind of Medicin is commended by *Galen* in every kind of ulcerated *Cancers*. Alſo this following Water is very profitable, and often proved by me. ℞ *Stercoris bubuli* ℔ iv. *herbæ Roberti plantag. ſempervivi, hyoſcyami, portulac. lactuc. endiv. an. m.* i. *cancros fluviatiles, num.* xij. Let them be all beaten together and diſtilled in a Leaden Alembick, keep the liquor for uſe, and with it make often injection into the part, or if the ſite of the part will permit, let the cancerous ulcers be waſhed therewith, and pledgets of lint ſteeped therein, be applied and renewed ever and anon; for ſo the acrimony and force of the inflammation is retunded, and the pain aſſwaged. *Galen* beats into powder River Crabs burnt; the powder mixed with Ointment of Roſes is moſt profitably applied upon lint to cancerous Ulcers.

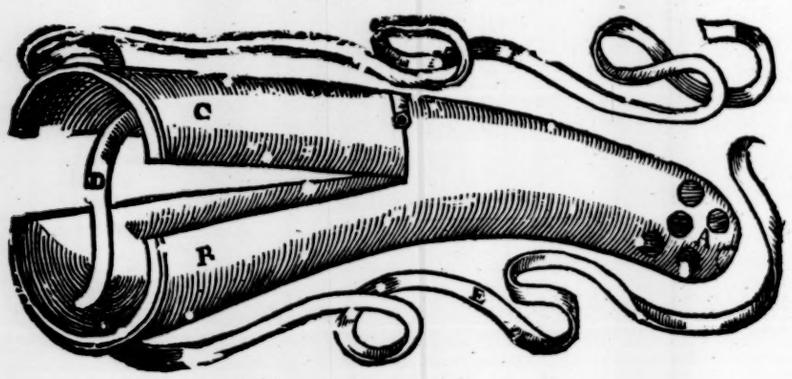
Lib. 9. Simpl.

Lib. 4. de comp. med. ſecundum gen.

It will be very convenient to put into the neck of the Womb the following Inſtrument made of Gold or Silver, whereby the cancerous filth may have free and ſafe paſſage forth, and the filthy and putredinous Vapours may more eaſily breathe forth. Therefore let it be hollow quite through, ſome five or ſix fingers long, and about the bigneſs of ones thumb, at the upper end perforated with many holes whereby the filth may have paſſage forth. Let the outer or lower end be ſome two fingers thick in the circumference, make it with a neat ſpring, that may hold that end open,

open, more or leſs, according to the Phyſicians mind; let there be two ſtrings or laces put unto it, by which being tied before and behind to the rowler, with which the Woman ſhall girt her loins, the Device may be kept from falling, as you may ſee in the following Figure.

A Vent made like a Peſſary, for the Womb affected with a cancerous Ulcer.



A *Shews the upper end perforated with five or ſix holes.*
B *The lower end.*
C *That part of the end which is opened by the ſtring, which is marked with the letter* D.
E E *The ſtrings or laces.*

Lib. 6. ſimp. Plates of Lead A Hiſtory.

Neither is that remedy for not ulcerated *Cancers* to be contemned, which conſiſts of a Plate of Lead beſmeared with Quick-ſilver; for *Galen* himſelf teſtifies that Lead is a good Medicin for malign and inveterate Ulcers. But *Guido Cauliacenſis* is a witneſs of ancient credit and learning, that ſuch Plates of Lead rubbed over with Quick-ſilver, to ſuch malign Ulcers as contemn the force of other Medicins, are, as it were, Antidotes to waſte and overcome their malignity and evil nature. This kind of remedy, when it was preſcribed by that moſt excellent Phyſician *Hollerius*, who commanded me to apply it to the Lady of *Montigni*, Maid of Honour to the Queen-mother, troubled with a *Cancer* in her left Breſt, which equalled the bigneſs of a Walnut, did not truly throughly heal it, yet notwithſtanding kept it from further growth. Wherefore at length growing wearyof it, when ſhe had committed her ſelf to a certain Phyſician, boldly promiſing her quick help, ſhe tried, with loſs of her life, how dangerous and diſadvantagious the cure of a *Cancer* was, which is undertaken according to the manner of healing other ulcers; for this Phyſitian, when he had caſt away this our Medicin, and had begun the cure with mollifying, heating and attractive things, the pain, inflammation, and all the other ſymptoms increaſing, the tumor grew to that bigneſs, that being the humour drawn thither could not be contained in the part it ſelf, it ſtretched the breſt forth ſo much, that it broke it in the middle, juſt as a Pomgranate cleaves when it comes to its full maturity; whereupon an immoderate flux of bloud followed, for ſtaying whereof he was forced to ſtrew cauſtick powders thereon; but by this means the inflammation and pain becoming more raging, and ſwoundings coming upon her, ſhe poor Soul in ſtead of her promiſed health, yielded up her Ghoſt in the Phyſicians boſom.

CHAP. XXXI.

Of the Fever which happeneth in Scirrhous Tumors.

Why a Quartan happens upon Scirrhous tumors.

Such a Fever is a Quartan, or certainly coming near unto the nature of a Quartan, by reaſon of the nature of the Melancholick humour of which it is bred. For this ſhut up in a certain ſeat in which it makes the tumour, by communication of putrid vapours heats the heart above meaſure, and enflames the humours contained therein, whence ariſes a Fever. Now therefore a Quartan is a Fever coming every fourth day, and having two days intermiſſion.

The primitive cauſes thereof are theſe things which increaſe Melancholick humours in the body, ſuch as the long eating of Pulſe, of coarſe and burnt Bread, of ſalt Fleſh and Fiſh, of groſs Meats, as Beef, Goat, Veniſon, old Hares, old Cheeſe, Cabbadge, thick and muddy Wines, and other ſuch things of the ſame kind.

The antecedent cauſes are, heaped up plenty of Melancholick humours, abounding over all the body. But the conjunct cauſes are Melancholick humours putrefying without the greater Veſſels, in the ſmall Veins, and habit of the body.

The ſigns.

We may gather the ſigns of a Quartan Fever from things which they call natural, not natural, and againſt nature. From things natural; for a cold and dry temper, old age, cold and fat, Men, having their Veins ſmall, and lying hid, their Spleen ſwollen and weak, are uſually troubled with Quartan Fevers.

Why they are frequent in Autumn.

Of things not natural; this Fever or Ague is frequent in Autumn, not onely becauſe, for that it is cold and dry, it is fit to heap up Melancholick humours; but chiefly by reaſon that the humours by the heat of the preceding Summer are eaſily converted into aduſt Melancholy, whence far worſer and more dangerous Quartans ariſe, than of the ſimple Melancholick humour: to conclude, through any cold or dry ſeaſon in a region cold and dry, men that have the like Temper eaſily

eaſily fall into Quartains; if to theſe a painful kind of life full of danger and ſorrow doth accrew.

Of things contrary to Nature, becauſe the fits take one with painful ſhaking, inferring, as it were, the ſenſe of breaking or ſhaking the bones; further it taketh one every fourth day with an itching over the whole body, and oft-times with a thin skurf and puſtules, eſpecially on the legs; the pulſe at the beginning is little, ſlow, and deep, and the urin alſo is then white and wateriſh, inclining to ſomewhat a dark colour.

In the declination when the matter is concocted, the urin becomes black, not occaſioned by any malign ſymptom or preternatural exceſs of heat (for ſo it ſhould be deadly) but by excretion of the conjunct matter. The fit of the Quartain continues twenty four hours, and the intermiſſion is forty four hours. It often takes its original from an obſtruction, pain and *Scirrhus* of the Spleen, and of the ſuppreſſing of the Courſes and Hæmorrhoides.

Quartains taken in the Summer are for the moſt part ſhort, but in the Autumn long, eſpecially ſuch as continue till Winter. Thoſe which come by ſucceſſion of any diſeaſe of the Liver, Spleen, or any other precedent diſeaſe, are worſe than ſuch as are bred of themſelves, and commonly end in a Dropſie. But thoſe which happen without the fault of any bowels, and to ſuch a Patient as will be governed by the Phyſician in his Diet, infer no greater harm, but free him from more grievous and long diſeaſes, as Melancholy, the Falling-ſickneſs, Convulſion, Madneſs; becauſe the Melancholy humor, the author of ſuch diſeaſes, is expelled every fourth day by the force of the fit of the Quartain. Prognoſtick. From what diſeaſes a Quartain frees one.

A Quartain Feaver, if there be no errour committed, commonly exceeds not a year; for otherwiſe ſome Quartains have been found to laſt to the twelfth year, according to the opinion of *Avicen*: The Quartain beginning in Autumn is oft-times ended in the following Spring; the Quartain which is cauſed by aduſt blood, or choler, or ſalt-flegm, is more eaſily and ſooner cured, than that which proceeds from aduſt melancholy humor; becauſe the melancholy humor, terreſtrial of its own nature, and harder to be diſcuſſed than any other humor, is again made by aduſtion (the ſubtiler parts being diſſolved and the groſſer ſubſiding) more ſtubborn, groſs, malign, and acrid. The cure is wholly abſolved by two means, that is, by Diet and Medicines. The diet ought to be preſcribed contrary to the cauſe of the Feaver in the uſe of the ſix things not natural, as much as lies in our power. Wherefore the Patient ſhall eſchew Swines fleſh, flatulent, viſcid and glutinous meats, fenny Fowls, ſalt meats and Veniſon, and all things of hard digeſtion. The uſe of white Wine indifferent hot and thin, is convenient to attenuate and incide the groſs humor, and to move urin and ſweat; yea verily at the beginning of the fit, a draught of ſuch Wine will cauſe vomiting, which is a thing of ſo great moment, that by this one remedy many have been cured. Yet if we may take occaſion and opportunity to provoke vomit, there is no time thought fitter for that purpoſe than preſently after meat; for then it is the ſooner provoked, the fibers of the ſtomach being humected and relaxed, and the ſtomach is ſooner turned to vomiting, whereupon follows a more plentiful, happy, and eaſie evacuation of the Phlegmatick and Cholerick humor, and leſs troubleſome to Nature: And of all the crudities with which the mouth of the ventricle abounds in a Quartain, by reaſon of the more copious afflux or the Melancholick humor, which by his qualities cold and dry diſturbs all the actions and natural faculties. Moreover, exerciſes and frictions are good before meat; ſuch paſſions of the mind are as contrary to the cauſe from which this Feaver takes his original, are fit to be cheriſhed by the Patient, as Laughter, Jeſting, Muſick, and all ſuch like things full of pleaſure and mirth. At the beginning the Patient muſt be gently handled and dealt withal, and we muſt abſtain from all very ſtrong medicines, until ſuch time as the diſeaſe hath been of ſome continuance. For this humour, contumacious at the beginning, when as yet Nature hath attempted nothing, is again made more ſtubborn, terreſtrial and dry, by the almoſt fiery heat of acrid medicines. If the body abound with blood, ſome part thereof muſt be taken away by opening the Median or Baſilick-vein of the left arm, with this caution, that if it appear more groſs and black, we ſuffer it to flow more plentifully; if more thin, and tinctured with a laudable and red colour that we preſently ſtay it. The matter of this Feaver muſt be ripened, concocted and diminiſhed with the Syrups of *Epithymum* of *Scolopendrium*, of Maiden-hair, Agrimony, with the waters of Hops, Bugloſs, Borage, and the like. I ſincerely proteſt, next unto God, I have cured very many Quartains by giving a portion of a little Treacle diſſolved in about ſome two ounces of *Aqua vitæ*, alſo ſometimes by two or three grains of Musk diſſolved in Muskadine, given at the beginning of a particular fit towards the general declination of the diſeaſe after general purgations, the humor and body being prepared, and the powers ſtrong: And certainly an inveterate Quartain can ſcarce ever be diſcuſſed, unleſs the body be much heated with meats and medicines. Therefore it is not altogether to be diſproved, which many ſay, that they have driven away a Quartain by taking a draught of Wine every day aſſoon as they came forth of their beds, in which ſome leaves of Sage had been infuſed all the night. Alſo it is good a little before the fit to anoint all the ſpine of the back with Oyls heating all the nervous parts, ſuch as are the Oyl of Rue, Walnuts, of the Peppers, mixing therewith a little *Aqua vitæ*; but for this purpoſe, the Oyl of *Caſtoreum* which hath been boiled in an Apple of *Coliquintida*, the Kernels taken out, upon hot coals, to the conſumption of the half part, mixing therewith ſome little quantity of the Powders of Pepper, Pellitory of *Spain*, and *Euphorbium*, is excellent. Certainly, ſuch like Inunctions are good, not only to mitigate the vehemency of the terrible ſhaking, but alſo to provoke ſweats; for becauſe by their humid heat they diſcuſs this humor being dull and rebellious to the expulſive faculty; for the Melancholy is, as it were, the droſs and mud of the blood. Therefore, if on the contrary, The Quartain Feaver ſhall be cauſed by aduſt choler, we muſt hope for and expect a cure by refrigerating and humective medicines, ſuch as Sorrel, Lettuce, Purſlane, broths of the decoctions of Cucumbers, Gourds, Mellons, and Pompions. For in this caſe, if any uſe hot medicines, he ſhall make this humor moſt obſtinate by the reſolving of the ſubtiler parts. Thus *Trallianus* boaſts that he hath cured Diet. How much vomiting prevails to cure a Quartain. Medicines. What Quartains muſt be cured with refrigerating things.

theſe kinds of Quartain Feaver by the only uſe of refrigerating *Epithemaes* being often repeated a little before the beginning of the fit. And this is the ſum of the cure of true and legitimate intermitting Feavers; that is, of thoſe which are cauſed by one ſimple humor, whereby the cure of thoſe which they call Baſtard intermitting Feavers, may be eaſily gathered and underſtood; as which are bred by a humor impure, and not of one kind, but mixt or compoſed by admixture of ſome other matter; for example, according to the mixture of divers humors Phlegmatick and Cholerick, the Medicins muſt alſo be mixt, as if it were a confuſed kind of Feaver of a Quotidian and Tertian, it muſt be cured by a medicine compoſed of things evacuating flegm and choler.

What baſtard Agues are, and how they muſt be cured.

CHAP. XXXII.

Of an Aneuriſma, *that is, the dilatation, or ſpringing of an Artery, Vein, or Sinew.*

What it is.

AN *Aneuriſma* is a ſoft tumor yielding to the touch, made by the blood and ſpirit poured forth under the fleſh and muſcles, by the dilatation or relaxation of an Artery. Yet the Author of the definitions, ſeems to call any dilatation of any veinous veſſel by the name of an *Aneuriſma*. *Galen* calls an *Aneuriſma*, an opening made of the *Anatomiſts* of an Artery. Alſo an *Aneuriſma* is made when an Artery that is wounded cloſeth too ſlowly, the ſubſtance which is above it being in the mean time agglutinated, filled with fleſh and cicatrized, which doth not ſeldom happen in opening of Arteries unskilfully performed and negligently cured; therefore *Aneuriſma's* are abſolutely made by the *Anaſtomoſis*, ſpringing, breaking, *Eroſion*, and wounding of the arteries. Theſe happen in all parts of the body, but more frequently in the throat, eſpecially in women after a painful travail. For when as they more ſtrongly ſtrive to hold their breath, for the more powerful expulſion of the birth, it happens that the artery is dilated and broken, whence follows an effuſion of blood and ſpirits under the skin. The ſigns are, a ſwelling one while great, another ſmall, with a pulſation and a colour not not varying from the native conſtitution of the skin. It is a ſoft tumor, and ſo yielding to the impreſſion of the fingers, that if it peradventure be ſmall, it wholly vaniſheth, the arterious blood and ſpirits flying back into the body of the artery, but preſently, aſſoon as you take your fingers away, they return again with like celerity. Some *Aneuriſma's* do not only when they are preſſed, but alſo of themſelves, make a ſenſible hiſſing, if you lay your ear near to them, by reaſon of the motion of the vital ſpirit ruſhing with great violence through the ſtraitneſs of the paſſage.

In what parts they chiefly happen.

Prognoſtick.

Wherefore in *Aneuriſma's* in which there is a great rupture of the artery, ſuch a noiſe is not heard, becauſe the ſpirit is carried through a larger paſſage. Great *Aneuriſma's* under the arm-pits, in the groins and other parts wherein there are large veſſels, admit no cure. becauſe ſo great an eruption of blood and ſpirit often follows upon ſuch an Inciſion, that death prevents both art and cure.

A Hiſtory.

Which I obſerved a few years ago in a certain Prieſt of St. *Andrews* of the Arches, Mr. *John Maillet*, dwelling with a chief Preſident *Chriſtopher de Thou*. Who having an *Aneuriſma* at the ſetting on of the ſhoulder about the bigneſs of a Wall-nut, I charged him, he ſhould not let it be opened, for if he did, it would bring him into manifeſt danger of his life, and that it would be more ſafe for him to break the violence thereof with double clothes ſteeped in the juice of Night-ſhade and Houſleek, with new and wheyey cheeſe mixt therewith: Or with *Unguentum de Bolo*, or *Emplaſtrum contra rupturam*, and ſuch other refrigerating and aſtringent medicines, if he would lay upon it a thin plate of Lead, and would uſe ſhorter breeches, that his doublet might ſerve to hold it too, to which he might faſten his breeches inſtead of a ſwathe, and in the mean time he ſhould eſchew all things which attenuate and inflame the blood, but eſpecially he ſhould keep himſelf from all great ſtraining of his voice. Although he had uſed his diet for a year, yet he could not ſo handle the matter but that the tumor increaſed; which he obſerving goes to a Barber, who ſuppoſing the tumor to be of the kind of vulgar Impoſthumes, applies to it in the evening a Cauſtick cauſing an Eſchar ſo to open it. In the morning ſuch an abundance of blood flowed forth from the tumor being opened, that he therewith aſtoniſhed, implores all poſſible aid, and bids that I ſhould be called to ſtay this his great bleeding, and he repented that he had not followed my direction. Wherefore I was called, but when I was ſcarce over the threſhold, he gave up his ghoſt with his blood. Wherefore I diligently admoniſh the Chirurgeon that he do not raſhly open *Aneuriſma's*, unleſs they be ſmall, in an ignoble part, and not indued with large veſſels, but rather let him perform the cure after this manner: Cut the skin which lies over it until the artery appear, and then ſeparate it with your knife from the particles about it, then thruſt a blunt and crooked needle with a thred in it under it; bind it, then cut it off, and ſo expect the falling off of the thread of it ſelf, whiles Nature covers the Orifices of the cut artery with the new fleſh, then the reſidue of the cure may be performed after the manner of ſimple wounds. The *Aneuriſma's* which happen in the internal parts are incurable. Such as frequently happen to thoſe who have often had the unction and ſweat for the cure of the French diſeaſe, becauſe being ſo attenuated and heated therewith, that it cannot be contained in the receptacles of the artery, it diſtends it to that largeneſs as to hold a mans fiſt: Which I have obſerved in the dead body of a certain Taylor, who by an *Aneuriſma* of the arterious vein ſuddenly whilſt he was playing at Tennis fell down dead, the veſſel being broken; his body being opened, I found a great quantity of blood poured forth into the capacity of the cheſt, but the body of the artery was dilated to that largeneſs I formerly mentioned, and the inner coat thereof was bony. For which cauſe within a while after I ſhewed it to the great admiration of the beholders in the Phyſicians School, whilſt I publickly diſſected a body there; whilſt he lived, he ſaid he felt a beating and a great heat over all his body the force of the pulſation of all the Arteries, by the occaſion whereof he often ſwounded. Dr. *Sylvius* the Kings Profeſſor of Phyſick at that time forbad him the uſe of Wine, and wiſhed him to uſe boiled water for his drink, and

Aneuriſma's muſt not raſhly be opened.

How they muſt be cured.

Thoſe of the inward parts incureable.

A Hiſtory.

and Curds and new Cheeſes for his meat, and to apply them in form of Cataplaſms upon the grieved and ſwoln part. At night he uſed a Ptiſan of Barley meal and Poppy-ſeeds, and was purged now and then with a Clyſter of refrigerating and emollient things, or with Caſſia alone, by which medicines he ſaid he found himſelf much better. The cauſe of ſuch a bony conſtitution of the Arteries by *Aneuriſmaes* is, for that the hot and fervid blood firſt dilates the coats of an artery, then breaks them; which when it happens, it then borrows from the neighbouring bodies, a fit matter to reſtore the looſed continuity thereof.

This matter, whilſt by little and little it is dried and hardned, it degenerates into a griſtly or elſe a bony ſubſtance, juſt by the force of the ſame material and efficient cauſes, by which ſtones are generated in the reins and bladder. For the more terreſtrial portion of the blood is dried and condenſed by the power of the unnatural heat contained in the part affected with an *Aneuriſma*; whereby it comes to paſs, that the ſubſtance added to the dilated and broken artery is turned into a body of a bony conſiſtence. In which the ſingular providence of Nature, the Hand-maid of God, is ſhewed, as that which, as it were, by making and oppoſing a new wall or bank, would hinder and break the violence of the raging blood ſwelling with the abundance of the vital ſpirits; unleſs any had rather to refer the cauſe of that hardneſs to the continual application of refrigerating and aſtringent medicines. Which have power to condenſate and harden, as may not obſcurely be gathered by the writings of *Galen*. But beware you be not deceived by the fore-mentioned ſigns; for ſometimes in large *Aneuriſmaes* you can perceive no pulſation, neither can you force the blood into the artery by the preſſure of your fingers, either becauſe the quantity of ſuch blood is greater than which can be contained in the antient receptacles of the artery, or becauſe it is condenſate and concrete into clods, whereupon wanting the benefit of ventilation from the heart, it preſently putrefies: Thence enſue great pain, a Gangrene, and mortification of the part, and laſtly, the death of the creature.

Lib. 4. cap. ult. de præſ. ex pulſu.

A Caution in the knowing *Aneuriſmats.*

The end of the Seventh Book.

BOOK VIII.

Of particular Tumors againſt Nature.

The PREFACE.

BEcauſe the cure of Diſeaſes muſt be varied according to the variety of the temper, not only of the body in general, but alſo of each part thereof; the ſtrength, figure, form, ſite, and ſenſe thereof being taken into conſideration: I think it worth my pains, having already ſpoken of Tumors in general, if I ſhall treat of them in particular, which affect each part of the body, beginning with thoſe which aſſail the head. Therefore the Tumor either affects the whole head, or elſe only ſome particle thereof, as the Eyes, Ears, Noſe, Gums, and the like. Let the Hydrocephalos *and* Phyſocephalos *be examples of thoſe Tumors which poſſeſs the whole head.*

CHAP. I.

Of an Hydrocephalos *or watry Tumor which commonly affects the heads of Infants.*

THe *Greeks* call this Diſeaſe *Hydrocephalos*, as it were a Dropſie of the head, by a wateriſh humor; being a diſeaſe almoſt peculiar to Infants newly born. It hath for an external cauſe the violent compreſſion of the head by the hand of the Midwife, or otherwiſe at the birth, or by a fall, contuſion, and the like. For hence comes a breaking of a vein, or artery, and an effuſion of the blood under the skin. Which by corruption becoming whayiſh, laſtly degenerateth into a certain wateriſh humor. It hath alſo an inward cauſe, which is the abundance of ſerous and acrid blood, which by its tenuity and heat ſweats through the pores of the veſſels, ſomtimes between the muſculous skin of the head, and the *Pericranium*; ſometimes between the *Pericranium* and the skull; and ſometimes between the skull and membrane called *Dura mater*, and otherwhiles in the ventricles of the brain.

What it is. The cauſes.

Differences by reaſon of place.

The ſigns of it, contained in the ſpace between the muſculous skin and the *Pericranium*, are a manifeſt tumor without pain, ſoft, and much yielding to the preſſure of the fingers. The ſigns when it remaineth between the *Pericranium* and the skull, are for the moſt part like the fore-named, unleſs it be that the Tumor is a little harder, and not ſo yielding to the finger, by reaſon of the parts between it and the finger: And alſo there is ſomewhat more ſenſe of pain. But when it is in the ſpace between the skull and *Dura mater*, or in the ventricles of the brain, or of the whole ſubſtance thereof, there is a dulneſs of the ſenſes, as of the ſight and hearing; the tumor doth not yield to the touch, unleſs you uſe ſtrong impreſſion, for then it ſinketh ſomewhat down, eſpecially in Infants newly born; who have their skulls almoſt as ſoft as wax, and the junctures of their ſutures lax, both by nature, as alſo by accident, by reaſon of the humor contained therein moiſtening and relaxing all the adjacent parts; the humor contained here lifts up the skull ſomewhat more high, eſpecially at the meetings of the ſutures; which you may thus know, becauſe the tumor being preſſed, the humor flies back into the ſecret paſſage of the brain.

Signs.

To conclude, the pain is more vehement, the whole head more ſwollen, the fore-head ſtands ſomewhat further out, the eye is fixt and immoveable, and alſo weeps by reaſon of the ſerous humor ſweating out of the brain.

A Hiſtory. *Veſalius* writes, that he ſaw a Girl of two years old, whoſe head was thicker than any mans head by this kind of Tumor, and the skull not bony, but membranous, as it uſeth to be in Abortive-births, and that there was nine pound of water ran out of it.

Abucraſis tells, that he ſaw a Child whoſe head grew every day bigger by reaſon of the watery moiſture contained therein, till at length the Tumor became ſo great, that his neck could not bear it neither ſtanding nor ſitting, ſo that he died in a ſhort time. I have obſerved and had in cure four children troubled with this diſeaſe, one of which being diſſected after it died, had a brain no bigger than a Tennis-Ball. But of a Tumor and humor contained within under the *Cranium*, or skull, I have ſeen none recover, but they are eaſily healed of an external Tumor.

Therefore whether the humor lye under the *Pericranium*, or under the muſculous skin of the head, it muſt firſt be aſſailed with reſolving medicines, but if it cannot be thus overcome, you muſt make an Inciſion, taking heed of the Temporal Muſcle, and thence preſs out all the humor, whether it reſemble the waſhing of fleſh newly killed, or blackiſh blood, or congealed or knotted blood, as when the tumor hath been cauſed by contuſion; then the wound muſt be filled with dry lint, and covered with double boulſters; and laſtly, bound with a fitting ligature.

CHAP. II.

Of a Polypus, *being an eating Diſeaſe in the Noſe.*

The reaſon of the name. THe *Polypus* is a tumor of the noſe againſt Nature, commonly ariſing from the *Os Ethmoides*, or ſpongy-bone. It is ſo called, becauſe it reſembles the feet of a Sea-*Polypus* in figure, and the fleſh thereof in conſiſtence. This tumor ſtops the noſe, intercepting and hindring the liberty of ſpeaking and blowing the noſe. *Celſus* ſaith, the *Polypus* is a caruncle of excreſcence one while white, another while reddiſh, which adheres to the bone of the noſe, and ſometimes fills the noſtrils hanging towards the lips, ſometimes it deſcends back through that hole, by which the ſpirit deſcends from the noſe to the throttle; it grows ſo that it may be ſeen behind the *Uvula*, and often ſtrangles a man by ſtopping his breath. There are five kinds thereof; the firſt is, a ſoft membrane, long and thin like the relaxed and depreſſed *Uvula*, hanging from the middle griſtle of the noſe, being filled with a phlegmatick and viſcid humor. This in exſpiration hangs out of the noſe, but is drawn in and hid by inſpiration; it makes one ſnaffle in their ſpeech, and ſnort in their ſleep. The ſecond hath hard fleſh, bred of melancholy blood without aduſtion, which obſtructing the noſtrils, intercepts the reſpiration made by that part. The third is fleſh hanging from the griſtle, round and ſoft, being the off-ſpring of phlegmatick blood. The fourth is a hard tumor, like fleſh, which when it is touched, yields a ſound like a ſtone; it is generated of melancholy blood dried, being ſomewhat of the nature of a *Scirrhus* confirmed, and without pain. The fifth is, as it were, compoſed of many cancrous Ulcers ſpread over the tranſverſe ſurface of the griſtle.

Lib. 6. cap. 8.

The differences hereof.

Which of them admit no manual operation. Of all theſe ſorts of *Polypi* ſome are not ulcerated, others ulcerated, which ſend forth a ſtinking and ſtrong ſmelling filth. Such of them as are painful, hard, reſiſting, and which have a livid, or leaden colour, muſt not be touched with the hand, becauſe they favour of the nature of a *Cancer*, as into which they often degenerate; yet by reaſon of the pain which oppreſſes more violently, you may uſe the Anodyne medicines formerly deſcribed in a *Cancer*, ſuch as this following.

An Anodyne. ℞ *Olei de vitell. ovorum* ℥ ij, *Litharg. auri, & Tuthiæ præp. an.* ℥ i, *ſucci plat. ſolani an.* ℥ i ß, *Lapid. hæmatit. & camphoræ, an.* ℥ ß. Let them be wrought a long time in a leaden Mortar, and ſo make a medicine to be put into the noſtrils. Thoſe which are ſoft, looſe, and without pain, are ſometimes curable, being plucked away with an Inſtrument made for that purpoſe, or elſe waſted by actual cauteries put in through a pipe, ſo that they touch not the ſound part; or by potential cauteries, as *Egyptiacum* compoſed of equal parts of all the ſimples with Vitriol, which hath a faculty to waſte ſuch like fleſh. *Aqua fortis* and Oyl of Vitriol have the ſame faculty, for theſe take away a *Polypus* by the root; for if any part there remain, it will breed again. But cauteries and acrid medicines muſt be put into the noſtrils with this caution, that in the mean time cold repelling and aſtringent medicines be applied to the noſe and parts about it to aſſwage the pain, and hinder the inflammation. Such as are *Unguentum de bello*, and *Unguentum nutritum*, white of Eggs beaten with Roſe-leaves, and many other things of the like nature.

Why it muſt be taken clear away.

CHAP. III.

Of the Parotides, *that is, certain ſwellings about the Ears.*

What it is. THe *Parotis* is a tumor againſt Nature, affecting the glandules and thoſe parts ſeated behind and about the Ears, which are called the Emunctories of the brain; for theſe becauſe they are looſe and ſpongy, are fit to receive the excrements thereof. Of theſe ſome are critical, the matter of the diſeaſe ſomewhat digeſted being ſent thither by the force of Nature. Others Symptomatical, the excrements of the brain increaſed in quantity, or quality, ruſhing thither of their own accord. Such abſceſſes often have great inflammations joyned with them, becauſe the biting humor which flows thither is more vitiated in quality than in quantity. Beſides alſo, they often cauſe great pain, by reaſon of the diſtention of the parts indued with the moſt exquiſite ſenſe, as alſo by reaſon of a nerve of the fifth Conjugation ſpread over theſe parts; as alſo of the neighbouring membranes of the brain, by which means the Patient is troubled with head-ach, and all

The differences. Their ſigns and ſymptoms.

his

his face becomes ſwoln. Yet many times this kind of Tumor uſeth to be raiſed by a tough, viſcous, and groſs humor.

This diſeaſe doth more grievouſly afflict young men than old; it commonly brings a Feaver and watching. It is difficult to be cured, eſpecially, when it is cauſed by a groſs, tough, and viſcid humor, ſent thither by the *Criſis*. Prognoſtick.

The cure muſt be performed by diet, which muſt be contrary to the quality of the humor in the temper and conſiſtence of the meats. If the inflammation and redneſs be great, which indicate abundance of blood, Phlebotomy will be profitable, yea very neceſſary. But here we muſt not uſe the like judgment, in application of local medicines, as we do in other tumors, as *Galen* admoniſheth us; that is, we muſt not uſe repercuſſives at the beginning, eſpecially, if the abſceſs be critical; for ſo we ſhould infringe or fore-ſlow the endeavours of Nature forcibly freeing it ſelf from the morbifique matter. But we muſt much leſs repel, or drive it back, if the matter which hath flowed thither be venenate, for ſo the reflow thereof to the noble parts would prove mortal. Wherefore the Chirurgeon ſhall rather aſſiſt Nature in attracting and drawing forth that humor. Yet if the defluxion ſhall be ſo violent, if the pain ſo fierce, that thence there may be fear of watchings, and a Feaver, which may deject the powers; *Galen* thinks, it will be expedient with many reſolving medicines to mix ſome repelling. Wherefore at the beginning let ſuch a Cataplaſm be applied. The cure. *Lib. 3. de comp. med. ſec. Locos. Hip. aph. 21. lib. 1.*

℞ *Far. hord. & ſem. lin. ana* ℥ ij, *coquantur cum mulſo aut decocto cham. addendo but. recen. & olei cham. ana* ℥ i, *fiat cataplaſma.* And the following Oyntment will alſo be good. Gentle reſolving medicines.

℞ *But. recen.* ℥ ii, *olei cham. & lilior. an* ℥ i, *unguen. de Althea* ℥ ß, *ceræ parum:* Make an Oyntment to be applied with moiſt and greaſie wool, to mitigate the pain; alſo ſomewhat more ſtrong diſcuſſing and reſolving medicines will be profitable; as,

℞ *Rad. Altheæ & bryon. an.* ℥ ij, *fol. rutæ, puleg. orig. an. m.* i, *flo. chamæm. melil. an. p.* i, *coquantur in hydromelite, piſtentur, trajiciantur, addendo farin. fænugræc. orobi. an.* ℥ i, *pul. Ireos, cham. melilot. an.* ℥ ij. *olei aneth. rutac. an.* ℥ i, *fiat cataplaſma.* But if you determine to reſolve it any more, you may uſe *Emplaſtrum Oxycroceum* and *Melilot-plaiſter.* If the humor doth there concrete and grow hard, you muſt betake you to the medicines which were preſcribed in the Chapter of the *Scirrhus*; but if it tend to ſuppuration, you ſhall apply the following medicine. Stronger reſolvers.

℞ *Rad. liliorum & ceparum ſub cineribus coct. an.* ℥ iij. *Vitell. ovor. num.* ii, *axung. ſuilla & unguent. baſilicon, an.* ℥ i, *farr. ſem. lini* ℥ i ß, *fiat cataplaſma.* But if the matter do ſo require, let the tumor be opened as we have formerly preſcribed. A ripening medicine.

CHAP. IV.

Of the Epulis, *or over-growing of the fleſh of the Gums.*

THe *Epulis* is a fleſhy excreſcence of the gums between the teeth, which is by little and little oft-times increaſed to the bigneſs of an Egg, ſo that it both hinders the ſpeech and eating; it caſts forth ſalvious and ſtinking filth, and not ſeldom degenerates into a *Cancer*, which you may underſtand by the propriety of the colour, pain, and other accidents; for then you muſt by no means touch it with your hand. But that which doth not torment the Patient with pain, may be pluck'd away; and let this be the manner thereof. What it is. The Symptomes.

Let it be tied with a double thred, which muſt be ſtraiter twiched until ſuch time as it fall off; when it ſhall fall away, the place muſt be burnt with a cautery, put through a trunk or pipe, or with *Aqua fortis*, or oyl of *Vitriol*, but with great care that the ſound parts adjoyning thereto be not hurt; for if ſo be that it be not burnt, it uſually returns. The Chirurgical cure.

I have often by this means taken away ſuch large tumors of this kind, that they hung out of the mouth in no ſmall bigneſs, to the great diſfiguring of the face, which when as no Chirurgeon durſt touch, becauſe the fleſh looked livid, I ventured upon, becauſe they were free from pain; and by taking them away and cauterizing the place, I perfectly healed them: not truly ſuddenly, and at once; for although I burnt the place after diſſection, yet nevertheleſs they ſprung up again, becauſe a certain portion of the bone and ſockets in which the teeth ſtand faſtned, were become rotten. I have often obſerved ſuch like fleſh by continuance of time to have turned into a griſtly and bony ſubſtance. Wherefore the cure muſt be begun as ſpeedily as may be; for being but little, and having faſtened no deep roots, it is more eaſily taken away, being then only filled with a viſcid humor, which in ſucceſs of time is hardened, and makes the taking away thereof more difficult. Why the cure muſt not be deferred.

CHAP. V.

Of the Ranula.

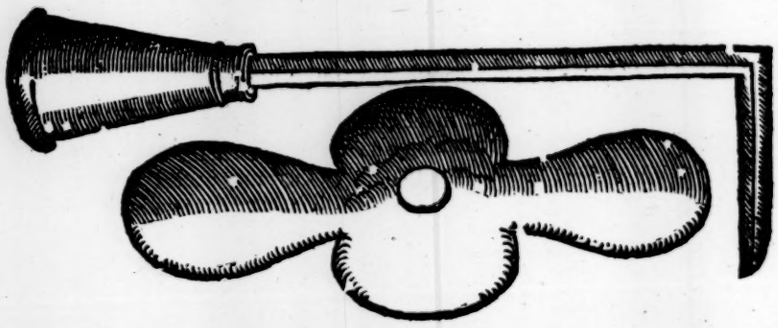
THere is oft-times a tumor under the tongue, which takes away the liberty of pronuntiation or ſpeech; wherefore the Greeks call it *Batrachium*, the Latins *Ranula*, becauſe ſuch as have this diſeaſe of the tongue, ſeem to expreſs their minds by croaking rather than by ſpeaking. The Reaſon why it is ſo called.

It is cauſed by the falling down of a cold, moiſt, groſs, tough, viſcid, phlegmatick matter, from the brain upon the tongue, which matter in colour and conſiſtence reſembles the white of an Egg, yet ſometimes it looks of a citrin or yellowiſh colour. The Cauſe.

That you may ſafely perform the cure, you muſt open the Tumor rather with a Cautery of hot Iron, than with a Knife, for otherwiſe it will return again. The manner of opening it muſt be thus. You ſhall get a bended hollow and perforated Iron-plate with a hole in the midſt, and making the Patient to hold open his mouth, you ſhall ſo fit it, that the hole may be upon the part The Cure.

which muſt be opened. Then there you muſt open it with an hot Iron, for ſo you ſhall hurt no part of the mouth which is whole; but when you are ready to burn it, by thruſting your thumb under the Patients chin, you may ſomewhat elevate the Tumor whereby you may open it with more certainty; when it is opened, you muſt thruſt out the matter contained therein, and then waſh the Patients mouth with ſome Barly-water, Honey, and Sugar of Roſes; for ſo the Ulcer will be ſafely and quickly healed.

The Delineation of the Iron-plate, and crooked actual Cautery.



CHAP. VI.

Of the ſwelling of the Glandules, or Almonds of the Throat.

Why the glandules are called Almonds. Their uſe.

NAture at the jaws near the roots of the tongue, hath placed two glandules oppoſite to one another; in figure and magnitude like to Almonds, whence alſo they have their name; their office is to receive the ſpittle falling down from the brain, both leſt that the too violent falling down of the humor ſhould hinder the tongue in ſpeaking, as alſo, that the tongue might always have moiſture, as it were, laid up in ſtore, leſt by continual ſpeaking, it ſhould grow dry and fail. For thus this ſpittle being conſumed by feaveriſh heats, the Patients are ſcarce able to ſpeak, unleſs they firſt moiſten their tongue by much waſhing their mouth.

The cauſe of their tumor.

Theſe glandules, becauſe they are ſeated in a hot and moiſt place, are very ſubject to inflammations; for there flows into theſe oft-times together with the blood, a great quantity of crude, phlegmatick and viſcous humors, whence ariſes a Tumor; which is not ſeldom occaſioned by drinking much, and that vaporous Wine; by too much Gluttony, and ſtaying abroad in the open air.

Symtomes.

Swallowing is painful and troubleſome to the Patient, and commonly he hath a Feaver. Oft-times the neighbouring muſcles of the throttle and neck are ſo ſwoln together with theſe glandules, that (as it uſually happens in the *Squinzy*) the paſſage of the breath and air is ſtopped, and the Patient ſtrangled.

Cure.

We reſiſt this imminent danger by purging and blood-letting, by applying Cupping-glaſſes to the neck and ſhoulders, by frictions and ligatures of the extreme parts, and by waſhing and gargling the mouth and throat with aſtringent Gagariſms. But if they come to Suppuration, you muſt with your Inciſion-knife make way for the evacuation of the *Pus*, or matter; but, if on the contrary, theſe things performed according to art, defluxion be increaſed, and there is preſent danger of death by ſtopping and intercepting the breath, for the ſhunning ſo great and imminent danger, the top or upper part of the *Aſpera arteria* or Weazon muſt be opened, in that place where it uſes to ſtand moſt out; and it may be done ſo much the ſafer, becauſe the jugular veins and arteries are furtheſt diſtant from this place, and for that this place hath commonly little fleſh upon it. And that the Inciſion may be the fitlier made, the Patient muſt be wiſhed to bend his head back, that ſo the artery may be the more eaſily come to by the Inſtrument; then you ſhall make an Inciſion overthwart way with a crooked knife between two rings (not hurting nor touching the griſtly ſubſtance) that is to ſay, the membrane which ties together the griſtly rings, being only cut; you ſhall then judge that you have made the Inciſion large enough, when you ſhall perceive the breath to break out by the wound; the wound muſt be kept open ſo long, until the danger of ſuffocation be paſt; and then it muſt be ſowed up not touching the griſtle: But if the lips of the wound ſhall be hard and callous; they muſt be lightly ſcarrified, that ſo they may become bloody for their eaſie agglutination and union, as we ſhall ſhew more at large in the cure of Hare-lips. I have had many in cure, who have recovered, that have had their weazon together with the griſtly rings thereof cut with a great wound, as we ſhall note when we ſhall come to treat of the cure of that wounds of that part.

Extreme diſeaſes muſt have extreme remedies.

How you muſt open the weazon.

CHAP. VII.

Of the Inflammation and Relaxation in the Uvula *or* Columella.

What the *uvula* is, and what the uſe thereof.

THe *Uvula* is a little body, ſpongy, and ſomewhat ſharpened to the form of a Pine-apple, hanging even down from the upper and inner part of the palat, ſo to break the force of the air drawn in, in breathing, and carried to the lungs; and to be as a quill to form and tune the voice. It often grows above meaſure by receiving moiſture falling down from the brain, becoming ſharp by little and little from a broader and more ſwoln *Baſis*. Which thing cauſes

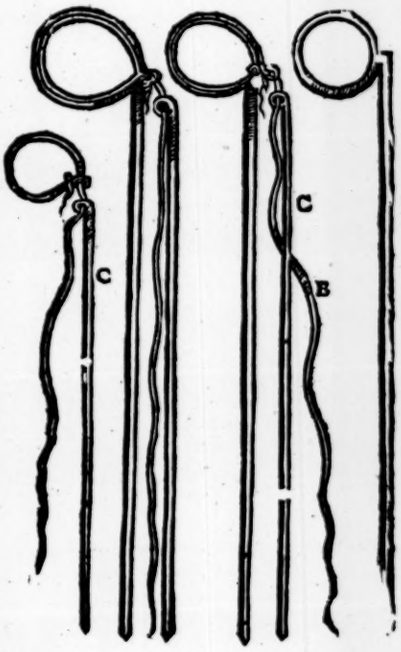
The cauſe of the ſwelling thereof.

many

many ſymptomes; for by the continual irritation of the diſtilling humor the cough is cauſed, which alſo hinders the ſleep, and intercepts the liberty of ſpeech; as alſo, by hindering reſpiration, the Patients cannot ſleep, unleſs with open mouth: They are exerciſed with a vain endeavouring to ſwallow (having, as it were, a morſel ſticking in their jaws) and are in danger of being ſtrangled. Symptomes.

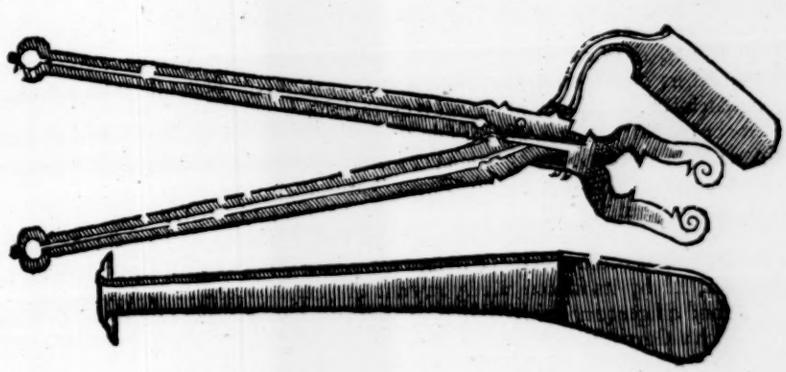
This diſeaſe muſt be reſiſted and aſſailed by purging, bleeding, cupping, taking of clyſters, uſing aſtringent Gargles, and a convenient diet; but if it cannot thus be overcome, the cure muſt be tried by a cauſtick of *Aqua fortis*, which I have divers times done with good ſucceſs. But if it cannot be ſo done, it will be better to put to your hand, than through idleneſs to ſuffer the Patient to remain in imminent and deadly danger of ſtrangling: yet in this there muſt very great caution be uſed; for the Chirurgeon ſhall not judge the *Uvula* fit to be touched with an inſtrument, or cauſtick, which is ſwoln with much inflamed, or black blood, after the manner of a *Cancer*; but he ſhall boldly put to his hand, if it be longiſh, grow ſmall by little and little into a ſharp, looſe and ſoft point; if it be neither exceeding red, neither ſwoln with too much blood, but whitiſh and without pain. Therefore that you may more eaſily and ſafely cut away that which redounds and is ſuperfluous, deſire the Patient to ſit in a light place, and hold his mouth open; then take hold of the top of the *Uvula* with your Sizzers, and cut away as much thereof as ſhall be thought unprofitable. Otherwiſe you ſhall bind it with the inſtrument here-under deſcribed. The invention of this Inſtrument is to be aſcribed to *Honoratus Taſtellanus*, that diligent and learned man, the Kings Phyſician ordinary, and the chief Phyſician of the Queen-mother. Which alſo may be uſed in binding of *Polypi*, and warts in the neck of the womb. The Cure. The Cure by Chirurgery.

The Delineation of Conſtrictory-rings, fit to twitch or bind the Columella, *with a twiſted thread.*



A *Shews the ring, whoſe upper part is ſomewhat hollow.*
B *A double waxed thread, which is couched in the hollowneſs of the ring, and hath a running, or looſe knot upon it.*
C *An Iron rod, into the eye whereof the forementioned double thread is put, and it is to twitch the* Columella, *when as much thereof is taken hold of, as is unprofitable, and ſo take it away without any flux of blood. When you would ſtraiten the thread, draw it again through the Iron-rod, and ſo ſtrain it as much as you ſhall think good, letting the end of the thread hang out of the mouth. But every day it muſt be twitched harder than other, until it fall away by means thereof, and ſo the part and Patient be reſtored to health. I have delineated three of theſe Inſtruments, that you may uſe which you will, as occaſion ſhall be offered.*

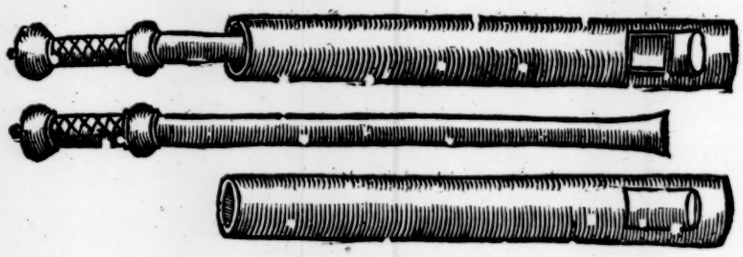
A Figure of the Speculum oris, *by which the mouth is held and kept open whilſt the Chirurgion is buſied in the cutting away, or binding the* Uvula.



But if an eating Ulcer ſhall aſſociate this relaxation of the *Uvula*, together with a flux of blood, then it muſt be burnt and ſeared with an hot Iron, ſo thruſt into a Trunk, or Pipe, with an hole in it, that ſo no ſound part of the mouth may be offended therewith.

A

A hollow Trunk with a hole in the ſide, with the hot Iron inſerted, or put therein.



CHAP. VIII.

Of the Angina, *or Squinzy.*

What it is. THe Squinancy, or Squincy, is a ſwelling of the jaws, which hinders the entring of the ambient air into the weazon, and the vapours and the ſpirit from paſſage forth, and the meat alſo from being ſwallowed. There are three differences thereof. The firſt torments the Patient with great pain, no ſwelling being outwardly apparent, by reaſon the Morbifick humor lies hid behind the almonds or glandules of the *Vertebræ* of the neck, ſo that it cannot be perceived, unleſs you hold down the tongue with a Spatula, or the *Speculum oris*, for ſo you may ſee the redneſs and tumor there lying hid. The Patient cannot draw his breath, nor ſwallow down meat nor drink: his tongue (like a Grey-hounds after a courſe) hangs out of his mouth; and he holds his mouth open, that ſo he may the more eaſily draw his breath; to conclude, his voice is, as it were, drown'd in his jaws and noſe; he cannot lie upon his back, but lying is forced to ſit, ſo to breathe more freely: And becauſe the paſſage is ſtopt, the drink flies out at his noſe; the eyes are fiery and ſwoln, and ſtanding out of their orb. Thoſe which are thus affected are often ſuddenly ſuffocated, a foam riſing about their mouths.

The differences.

The firſt kind.

The Symptoms.

The ſecond kind. The ſecond difference is ſaid to be that, in which the tumor appears inwardly, but little or ſcarce any thing at all outwardly, the tongue, glandules and jaws, appearing ſomewhat ſwoln.

The third. The third, being leaſt dangerous of them all, cauſes a great ſwelling outwardly, but little inwardly.

The cauſes. The cauſes are either internal or external. The external are a ſtroak, ſplinter, or the like thing ſticking in the throat, or the exceſs of extreme cold or heat. The internal cauſes are a more plentiful defluxion of the humors either from the whole body or the Brain, which participate of the nature, either of blood, choler, or flegm, but ſeldom of Melancholy. The ſigns by which the kind and commixture may be known, have been declared in the general Treatiſe of Tumors. The Squincy is more dangerous, by how much the humor is leſs apparent within and without. That is leſs dangerous which ſhews it ſelf outwardly, becauſe ſuch an one ſhuts not up the ways of the meat, nor breath. Some die of a Squincy in twelve hours, others in two, four or ſeven days. Thoſe (ſaith *Hippocrates*) which ſcape the Squincy, the diſeaſe paſſes to the lungs, and they die within ſeven days; but if they ſcape theſe days, they are ſuppurated; but alſo often-times this kind of diſeaſe is terminated by diſappearing, that is, by an obſcure reflux of the humor into ſome noble part, as into the lungs (whence the *Empyema* proceeds) and into other principal parts, whoſe violating brings inevitable death; ſometimes by reſolution, otherwiſe by ſuppuration.

Hip. ſect. 3. prog. 2. Aphor. 10. ſect. 5.

The way of reſolution is the more to be deſired; it happens when the matter is ſmall, and that ſubtle; eſpecially, if the Phyſician ſhall draw blood by opening a vein, and the Patient uſe fitting Gargariſms. A critical Squincy divers times proves deadly, by reaſon of the great falling down of the humor upon the throttle, by which the paſſage of the breath is ſuddenly ſhut up. Broths muſt be uſed made with Capons, and Veal ſeaſoned with Lettuce, Purſlain, Sorrel, and the cold Seeds.

Diet. If the Patient ſhall be ſomewhat weak, let him have potched Eggs, and Barly Creams, the Barly being ſomewhat boiled with Raiſons in Water and Sugar, and other meats of this kind. Let him be forbidden Wine, inſtead whereof he may uſe *Hydromelita*, and *Hydroſacchara*, that is, drinks made of Water and Honey, or Water and Sugar; as alſo Syrups of dried Roſes, of Violets, Sorrel and Limmons, and others of this kind. Let him avoid too much ſleep. But in the mean time the Phyſician muſt be careful of all, becauſe this diſeaſe is of their kind, which brook no delays. Wherefore

Cure. let the *Baſilica* be preſently opened, on that ſide the tumor is the greater; then within a ſhort time ter the ſame day, for evacuation of the conjunct matter, let the vein under the tongue be opened; let Cupping-Glaſſes be applied, ſometimes with Scarification, ſometimes without, to the neck and ſhoulders, and let frictions and painful ligatures be uſed to the extreme parts. But let the humor impact in the part be drawn away by Clyſters and ſharp Suppoſitories. Whilſt the matter is in

Repelling Gargariſms. defluxion, let the mouth without delay be waſhed with aſtringent Gargariſms to hinder the defluxion of the humor, leſt by its ſudden falling down it kill the Patient; as it often happens, all the Phyſicians care and diligence notwithſtanding. Therefore let the mouth be frequently waſhed with Oxycrate, or ſuch a Gargariſm; ℞ *Pomorum ſylveſt. nu.* iiij. *ſumach, Roſar. rub. an. m. ſſ. herber.* ʒ ii. let them be all boyled with ſufficient quantity of water to the conſumption of the half, adding thereunto of the Wine of four Pomgranats, ʒ iiij, of *Diamoron* ʒ ij, let it be a little more boyled, and make a gargle according to Art. And there may be other Gargariſms made of the waters of Plantain, Night-ſhade, Verjuyce, Julep of Roſes, and the like. But if the matter of the defluxion ſhall be Phlegmatick, Alum, Pomgranat-pill, Cypreſs-nuts, and a little Vinegar may be ſafely added. But

on

on the contrary, Repercuſſives muſt not be outwardly applied, but rather Lenitives, whereby the external parts may be relaxed and rarified, and ſo the way be open either for the diffuſing or reſolving the portion of the humor. You ſhall know the humour to begin to be reſolved, if the Feaver leave the Patient, if he ſwallow, ſpeak, and breathe more freely, if he ſleep quietly, and the pain begin to be much aſſwaged. Therefore then Nature's endeavour muſt be helped by applying reſolved medicines, or elſe by uſing Suppuratives inwardly and outwardly, if the matter ſeem to turn into *Pus*. Therefore let Gargariſms be made of the roots of Marſh-mallows, Figs, Jujubes, Damask-prunes, Dates, perfectly boyled in water. The like benefit may be had by Gargariſms of Cows-milk with Sugar, by Oyl of Sweet-almons, or Violets warm, for ſuch things help forward Suppuration and aſſwage pain; let ſuppurating Cataplaſms be applied outwardly to the neck and throat, and the parts be wrapped with wool moiſtned with Oyl of Lilies. When the Phyſician ſhall perceive that the humor is perfectly turned into *Pus*, let the Patients mouth be opened with the *Speculum oris*, and the abſceſs opened with a crooked and long Inciſion-knife; then let the mouth be now and then waſhed with cleanſing Gargles; as ℞ *Aquæ hordei lib. ſſ. mellis roſ. & ſyr. roſar. ſic. an.* ℥ i, *fiat gargariſma.* Alſo, the uſe of *ænomel*, that is, Wine and Honey, will be fit for this purpoſe. The Ulcer being cleanſed by theſe means, let it be cicatrized with a little Roch-Alum added to the former Gargariſms.

Ripening Gargariſms.

Detergent Gargariſms.

The Figure of an Inciſion-knife, opened out of the haft, which ſerves for a ſheath thereto.

CHAP. IX.

Of the Bronchocele, *or* Rupture *of the Throat.*

THat which the French call *Goetra*, that the Greeks call *Bronchocele*, the Latins *Gutturis Hernia*, that is, the Rupture of the throat. For it is a round tumor of the throat, the matter whereof coming from within outwards, is contained between the skin and weazon; it proceeds in women from the ſame cauſe as an *Aneuriſma*.

The reaſon of the name.

But this general name of *Bronchocele* undergoes many differences; for ſometimes it retains the nature of *Melicerides*, other-whiles of *Steatoma's*, *Atheroma's* or *Aneuriſma's*; in ſome there is found a fleſhy ſubſtance having ſome ſmall pain; ſome of theſe are ſmall, others ſo great, that they ſeem almoſt to cover all the throat; ſome have a ciſt, or bag, others have no ſuch thing; all, how many ſoever they be, and what end they ſhall have, may be known by their proper ſigns; theſe which ſhall be curable, may be opened with an actual or potential cautery, or with an Inciſion-knife. Hence, if it be poſſible, let the matter be preſently evacuated; but if it cannot be done at once, let it be performed at divers times, and diſcuſſed by fit remedies; and laſtly, let the ulcer be conſolidated and cicatrized.

The differences.

The Cure.

CHAP. X.

Of the Pleuriſie.

THe Pleuriſie is an inflammation of the membrane, inveſting the ribs, cauſed by ſubtile and cholerick blood; ſpringing upwards with great violence from the hollow vein into the *Azygos*, and thence into the intercoſtal veins, and is at length poured forth into the empty ſpaces of the intercoſtal muſcles, and the mentioned membrane. Being contained there, if it tend to ſuppuration, it commonly, infers a pricking pain, a Feaver, and difficulty of breathing. This ſuppurated blood is purged and evacuated one while by the mouth; the lungs ſucking it, and ſo caſting it into the weazon, and ſo into the mouth; otherwhiles by urin, and ſometimes by ſtool.

What it is.

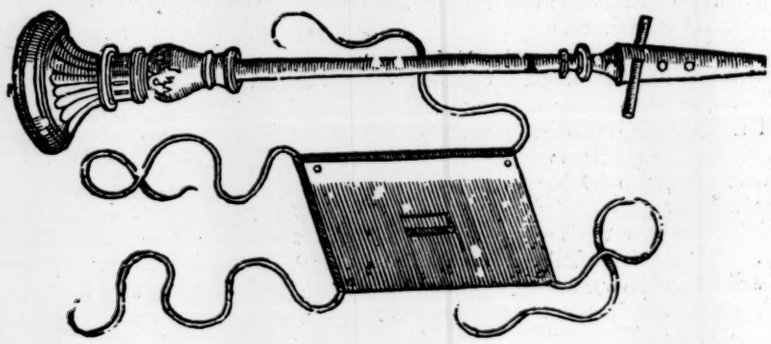
Of a Pleuriſie coming to ſuppuration.

But if nature, being too weak, cannot expectorate the purulent blood poured forth into the capacity of the cheſt, the diſeaſe is turned into *Empyema*, wherefore the Chirurgeon muſt then be called, who beginning to reckon from below upwards, may make a vent between the third and fourth true and legitimate ribs; and that muſt be done either with an actual or potential cautery, or with a ſharp knife drawn upwards, towards the back, but not downwards, leſt the veſſels ſhould be violated which are diſſeminated under the rib. This apertion may be ſafely and eaſily performed by this actual cautery; it is perforated with four holes, through one whereof there is a pin put higher or lower, according to the depth and manner of your Inciſion: Then the point thereof is thruſt through a plate of Iron perforated alſo in the midſt, into the part deſigned by the Phyſician, leſt the wavering hand might peradventure touch, and ſo hurt the other parts not to be meddled withal. The ſame plate muſt be ſomewhat hollowed, that ſo it might be more eaſily fitted to the gibbous ſide, and bound by the corners on the contrary ſide with four ſtrings. Wherefore I have thought good here to expreſs the figures thereof.

Of the change thereof into an *Empyema*.

Of the aperti-on of the ſide in an *Empye-ma*.

The Figure of an actual Cautery, with its Plate fit to be uſed in a Pleuriſie.



But if the Patient ſhall have a large body, cheſt and ribs, you may divide and perforate the ribs themſelves with a Trepan; howſoever the apertion be made, the *pus*, or matter, muſt be evacuated by little and little at ſeveral times; and the capacity of the cheſt cleanſed from the purulent matter by a detergent injection of vi. ounces of Barley-water, and ℥ ii, Honey of Roſes, and other the like things mentioned at large in our cure of Wounds.

CHAP. XI.

Of the Dropſie.

What the Dropſie is.

THe Dropſie is a Tumor againſt nature by the abundance of wateriſh humor, of flatulencies, or Phlegm, gathered one while in all the habit of the body, otherwhiles in ſome part and that eſpecially in the capacity of the belly between the *Peritonæum* and entrails. From this diſtinction of places and matters, there ariſe divers kinds of Dropſies. Firſt, that Dropſie which fills that ſpace of the belly, is either moiſt or dry. The moiſt is called the *Aſcites*, by reaſon of the ſimilitude it hath with a leather-bottle, or *Borachio*, becauſe the wateriſh humor is contained in that capacity, as it were in ſuch a veſſel.

The differences thereof.

The dry is called the *Tympanites*, or Tympany, by reaſon the belly ſwollen with wind ſounds like a *Tympanum*, that is, a Drum. But when the whole habit of the body is diſtended with a phlegmatick humor, it is called *Anaſarca* or *Leucophlegmatia*. In this laſt kind of Dropſie the lower parts firſt ſwell, as which by reaſon of their ſite are moſt ſubject to receive defluxions, and more remote from the fountain of the native heat; wherefore if you preſs them down, the print of your finger will remain ſometime after; the Patients face will become pale and puffed up, whereby it may be diſtinguiſhed from the two other kinds of Dropſie. For in them firſt the belly, then by a certain conſequence the thighs and feet do ſwell. There are beſides alſo particular Dropſies, contained in the ſtrait bounds of certain places, ſuch are the *Hydrocephalus* in the head; the *Bronchocele* in the throat; the *Pleurocele* in the cheſt; the *Hydrocele* in the *Scrotum*, or cod; and ſo of the reſt. Yet they all ariſe from the ſame cauſe, that is, the weakneſs or defect of the altering or concocting faculties, eſpecially of the liver, which hath been cauſed by a *Scirrhus*, or any kind of great diſtemper, chiefly cold, whether it happen primarily, or ſecondarily by reaſon of ſome hot diſtemper diſſipating the native and inbred heat, ſuch a Dropſie is incurable; or elſe it comes by conſent of ſome other higher or lower part; for if in the lungs, midriff, or reins, there be any diſtemper, or diſeaſe bred, it is eaſily communicated to the gibbous part of the liver, by the branches of the hollow vein, which run thither. But if the miſchief proceed from the ſpleen, ſtomach, meſentery, guts, eſpecially the *jejunum* and *Ileum*, it creeps into the hollow ſide of the liver by the meſeraick veins, and other branches of the *Vena porta* or gate-vein. For thus ſuch as are troubled with the *Aſthma*, Ptiſick, Spleen, Jaundiſe, and alſo the Phrenſie, fall into a Dropſie.

The Symptomes.

The cauſes.

How divers diſeaſes turn into Dropſies.

Laſtly, All ſuch as have the menſtrual or hæmorrhoidal blood ſuppreſſed or too immoderately flowing contrary to their cuſtom, either overwhelms, diminiſheth or extinguiſheth the native heat; no otherwiſe than fire, which is ſuffocated by too great a quantity of wood; or dieth and is extinguiſhed for want thereof. We muſt look for the ſame from the excrements of the belly or bladder, caſt forth either too ſparingly or too immoderately: Or by too large quantity of meats too cold and raſhly devoured without any order. To conclude, by every default of external cauſes through which occaſion, errour may happen in diet or exerciſe.

The ſigns of an *Aſcites*.

The *Aſcites* is diſtinguiſhed from the two other kinds of Dropſies, both by the magnitude of the efficient cauſe, as alſo by the violence of the Symptoms, as the dejected appetite, thirſt, and ſwelling of the *Abdomen*. And alſo when the body is moved or turned upon either ſide, you may hear a ſound as of the joggling of water in a veſſel half full. Laſtly, the humor is diverſly driven upwards or downwards, according to the turning of the body and compreſſion of the *Abdomen*: It alſo cauſeth various Symptoms by preſſure of the parts to which it floweth. For it cauſeth difficulty of breathing and the cough by preſſing of the midriff; by ſweating through into the capacity of the cheſt, it cauſeth like Symptoms as the *Empyema*. Beſides alſo the Patients often ſeem, as it were, by the ebbing and flowing of the wateriſh humor, one while to be carried to the skies, and another whiles to be drowned in the water, which I have learn'd not by reading of any author, but by the report of the Patients themſelves. But if theſe wateriſh humors be fallen down to the lower parts, they ſuppreſs the excrements of the guts and bladder by preſſing and ſtraitning the paſſages. When the Patient

The Symptomes.

lies

lies on his back, the tumor ſeems leſs, becauſe it is ſpread on both ſides: On the contrary, when he ſtands or ſits, it ſeems greater, for that all the humor is forced or driven into the lower belly, whence he feels a heavineſs in the *Pecten* or ſhare. The upper parts of the body fall away by defect of the blood fit for nouriſhment in quality and conſiſtence, but the lower parts ſwell by the flowing down of the ſerous and wateriſh humor to them. The pulſe is little, quick, and hard with tention.

This diſeaſe is of the kind of Chronical or long diſeaſes; wherefore it is ſcarce, or never cured, eſpecially in thoſe who have it from their Mothers womb, who have the action of their ſtomach depraved; and thoſe who are cachectick, and old; and laſtly, all ſuch as have the natural faculty languiſhing and faulty. Prognoſticks.

On the contrary, young and ſtrong men, eſpecially if they have no feaver, and finally all who can endure labour, and thoſe exerciſes which are fit for curing this diſeaſe, eaſily recover; principally if they uſe a Phyſician, before the water which is gathered together do putrefie and infect the bowels by its contagion.

CHAP. XII.

Of the cure of the Dropſie.

THe beginning of the cure muſt be with gentle and mild medicines; neither muſt we come to a *Paracenteſis*, unleſs we have formerly uſed and tried theſe. Therefore, it ſhall be the part of the Phyſician to preſcribe a drying diet, and ſuch medicines as carry away water, both by ſtool and urine, *Hippocrates* ordains this powder for Hydropick perſons. ℞ *Canthar. ablatis capitib. & aliis* ʒʃ *comburantur in furno, & fiat pulvis*; of which adminiſter two grains in white wine; for, nature, helped by this, and the like remedies, hath not ſeldom been ſeen to have cured the Dropſie. But that we may haſten the cure, it will be available to ſtir up the native heat of the part by application of thoſe medicines which have a diſcuſſing force; as bags, baths, ointments, and Emplaiſters. Let bags be made of dry and harſh Bran, Oats, Salt, Sulphur, being made hot; or, for want of them, of Sanders or Aſhes often heated. *Hip. lib. 4. de acut. & lib. de intern.* Bags.

The more effectual baths are Salt, Nitrous, and Sulphurous waters, whether by nature or art, that is, prepared by the diſſolution of Sal, Nitre, and Sulphur; to which if Rue, Marjoram, the leaves of Fennel, and tops of Dill, of *Stœchas*, and the like, be added, the buſineſs will go better forwards. Let bags be made of the oyl of Rue, Dill, Bays, and Squills, in which ſome *Euphorbium*, Pellitory of *Spain*, or Pepper, have been boiled. Let Plaiſters be made of Frankincenſe, Myrrh, Turpentine, *Coſtus*, Bayberries, Engliſh Galengal, Honey, the dung of Oxen, Pigeons, Goats, Horſes, and the like, which alſo may be applied by themſeves. If the diſeaſe continue, we muſt come to *Sinapiſms* and *Phœnigms*, that is, to rubrifying and veſicatory medicines. When the bliſters are raiſed, they muſt be anointed again, that ſo the water may by little and little flow ſo long until the humor be exhauſted, and the Patient reſtored to health. Baths. Liniments. Emplaiſters. Veſicatories.

Galen writes, the Husbandmen in *Aſia*, when they carried wheat out of the Countrey into the City in Cars, when they would ſteal away and not be taken, hide ſome ſtone-jugs fill'd with water in the midſt of the Wheat; for that will draw the moiſture through the jugs into it ſelf, and increaſe both the quantity and weight. When certain pragmatical Phyſicians had read this, they thought that Wheat had force to draw out the water, ſo that if any ſick of the Dropſie ſhould be buried in a heap of Wheat, it would draw out all the water. *Gal. lib. de facul. natur. 1.*

But if the Phyſician ſhall profit nothing by theſe means, he muſt come to the exquiſitly chief remedy, that is, to *Paracenteſis*. Of which becauſe the opinions of the ancient Phyſicians have been diverſe, we will produce and explain them. Divers opinions of *Paracenteſis*, or opening of the belly.

Thoſe therefore which diſallow *Paracenteſis*, conclude it dangerous for three reaſons: The firſt, becauſe by pouring out the contained water, together with it, you diſſipate and reſolve the ſpirits, and conſequently the natural, vital, and animal faculties. Another opinion is, becauſe the liver wanting the water by which formerly it was born up, thence-forward hanging down by its weight, depreſſeth and draweth downwards the midriff and the whole cheſt, whence a dry cough, and a difficulty of breathing proceed. The third is, becauſe the ſubſtance of the *Peritonæum*, as that which is nervous, cannot be pricked or cut without danger, neither can that which is pricked or cut, be eaſily agglutinated and united, by reaſon of the ſpermatick and bloodleſs nature thereof. *Eraſiſtratus* moved by theſe reaſons, condemned *Paracenteſis* as deadly: Alſo, he perſwaded that it was unprofitable, for theſe following reaſons; *viz.* Becauſe the water poured forth, doth not take away with it the cauſe of the Dropſie, and the diſtemper and hardneſs of the liver, and of the other bowels, whereby it comes to paſs that by breeding new waters they may eaſily again fall into the Dropſie. And then the Feaver, the thirſt, the hot and dry diſtemper of the bowels, all which were mitigated by the touch of the included water, are aggravated by the abſence thereof, being poured forth; Which thing ſeemeth to have moved *Avicen* and *Gordonius* that he ſaid none, the other ſaid very few, lived after the *Paracenteſis*: But the refutation of all ſuch reaſons is very eaſie. Reaſons againſt it. *Eraſiſtratus* his reaſons againſt it.

For, for the firſt; *Galen* infers that harmful diſſipation of ſpirits, and reſolving the faculties happens, when the *Paracenteſis* is not diligently, and artificially performed. As in which the water is preſently poured forth; truly, if that reaſon have any validity, Phlebotomy muſt ſeem to be removed far from the number of wholſome remedies, as whereby the blood is poured forth, which hath far more pure and ſubtil ſpirits, than thoſe which are ſaid to be diffuſed and mixed with the Dropſie-waters. But that danger which the ſecond reaſon threatens ſhall eaſily be avoided; the Patient being deſired to lie upon his back in his bed, for ſo the liver will not hang down. But for the third reaſon, the fear of pricking the *Peritonæum*, is childiſh: For thoſe evils which follow upon wounds of the nervous parts, happen by reaſon of the exquiſite ſenſe of the part, which in the *Peritonæum* ill affected and altered by the contained water, is either none or very ſmall. But reaſon Reaſons for it.

and

and experience teach, many nervous parts, alſo the very membranes themſelves being far removed from a fleſhy ſubſtance, being wounded admit cure; certainly much more the *Peritonæum*, as that which adheres ſo ſtraitly to the muſcles of the *Abdomen*, that the diſſector cannot ſeparate it from the fleſh, but with much labour. But the reaſon which ſeems to argue the unprofitableneſs of *Paracenteſis* is refelled by the authority of *Celſus*. I, ſaith he, am not ignorant that *Eraſiſtratus* did not like *Paracenteſis*; for he thought the Dropſie to be a diſeaſe of the Liver, and ſo that it muſt be cured; and that the water was in vain let forth, which, the liver being vitiated, might grow again. But firſt, this is not the fault of this bowel alone, and then although the water had his original from the liver, yet unleſs the water which ſtayeth there contrary to Nature be evacuated, it hurteth both the liver, and the reſt of the inner parts, whilſt it either increaſeth their hardneſs, or at the leaſt keepeth it hard, and yet notwithſtanding it is fit the body be cured. And although the once letting forth of the humor profit nothing, yet it makes way for medicines, which while it was there contained, it hindered. But this ſerous, ſalt, and corrupt humor is ſo far from being able to mitigate a feaver and thirſt, that on the contrary it increaſeth them. And alſo it augmenteth the cold diſtemper, whilſt by its abundance it overwhelms and extinguiſheth the native heat. But the authority of *Celius Aurelianus* that moſt noble Phyſician, though a Methodick, may ſatisfie *Avicen* and *Gordonius*. They, ſaith he, which dare avouch that all ſuch as have the water let out by opening their belly have died, do lie; for we have ſeen many recover by this kind of remedy: But if any died, it hapned either by the default of the ſlow or negligent adminiſtration of the *Paracenteſis*. I will add this one thing which may take away all errour or controverſie; we unwiſely doubt of the remedy when the Patient is brought to that neceſſity, that we can only help him by that means.

Lib. 3. *cap.* 21.

Lib. de morb. Ch. cap. de Hydrope.

The places of the apertion muſt be divers according to the parts chiefly affected.

Now muſt we ſhew how the belly ought to be opened. If the Dropſie happen by fault of the liver, the ſection muſt be made on the left ſide; but if of the ſpleen, in the right: for if the Patient ſhould lie upon the ſide which is opened, the pain of the wound would continually trouble him, and the water running into that part where the ſection is would continually drop, whence would follow a diſſolution of the faculties. The ſection muſt be made three fingers breadth below the navel, to wit, at the ſide of the right muſcle, but not upon that which they call the *Linea Alba*; neither upon nervous parts of the reſt of the muſcles of the *Epigaſtrium*; that ſo we may prevent pain and difficulty of hearing. Therefore we muſt have a care that the Patient lye upon his right ſide, if the Inciſion be made in the left, or on the left, if in the right. Then the Chirurgion both with his own hand, as alſo with the hand of his ſervant aſſiſting him, muſt take up the skin of the belly, with the fleſhy pannicle lying under it, and ſeparate them from the reſt; then let him divide them ſo ſeparated with a ſection even to the fleſh lying under them; which being done, let him force as much as he can the divided skin upwards towards the ſtomach, that when the wound, which muſt preſently be made in the fleſh lying there-under, ſhall be conſolidated, the skin, by its falling therein, may ſerve for that purpoſe; then therefore let him divide the muſculous fleſh and *Peritonæum* with a ſmall wound, not hurting the kall or guts.

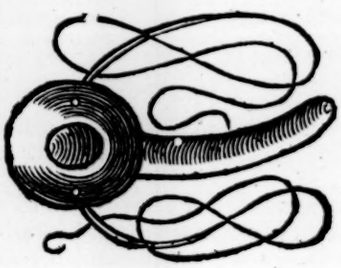
The manner of making apertion.

Then put into the wound a trunk, or golden, or ſilver crooked pipe, of the thickneſs of a Gooſe-quill, and of the length of ſome half a finger. Let that part of it which goes into the capacity of the belly have ſomething a broad head, and that perforated with two ſmall holes, by which a ſtring being faſtened, it may be bound ſo about the body, that it cannot be moved, unleſs at the Chirurgeons pleaſure. Let a ſponge be put into the pipe, which may receive the dropping humor; and let it be taken out when you would evacuate the water; but let it not be poured out all together, but by little and little for fear of diſſipation of the ſpirits, and reſolution of the faculties, which I once ſaw happen to one ſick of the Dropſie. He being impatient of the diſeaſe and cure thereof, thruſt a Bodkin into his belly, and did much rejoyce at the pouring forth of the water, as if he had been freed from the humor and the diſeaſe, but died within a few hours, becauſe the force of the water running forth, could by no means be ſtaid, for the Inciſion was not artificially made. But it will not be ſufficient to have made way for the humor by the means afore-mentioned, but alſo the external orifice of the pipe muſt be ſtopped and ſtrengthened by double clothes, and a ſtrong ligature, leſt any of the water flow forth againſt our wills. But we muſt note, that the pipe is not to be drawn out of the wound, before as much water ſhall be iſſued forth as we deſire, and the tumor requireth; for once drawn forth, it cannot eaſily be put in again, and without force and pain be fitted to the lips of the wound, becauſe the skin and fleſhy pannicle cover it by their falling into the wound of the fleſh or muſcle. But whilſt the water is in evacuation, we muſt have a diligent care of feeding the Patient, as alſo of his ſtrength; for if that fail, and he ſeem to be debilitated, the effuſion of the water muſt be ſtayed for ſome days, which at the length performed according to our deſire, the wound muſt be ſo conſolidated that the Chirurgeon beware it degenerate not into a Fiſtula.

A Hiſtory.

A caution for taking out the pipe.

The Figure of a Pipe in form of a Quill, to evacuate the water in Dropſies.



Another manner of evacuating the water after the apertion.

Others perform this buſineſs after another manner; for, making an Inciſion, they thruſt through the lips of the wound with a needle and thred; but they take up much of the fleſhy ſubſtance with the needle, leſt that which is taken up ſhould be rent and torn by the forcible drawing of the lips together. Then the thred it ſelf is wrapped up and down over both ends of the needle, ſo thruſt through, as is uſually done in a hare-lip, that ſo the lips of the wound may ſo cloſely cohere, that not a drop of water may get out againſt the Chirurgeons will. Sometimes ſuch as are cured and healed of the Dropſie, fall into the Jaundiſe, whom I uſually cure after this manner.

A medicine for the Jaundiſe.

℞. *ſterc. anſer.* ℥ ij. diſſolve it in ℥ iij, *vini. alb. coletur*: Make a Potion, and let it be given two hours before meat.

CHAP.

CHAP. XIII.

Of the tumor and relaxation of the Navel.

THe *Exomphalos* or ſwelling of the navel, is cauſed by the *Peritonæum*, either relaxed or broken; for by this occaſion oft-times the guts, and oft-times the kall, fall into the ſeat of the navel, and ſometimes ſuperfluous fleſh is there generated; otherwiſe, this tumor is as an *Aneuriſma* by too great a quantity of blood poured forth in that place: Otherwiſe by a flatulent matter, and ſometimes by a wateriſh humor. If the humor be occaſioned by the kall, the part it ſelf will retain his proper colour, that is, the colour of the skin; the tumor will be ſoft and almoſt without pain, and which will recide without noiſe, either by the preſſure of your fingers, or of it ſelf when the Patient lieth on his back; but tumor cauſed by the guts, is more unequal, and when it is forced in by the preſſure of your fingers, there is ſuch a noiſe heard, as in the *Enterocele*; but if the tumor proceed of ſuperfluous fleſh it will be harder and more ſtubborn, not eaſily retiring into the body, although the Patient lie upon his back, and you preſs it with your fingers.

The divers cauſes thereof.

Signs hereof occaſioned by the kall.

By the guts.

By Fleſh.

The tumor is ſofter which proceeds of wind, but which will not retire into the body, and ſounds under your nail like a taber. If the ſwelling be cauſed by a wateriſh humor, it hath all things common with the flatuous tumor, except that it is not ſo viſible and without noiſe. If it be from effuſion of blood, it is of a livid colour; but if the effuſed blood ſhall be arterial, then there are the ſigns of an *Aneuriſma*. Wherefore when the tumor is cauſed by the guts, kall, wind or a wateriſh humor, it is cured by Chyrurgery; but not if it proceed from a fleſhy excreſcence or ſuffuſion of blood. The tumor of the navel proceeding from the kall and guts, the Patient muſt lie upon his back to be cured; and then the kall and guts, muſt with your fingers be forced into their due place: Then the skin with which the tumor is circumſcribed muſt be taken up with your fingers, and thruſt through with a needle, drawing after it a double twined and ſtrong thred; then it muſt be ſcarified about the ſides, that ſo it may be the eaſier agglutinated. Then muſt it be thruſt through with a needle three or four times, according to the manner and condition of the diſtention and tumor. And ſo twitch it ſtrongly with a thred, that the skin which is ſo bound may at length fall off together with the ligature. But alſo you may cut off the skin ſo diſtended even to the ligature, and then cicatrize it, as ſhall be fit. A flatulent tumor of the navel ſhall be cured with the ſame remedies, as we ſhall hereafter mention in the cure of a windy rupture, but the watery may be poured forth by making a ſmall incition. And the wound ſhall be kept open ſo long, untill all the water be drained forth.

By wind.

By a wateriſh humor.

By bruiſed blood.

Which may be cured by Chirurgery, which not.

The cure by Chirurgery.

CHAP. XIV.

Of the Tumors of the Groins and Cods called Herniæ, *that is, Ruptures.*

THe ancient Phyſicians have made many kinds of Ruptures, yet indeed there are only three to be called by that name, that is, the *Inteſtinalis*, or that of the guts; the *Zirbalis*, or that of the kall; and, that which is mixed of them both. The other kinds of Ruptures have come into this order, rather by ſimilitude, than any truth of the thing; for in them the gut or kall do not forſake their places.

There are only three ſorts of Ruptures.

The Greeks have given to all theſe ſeveral names, both from the ſeat of the tumor, as alſo from their matter. For thus they have called an unperfect rupture which deſcends not beyond the groins, nor falls down into the cods, *Bubonocele:* but the compleat which penetrates into the cod, if it be by falling down of the gut, *Enterocele:* if from the kall, *Epiplocele*; if from them both together, they name it *Entero-epiplocele:* but if the tumor proceed from a wateriſh humor, they term it *Hydrocele:* if from wind, *Phyſocele*; if from both, *Hydro-phyſocele*; if a fleſhy excreſcence ſhall grow about the teſticle, or in the ſubſtance thereof, it is named *Sarcocele.* If the veins interwoven, and divaricated divers ways, ſhall be ſwoln in the cod and teſticles, the tumor obtains the name of a *Cirſocele.* But if the humors ſhall be ſhut up or ſent thither, the name is impoſed upon the tumor, from the predominant humor, as we have noted in the beginning of our Tractate of Tumors. The cauſes are many, as, all too violent motions, a ſtroke, a fall from a high place, vomiting, a cough, leaping, riding upon a trotting horſe, the ſounding of trumpets, or ſackbuts, the carrying or lifting up of a heavy burthen, racking, alſo the too immoderate uſe of viſcid and flatulent meats; for all ſuch things may either relax or break the *Peritonæum*, as that which is a thin and extended membrane. The ſigns of a *Bubonocele* are a round tumor in the groin, which preſſed, is eaſily forced in. The ſigns of an *Enterocele* are a hard tumor in the cod, which forced, returneth back and departeth with a certain murmur and pain; but the tumor proceeding of the kall, is lax and feels ſoft like wool, and which is more difficultly forced in, than that which proceeds from the guts, but yet without murmuring and pain; for the ſubſtance of the guts, ſeeing it is one, and continued to it ſelf, they do not only mutually ſucceed each other, but by a certain conſequence do, as in a dance, draw each other, ſo to avoid diſtention, which in their membranous body cannot be without pain, by reaſon of their change of place from that which is natural, into that againſt nature: None of all which can befal the kall, ſeeing it is a ſtupid body, and almoſt without ſenſe, heavy, dull, and immoveable. The ſigns that the *Peritonæum* is broken, are the ſudden increaſe of tumor, and a ſharp and cutting pain; for when the *Peritonæum* is only relaxed, the tumor groweth by little and little, and ſo conſequently with ſmall pain; yet ſuch pain returns ſo often, as the tumor is renewed by the falling down of the gut, or kail, which happens not to the *Peritonæum* being broken: for the way being once open, and paſſable to the falling body, the tumor is renewed without any diſtention, and ſo without any pain to ſpeak of.

Bubonocele.

Enterocele and *Epiplocele.*

Hydrocele.

Phyſocele.

Sarcocele.

Cirſocele.

The cauſes.

The ſigns.

The reſt of the ſigns ſhall be handled in their places. Sometimes it happens that the guts and kall, do firmly adhere to the proceſs of the *Peritonæum*, that they cannot be driven back into their proper ſeat. This ſtubborn adheſion happens by the intervention of the viſcid matter, or by means of ſome excoriation cauſed by the rude hand of a Chirurgeon, in too violently forcing of the gut, or kall, into their place. But alſo, too long ſtay of the gut in the cod, and the neglect of wearing a Truſs, may give occaſion to ſuch adheſion. A perfect and inveterate Rupture by the breaking of the proceſs of the *Peritonæum* in men of full growth, never, or very ſeldom admits of cure. But you muſt note, that by great Ruptures of the *Peritonæum*, the guts may fall into the cod, to the bigneſs of a mans head, without much pain and danger of life, becauſe the excrements, as they may eaſily enter, by reaſon of the largeneſs of the place and Rupture, ſo alſo they may eaſily return.

What Rupture is uncureable.

CHAP. XV.

Of the Cure of Ruptures.

To what Ruptures children are ſubject.

BEcauſe children are very ſubject to Ruptures, but thoſe truly not fleſhy or varicous, but watry, windy, and eſpecially of the guts, by reaſon of continual and painful crying and coughing: Therefore in the firſt place we will treat of their cure. Wherefore the Chirurgeon, called to reſtore the gut which is faln down, ſhall place the child, either on a table, or in a bed, ſo that his head ſhall be low, but his buttocks and thighs higher; then ſhall he force with his hands by little and little, and gently, the gut into the proper place; and ſhall foment the groin with the aſtringent Fomentation, deſcribed in the falling down of the womb. Then let him apply this remedy: ℞ *Præſcript. decoctionis quantum ſufficit, farinæ hordei & fabarum, an.* ℥ i, *pulver. Aloes, Maſtithes, Myrtill. & Sarcocc. an.* ℥ ſ, *Boli Armeni* ℥ ij. Let them be incorporated and made a Cataplaſm according to art. For the ſame purpoſe he may apply *Emplaſtrum contra Rupturam:* but the chief of the cure conſiſts in folded Clothes, and Truſſes, and Ligatures artificially made, that the reſtored gut may be contained in its place, for which purpoſe he ſhall keep the child ſeated in his cradle for thirty or forty days, as we mentioned before; and keep him from crying, ſhouting, and coughing; *Aetius* bids, ſteep paper three days in water, and apply it made in a ball to the groin, the gut being firſt put up; for that remedy by three days adheſion will keep it from falling down. But it will be, as I ſuppoſe, more effectual, if the paper be ſteeped not in common, but in the aſtringent water, deſcribed in the falling down of the womb. Truly I have healed many by the help of ſuch remedies, and have delivered them from the hands of the Gelders, which are greedy of childrens teſticles, by reaſon of the great gain they receive from thence. They by a crafty cozenage, perſwade the Parents, that the falling down of the gut into the cod, is uncurable: Which thing, notwithſtanding experience convinceth to be falſe, if ſo be the cure be performed according to the fore-mentioned manner, when the *Peritonæum* is only relaxed, and not broken: for the proceſs thereof by which the gut doth fall as in a ſteep way, in progreſs of time and age is ſtraitned and knit together, whilſt alſo in the mean time the guts grow thicker.

An aſtringent Cataplaſm.

Ser. 1. *c.* 24.

The craft and covetouſneſs of Gelders.

Another way to cure Ruptures.

A certain Chirurgeon who deſerveth credit, hath told me that he hath cured many children, as thus, He beats a Loadſtone into fine powder, and gives it in pap, and then he anoints with honey the groin, by which the gut came out, and then ſtrewed it over with fine filings of Iron. He adminiſtred this kind of remedy for ten or twelve days: The part for other things being bound up with a Ligature and Truſs as was fitting. The efficacy of this remedy ſeemeth to conſiſt in this; that the Loadſtone by a natural deſire of drawing the Iron which is ſtrewed upon the groin, joyns to it the fleſhy and fatty particles interpoſed between them, by a certain violent impetuoſity, which on every ſide preſſing and bending the looſneſs of the *Peritonæum*, yea verily adjoyning themſelves to it, in proceſs of time by a firm adheſion intercept the paſſage and falling down of the gut or kall; which may ſeem no more abhorring from reaſon, than that we behold the Loadſtone it ſelf through the thickneſs of a table, to draw Iron after it any way. The ſame Chirurgeon affirmed, that he frequently and happily uſed the following medicine. He burnt into aſhes in an oven red Snails, ſhut up in an earthen pot, and gave the powder of them to little children, in pap; but to thoſe which were bigger in broth.

The reaſon of this cure.

Another medicine.

But we muſt deſpair of nothing in this diſeaſe, for the cure may happily proceed in men of full growth, as of forty year old, who have filled the three dimenſions of the body, as this following relation teſtifies.

A notable Hiſtory.

There was a certain Prieſt in the Pariſh of St. *Andrews*, called *John Moret*, whoſe office was to ſing an Epiſtle with a loud voice as often as the ſolemnity of the day, and the thing required. Wherefore ſeeing he was troubled with the *Enterocele*, he came to me, requiring help, ſaying, he was troubled with a grievous pain, eſpecially then, when he ſtretched his voice in the Epiſtle. When I had ſeen the bigneſs of the *Enterocele*, I perſwaded him to get another to ſerve in his place; ſo having gotten leave of M. *Curio*, Clerk and Deacon of Divinity, he committed himſelf unto me: I handled him according unto art, and commanded him he ſhould never go without a Truſs; and he followed my directions. When I met him ſome five or ſix years after, I asked him, How he did? he anſwered, Very well, for he was wholly freed from the diſeaſe, with which he was formerly troubled; which I could not perſwade my ſelf of, before that I had found that he had told me the truth, by the diligent obſervation of his genitals. But ſome ſix months after, he dying of a Pleuriſie, I came to *Curio*'s houſe where he died, and deſired leave to open his body, that I might obſerve whether Nature had done any thing at all in the paſſage through which the gut fell down: I call God to witneſs, that I found a certain fatty ſubſtance about the proceſs of the *Peritonæum* about the bigneſs of a little Egg, and it did ſtick ſo hard to that place, that I could ſcarce pull it away without the rending of the neighbouring parts. And this was the ſpeedy cauſe of his

We muſt never deſpair in diſeaſes, if ſo be Nature be aſſociated by Art.

his cure. But it is moſt worthy of obſervation and admiration, that Nature but a little helped by art, healeth diſeaſes which are thought incurable. The chief of the cure conſiſts in this, that we firmly ſtay the gut in its place, after the ſame manner as theſe two Figures ſhew.

The Figure of a man broken on one ſide, wearing a Truſs whoſe Bolſter muſt have three Tuberoſities, two on the upper, and one on the lower part; and there muſt be a hollowneſs between them in the midſt, that they may not too ſtraitly preſs the ſhare-bone, and ſo cauſe pain. The manner of ſuch a Truſs, I found out not long ago, and it ſeemed better and ſafer than the reſt for to hinder the falling down of the gut and kall.

A *Shews the ſhoulder-band which is tied before and behind to the girdle of the Truſs.*
B *The Truſs.*
C *The Cavity left in the midſt of the Tuberoſities.*

Another Figure of a Man having a Rupture on both ſides, ſhewing by what means, with what kind of and what ſhoulder-band he muſt be bound on each groin.

A *ſheweth the ſhoulder-band divided in the midſt for the putting through of the head.*
B *The Truſs, with two Bolſters, between which is a hole for putting through the yard. The form of both Bolſters ought to be the ſame with the former.*

In the mean time we muſt not omit diet. We muſt forbid the uſe of all things, which may either relax, dilate, or break the proceſs of the *Peritonæum*, of which I have already treated ſufficiently. Sometimes, but eſpecially in old men, the guts cannot be reſtored into their place, by reaſon of the quantity of the excrements hardned in them: In this caſe they muſt not be too violently forced, but the Patient muſt be kept in his bed; and, lying with his head low, and his knees higher let the following Cataplaſms be applied.

℞ *Rad. alth. & lil. ana* ℥ ij. *Seminis lini & fænugr. an.* ℥ ß, *fol. malvæ, & viol. pariet. an. m.* ſ. Let them be boiled in fair water, afterwards beaten, and drawn through a ſearſe, adding thereto of new Butter without Salt, and Oyl of Lilies as much as ſhall ſuffice. Make a Cataplaſm in the form of a liquid Pultis. Let it be applied hot to the cod, and bottom of the belly; by the help of this remedy when it had been applied all night, the guts have not ſeldom been ſeen of themſelves, without the hand of a Chirurgeon, to have returned into their proper place. The windineſs being reſolved, which hindered the going back of the excrements into another gut, whereby they might be evacuated and expelled. But if the excrements will not go back thus, the flatulencies, yet reſiſting undiſcuſſed, an emollient and carminative clyſter is to be admitted, with a little Chymical Oyl of Turpentine, Dill, Juniper, or Fennil. Clyſters of Muſcadine, Oyl of Walnuts, and *Aqua vitæ*, and a ſmall quantity of any the aforeſaid Oyls, are good for the ſame purpoſe. A Cataplaſm to ſoften the excrements. Chymical oyl.

It often happens that the guts cannot yet be reſtored, becauſe the proceſs of the *Peritonæum* is not wide enough. For when the excrements are fallen down with the gut into the cod; they grow hard by little and little, and increaſe by the acceſs of flatulences cauſed by reſolution, which cauſe ſuch a tumor as cannot be put up through that hole, by which a little before it fell down: Whereby it happens that by putrefaction of the matter there contained, come inflammations, and a new acceſs of pain; and laſtly, a vomiting and evacuation of the excrements by the mouth, being hindered from the other paſſage of the fundament. They vulgarly call this affect *Miſerere mei.* That you may help this ſymptom, you muſt rather aſſay extreme remedies, than ſuffer the Patient to die by ſo filthy and loathſom a death. And we muſt cure it by Chirurgery, after this manner following. We will bind the Patient lying on his back, upon a table or bench; then preſently make an Inciſion in the upper part of the cod, not touching the ſubſtance of the gut; then we muſt have a ſilver Cane or Pipe, of the thickneſs of a Gooſe-quil, round and gibbous in one part thereof, but ſomewhat hollowed in the other, as is ſhewed by this following Figure.

The Figure of the Pipe or Cane.

The Chirurgical cure by the Golden tie.

We muſt put it into the place of the Inciſion, and put it under the production of the *Peritonæum* being cut together with the cod, all the length of the production, that ſo with a ſharp knife we may divide the proceſs of the *Peritonæum*, according to that cavity ſeparated from the guts there contained, by the benefit of the Cane in a right line not hurting the guts. When you have made an indifferent Inciſion, the guts muſt gently be put up into the belly with your fingers, and then ſo much of the cut *Peritonæum* muſt be ſowed up, as ſhall ſeem ſufficient, that by that paſſage made more ſtrait, nothing may fall into the cod after it is cicatrized.

But if there be ſuch abundance of excrements hardned, either by the ſtay or heat of inflammation, that that Inciſion is not ſufficient to force the excrements into their place, the Inciſion muſt be made longer, your Cane being thruſt up towards the belly: So that it may be ſufficient for the free regreſs of the guts into the belly. Then ſow it up as is fit, and the way will be ſhut up againſt the falling down of the gut or kall; the proceſs of the *Peritonæum* being made more ſtrait, by reaſon of the future; for the reſt, the wound ſhall be cured according to Art. But before you undertake this work, conſider diligently whether the ſtrength of the Patient be ſufficient, neither attempt any thing before you have foretold, and declared the danger to the Patients friends.

CHAP. XVI.

Of the Golden Ligature, or the Punctus Aureus, *as they call it.*

IF the Rupture will not be cured by all theſe means, by reaſon of the great ſolution of the continuity of the relax'd or broken *Peritonæum*, and the Patient by the conſent of his friends there preſent, is ready to undergo the danger in hope of recovery; the cure ſhall be attempted by that which they call the *Punctus aureus*, or Golden tie.

For which purpoſe a Chirurgeon which hath a skilful and ſure hand, is to be imployed, He ſhall make an Inciſion about the ſhare-bone, into which he ſhall thruſt a Probe like to the Cane, a little before deſcribed; and thruſt it long-ways under the proceſs of the *Peritonæum*, and by lifting it up, ſeparate it from the adjoyning fibrous, and nervous bodies, to which it adheres; then preſently draw aſide the ſpermatick veſſels, with the *Cremaſter*, or hanging muſcle of the teſticle; which being done, he ſhall draw aſide the proceſs it ſelf, alone by it ſelf: And he ſhall take as much thereof as is too lax, with ſmall and gentle mullets, perforated in the midſt, and ſhall with a needle, having five or ſix threds, thruſt it through as near as he can to the ſpermatick veſſels, and Cremaſter muſcles. But the needle alſo muſt be drawn again in to midſt of the remnant of the proceſs, taking up with it the lips of the wound; then the thred muſt be tied on a ſtrait knot, and ſo much thereof muſt be left after the Section, as may be ſufficient to hang out of the wound. This thred will of it ſelf be diſſolved by little and little by putrefaction: Neither muſt it be drawn out before that Nature ſhall regenerate and reſtore fleſh into the place of the ligature, otherwiſe all our labour ſhall be ſpent in vain.

And laſtly, Let the wound be cleanſed, filled with fleſh, and cicatrized, whoſe callous hardneſs may withſtand the falling of the gut or kall.

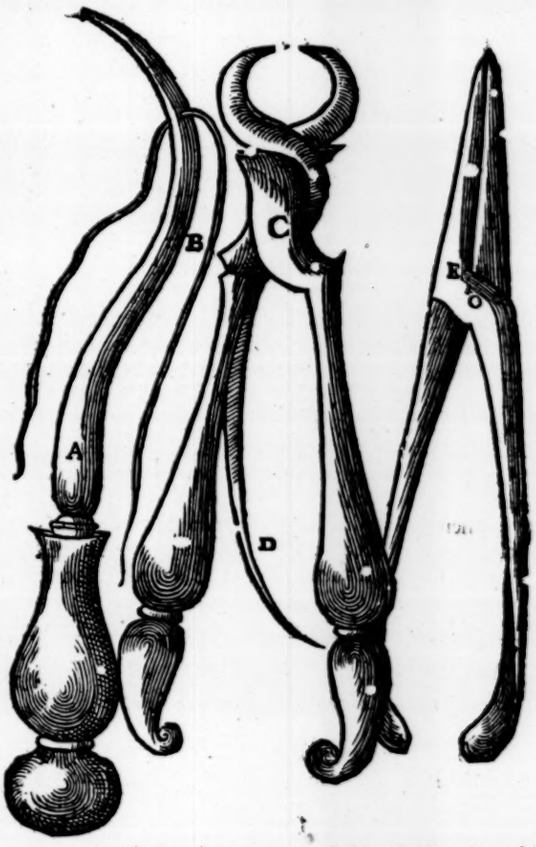
Another manner thereof.

There are ſome Chirurgeons who would perform this Golden Ligature after another manner. They cut the skin above the ſhare-bone where the falling down commonly is, even to the proceſs of the *Peritonæum*, and they wrap once or twice about it, being uncovered, a ſmall Golden Wire, and only ſtraiten the paſſage as much as may ſuffice to amend the looſneſs of this proceſs, leaving the ſpermatick veſſels at liberty; then they twiſt the ends of the wire twice or thrice with ſmall mullets, and cut off the remnant thereof; that which remains after the cutting, they turn in,

left

leſt with the ſharpneſs they ſhould prick the fleſh growing upon it. Then leaving the Golden Wire there, they cure the wound like to other ſimple wounds, and they keep the Patient ſome fifteen or twenty days in his bed, with his knees ſomething higher, and his head ſomething lower.

Many are healed by this means; others have fallen again into the diſeaſe by reaſon of the ill twiſting of the wire.



A *Shews a crooked needle having an eye not far from the point, through which you may put the Golden Wire.*

B B *The Golden Wire put through the eye of of the needle.*

C *The Mullets or Pincers, to cut away the waſte or ſuperfluous ends of the wire.*

D *The ſpring of the Mullets.*

E *The Mullets to twiſt the ends of the wire together.*

There is alſo another manner of this Golden tie, which I judge more quick and ſafe, even for that there is no external body left in that part after the cure. Wherefore they wrap a leaden wire inſtead of the golden, which comes but once about the proceſs of the *Peritonæum*, then twine it as much as need requires; that is, not too looſly, leſt it ſhould leave way for the falling down of the body, neither too ſtraitly, leſt a Gangrene ſhould come by hindering the paſſage of the ſpirits and nouriſhment. The ends thereof are ſuffered to hang out; when in the proceſs of time, this contraction of the *Peritonæum* ſeems callous, then the wire is untwiſted and gently drawn out. And the reſt of the cure performed according to Art. But let not the Chirurgeon thruſt himſelf upon his work raſhly, without the advice of the Phyſician, for it divers times comes to paſs, that the teſticles are not as yet fallen down into the cod by the too great ſluggiſhneſs of Nature, in ſome of a pretty growth; but remains long in the groins, cauſing a tumor with pain, which thing may make a good Chirurgeon believe that it is an *Enterocele*. Therefore whilſt he labours by repelling medicines and truſſes to force back this tumor, he increaſeth the pain, and hinders the falling down of the teſticles into the cod. I obſerved this not long ago in a Boy, which an unskilful Chirurgion had long, and grievouſly troubled, as if he had a rupture: For when I had obſerved that there was but one ſtone in the cod, and knew the Boy was never gelt; I bid them caſt away the Plaiſters and Truſſes, and wiſh'd his Parents that they ſhould ſuffer him to run and leap, that ſo the idling ſtone might be drawn into the cod, which thing by little and little, and without pain, had the event as I foretold.

The third manner thereof.

A thing to be noted.

A Hiſtory.

That the reaſon of this affect may be underſtood, we muſt know that man differs from a woman, only in efficacy of heat; but it is the nature of ſtrong heat to drive forth, as of cold to keep in. Hence it is that the ſtones in men hang forth in the cod, but in women they lie hid in the lower belly. Therefore it happens that in ſome males more cold by Nature, the teſticles are ſhut up ſome certain time, until at length they are forc'd down into the cod by youthful heat. But that we may return to our former Treatiſe of the Cod, although that way of curing Ruptures wants not pain and danger, yet is ſafer than that which is performed by gelding, which by the cruelty thereof expoſes the Patient to manifeſt danger of death. For the Gelders while they fear leſt when the cure is finiſhed, the relaxation may remain, pull with violence the proceſs of the *Peritonæum* from the parts to which it adheres, and together with it a nerve of the ſixth conjugation which runs to the ſtones; they offer the ſame violence to the ſpermatick veſſels; by which things enſue great pain, convulſion, efflux of blood, inflammation, putrefaction, and laſtly death, as I have obſerved in many whom I have diſſected, having died a few days after their gelding. Although ſome eſcape theſe dangers, yet they are deprived of the faculty of generation for all their life after;

for performance whereof, Nature hath beſtowed the teſticles, as parts principally neceſſary for the conſervation of mankind. Through which occaſion *Galen* hath not feared to prefer them before the heart, becauſe the heart is the beginning of life, but the teſticles of a better life; for it is far more noble to live well, than ſimply and abſolutely to live; therefore Eunuchs degenerate into a womaniſh nature; for they remain without beards, their voice is weak, their courage fails them, and they turn cowards; and ſeeing they are unfit for all human actions, their life cannot but be miſerable. Wherefore I will never ſubſcribe to the cutting out of the Stones, unleſs a *Sarcocele* or Gangrene invade them, But that the way of performing the *Punctus aureus* may be better known, I have thought good (in the foregoing page) to ſet down the Inſtruments, by which this operation is performed, before your view.

Lib. de arte medica.

Lib. de ſem.

Another more eaſie and ſafe way to reſtore the Gut and Kall.

Lib 3. *cap.* 33. THeodorick and *Guido* have invented another way of performing this operation. They put back into their places the gut and kall being fallen down, the Patient being ſo placed, that his thighs are high and his head is ſomewhat low; then they draw aſide the lower portion of the production of the *Peritonæum*, and alſo the ſpermatick veſſels, and cremaſter-muſcle to the *Iſchium*; then by applying a cauſtick fitted to the age and diſeaſe, they burn the other part of the proceſs, directly perpendicular to the ſhare-bone, where the gut did fall down. Then they pull off the Eſchar thus made with a knife even to the quick, then they apply another cauſtick in the ſame place, which may go even to the bone, then procure the falling of this Eſchar made on the foreſaid proceſs. And afterwards they heal the Ulcer which remains; which preſently contracting ſomewhat a thick *Callus*, ſo keeps up the guts and kall, that it binds them from falling down into the cod. This way of reſtoring the gut and kall, though it be ſafer and more facile; yet the Chirurgeon muſt not attempt it, if the guts or kall ſtick ſo faſt, agglutinated to the proceſs of the *Peritonæum*, that they cannot be ſevered, nor put back into their places (for from the guts ſo burnt and violated, greater miſchief would enſue) if by the broken and too much dilated proceſs, the bodies thereby reſtrained, make an exceeding great tumor by their falling down; if the teſticle yet lying in the groin as in a *Bubonocele*, a kind of *Enterocele* being not yet deſcended in the *Scotum*, or cod, if the Patients be not come to ſuch age, as they can keep themſelves from ſtirring, or hold their excrements while the operation is performed.

CHAP. XVIII.

Of the cure of other kinds of Ruptures.

EPiplocele is the falling down of the kall into the groin or cod; it hath the ſame cauſes as an *Enterocele*. The ſigns have been explained. It is not ſo dangerous, nor infers a conſequence of ſo many evil ſymptoms, as the *Enterocele* doth, yet the cure is the ſame with the other.

What a *Hydrocele* is. *Hydrocele* is a wateriſh tumor in the cod; which is gathered by little and little between the membranes encompaſſing the teſticles, eſpecially the *Dartes* and *Erythroides*; it may be called a particular Dropſie, for it proceeds from the ſame cauſes, but chiefly from the defect of native heat.

The ſigns. The ſigns are a tumor encreaſing ſlowly without much pain, heavy, and almoſt of a glaſſie clearneſs, which you may perceive by holding a candle on the other ſide; by preſſing the cod above, the water flows down, and by preſſing it below, it riſes upwards, unleſs peradventure in too great a quantity it fills up the whole capacity of the cod, yet it can never be forced or put up into the belly as the kall or guts may, for oft-times it is contained in a ciſt or bag; it is diſtinguiſhed from a *Sarcocele*, by the ſmoothneſs and equality thereof.

The Cure. The cure muſt firſt be tried with reſolving, drying and diſcuſſing medicines, repeated often before, and in the Chapter of the Dropſie; this which follows I have often tried and with good ſucceſs.

A medicine to draw forth the contained matter. ℞ *Ung. comitiſſæ, & deſiccat. rub. an* ℥ ij, *malaxentur ſimul*, and make a medicine for your eaſe. The water by this kind of remedy is digeſted and reſolved, or rather dried up, eſpecially if it be not in too great quantity. But if the ſwelling, by reaſon of the great quantity of water, will not yield to thoſe remedies, there is need of Chirurgery; the cod and membranes wherein the water is contained, muſt be thruſt through with a Seton, that is, with a large three-ſquare pointed Needle, thred with a skean of Silk; you muſt thruſt your Needle preſently through the holes of the Mullets made for that purpoſe, not touching the ſubſtance of the teſticles. The skean of thred muſt be left there, or removed twice or thrice a day, that the humor may drop down, and be evacuated by little and little. But if the pain be more vehement by reaſon of the Seton, and inflammation come upon it, it muſt be taken away, and neglecting the proper cure of the diſeaſe, we muſt reſiſt the ſymptoms.

Some Practitioners uſe not a Seton, but with a Razor, or Inciſion-knife, they open the lower part of the cod, making an Incilion ſome half fingers breadth long, penetrating even to the contained water; always leaving untouched the ſubſtance of the teſticles and veſſels, and they keep the wound open, until all the water ſeems evacuated; truly by this only way the cure of a watery rupture whoſe matter is contained in a ciſt, is ſafe, and to be expected; as we have ſaid in our Treatiſe of Tumors in general.

What a *Pneumatocele* is. The *Pneumatocele*, is a flatulent tumor in the cod, generated by the imbecillity of heat reſiding in the part.

The Cure. It is known by the roundneſs, levity, renitency and ſhining. It is cured by preſcribing a convenient diet, by the application of medicines which reſolve and diſcuſs flatulencies, as the ſeeds of Annis, Fennel, Fenugreek, *Agnus Caſtus*, *Rue*, *Origanum*, and other things ſet down by *Avicen* in his Treatiſe of Ruptures. I have often uſed, with good ſucceſs for this purpoſe, *Emplaſtrum Vigo-*

nis

nis cum Mercurio; and *Emplaſtrum Diacalcitheos*, diſſolved in ſome good Wine, as Muſcadine with Oyl of Bays.

A *Sarcocele* is a Tumor againſt Nature, which is generated about the ſtones by a ſcirrhous fleſh. Groſs and viſcid humors breed ſuch kind of fleſh, which the part could not overcome and aſſimilate to it ſelf; whence this over-abundance of fleſh proceeds like as Warts do. *Varices*, or ſwoln veins often aſſociate this tumor; and it increaſes with pain. It is known by the hardneſs, aſperity, inequality and roughneſs. It cannot be cured but by amputation, or cutting it away; but you muſt diligently obſerve, that the fleſh be not grown too high, and have already ſeized upon the groin; for ſo nothing can be attempted without the danger of life. What a *Sarcocele* is. The Signs. Prognoſticks.

But if any man think, that he in ſuch a caſe may ſomewhat eaſe the Patient by the cutting away of ſome portion of the ſame ſoft fleſh, he is deceived. For a *Fungus* will grow, if the leaſt portion thereof be but left, being an evil far worſe than the former; but if the tumor be either ſmall or indifferent, the Chirurgeon taking the whole tumor, that is, the teſticle tumified through the whole ſubſtance, with the proceſs incompaſſing it, and adhering thereto on every ſide, and make an inciſion in the cod, even to the tumor; then ſeparate all the tumid body, that is, the teſticle from the cod: Then let him thruſt a needle with a ſtrong thred in it, through the midſt of the proceſs, above the region of the ſwoln teſticle; and then preſently let him thruſt it the ſecond time through the ſame part of the proceſs; then ſhall both the ends of the thred be tied on a knot, the other middle portion of the *Peritonæum* being comprehended in the ſame knot. This being done, he muſt cut away the whole proceſs with the teſticle comprehended therein. But the ends of the thred, with which the upper part of the proceſs was bound, muſt be ſuffered to hang ſome length out of the wound, or inciſion of the cod. Then a repercuſſive medicine ſhall be applied to the wound and the neigbouring parts with a convenient ligature. And the cure muſt be performed as we have formerly mentioned. The Cure.

The *Cirſocele* is a tumor of veins dilated, and woven with a various and mutual implication about the teſticle and cod, and ſwelling with a groſs and melancholy blood. The cauſes are the ſame as thoſe of the *Varices*. But the ſigns are manifeſt. What a *Cirſocele* is.

To heal this tumor, you muſt make an Inciſion in the cod, the bredth of two fingers to the *Varix*. Then put under the varicous vein, a needle having a double thred in it, as high as you can, that you may bind the roots thereof: Then let the needle be again put after the ſame manner about the lower part of the ſame vein, leaving the ſpace of two fingers between the ligatures. But before you bind the thred of this loweſt ligature, the *Varix* muſt be opened in the midſt, almoſt after the ſame manner as you open a vein in the arm to let blood: That ſo this groſs blood cauſing a tumor in the cod, may be evacuated as is uſually done in the cure of the *Varices*. The wound that remains ſhall be cured by the rules of Art after the manner of other wounds; leaving the threds in it, which preſently fall away of themſelves. To conclude then, it being grown callous, eſpecially in the upper part thereof, where the vein was bound, it muſt be cicatrized; for ſo afterwards blood cannot be ſtrained or run that way. The Cure.

Hernia Humoralis is a tumor generated by the confuſed mixture of many humors in the cod, or between the tunicles which involve the teſticles, often alſo in the proper ſubſtance of the teſticles. It hath like cauſes, ſigns and cures as other tumors. While the cure is in hand, Reſt, Truſſes, and fit Rowlers to ſuſtain and bear up the teſticles, are to be uſed. *Hernia Humoralis.*

CHAP. XVIII.

Of the falling down of the Fundament.

WHen the muſcle called the *Sphincter* which ingirts the fundament is relaxed, then it comes to paſs that it cannot ſuſtain the right gut. This diſeaſe is very frequent to children by reaſon of the too much humidity of the belly; which falling down upon that muſcle mollifieth and relaxeth it, or preſſeth it down by an unaccuſtomed weight, ſo that the muſcles called *Levatores Ani*, or the lifters up of the fundament, are not ſufficient to bear up any longer. A great Bloody-flux gives occaſion to this effect. A ſtrong endeavour to expel hard excrements, the *Hæmorrhoids*, which ſuppreſſed do over-load the right gut, but flowing relax it: Cold, as in thoſe which go without breeches in Winter, or ſit a long time upon a cold ſtone, a ſtroke or fall upon the holy-bone, a Palſie of nerves which go from the Holy-bone to the muſcles the lifters up of the fundament: the weight of the ſtone being in the bladder. The cauſes.

That this diſeaſe may be healed, we muſt forbid the Patient too much drinking, too often eating of Broth, and from feeding on cold Fruits. For local medicines the part muſt be fomented with an aſtringent decoction made of the rinds of Pomegranats, Galls, Myrtles, Knotgraſs, Shepherds-purſe, Cypreſs Nuts, Alum, and common Salt boiled in Smiths-water, or Red-wine. After the Fomentation, let the gut be anointed with Oyl of Roſes or Myrtles, and then let it be gently put by little and little into its place, charging the child, if he can underſtand your meaning, to hold his breath. When the gut ſhall be reſtored, the part muſt be diligently wiped, leſt the gut fall down again by reaſon of the ſlipperineſs of the unction. Then let the powder preſcribed for the falling down of the Womb be put into the fundament as far as you can: Then you muſt ſtraitly bind the loins with a ſwathe, to the midſt whereof behind let another be faſtned which may be tied at the *Pubes* coming along the *Peritonæum*, ſo to hold up the fundament the better to contain it in its place, a ſpunge dipt in the aſtringent decoction. The Patient, if he be of ſufficient age to have care of himſelf, ſhall be wiſhed when he goes to ſtool, that he ſit upon two pieces of wood being ſet ſome inch aſunder, leſt by his ſtraining he thruſt forth the gut together with the excrement; but if he can do it ſtanding, he ſhall never by ſtraining thruſt forth the gut. The cure.

But if the gut cannot by the preſcribed means be reſtored to its place, *Hippocrates* bids that the *Hippocrates* his cure.

the Patient hanging by the heels be ſhaken; for ſo the gut by that ſhaking will return to his place: But the ſame *Hippocrates* wiſheth to anoint the fundament, becauſe that remedy having a drying faculty, hath alſo power to reſolve the flatulent humors without any acrimony, by reaſon of which the gut was the leſs able to be contained in his place.

CHAP. XIX.

Of the Paronychia.

What the *Paronychia* is.

THe *Paronychia* or *Panaris* is a tumor in the ends of the fingers, with great inflammation, coming of a malign and venemous humor, which from the bones by the *Perioſteum* is communicated to the tendons and nerves of that part which it affecteth, whereof cruel ſymptoms do follow, as pulſifick pain, a Feaver, reſtleſneſs, ſo that the affected through impatiency of the pain are variouſly agitated like thoſe tormented with Carbuncles: For which cauſe *Guido* and *Johannes de Vigo* judge this diſeaſe to be mortal; wherefore you muſt provide a skilful Phyſician for the cure of this diſeaſe, which may appoint convenient diet, purging and blood-letting. In the mean time the Chirurgeon ſhall make way for the virulent and venenate matter, by making inciſion in the inner part of the finger, even to the bone alongſt the firſt joynt thereof; for *Vigo* ſaith, there is not a preſenter remedy, if ſo be that it be quickly done, and before the mutaration of the matter; for it vindicates the finger from the corruption of the bone and nerves, and aſſwages pain, which I have often and happily tried immediately at the beginning, before the perfect impreſſion of the virulency.

Lib. cap. 4. tract.

But the wound being made, you muſt ſuffer it to bleed well, then preſently let him dip his finger in ſtrong and warm Vinegar, in which ſome Treacle being diſſolved may draw forth the virulency. But to appeaſe the pain, the ſame remedies muſt be applied to the affected part as are uſed in Carbuncles, as the leaves of Sorrel, Henbane, Hemlock, Mandrake roaſted under the Embers, and beaten in a Mortar with new *Unguentum Populeon*, or Oyl of Roſes, or new Butter without Salt: For ſuch like medicines alſo help forward ſuppuration; whilſt by their coldneſs, they repreſs the extraneous heat affecting the part; and ſo ſtrengthen the native heat, being the author of ſuppuration: Which reaſon moved the ancient Phyſicians to uſe ſuch medicines in a Carbuncle; but if by reaſon of the fearfulneſs of the Patient, or unskilfulneſs of the Chirurgeon, no inciſion be made, a Gangrene and Sphacel ſhall poſſeſs the part, it remains that you cut off with your cutting Mullets as much of the part as ſhall be corrupt, and perform the reſt of the cure according to Art. Yet it doth not ſeldom happen, that there may be no need to cut off ſuch a finger, becauſe it being corrupted together with the bone by little and little, diſſolves into a purulent, or rather ſanious or much ſtinking filth. But in this affect there is often cauſed an Eſchar by the aduſtion of putredinous heat, and ſuperfluous fleſh indued with moſt exquiſite ſenſe groweth underneath it, which muſt in like manner be cut off with the Mullets, that the part may receive comfort, the pain being aſſwaged by the copious effuſion of blood.

CHAP. XX.

Of the ſwelling of the Knees.

Gal. com. ad ſent. 1. ſer. 4. lib. 6. Epid. Gal. com. ad ſent. 67. ſect. 2. prog.

AFter long and dangerous diſeaſes there oftentimes ariſe tumors in the knees, and alſo in Plethorick bodies, and ſuch as have evil juyce after labours and exerciſe. This kind of diſeaſe is frequent, becauſe the humor eaſily falls into the part which hath been heated by labour. But if ſuch tumor follow long diſeaſes, they are dangerous and difficult to cure, and therefore not to be neglected; for bitter pain accompanieth them, becauſe the humor falling thither, diſtends the membranes, which being many, involve the part; beſides that, this humor participateth of a certain virulent and malign quality, whether it be cold or hot, when it hath ſettled into thoſe parts, being ſuch as we find in the pains of the joynts, and in the bitings of venemous Creatures.

The Cure.

For the cure, if the tumor be cauſed by blood, let a ſlender and refrigerating diet be appointed, and Phlebotomy for the revulſion of the antecedent cauſe; divers local medicines ſhall be uſed, according to the variety of the four times. But for to aſſwage the pain, *Anodynes*, or mitigating medicines ſhall be appointed: Of all which we have ſufficiently treated in the Chapter of the cure of a Phlegmon.

And becauſe theſe parts are of exact ſenſe, if there be neceſſity to open the tumor, yet muſt we not do it raſhly, or unconſiderately, for fear of pain and evil accidents.

This kind of tumor is oft-times raiſed by wind contained there; in which caſe the Chirurgeon muſt be very provident, that he be not deceived with the ſhew of flowing of the humor, which he ſeems to perceive by the preſſures of his fingers, as if there were matter and humor contained therein, and ſo be brought to open the tumor. For the wind breaking forth inſtead of the humor, cauſeth evil ſymptoms by reaſon of the Section raſhly made in a part ſo ſenſible.

But if wateriſh humors ſhall tumefie the part, the body ſhall firſt be purged with medicines purging flegm: And then inciding, attenuating, rarifying, diſcuſſing, and very drying local medicines ſhall be uſed.

Of which we have abundantly ſpoken in the Chapter of the *Oedema*. Yet this humor divers times lies deep between the whirl-bone and the joynt, which cauſeth it that it cannot be diſcuſſed and reſolved by reaſon of the weakneſs of the part, and defect of heat, ſo that the adventitious humor often moves and excludes the bones from their ſeat. As I have obſerved it to have happened to many.

In

In which caſe, Irrigations of red Wine, falling ſomething high whereby the force of the Medicine may enter and more eaſily penetrate, are much commended.

CHAP. XXI.
Of the Dracunculus.

It is not as yet ſufficiently known what *Dracunculi* are.

I Cannot chuſe but explain in this place thoſe things which may be ſpoken of that kind of tumor againſt Nature, which by the Ancients is called *Dracunculus*. The matter and reaſon of theſe hath been variouſly handled by divers Authors, ſo that hitherto we have nothing written of them, to which we may by right and with good reaſon adhere as a firm foundation of their eſſence.

For firſt, for *Galen*'s opinion, *Lib. 6. de Loc. affect. cap.* 3. The generation, ſaith he, of thoſe hairs which are evacuated by the urin is worthy no leſs admiration than the *Dracunculi*, which, as they ſay, in a certain place of *Arabia* breed in the legs of men, being of a nervous nature, and like Worms in colour and thickneſs.

Lib. 4. cap. ult.

Therefore ſeeing I have heard many who have ſaid they have ſeen them, but I my ſelf never ſaw them, I cannot conjecture any thing exactly neither of their original nor eſſence.

Paulus Ægineta writes, that the *Dracunculi* are bred in *India*, and the higher parts of *Egypt*, like Worms in the muſculous parts of mans body, that is, the arms, thighs and legs, and alſo creep by the intercoſtal muſcles in children with a manifeſt motion.

The cure out of *Ægineta*.

But whether they be creatures indeed, or only have the ſhape of creatures, they muſt be cured with a hot fomentation, by which the *Dracunculus* raiſed to a juſt tumor, may put forth it ſelf, and be pluck'd away piece-meal with the fingers: Alſo ſuppurating Cataplaſms may be applied, compoſed of Water, Honey, Wheat and Barley-meal.

Avicen being various, having no certainty whereon to reſt, inclineth one while to this, and another while to that opinion: For now he ſpeaketh of the *Dracunculi*, as of creatures, then preſently of a matter and humor ſhut up in a certain place; for the reſt, he rightly delivers the cure and eſſence of this diſeaſe, as we ſhall afterwards ſhew.

Cap. 21. lib. 4. ſent. 3. tract. 3.

Aetius ſaith, the *Dracunculi* are like Worms, and that they are found ſometimes great, ſometimes ſmall, and that their generation is not unlike to that of flat Worms, which are bred in the guts, for they move under the skin, without any trouble, but in proceſs of time, the place becomes ſuppurate about the end of the *Dracunculus*. The skin openeth, and the head thereof is thruſt forth.

Lib. 14. cap. ult.

But if the *Dracunculus* be pulled, it cauſeth great grief; eſpecially, if it be broken by too violent pulling. For that which is left cauſeth moſt vehement pain. Wherefore that the creature may not run back, the arm muſt be bound with a ſtrong thred, and this muſt be done every day, that the *Dracunculus* going forward by little and little, may be intercepted by this binding, but not broken off.

The cure out of *Aetius*.

The place muſt be bathed with *Aqua mulſa*, and oyl in which Wormwood or Southernwood hath been boyled, or ſome other of thoſe medicines which are preſcribed for the Worms of the belly.

But if the *Dracunculus* going forward of its one accord, may be eaſily drawn forth, we muſt do nothing elſe: But if it be turned to ſuppuration, we muſt not leave off the Cataplaſms, the *Aqua mulſa*, and anointing with oyl: It was uſual with him after the taking away of the Cataplaſms, to apply *Emplaſtrum è Baccis Lauri*: But when it is come to ſuppuration, the skin muſt be opened long-ways, and the *Dracunculus* ſo laid open muſt be taken away, but the skin muſt be filled with lint, and the reſt of the ſuppurative cure uſed, ſo that the creature being ſuppurated and drawn forth, the wound may be incarnated and cicatrized.

Tractat. 7. c. 34.

The cure out of *Rhaſis*.

Rhaſis writeth, that when the part is lifted up into a bliſter, and the vein haſteneth its egreſs, it is good for the Patient to drink the firſt day half a dram of *Aloes*, the next day a whole dram, the third day two drams; and in like manner the place affected muſt be fomented with *Aloes*, for ſo that which lies hid will break forth: That which ſhall come forth muſt be rolled in a pipe of Lead, which may equal the weight of a dram, ſo that it may hang down, for the vein drawn by the weight will come more forth; and when that which ſhall come forth is grown much and long, it muſt be cut off, but not by the root, but ſo that a portion thereof may remain and hang forth, to which the leaden Pipe may be faſtened, for otherwiſe it would withdraw its ſelf into its skin and its lurking hole, and ſo cauſe a putrid and malignant Ulcer.

Therefore we muſt gently meet with this diſeaſe, and the vein muſt be drawn by little and little out of the Body, until it be all come forth, that no worſe thing happen: But if by chance it ſhall happen that as much of the vein as ſhall be come forth ſhall be cut off by the roots, then the Ulcer muſt be opened long-ways with an Inciſion-knife, and that ſo that whatſoever remains thereof may be wholly taken away. Then for ſome days the part muſt be anointed with butter until whatſoever of ſuch a ſubſtance adheres, being conſumed with putrefaction ſhall flow away. Then the Ulcer muſt be cured with ſarcotick things.

His opinion of them.

Therefore *Rhaſis* thus in the ſame Text expreſſeth the ſame thing by divers names, and armed with Iron and Lead, he comes to the cure thereof, as if he meant to encounter with ſome fierce Beaſt.

Soranus his opinion.

Soranus the Phyſician, who lived in the times of *Galen*, was of a quite contrary opinion, as *Paulus Ægineta* in the place being before cited, relates of him; as who denies the *Dracunculus* to be a living-creature, but only a condenſation of a certain ſmall nerve, which ſeems both to the Phyſician and Patients to have ſome motion under the skin.

Wherefore *Soranus* ſeems to have come nearer the truth than the reſt, but yet not ſo, as throughly to underſtand, and know the Eſſence of this Diſeaſe, as we ſhall demonſtrate hereafter.

Manardus

Epiſt. 2. lib. 7. *Manardus* writes, that the *Dracunculi* are generated of evil and unlaudable blood, groſs, hot, and melancholick; or of aduſt phlegm very much dried.

Gorræus a moſt learned Phyſician of our time, *Lib. de Definitionib. medic.* denies any of our Phyſicians to be able to ſay any thing of the *Dracunculi*, becauſe it is a diſeaſe ſo unfrequent in theſe our Regions, that it is ſcarce ever met withal in practice.

The Author of the Introduction, and Medicinal Definitions, defines the *Dracunculus* to be a diſeaſe very like the *Varices*; then cauſing great pain, when increaſing by little and little, it begins to be moved: Therefore to be cured after the ſame manner, and by the ſame method of Section and Inciſion, as the *Varices* are. Which thing ſeems chiefly to have moved *Guido* to refer this kind of diſeaſe to the *Varices* in his Tractate of Impoſthumes, becauſe it hath the ſame cauſe, and is healed with the ſame remedy as the *Varices*.

But ſeeing that divers names have been impoſed upon this diſeaſe by ſeveral Writers, yet they have all expreſſed it by the name of a Vein, for it is called by *Avicen* and *Guido*, *Vena Medeñ*, becauſe it is a diſeaſe frequent in the City *Medina*: by *Albucraſis*, *Vena Civilis*. *Haliabas* hath called it *Vena Famoſa*; others have called it *Vena Cruris*, or the Leg-vein. Truly, the contrariety of ſo many opinions repugnant not only amongſt themſelves, but alſo with themſelves, eaſily argueth how little certainty they had of the eſſence of this diſeaſe, who have written of it unto us: To which alſo this may be added, that none of the later Phyſicians have written any thing thereof. For although *Jacobus Dalechampius*, a man moſt converſant in every part of Phyſick, hath written much of this matter in his Book of the *French* Surgery which he ſet forth ſome years ago: Yet he hath left us no ampler teſtimony of his induſtry, than that he was very diligent in collecting the writings of the Ancients concerning this thing, interpoſing no judgment of his own, the better to aſſure us of a thing ſo controverted.

But my modeſty cannot ſo contain me, but that I ſhall chuſe rather to undergo the cenſure of being thought too daring, than (as much as in me lieth) to ſuffer this queſtion of the *Dracunculi*, to remain longer ambiguous and undecided. Therefore for the preſent, I will thus order it, that refuting the opinions of the Ancients, I may ſtrengthen by certain reaſons, my opinion of the eſſence and cure of this diſeaſe.

Aetius opinion confuted. *Tract. 3. ſerm. 1. cap. 40.* For firſt, that *Dracunculi* are no living things, nor like unto Worms, nor of like generation as the flat Worms of the belly, which was the opinion of *Aetius*, is eaſie to diſprove both by his Writings, as alſo by Reaſon it ſelf. For he writes, that the broad Worm which he calls *Tænia*, is, as it were, a certain *Metamorphoſis*, or Tranſmutation, of the inner tunicle of the ſmall guts into a quick living and moveable body.

But no man ever ſaid, neither will he confeſs that the *Dracunculi* hath the material cauſes of their beginning from the tunicle of the vein, in which they are cloſed, or from the fibers of a nervous body, to which often they are adjoyned; but much leſs from the skin under which they lie, may they draw the material cauſes of their original.

Moreover, neither can there be any generation of Worms, nor of any other living Creatures whatſoever, who have their original from putrefaction, unleſs by the corruption of ſome matter, of whoſe better and more benign part, Nature by the force of the vital heat, produceth ſome animate body, as *Ariſtotle* teacheth. Wherefore to produce this effect, it is fit the matter ſhould have ſuch a diſpoſition to putrefaction as is required for the generation of ſuch a creature as they would make the *Dracunculus* to be: It is fit the helping cauſes ſhould concur as aſſiſtant to the principals in the action. And it is meet the place ſhould be opportune or fit. *4 Meteorolog.*

Natural Melancholick humors is moſt unapt to putrefie. Stink, an unſeparable companion to putrefaction.

But there may be many cauſes found which may give life to the *Dracunculi*; for by the common conſent of all thoſe who have written of them, their generation proceeds from an humor melancholick, terreſtrial and groſs, which by its qualities both by the firſt coldneſs and drineſs, as alſo by the ſecond, that is Acidity, is not only thought moſt unfit of all others for putrefaction, but alſo is is judged to reſiſt putrefaction, as that which is cauſed by heat and ſuperfluous humidity. Beſides, if the material cauſe of this diſeaſe ſhould be from a humor putrefying and turning by putrefaction into ſome living creature, it was fit there ſhould be ſtench alſo, as being an unſeparable accident of putrefaction; for thus, the excrements in the guts of which the Worms are generated, do ſmell or ſtink.

Therefore that which exhales from their bodies who are troubled with the *Dracunculi*, ſhould be ſtinking, as it happens to thoſe ſick of the *Pthiriaſis* or *Lowſie-evil*. But none of thoſe who have delivered the accidents or ſymptoms of the *Dracunculi* are found to have made mention hereof; but of the efficient cauſe whereby ſo great heat may be raiſed in the places next under the skin, by the efficacy whereof ſuch a creature may be formed of a matter melancholick and moſt unapt to putrefie, as they make the *Dracunculus* to be, who feign our bodies to be fruitful Monſters; eſpecially ſeeing the ſurface of the body is continually ventilated by the ſmall arteries ſpread under the skin, as alſo by the benefit of inſenſible Tranſpiration, and breathed with the coolneſs of the air incompaſſing us. But now the material and efficient cauſes being defective, or certainly very weak, for the generation of ſo laborious an effect; what coadjutory cauſe can yield aſſiſtance? Can the humidity of meats; for thoſe bodies which are fed with warm and moiſt meats, as Milk, Cheeſe, Summer-fruits, uſually breed Worms, as we are taught by experience in children.

What things uſually breed worms.

But on the contrary *Avicen* in the place before cited writeth, that meats of a hot and dry temper chiefly breed this kind of diſeaſe, and that it is not ſo frequent to moiſt bodies, and ſuch as are accuſtomed to the Bath, moiſt meats and Wine moderately taken. But whether may the condition of the air of thoſe Regions in which it is, as it were, an Endemial diſeaſe, confer any thing to the generation of ſuch creatures? Certainly, for this purpoſe in a cloudy, warm and thick air, ſuch as uſeth to be at the beginning of the Spring when all the places reſound with Frogs, Toads, and the like creatures bred of putrefaction.

But on the contrary, *Jacobus Dalechampius* by the opinion of all the Phyſicians that have written of the *Dracunculi*, writes, that this diſeaſe breeds in the dry and Sun-burnt Regions of *India* and *Arabia*; but if at the leaſt that part of our body which is next under the skin ſhould have any opportunity to ingender and nouriſh ſuch creatures, they may be judged to have written that the *Dracunculus* is a living creature, with ſome probability. But if there be no opportunity for generation in that place, nor capacity for the nourithment of ſuch like creatures as in the guts, if that Region of the body be breathed upon with no warmneſs and ſmothering heat, if it be defiled with none of thoſe groſs excrements, as the guts uſually are, but only by the ſubtiller exhalation, which have an eaſie and inſenſible tranſpiration by the pores of the skin, which may ſeem to be a juſt cauſe of ſo monſtrous and prodigious an effect: But we ſhall little profit with theſe engines of reaſon unleſs we caſt down at once all the Bulwarks, with which this old opinion of the *Dracunculi* may ſtand and be defended. *Cap. 83. Chir. Gallic.*

For firſt they ſay, Why have the ancients expreſſed this kind of diſeaſe by the name of a living thing, that is, of a *Dracunculus* or little Serpent? I anſwer, becauſe in Phyſick, names are often impoſed upon diſeaſes rather by ſimilitude than from the truth of the thing; for the confirmation whereof, the examples of three diſeaſes may ſuffice, that of the *Cancer*, *Polypus*, and *Elephas*. For theſe have thoſe names, not becauſe any Crab, Polypus, or living Elephant may breed in the body by ſuch like Diſeaſes, but becauſe this by its propagation into the adjacent parts repreſents the feet and claws of a Crab; the other repreſents the fleſh of the Sea-Polypus in its ſubſtance; and the third, becauſe ſuch as have the Leproſie, have their skin wrinkled, rough, and horrid with ſcales and knots, as the skin of a living Elephant. So truly, this diſeaſe of which we now enquire ſeems by good right to have deſerved the name *Dracunculus*, becauſe in its whole conformation, colour, quality and production into length and thickneſs it expreſſeth the image of a Serpent. But, whence, will they ſay, (if it be without life) is that manifeſt motion in the matter? We reply, that the humor, the cauſe of this diſeaſe is ſubtil and hot, and ſo runs with violence into the part whence it may ſeem to move. But when the *Dracunculi* are ſeparated, why do they put their heads, as it were, out of their holes? We anſwer, In this the Ancients have been very much deceived; becauſe after the Suppuration, the Ulcer being opened, ſome nervous body being laid bare, thruſt forth and ſubjected it ſelf to the ſight, which by the convulſive and ſhaking motion, might expreſs the crooked creeping of a Serpent. But they will ſay, pain happens not unleſs to things indued with ſenſe and life, but this *Dracunculus* when he is drawn too violently, eſpecially if he be broken, thereby will cauſe extreme pain: We do anſwer, that the concluſion doth not follow, and is of no conſequence; for theſe pains happen not, unleſs when the unprovident Surgion draws or pulls inſtead of the *Dracunculus* ſome nervous or membranous body ſwoln and repleat with aduſt humor, whence there cannot but be great pain, that part being pull'd which is the author of ſenſe. But it is childiſh, to ſay that the *Dracunculus* feels, for that it cauſeth ſharp pains to the living body in which it is. Therefore that at laſt we may determine ſomething of the nature, eſſence, and generation of theſe *Dracunculi*, I dare boldly affirm, it is nothing elſe but a tumor and abſceſs bred from the heat of the blood in a venenate kind. Such blood driven by the expulſive faculty through the veins to the external parts, eſpecially the limits, that is, the arms and legs, cauſeth a tumor round and long often ſtretched from the joynt of the ſhoulder even to the wriſt, or from the groin even to one of the ankles with tenſion, heat, renitency, pricking pain, and a feaver. But this tumor is ſome while ſtretch-forth ſtrait, otherwhiles into oblique and crooked tumors, which hath been the cauſe that many, taken with this kind of diſeaſe, and having their limbs ſo infolded as with the twinings of a Serpent, would ſay, they had a Serpent. I have thus much to ſay of the *Dracunculi*, eſpecially of thoſe of our own Country.

Why they are called *Dracunculi*.

For the cure, it is not unlike to the cure of a Phlegmon ariſing from a Defluxion; for here alſo in like manner the remedies muſt be varied according to the four times of the diſeaſe, and the ſame rule of diet, Phlebotomy and purging muſt be obſerved, which is before preſcribed in the cure of a Phlegmon.

The Cure.

The mention of the *Dracunculi* calls to my memory another kind of Abſceſs, altogether as rare. This our *French* men name *Cridones*, I think *a Crinibus*, i. from hairs: It chiefly troubles children, and pricks their back like thorns. They toſs up and down being not able to take any reſt. This diſeaſe ariſeth from ſmall hairs which are ſcarce of a pins length, but thoſe thick and ſtrong. It is cured with a fomentation of water more than warm, after which you muſt preſently apply an oyntment made of hony and wheaten flower; for ſo theſe hairs lying under the skin are allured and drawn forth; and being thus drawn, they muſt be plucked out with ſmall mullets. I imagine this kind of diſeaſe was not known to the ancient Phyſicians.

So the *Malum pilare* in *Ariſtotle, cap.* 11. *lib.* 7. *hiſt. animal.*

The end of the Eighth Book.

THE

BOOK IX.

Of Wounds in general.

CHAP. I.

What a Wound is, what the kinds and differences thereof are, and from whence they may be drawn or derived.

What a wound properly is.

A Wound is a ſolution of Continuity, cauſed by a ſtroke, fall, or bite, newly done, bloody, and with putrefaction and filth. They alſo call it a new ſimple Ulcer; for the ſolution of Continuity happens to all parts of the body; but according to the diverſity of parts, it hath divers names amongſt the Greeks. For in the fleſh it is called *Helcos*, in the bone *Gatagma*, in the nerve *Spaſma*, in the ligament *Thalaſma*, in the veſſels *Apoſpaſma*, in the muſcles *Regma*; and that ſolution of Continuity, which happens in the veſſels, their mouths being open, is termed *Anaſtomoſis*; that which happens by eroſion, *Aneuroſis*; that which is generated by ſweating out and tranſcolation, *Diapedeſis*. That theſe may be the more eaſily underſtood, I have thought good to deſcribe them in the following Table.

Divers appellations of wounds according to the varieties of the parts.

A Table of the differences of Wounds.

- The Differences of Wounds are drawn or taken,
  - From the nature of the parts in which they are made or happen. But theſe parts are
    - Either ſimilar, and theſe
      - Either ſoft, as the { Glandules, Fleſh, Fat, Marrow.
      - Or hard, as { A Bone, A Griſtle.
      - Of a middle conſiſtence, as the { Membranes, Ligaments, Fibers, Veſſels, Nerves, Veins, Arteries.
    - Or Organical, and theſe either
      - Principal, as the { Brain, Heart, Liver, to which ſome add the Womb and Teſticles.
      - Or ſerving the principal as, { The Weaſon, Lungs, Gullet, Stomach, Guts, Bladder.
      - Or neither, as { The Ears, Noſe, Feet, Hands, and other of the ſame kind.
  - From their proper eſſence, from whence they are called,
    - Simple wounds { When there is no complication of any other diſeaſe or ſymptom, beſides.
    - Or compound, { When there is a complication of ſome one or more diſeaſes, which unleſs they be taken away, we muſt not hope for to cure the wound.
  - From their quantity according to which they are called, { Great, Indifferent, Little, Long, Broad, Deep, Short, Narrow, Superficiary.
  - From their Figure, according to which they are named, { Strait, Oblique, Cornered.

CHAP. II.

Of the cauſes of Wounds.

Divers denominations from their cauſes.

ALL things which may outwardly aſſail the body with force and violence, may be counted the cauſes of wounds; which are called green, and properly bloody. Theſe things are either animate, or inanimate, as the bitings and prickings of Beaſts. The inanimate, as the ſtroke of an Arrow, Sword, Club, Gun, Stone, a Dagger, and all ſuch like things.

From the variety of ſuch like cauſes, they have divers names: For thoſe which are made by ſharp and pricking things are called Punctures: Thoſe cauſed by cutting things, are called Wounds or Gaſhes; and thoſe which are made by heavy and obtuſe things are named Contuſions, or wounds with contuſions.

CHAP.

CHAP. III.

Of the Signs of Wounds.

WOunds are firſt known by ſight, and by the ſigns drawn from thence. The Chirurgeon ought firſt and chiefly, to conſider, what wounds are curable, and what not; what wounds will ſcarce admit of cure, and what may be eaſily cured; for it is not the part of a prudent Chirurgeon, to promiſe cure in a deadly or dangerous and difficult wound; leſt he may ſeem to have killed him, whom not the unſufficiency of the Art, but the greatneſs of the wound hath ſlain. A caution for making reports of Wounds.

But when the Wound is dangerous, but yet without deſpair of recovery, it belongs to him to admoniſh the Patients friends which are by, of the preſent danger, and doubtful ſtate of the Wound, that if Art ſhall be overcome by the greatneſs thereof, he ſhall not be thought ignorant of the Art, neither to have deceived them.

But as this is the part and duty of a good and prudent Chirurgeon, ſo it is the trick of a cheating and jugling Knave, to enlarge ſmall wounds, that ſo he may ſeem to have done a great cure, when it is nothing ſo. A jugling cheating Chirurgeon.

But it is agreeable to reaſon, that the Chirurgeon profeſſing the Diſeaſe eaſie to be cured, will think himſelf in credit bound by ſuch promiſes and his duty, and therefore ſeek all means for the quick recovery of the Patient; leſt that which was of its own nature ſmall, may by his negligence become great. Therefore it is expedient he ſhould know what Wounds are to be accounted great.

This (as *Galen* ſaith) is three ways to be known; The firſt is by the magnitude and principality of the part affected; for thus the wounds of the Brain, Heart, and of the greater Veſſels, though ſmall of themſelves, yet are thought great. Then from the greatneſs of the ſolution of continuity; for which cauſe Wounds may be judged great, in which much of the ſubſtance of the part is loſt in every dimenſion, though the part be one of thoſe which are accounted ſervile. Then from the malignity; through which occaſion the Wounds of the joints are accounted great, becauſe for the moſt part they are ill conditioned. *Lib.4. Meth. cap.6.1.* Wounds are called Great, out of three reſpects.

CHAP. IV.

Of Prognoſticks to be made in Wounds.

THoſe Wounds are thought dangerous, wherein any large Nerve, Vein, or Artery are hurt. From the firſt there is fear of Convulſion, but from the other large effuſion of the veinous, or arterious bloud, whence the powers are debilitated; alſo theſe are judged evil, which are upon the Arm-pits, Groins, Legs, Joints, and between the Fingers; and likewiſe thoſe which hurt the head or tail of a Muſcle. What wounds are dangerous.

They are leaſt dangerous of all other which wound onely the fleſhy ſubſtance. What leaſt dangerous.

But they are deadly which are inflicted upon the Bladder, Brain, Heart, Liver, Lungs, Stomach, and ſmall Guts. What deadly. *Hipp. aphor.19. Lib.6.*

But if any Bone, Griſle, Nerve, or portion of the Cheek, or Prepuce, ſhall be cut away, they cannot be reſtored.

Contuſed wounds are more difficult to cure than thoſe which are from a ſimple ſolution of continuity; for before you muſt think to heal them up, you muſt ſuppurate and cleanſe them, which cannot be done in a ſhort time. Why round Wounds are difficult to heal.

Wounds which are round and circular are ſo much the worſe, for there can be no unity unleſs by an angle, that is, a meeting together of two lines, which can have no place in round Wounds, becauſe a circular figure conſiſts of one oblique line. Beſides, Wounds are by ſo much thought the greater, by how much their extreams and lips are the further disjoined, which happens to round Wounds. Contrary to theſe are cornered Wounds, or ſuch as are made alongſt the fibers, as ſuch as may be healed.

Wounds may be more eaſily healed in young men than in old, becauſe in them Nature is more vigorous, and there is a greater plenty of fruitful, or good bloud, by which the loſs of the fleſh may be the better and more readily reſtored, which is ſlowlier done in old bodies, by reaſon their bloud is ſmaller in quantity and more dry, and the ſtrength of nature more languid.

Wounds received in the Spring, are not altogether ſo difficult to heal as thoſe taken in Winter or Summer. For all exceſs of heat and cold is hurtful to them, it is ill for a Convulſion to happen upon a Wound, for it is a ſign that ſome Nervous body is hurt; the Brain ſuffering together therewith, as that which is the Original of the Nerves. A tumor coming upon great Wounds is good; for it ſhews the force of nature is able to expel that which is harmful, and to eaſe the wounded part. *Hipp. lib. de ulcer. Hipp. aph. 66. lib. 5.*

The organical parts wholly cut off, cannot again be united: becauſe a vital part once ſevered and plucked from the trunk of the body, cannot any more receive influence from the heart as from a root without which there can be no life. The looſed continuity of the Nerves, Veins, Arteries, and alſo the Bones, is ſometimes reſtored, not truly, and, as they ſay, according to the firſt intention, but by the ſecond, that is, by repoſition of the like, but not of the ſame ſubſtance. The firſt intention takes place in the fleſhy parts by converting the Alimentary bloud into the proper ſubſtance of the wounded part. But the ſecond, in the ſpermatick in which the loſt ſubſtance may be repaired by interpoſition of ſome heterogeneous body, which Nature, diligent for its own preſervation, ſubſtitutes in place of that which is loſt: for thus the body, which reſtores and agglutinates, is no Bone but a *Callus*, whoſe original matter is from an humour ſomewhat groſſer than that, from whence the Bones have their original and beginning. What a *Callus* is, and whence it proceeds.

This humour, when it ſhall come to the place of the fracture, agglutinateth the ends of the Bones together, which otherwiſe could never be ſo knit by reaſon of their hardneſs. The Bones of Children are more eaſily and ſpeedily united by reaſon of the pliantneſs of their ſoft and tender ſubſtance. Small and contemptible wounds often prove mortal. Laſtly, We muſt here admoniſh the Chirurgeon that ſmall Wounds, and ſuch as no Artiſan will judge deadly, do divers times kill by reaſon of a certain occult and ill diſpoſition of the

Aphor. 1. *Sect.* 1. wounded, and encompaſſing bodies; for which cauſe we read it obſerved by *Hippocrates*, that it is not ſufficient for the Phyſician to perform his duty, but alſo external things muſt be rightly prepared and fitted.

CHAP. V.

Of the Cure of Wounds in general.

The general Indication of Wounds.

THe Chirurgeon ought for the right cure of Wounds to propoſe unto himſelf the common and general indication: that is, the uniting of the divided parts, which indication in ſuch a caſe is thought upon and known even by the vulgar: for that which is disjoined deſires to be united, becauſe Union is contrary to Diviſion. But by what means ſuch Union may be procured, is onely known to the skilful Artiſan. Therefore we attain unto this chief and principal Indication by the benefit of Nature as it were the chief Agent, and the work of the Chirurgeon as the ſervant of Nature. And unleſs Nature ſhall be ſtrong, the Chirurgeon ſhall never attain to his conceived and wiſhed for end: therefore that he may attain hereto, he muſt perform five things; the firſt is, that if there be any ſtrange body, as pieces of Wood, Iron, Bones, bruiſed Fleſh, congealed Bloud, or the like, whether they have come from without, or from within the Body, and ſhall be by accident faſtned or ſtuck in the Wound, he muſt take them away, for otherwiſe there is no Union to be expected.

Five things neceſſary for uniting Wounds.

Another is, that he join together the lips of the Wound, for they cannot otherwiſe be agglutinated and united. The third is, that he keep cloſe together the joined lips. The fourth, that he preſerve the temper of the wounded part; for the diſtemper remaining, it is impoſſible to reſtore it to its unity. The fifth is, that he correct the accidents, if any ſhall happen, becauſe theſe urging, the Phyſician is often forced to change the order of the Cure.

All ſtrange and external Bodies muſt be taken away, as ſpeedily as is poſſible, becauſe they hinder the action of Nature intending Unity, eſpecially if they preſs or prick any Nervous Body or Tendon, whence pain or an abſceſs may breed in any principal part, or other ſerving the principal.

Yet if by the quick and too haſty taking forth of ſuch like Bodies there be fear of cruel pain or great effuſion of bloud, it will be far better to commit the whole work to Nature than to exaſperate the Wound by too violent haſtening.

For Nature by little and little will exclude, as contrary to it, or elſe together with the *Pus*, what ſtrange Body ſoever ſhall be contained in the wounded part. But if there ſhall be danger in delay, it will be fit the Chirurgeon fall to work quickly, ſafely, and as mildly as the thing will ſuffer: for effuſion of bloud, Swooning, Convulſion, and other horrid ſymptoms, follow upon the too rough and boiſtrous handling of Wounds, whereby the Patient ſhall be brought into greater danger than by the Wound it ſelf.

Therefore he may pull out the ſtrange Bodies, either with his fingers or with inſtruments fit for that purpoſe: but they are ſometimes more eaſily and ſometimes more hardly pulled forth, according as the Body infixed is either hard or eaſie to be found or pulled out Which thing happens according to the variety of the figure of ſuch like Bodies, according to the condition of the part it ſelf, ſoft, hard, or deep, in which theſe bodies are faſtned more ſtraitly or more looſly; and then for fear of inferring any worſe harm, as the breaking of ſome Veſſel: but how we may perform this firſt intention, and alſo the expreſſion of the inſtruments neceſſary for this purpoſe, ſhall be ſhewn in the particular Treatiſe of Wounds made by Gun-ſhot, Arrows, and the like.

Ligatures and Sutures for to conjoin and hold together the lips of Wounds.

But the Chirurgeon ſhall attain to the ſecond and third ſcope of curing Wounds by two and the ſame means, that is, by Ligatures and Sutures: which notwithſtanding before he uſe he muſt well obſerve whether there be any great flux of Bloud preſent, for he ſhall ſtop it if it be too violent, but provoke it if too ſlow, (unleſs by chance it ſhall be poured out into any capacity or belly) that ſo the part freed from the ſuperfluous quantity of Bloud may be leſs ſubject to inflammation. Therefore the lips of the Wound ſhall be put together, and ſhall be kept ſo joined by Suture and Ligatures: Not truly of all, but onely of thoſe which both by their nature and magnitude, as alſo by the condition of the parts in which they are, are worthy and capable of both the remedies. For a ſimple and ſmall ſolution of continuity, ſtands onely in need of the Ligature which we call Incarnative, eſpecially if it be in the Arms or Legs, but that which divides the Muſcles tranſverſly, ſtands in need of both Suture and Ligature; that ſo the lips which are ſomewhat far diſtant from each other, and as it were, drawn towards their beginning and ends may be conjoined.

If any portion of a fleſhy ſubſtance by reaſon of ſome great Cut, ſhall hang down, it muſt neceſſarily be adjoined and kept in the place by Suture. The more notable and large Wounds of all the parts, ſtand in need of Suture, which do not eaſily admit a Ligature, by reaſon of the figure and ſite of the part in which they are, as the Ears, Noſe, Hairy-ſcalp, Eye-lids, Lips, Belly, and Throat.

Three ſorts of Ligatures.

There are three ſorts of Ligatures, by the joint conſent of all the Ancients. They commonly call the firſt a Glutinative or Incarnative, the ſecond Expulſive, the third Retentive. The Glutinative or Incarnative is fit for ſimple, green and yet bloudy Wounds. This conſiſts of two ends, and muſt ſo be drawn, that beginning on the contrary part of the Wound, we may ſo go upwards, partly croſſing it, and going downwards again, we may cloſely join together the Lips of the Wound. But let the Ligature be neither too ſtrait, leſt it may cauſe inflammation or pain; nor too looſe, leſt it be of no uſe, and may not well contain it.

What an Incarnative Ligature is.

What an Expulſive.

The expulſive Ligature is fit for ſanious and fiſtulous Ulcers, to preſs out the filth contained in them. This is performed with one Rowler, having one ſimple head; the beginning of binding muſt be taken from the bottom of the *Sinus*, or boſom thereof, and there it muſt be bound more ſtraitly, and ſo by little and little going higher, you muſt remit ſomething of that rigour even to the mouth of the Ulcer, that ſo (as we have ſaid) the ſanious matter may be preſſed forth.

The

The Retentive Ligature is fit for ſuch parts as cannot ſuffer ſtrait binding; ſuch are the Throat, Belly, as alſo all parts oppreſſed with pain, for the part vexed with pain, abhorreth binding. The uſe thereof, is to hold to local Medicins. It is performed with a Rowler, which conſiſts ſomewhiles of one, ſomewhiles of more heads. All theſe Rowlers ought to be of Linnen, and ſuch as is neither too new, nor too old, neither too coarſe nor too fine. Their bredth muſt be proportionable to the parts to which they ſhall be applied; the indication of their largeneſs being taken from their Magnitude, Figure, and Site. As we ſhall ſhew more at large in our Tractates of Fractures and Diſlocations.

What the retentive.

What the rowlers muſt be made of.

The Chirurgeon ſhall perform the firſt ſcope of curing Wounds, which is of preſerving the temper of the wounded part, by appointing a good order of Diet by the preſcript of a Phyſician, by uſing univerſal and local Medicins. A ſlender, cold and moiſt Diet muſt be obſerved, until that time be paſſed, wherein the Patient may be ſafe and free from accidents which are uſually feared. Therefore let him be fed ſparingly, eſpecially if he be plethorick; he ſhall abſtain from Salt and ſpiced Fleſh, and alſo from Wine: if he ſhall be of a cholerick or ſanguine nature, in ſtead of Wine he ſhall uſe the Decoction of Barley or Liquorice, or Water and Sugar. He ſhall keep himſelf quiet, for Reſt is (in *Celſus*'s opinion) the very beſt Medicin. He ſhall avoid Venery, Contentions, Brawls, Anger, and other perturbations of the mind. When he ſhall ſeem to be paſt danger, it will be time to fall by little and little to his accuſtomed manner and diet of life. Univerſal remedies are Phlebotomies and Purging, which have force to divert and hinder the defluxion, whereby the temper of the part might be in danger of change.

Why and how the temper of the wounded part muſt be preſerved.

For Phlebotomy it is not always neceſſary, as in ſmall Wounds and Bodies, which are neither troubled with ill humours, or Plethorick: But it is onely required in great Wounds, where there is fear of Defluxion, Pain, *Delirium*, Raving and unquietneſs; and laſtly, in a Body that is Plethorick, and when the Joints, Tendons, or Nerves are wounded. Gentle purgations muſt be appointed, becauſe the humours are moved and enraged by ſtronger; whence there is danger of defluxion and inflammation: wherefore nothing is to be attempted in this caſe without the advice of a Phyſician.

In what wounds bloud letting is not neceſſary.

The Topick and particular Medicins are Agglutinative, which ought to be endued with a drying and aſtrictive quality, whereby they may hold together the lips of the Wound and drive away defluxion, having always a regard to the nature of the part, and the greatneſs of the diſeaſe. The Simple Medicins are *Olibanum*, *Aloes*, *Sarcocolla*, *Bole Armenick*, *Terra ſigillata*, *Sanguis Draconis*, Common and Venice Turpentine, Gum, *Elemni*, Plantane, Horſetail, the greater Comfry, *Parina Volatilis*, and many other things of this kind, which we ſhall ſpeak of hereafter in our *Antidotary*.

What Medicins are to be judged agglutinative.

The fifth ſcope of healing Wounds, is the correction of thoſe Symptoms or Accidents which are accuſtomed to follow Wounds, which thing verily makes the Chirurgeon have much to do; for as he is often forced to omit the proper cure of the Diſeaſe, ſo to reſiſt the accidents and ſymptoms, as Bleeding, Pain, Inflammation, a Fever, Convulſion, Palſie, Talking idly, or Diſtraction, and the like. Of which we ſhall treat briefly and particularly, after we have firſt ſpoken of Sutures as much as we ſhall thing fitting for this place.

CHAP. VI.

Of Sutures.

What wounds ſtand in no need of a Suture.

When Wounds are made alongſt the Thighs, Legs, and Arms, they may eaſily want Sutures, becauſe the Solution of continuity is eaſily reſtored by Ligatures, but when they are made overthwart, they require a Suture, becauſe the fleſh and all ſuch like parts being cut are drawn towards the ſound parts; whereby it comes to paſs that they part the further each from other: wherefore that they may be joined and ſo kept, they muſt be ſewed, and if the Wound be deep, you muſt take up much fleſh with your Needle; for if you onely take hold of the upper part, the Wound is onely ſuperficially healed: but the matter ſhut up, and gathered together in the bottom of the Wound, will cauſe abſceſſes and hollow Ulcers: Wherefore now we muſt treat of making of Sutures.

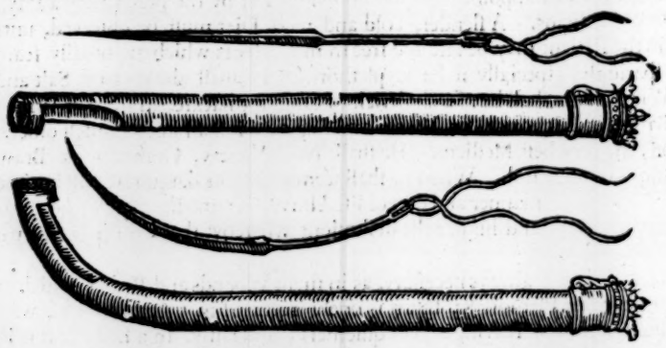
The firſt manner of Suture. The form of your Needle.

The firſt called *Interpunctus*, leaves the diſtance of a fingers bredth, and therefore is fit for the green Wounds of the fleſhy parts, which cannot be cured with a Ligature, and in which no heterogeneous or ſtrange body remains. It is performed after this manner. You muſt have a ſmooth Needle with a Thred in it, having a three-ſquare point, that ſo it may the better enter the Skin, with the head of it ſomewhat hollowed, that the Thred may lie therein; for ſo the Needle will the better go through. You muſt alſo have a little Pipe with a hole or window in the end, which you muſt hold and thruſt againſt the lip of the Wound, that it be not moved to the one ſide or other, whileſt you thruſt through the Needle: And that we may ſee through that window when the Needle is thruſt through, and alſo draw it together with the thred, and withall hold the lip of the Wound in more firmly, that it follow not at the drawing forth of the Needle and Thred. Having thus pierced the lips of the Wound, tie a knot, near to which cut off the Thred, leſt that if any of it be left below the knot, it may ſo ſtick to the Emplaiſters that it cannot be plucked and ſeparated from them without pain, when they are taken off. But you muſt note the firſt ſtitch muſt be thruſt through the midſt of the Wound, and then the ſecond muſt be in that ſpace which is between the midſt and one of the ends; but when you have made your ſtitches, the lips of the Wound muſt not be too cloſely joined, but a little ſpace muſt be left open between them, that the matter may have free paſſage forth, and inflammation and pain may be avoided: otherwiſe, if they ſhall be cloſely joined together without any diſtance between, a tumor after ariſing when the matter ſhall come to ſuppuration, the lips will be ſo much diſtended that they may eaſily be broken by the ſtiffneſs of the Thred. But you muſt neither take hold of too much nor too little fleſh with your Needle;

The form of the Pipe with a window in it

for too little will not hold, and too much cauſeth pain and inflammation. And beſides, leaves an ill-favoured ſcar. Yet in deep Wounds ſuch as are thoſe which are made in the thicker Muſcles, the Needle muſt be thruſt home, that ſo it may comprehend more of the fleſhy ſubſtance, leſt the Thred drawn away by the weight of the fleſh not taken hold of, may be broken. But oft-times Wounds are ſeen made in ſuch places, as it would be needful the Chirurgeon ſhould have a crooked Needle and Pipe, otherwiſe the Suture will not ſucceed according to his deſire. Wherefore I have thought good to ſet forth both their figures, that you may uſe either as occaſion ſhall ſerve.

The Figures of Pipes with Feneſtels in them, and Needles fit for Sutures.



The ſecond means of Suture.

The ſecond Suture is made juſt after the ſame manner as the Skinner ſows their Fells or Furs. And the Guts muſt be ſowed with this kind of Suture (if they ſhall be at any time wounded) that the Excrements come not forth by the Wound.

The third manner of Suture.

The third Suture is made by one or more Needles having Thred in them, thruſt through the Wound, the Thred being wrapped to and again at the head and the point of the Needle, as Boys uſe to faſten their Needle, for fear of loſing it, in their Caps or Cloths. This kind of Suture is fit in the curing and healing of Hare-lips, as we ſhall ſhew you hereafter expreſſed by a Figure.

The fourth kind of Suture termed *Gaſtroraphia*.

The fourth kind of Suture is termed *Gaſtroraphia*, invented for the reſtoring and uniting the great Muſcles of the *Epigaſtrium*, or lower Belly, cut with a great wound together with the *Peritonæum* lying under them. The manner whereof we ſhall ſhew in due place.

The fifth kind called the Dry Suture.

The fifth kind is called the dry Suture, which we uſe onely in the Wounds of the face, which alſo we will deſcribe in its proper place.

CHAP. VII.

Of the Flux of Bloud, which uſually happens in Wounds.

The ſigns of bloud flowing from an Artery.

OFt-times great bleeding follows upon Wounds, by reaſon of ſome Veſſel cut, broken, or torn, which there is need to heal and help diligently, becauſe the bloud is the treaſure of Nature, without which life cannot conſiſt. The Bloud which floweth from an Artery, is thus known. It is more ſubtile, it runs forth as it were leaping, by reaſon of the vital ſpirit contained together with it in the Arteries. On the contrary, that which floweth from a Vein is more groſs, black, and ſlow. Now there are many ways of ſtanching bloud.

The firſt way of ſtaying bleeding.

The firſt and moſt uſual is that, by which the lips of the Wound are cloſed, and, unleſs it be ſomewhat deep, are contained by Medicins which have an aſtringent, cooling, drying, and glutinous faculty: As *Terræ ſigill. Boli Armeni, ana* ℥ ß. *Thuris, Maſticis, Myrrhæ, Aloes, ana* ʒ ij. *Farinæ volat. molend.* ℥ i. *Fiat pulvis qui albumine ovi excipiatur.* Or, R. *Thuris & Aloes, ana partes æquales.* Let them be mixt with the White of an Egg, and the Down of a Hare, and let the pledgets be dipped in theſe Medicins, as well thoſe which are put unto the Wound, as thoſe which are applied about it. Then let the Wound be bound up with a double cloth and fit ligature, and the part be ſo ſeated as may ſeem the leaſt troubleſom and moſt free from pain.

The 2. manner of ſtanching it

But if the Bloud cannot be ſtaid by this means, when you have taken off all that covereth it, you ſhall preſs the Wound and the orifice of the Veſſel with your Thumb, ſo long until the bloud ſhall be concrete about it, into ſo thick a clot as may ſtop the paſſage.

The 3. way by binding of the Veſſels.

But if it cannot be thus ſtaid, then the Suture (if any be) muſt be opened, and the mouth of the Veſſel towards the original or root, muſt be taken hold of, and bound with your Needle and Thred, with as great a portion of the fleſh as the condition of the part will permit. For thus I have ſtaid great bleedings, even in the amputation of members, as I ſhall ſhew in fit place. To perform this Work we are often forced to divide the skin which covereth the wounded Veſſel. For if the Jugular Vein or Artery be cut, it will contract and draw it ſelf upwards and downwards. Then the Skin it ſelf muſt be laid open under which it lieth, and thruſting a Needle and Thred under it, it muſt be bound as I have often done. But before you looſe the knot, it is fit the fleſh ſhould be grown up, that it may ſtop the mouth of the Veſſel, leſt it ſhould then bleed.

An admonition.

The 4. way by Eſchatoricks.

But if the condition of the part ſhall be ſuch as may forbid this comprehenſion, and binding of the Veſſel; we muſt come to *Eſcharoticks*, ſuch as are the powder of burnt *Vitriol*, the powder of Mercury, with a ſmall quantity of burnt Allum; and Cauſticks which cauſe an Eſcar. The falling away of which muſt be left to Nature, and not procured by Art, leſt it ſhould fall away before that the orifice of the Veſſel ſhall be ſtopt with the fleſh or clotted bloud.

The 5. way by cutting off the Veſſels.

But ſometimes it happens that the Chirurgeon is forced wholly to cut off the Veſſel it ſelf,

that

that thus the ends of the cut Veſſel withdrawing themſelves, and ſhrinking upwards and downwards, being hidden by the quantity of the adjacent and incompaſſing parts, the flux of the bloud, which was before not to be ſtaid, may be ſtopped with leſs labour. Yet this is an extreme remedy and not to be uſed, unleſs you have in vain attempted the former.

CHAP. VIII.

Of the pain which happens upon Wounds.

Pain weakens the body, and cauſes defluxions.

THe pains which follow upon Wounds ought to be quickly aſſwaged, becauſe nothing ſo quickly dejects the powers, and it always cauſes a defluxion, of how good ſoever a habit and temper the body be of; for Nature ready to yield aſſiſtance to the wounded part, always ſends more humours to it than are needful for the nouriſhment thereof, whereby it comes to paſs that the defluxion is eaſily increaſed, either by the quantity, or quality, or by both.

Divers Anodynes or medicins to aſſwage pain.

Therefore to take away this pain, the author of defluxion, let ſuch medicins be applied to the part as have a repelling and mitigating faculty; as ℞ *Olei Myrtili, & Roſarum, ana* ʒ ij. *Ceræ alb.* ʒ i. *Farinæ hordei,* ʒ ß. *Boli armeni, & terræ ſigillat, ana* ʒ vj. Melt the Wax in the Oils, then incorporate all the reſt, and according to Art, make a Medicin to be applied about the part: or, ℞ *Emplaſt. Diacalcith.* ʒ iv. *Olc. Roſar. & aceti, ana* ʒ ß. *liquefiant ſimul*, and let a Medicin be made for the fore-mentioned uſe. Irrigations of Oil of Roſes and Myrtils, with the white of an Egg, or a whole Egg added thereto, may ſerve for lenitives, if there be no great inflammation; Rowlers and double cloths moiſtened in Oxycrate, will be alſo convenient for the ſame purpoſe. But the force of ſuch Medicins muſt be often renewed, for when they are dried, they augment the pain. But if the pain yield not to theſe, we muſt come to narcotick Medicins, ſuch as are the Oil of Poppy, of Mandrake, a Cataplaſm of Henbane and Sorrel, adding thereto Mallows and Marſh-mallows, of which we ſpoke formerly in treating of a Phlegmon.

Laſtly, We muſt give heed to the cauſe of the pain, to the kind and nature of the humour that flows down, and to the way which nature affects: for according to the variety of theſe things, the Medicins muſt be varied, as if heat cauſe pain, it will be aſſwaged by application of cooling things; and the like reaſon obſerved in the contrary: If Nature intend ſuppuration, you muſt help forwards its indeavours with ſuppurating Medicins.

CHAP. IX.

Of Convulſion by reaſon of a Wound.

What a Convulſion is.

A Convulſion is an unvoluntary contraction of the Muſcles (as of parts moveable at our pleaſure) towards their original, that is, the Brain and Spinal Marrow, for by this the convulſed member or the whole body (if the Convulſion be univerſal) cannot be moved at our pleaſure. Yet motion is not loſt in a Convulſion as it is in a Palſie, but it is onely depraved: and becauſe ſometimes the Convulſion poſſeſſeth the whole body, otherwhiles ſome part thereof, you muſt note that there are three kinds of Convulſions in general.

Three kinds of an univerſal Convulſion.

The firſt is called by the Greeks *Tetanos*, when as the whole body grows ſtiff like a ſtake that it cannot be moved any way.

The ſecond is called *Opiſthotonos*, which is when the whole body is drawn backwards.

The third is termed *Emproſthotonos*, which is when the whole body is bended or crooked forwards.

Three cauſes of a Convulſion.

A particular Convulſion is, when as the muſcle of the Eye, Tongue, and the like parts which is furniſhed with a Nerve, is taken with a Convulſion, Repletion, or Inanition, Sympathy or conſent of pain cauſe a Convulſion.

Cauſes of Repletion.

Abundance of humours cauſe Repletion, dulling the body by immoderate eating and drinking, and omiſſion of Exerciſe, or any accuſtomed evacuation, as ſuppreſſion of the Hemorrhoids and Courſes: for hence are ſuch like excrementitious humours drawn into the Nerves, with which they being repleat and filled are dilated more than is fit, whence neceſſarily becoming more ſhort, they ſuffer Convulſion. Examples whereof appear in Leather, and Lute or Viol ſtrings, which ſwollen with moiſture in a wet ſeaſon are broken by repletion.

Cauſes of Inanition.

Immoderate Vomitings, Fluxes, or Bleedings, cauſe Inanition or Emptineſs; wherefore a Convulſion cauſed by a Wound, is deadly: as alſo by burning Fevers. For by theſe and the like cauſes, the inbred and primogenious humidity of the Nerves is waſted, ſo that they are contracted like Leather which is ſhrunk up, by being held too near the fire, or as Fiddle-ſtrings which dried with Summers heat, are broken with violence; ſuch a Convulſion is incurable: For it is better a Fever follow a Convulſion, than a Convulſion a Fever; as we are taught by *Hippocrates*, ſo that ſuch a Fever be proportional to the ſtrength of the convulſifick cauſe, and the Convulſion proceed from Repletion; for the abundant and groſs humour cauſing the Convulſion is digeſted and waſted by the feveriſh heat. *Aph. 26. ſect. 2.*

Cauſes of Convulſion by conſent of pain.

The cauſes of a convulſion by reaſon of pain, are either the puncture of a Nerve, whether it be by a thing animal, as by the biting of a venemous Beaſt; or by a thing inanimate, as by the prick of a Needle, Thorn, or Pen-knife; or great and piercing cold, which is hurtful to the Wounds, principally of the nervous parts; whereby it comes to paſs, that by cauſing great and bitter pain in the Nerves they are contracted towards their original, that is, the Brain, as if they would crave ſuccour from their parents in their diſtreſſed eſtate. Beſides alſo, an ill vapour carried to the Brain from ſome putrefaction ſo vellicateth it, that contracting it ſelf, it alſo contracteth together with it all the Nerves and Muſcles; as we ſee it happeneth in thoſe which have the Falling-Sickneſs. By which it appears that not onely the Brain it ſelf ſuffereth together with the Nerves, but alſo the Nerves with the Brain.

Signs of a convulſion.

The ſigns of a Convulſion are, difficult, painful, and depraved motions,

motions, either of ſome part or of the whole body, turning aſide of the Eyes and whole Face, a contraction of the Lips, a drawing in of the Cheeks as if one laughed, and an univerſal Sweat.

CHAP. X.

The cure of a Convulſion.

The cauſe of a Convulſion by Repletion.

THe Cure of a Convulſion, is to be varied according to the variety of the convulſive Cauſe, for that which proceeds from Repletion muſt be otherwiſe cured, than that which is cauſed by an inanition; and that which proceeds of Pain, otherwiſe than either of them. For that which is cauſed by Repletion is cured by diſcuſſing and evacuating Medicins; as by Diet conveniently appointed, by purging, bleeding, digeſtive local Medicins, Exerciſe, Frictions, Sulphureous Baths and other things appointed by the preſcription of ſome learned Phyſician which ſhall overſee the cure, which may conſume the ſuperfluous and excrementitious humors that poſſeſs the ſubſtance of the Nerves and habit of the Body. The local remedies are Oils, Unguents, and Liniments, with which the Neck, Back-bone, and all the contracted parts ſhall be anointed. The Oils are, the Oil of Foxes, Bays, Cammomil, Worms, Turpentine, of *Coſtus*, of *Caſtoreum*: The Ointments are, *Unguentum Arragon, Agrippæ, de Althæa, Martiatum.* This may be the form of a Liniment; ℞ *Olei chamæm. & Laurin. ana* ℥ ij. *Olei Vulp.* ℥ i. *Unguenti de Althæa & Marti. an.* ℥ ß. *Axungiæ Vulpis*, ℥ i. *Aquæ vitæ* ℥ i. ß. *Ceræ quantum ſufficit.* Make a Liniment for your uſe. Or, ℞ *Olei Lumbric. de Spica & de Caſtoreo an.* ℥ iij. *Axung. hum.* ℥ i. *Sulphuris vivi*, ℥ ß. *Ceræ quantum ſufficit.* Make a Liniment. Or, ℞ *Unguenti Martiati, & Agrip. an.* ℥ iij. *Olei de Terebinth.* ℥ i. ß. *Olei Salviæ*, ℥ ß. *Aquæ vitæ* ℥ i. *Ceræ* ℥ i. ß. *fiat linimentum.* But this diſeaſe is cured by ſlender Diet, and Sweating, with the Decoctions of *Guaiacum*, becauſe by theſe remedies the groſs, tough, and viſcid excrements, which are in fault, are digeſted,

The cure of a Convulſion cauſed by inanition.

A Convulſion proceeding of Inanition is to be cured by the uſe of thoſe things which do wholſomly and moderately nouriſh. And therefore you muſt preſcribe a Diet conſiſting of Meats full of good nouriſhment, as Broths, and Cullices of Capons, Pigeons, Veal, and Mutton, boiling therein Violet and Mallow leaves. Conſerves muſt be ordained, which may ſtrengthen the debilitated powers, and humect the habit of the body; ſuch as are the Conſerves of Bugloſs, Violets, Borage, and Water Lillies. The following Broth will be profitable, ℞ *Lactucæ, Bugloſ. & portul. an. M.* i. *quatuor ſeminum frigid. major. an.* ℥ ß. *ſeminis Barberis*, ℥ i. Let them all be boiled with a Chicken, and let him take the Broth every morning. If thirſt oppreſs him, the following Julep will be good. ℞ *Aquæ roſar.* ℥ iv. *aquæ viol.* ℔ ß. *ſaccari albiſſimi* ℥ vi. *fiat Julep, utatur in ſiti.* If the Patient be bound in his body, emollient and humecting Clyſters ſhall be appointed, made of the decoction of a Sheeps head and feet, Mallows, Marſh Mallows, Pellitory of the Wall, Violet leaves, and other things of the like faculty. Or that the remedy may be more ready and quickly made, let the Clyſters be of Oil and Milk. Topick remedies ſhall be Liniments and Baths. Let this be the example of a Liniment, ℞ *Olei Viol. & Amygdal. dulc. an.* ℥ ij. *Olei Lilior. & Lumbric. an.* ℥ i. *Axungiæ porci recentis*, ℥ iij. *Ceræ novæ quantum ſufficit*, *fiat Linimentum*, with which let the whole ſpine and part affected be anointed: This ſhall be the form of an emollient and humecting bath. ℞ *Fol. Malvæ, Biſmalvæ, Pariet. ana M.* vj. *Seminis Lini & fœnug. an.* ℔ ß. *coquantur in aqua communi, addendo Olei Lilior.* ℔ ix. Make a Bath: into which let the Patient enter when it is warm. When he ſhall come forth of the Bath, let him be dried with warm cloths, or reſt in his bed avoiding ſweat. But if the Patient be able to undergo the charge, it will be good to ordain a Bath of Milk, or Oil alone, or of them equally mixt together.

An Emollient Liniment for any Convulſion.

An Emollient and humecting Bath.

CHAP. XI.

Of the Cure of a Convulſion by Sympathy and pain.

The Cure of a Convulſion by a puncture or bite.

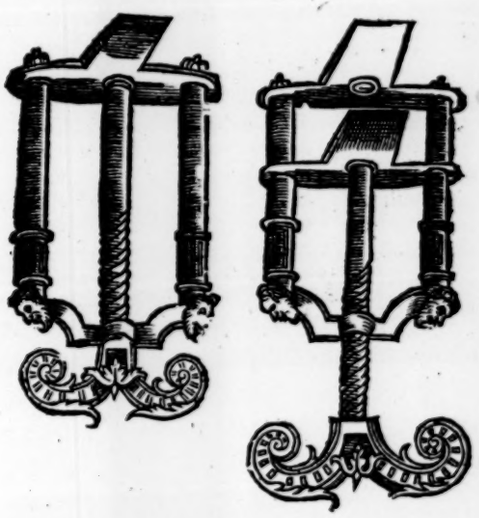
A Convulſion which is cauſed both by conſent of pain and communication of the affect, is cured by remedies which are contrary to the dolorifick cauſe. For thus if it proceed from a puncture or venemous bite, the wound muſt be dilated and enlarged by cutting the skin, that ſo the venenate matter may flow forth more freely, for which purpoſe alſo Medicins which are of a thin and liquid conſiſtence, but of a drying and digeſtive faculty ſhall be poured in, to call forth and diſſove the virulency, as Treacle and Mithridate diſſolved in *Aqua vitæ*, with a little of ſome Mercurial Powder; for this is a noble antidote. Alſo Cupping-glaſſes and ſcarifications will be good. Laſtly, the condition of all dolorifick cauſes, ſhall be oppugned by the oppoſition of contrary remedies; as if pain by reaſon of a pricked nerve or tendon, ſhall cauſe a Convulſion, it muſt preſently be reſiſted by proper remedies, as Oil of Turpentine, of *Euphorbium*, mixt with *Aqu. vitæ*, and alſo with other remedies appropriated to punctures of the nerves. If the pain proceed from exceſs of cold, becauſe cold is hurtful to the brain, the ſpinal marrow, and nerves; the Patient ſhall be placed in a hot air, ſuch as that of a Hot-houſe or Stove; all the ſpine of his back and convulſed parts muſt be anointed with the hot liniments above mentioned: for that is much better than ſuddenly to expoſe him from the conceived convulſifick cauſe to a moſt ſhot fire or warm bath. In the mean time the Chirurgeon muſt take diligent heed, that as ſoon as the ſign of the Convulſion to come, or already preſent, or at hand, do ſhew themſelves, that he put a ſtick between the Patients teeth, leſt they be faſt locked up by the pertinacious contraction of the Jaws, for many in ſuch a caſe have bit off their Tongues, for which purpoſe he ſhall be provided of an inſtrument called *Speculum Oris*, which may be dilated and contracted according to your mind by the means of a ſcrew, as the following figures demonſtrate; the one preſenting it open and ſomewhat twined up, and the other as it is ſhut.

A worthy *Altxipharmacum* or Antidote.

You muſt hinder the locking of the teeth.

The

The Figure of a Speculum Oris, *to open the Teeth when they are locked or held faſt together.*



CHAP. XII.

Of the Palſie.

THe Palſie is the reſolving or mollification of the nerves, with privation of ſenſe and motion, not truly of the whole Body, but of the one part thereof, as of the right or left ſide. And ſuch is properly named the Palſie: for otherwiſe and leſs properly the reſolution of ſome one member is alſo called the Palſie: for when the whole body is reſolved, it is an Apoplexy. Therefore the Palſie ſometimes takes half the body, otherwhiles the upper parts, which are between the Navel and the Head, otherwhiles the lower which are from the Navel to the Feet; ſometimes the Tongue, Gullet, Bladder, Yard, Eyes; and laſtly, any of the particles of the body. What a Palſie is. The differences thereof.

It differs from a Convulſion in its whole nature. For in a convulſion, there is a contention and contraction of the part, but in this a reſolving and relaxation thereof: beſides, it commonly happeneth that the ſenſe is either aboliſhed or very dull, which uſually remains perfect in a Convulſion. There are ſome which have a pricking, and as it were great pain in the part. How it differs from a Convulſion.

The cauſes are internal or external; the internal are humours obſtructing one of the Ventricles of the Brain, or one ſide of the ſpinal marrow, ſo that the animal faculty, the worker of Senſe and Motion, cannot by the nerves come to the part to perform its action. The external cauſes are a fall, blow, and the like injuries, by which oft-times the joints are diſlocated, the ſpinal marrow wreſted aſide, and conſtrictions and compreſſions of the *Vertebræ* ariſe, which are cauſes that the animal ſpirit cannot come to the Organs in its whole ſubſtance. But it is eaſie by skill in Anatomy perfectly to underſtand by the reſolved part the ſeat of the morbifick cauſe, for when there is a Palſie properly ſo called, that is, when the right or left ſide is wholly ſeized upon, then you may know that the obſtruction is in the brain, or ſpinal marrow; but if the parts of the head be untoucht, either of the ſides being wholly reſolved, the fault remains in the original of the ſpinal marrow; if the arms be taken with this Diſeaſe, we may certainly think that the matter of the Diſeaſe lies hid in the fifth, ſixth, and ſeventh *Vertebra* of the neck. But if the lower members languiſh, we muſt judge the Paralytick cauſe to be contained in the *Vertebræ* of the Loins and Holy-bone. Which thing the Chirurgeon muſt diligently obſerve that he may always have recourſe to the original of the Diſeaſe. The Palſie which proceeds from a nerve cut, or exceedingly bruiſed, is incurable, becauſe the way to the part by that means is ſhut againſt the animal ſpirit. Old men ſcarce or never recover of the Palſie, becauſe their native heat is languid, and they are oppreſſed with abundance of excrementitious humours; neither doth an inveterate Palſie which hath long poſſeſt the part, neither that which ſucceeds an Apoplexy, yield us any better hope of cure. It is good for a Fever to come upon a Palſie, for it makes the diſſipation of the reſolving and relaxing humour, to be hoped for. When the member affected with the Palſie is much waſted, and the oppoſite, on the contrary, much increaſed in quantity, heat, and colour, it is ill: for this is a ſign of the extreme weakneſs of the afflicted part, which ſuffers it ſelf to be defrauded of its nouriſhment, all the proviſion flowing to the ſound or oppoſite ſide. The Cauſes. It is good for a Fever to happen upon a Palſie.

CHAP. XIII.

Of the Cure of the Palſie.

IN the cure of the Palſie we muſt not attempt any thing, unleſs we have firſt uſed general remedies, Diet and Purging; all which care lieth upon the learned and prudent Phyſician. The Decoction of *Guaiacum* is very fit for this purpoſe, for it procures ſweat and attenuates, digeſts and drieth up all the humidity with relaxeth the nerves: but when ſweat doth not flow, it ſhall not The decoction of *Guaiacum* is good for a Palſie.

be

Things actually hot good for to be applied to paralytick members.

be unprofitable to put about the reſolved members, bricks heated red hot in the fire and quenched in a decoction of Wine, Vinegar, and reſolving herbs, or alſo ſtone Bottles, or Ox and Swine bladders, half filled with the ſame decoction; for ſuch heat which is actual reſuſcitateth and ſtrengtheneth the heat of the part, which in this Diſeaſe is commonly very languid: Then the Patient ſhall go into a Bathing-tub, which is vailed or covered over, juſt as we have deſcribed in our Treatiſe of Baths, that ſo he may receive the vapour of the following decoction. ℞ *Fol. Salviæ, Lavend. Lauri major. Abſinth. Thym. Angelicæ, Rutæ, ana M.* ß. *Florum Chamæm. Melil. Anethi, Anthoſ. ana* P. ij. *Baccar. Laur. & Juniper. Conquaſſatur. ana* ℥ i. *Caryophyl.* ℥ ij. *Aquæ fontanæ & Vini albi, ana* ℔ iv. Let them be all put in the Veſſel mentioned in the Treatiſe lately deſcribed for uſe. The Patient ſhall keep himſelf in that Bathing-tub, as long as his ſtrength will give him leave, then let him be put into his bed well covered, where he ſhall ſweat again, be dried, and reſt. Then let him be preſently anointed with the following Ointment, which *Leonellus Faventius* much commends: ℞ *Olei Laurini & de Terebinth. ana* ℥ iij. *Olei Nardini & petrolei, ana* ℥ i. *Vini malvatici,* ℥ iv. *Aquæ vitæ* ℥ ij. *Pyrethri, Piperis, Sinap. Granor. Junip. Gummi hederæ, anacard. Laudani puri, an.* ℥ i. ß. *Terantur & miſceantur omnia cum Oleis & Vino: bulliant in vaſe duplici uſque ad Vini conſumptionem, facta forti expreſſione, adde Galbani, Bdellii, Euphorbii, Myrrhæ, Caſtorei, adipis Urſi, Anatis, Ciconiæ, an.* ℥ ij. Make an Ointment in form of a Liniment, adding a little Wax if need ſhall require. Or you ſhall uſe the following remedy approved by many Phyſicians: ℞ *Myrrhæ & Aloes, Spicæ nardi, Sanguinis draconis, thuris, opoponacis, Bdellii, Carpobalſami, amomi, ſarcocollæ, croci, maſtic. gummi arabici, ſtyrac. liquidæ, ladani, caſtorei, ana* ℥ ij. *Moſchi,* ℈ i. *Aquæ vitæ,* ℥ i. *Terebinthinæ venetæ, ad pondus omnium, pulveriſabuntur pulveriſanda & gummi cliquabuntur cum aqua vitæ & aceti tantillo.* And let them all be put in fit Veſſels, that may be diſtilled in *Balneo Mariæ*, and let the Spine of the Back, and paralytick limbs be anointed with the liquor which comes from thence. I have often tried the force of this following Medicin: ℞ *Rad. Angel. Ireos floren. gentian. cyperi, ana* ℥ i. *Calami aromat. Cinam. Caryophyl. nucis Moſch. macis, ana* ℈ ij. *Salviæ major. Iuæ arthriticæ, Lavend. roriſm. ſatureiæ, puleg. calament. mentaſtri, ana M.* ß. *florum. chamæm. melil. hyperic. anthos, ſtœchad. ana* P. i. *Conciſa omnia contundantur, & in Aqua vit. & Vini malvat. an.* ℔ ij. *infundantur.* And let them be diſtilled in *Balneo Mariæ*, like the former, let the affected parts be moiſtned with the diſtilled liquor, of which alſo you may give the Patient a ſpoonful to drink in the morning with ſome Sugar. For thus the Stomach will be heated, and much phlegm contained therein as the fewel of this diſeaſe, will be conſumed.

Leo Faventius his Ointment.

An approved Ointment for the Palſie.

A diſtilled Water, good to waſh them outwardly, and to drink inwardly.

Exerciſes and frictions. Chymical Oil.

You muſt alſo appoint Exerciſes of the affected parts, and frequent and hard frictions, with hot linen cloths, that the native heat may be recalled, and the excrements contained in the parts digeſted: you may alſo uſe the Chymical Oyls of Roſemary, Thyme, Lavender, Cloves, Nutmegs; and laſtly, of all Spices, the manner of extracting whereof, we ſhall hereafter declare in a peculiar Treatiſe.

CHAP. XIV.

Of Swooning.

What Swooning is. Three cauſes of Swooning.

SWooning is a ſudden and pertinacious defect of all the powers, but eſpecially the vital; in this, the Patients lie without motion or ſenſe, ſo that the Ancients thought that it differed from Death onely in continuance of time. The cauſe of Swooning, which happens to thoſe that are Wounded, is Bleeding, which cauſeth a diſſipation of the ſpirits: or Fear, which cauſeth a ſudden and joint retirement of the ſpirits to the heart. Whence follows an intermiſſion of the proper duty, as alſo of of the reſt of the faculties, whileſt they being thus troubled, are at a ſtand. Alſo Swooning happens by a putrid and venenate vapour, carried to the Heart by the Arteries, and to the Brain by the Nerves; by which you may gather, that all Swooning happens by three cauſes. The firſt is, by diſſipation of the ſpirits and native heat, as in great bleeding. And then by the oppreſſion of theſe ſpirits by obſtruction, or compreſſion, as in Fear, or Tumult; for thus the ſpirits fly back haſtily from the ſurface and habit of the body, unto the Heart and Center. Laſtly, By Corruption, as in bodies filled with humours, and in poiſonous Wounds. The ſigns of Swooning are paleneſs, a dewy and ſudden ſweat ariſing, the failing of the pulſe, a ſudden falling of the body upon the ground without ſenſe and motion, a coldneſs poſſeſſing the whole body, ſo that the Patient may ſeem rather dead than alive. For many of theſe who fall into a Swoon die, unleſs they have preſent help.

The cure of Swooning cauſed by diſſipation of ſpirits. The cure of Swooning cauſed by a venenate air. The cure of Swooning cauſed by oppreſſion and obſtruction.

Therefore you ſhall help them, if when they are ready to fall, you ſprinkle much cold water in their face, if that the ſwooning happen by diſſipation of the ſpirits; or if they ſhall be ſet with their faces upwards upon a bed, or on the ground, as gently as may be; and if you give them bread dipt in Wine to hold and chew in their mouths. But if it be cauſed by a putrid vapour and poiſonous air, you ſhall give them a little Mithridate or Treacle in *Aqua vitæ* with a Spoon, as I uſually do to thoſe which have the Plague, or any part affected with a Gangrene, or Spacel. But if the Patients cannot be raiſed out of their Swoons, by reaſon of the pertinacious oppreſſion and compreſſion of the ſpirits about the Heart, you muſt give them all ſuch things as have power to diffuſe, call forth, and reſuſcitate the ſpirits, ſuch as are, ſtrong Wines to drink, ſweet Perfumes to ſmell: You muſt call them by their own name loud in their ear, and you muſt pluck them ſomewhat hard by the hairs of the Temples and Neck. Alſo rub the Temples, Noſtrils, Wriſts, and Palms of the Hands with *Aqua vitæ*, wherein Cloves, Nutmegs, and Ginger have been ſteeped.

CHAP.

CHAP. XV.

Of Delirium (i. e.) *Raving, Talking idly, or Doting.*

DOting or Talking idly, here is uſed for a ſymptom which commonly happeneth in Fevers cauſed by a wound, and inflammation; and it is a perturbation of the fanſie and function of the mind, not long induring. Wherefore ſuch a doting happens upon Wounds by reaſon of vehement pain, and a fever, when as the nervous parts, as the joints, ſtomach, and midriff, ſhall be violated. What a ſymptomatical *Delirium* is. The cauſes thereof.

For the Ancients did therefore call the Midriff *Phrena*, becauſe when this was hurt, as if the mind it ſelf were hurt, a certain phrenzie enſues; that is, a perturbation of the animal faculty, which is imployed in ratiocination, by reaſon of the community which the *Diaphragma* hath with the Brain, by the Nerves ſent from the ſixth conjugation, which are carried to the ſtomach. Therefore Doting happens by too much bleeding, which cauſeth a diſſipation of the ſpirits, whereby it happens that the motions and thoughts of the mind err, as we ſee it happens to thoſe who have bled much in the amputation of a member. And it happens by the puncture of a venemous Beaſt, or from Seed retained or corrupted in the Womb, or from a Gangrene or Sphacel, from a venenate and putrid air carried up to the Brain, or from a ſudden tumult and fear. Laſtly, What things ſoever with any diſtemper, eſpecially hot, do hurt and debilitate the mind These may cauſe Doting by the afflux of humours, ſpecially cholerick, by diſſipation, oppreſſion or corruption of the ſpirits. Therefore if it ſhall proceed from the inflammation of the Brain, and *Meninges* or Membranes thereof; after Purging and Bloudletting by the preſcription of a Phyſician, the hair being ſhaved or cut off, the head ſhall be fomented with Roſe Vinegar, and then an Emplaiſter of *Diacalcitheos*, diſſolved in Oil and Vinegar of Roſes, ſhall be laid thereupon. Sleep ſhall be procured with Barly creams, wherein the ſeeds of white Poppy have been boiled, with Broths made of the decoction of the cold ſeeds of Lettuce, Purſlain, Sorrel, and ſuch like. Cold things ſhall be applied to his Noſtrils, as the ſeeds of Poppy gently beaten with Roſe-water and a little Vinegar. Let him have merry and pleaſant Companions that may divert his mind from all cogitations of ſorrowful things, and may eaſe and free him of cares, and with their ſweet intreaties may bring him to himſelf again. But if it happen by default of the ſpirits, you muſt ſeek remedy from thoſe things which have been ſet down in the Chapter of Swooning. Why the Brain ſuffers with the Midriff. The Cure.

The End of the Nineth Book.

BOOK X.

Of the Green and Bloudy WOUNDS *of each Part.*

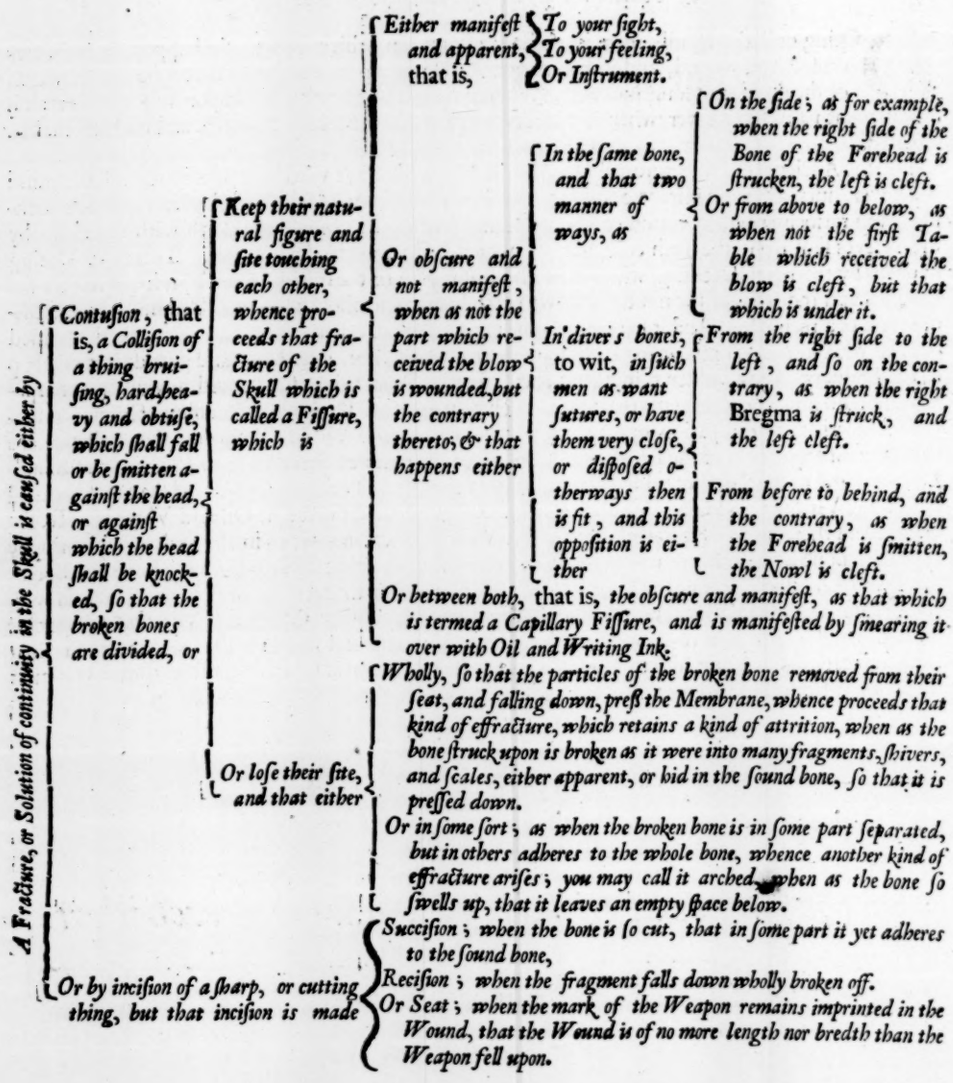
CHAP. I.

Of the kind or differences of a broken Skull.

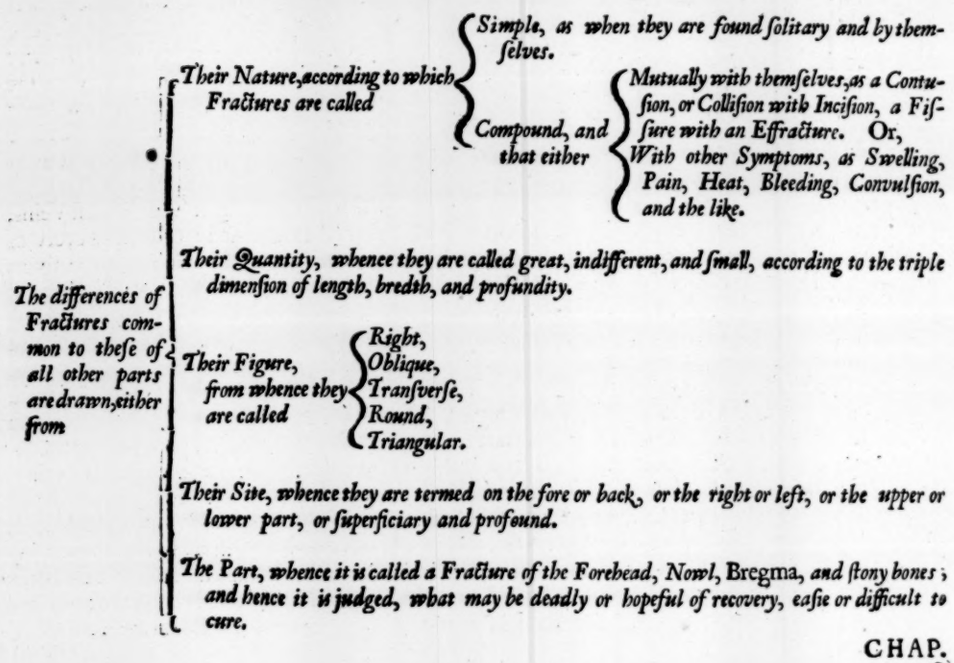
NOw that we have briefly treated of Wounds in general, that is, of their differences, ſigns, cauſes, prognoſticks and cure, and alſo ſhewed the reaſon, of the accidents and ſymptoms which uſually follow and accompany them, it remains that we treat of them as they are incident to each part, becauſe the cure of Wounds muſt be diverſly performed according to the diverſity of the parts. Now we will begin with the Wounds of the Head. Therefore the head hath the hairy ſcalp lightly bruiſed without any wound, otherwhiles it is wounded without a Contuſion, and ſometimes it is both contuſed and wounded: but a fracture made in the skull, is ſometimes ſuperficiary, ſometimes it deſcends even to the *Diploe*, ſometimes it penetrates through the two Tables, and the Meninges, into the very ſubſtance of the Brain; beſides the Brain is oft-times moved and ſhaken with breaking of the internal Veins, and divers ſymptoms happen when there appears no Wound at all in the head: of all and every of which we will ſpeak in order, and add their cure, eſpecially according to the opinion of the divine *Hippocrates*. He in his Book *Of the Wounds of the Head*, ſeems to have made 4 or 5 kinds of fractures of the Skull. The firſt is called a Fiſſure or Fracture, the ſecond a Contuſion or Colliſion, the third is termed *Effractura*, the fourth is named *Sedes*, or a ſeat; the fifth (if you pleaſe to add it) you may call a Counterfiſſure, or as the Interpreter of *Paulus* calls it, a *Reſonitus*. As when the bone is cleft on the contrary ſide, to that which received the ſtroke. There are many differences of theſe five kinds of a broken Skull. For ſome fractures are great, ſome ſmall, and others indifferent: ſome run out to a greater length or bredth, others are more contracted; ſome reſide onely in the ſuperficies, others deſcend to the *Diploe*, or elſe pierce through both the Tables of the Skull; ſome run in a right line, others in an oblique and circular; ſome are complicated amongſt themſelves, as a Fiſſure is neceſſarily and always accompanied with a Colliſion or Contuſion, and others are aſſociated with divers accidents, as pain, heat, ſwelling, bleeding, and the like. Sometimes the Skull is ſo broken, that the Membrane lying under it, is preſſed with ſhivers of the Bone, as with pricking Needles. Somewhiles none of the bones fall off. All which differences are diligently to be obſerved, becauſe they force us to vary cure, and therefore for the help of memory, I have thought good to deſcribe them in the following Table. The differences of a broken head. The kinds of a broken skull out of *Hippocrates*. Differences from their quantity. Differences from their figure. From their complication.

A Table

A Table of the Fractures of the Skull.



Another Table of the differences of a fractured Skull.



CHAP.

CHAP. II.

Of the cauſes and ſigns of a broken Skull.

THe cauſes of a broken Skull are external, as a fall, a blow, or ſtroak with any kind of Weapon, ſharp, obtuſe, heavy, hard, the bitings of Beaſts, and many other things of the like kind. The external cauſes.
But the ſigns by which we come to know that the Skull is broken, are of two kinds; for ſome of them are found out by the reaſoning and diſcourſe of the mind, other by the ſenſe, as thoſe which lay open the Wound to the Eye and Hand.

The Rational ſigns ſhew by theſe things which have happened upon the thing it ſelf, whether it be, and of what ſort it is. For you may know the Skull is broken, if the Patient ſhall fall down with the ſtroak, or if he ſhall fall headlong from a high place upon ſome hard thing. If for ſome time after the ſtroak he ſhall lie without ſpeaking, ſight, and hearing; if he ſhall have felt and feel much pain, ſo that he is often forced to put his hand to the Wound. But alſo the Weapon is to be conſidered, that is, whether if it be heavy, obtuſe, pricking, or ſharp. Alſo we muſt conſider with what and how great ſtrength the ſtroak was given, and with how great anger, and from what diſtance the Weapon fell. Alſo we muſt conſider whether the Patient received the blow with his Head unarmed and naked; whether he fell into a Swoon preſently after the blow; whether when he came to himſelf, he was in his right ſenſes; whether his eyes were blinded; whether he were troubled with a giddineſs or dizineſs, and whether he bled at the noſe, mouth, ears, or eyes; and laſtly, whether he vomited. For *Hippocrates* writes, that thoſe who have their Brain cut, muſt neceſſarily have a Fever and vomiting of Choler to enſue thereupon, which *Galen* confirming in his Commentary, ſaith that the ſame happens alſo when the Wound comes to the Membranes of the Brain. Rational cauſes. *Aphor. 50. ſect. 6.*

Alſo a dull ſound as from a broken Veſſel coming from the Skull, (the Hairy ſcalp and *Pericranium* being taken off) and it being lightly ſmitten upon with an iron Probe, is ſaid to be a ſign of a fracture thereof, as it is recorded by *Paulus Ægineta*. Truly all theſe ſigns make a great conjecture, or rather aſſuredneſs that the Skull is wounded, and the Brain hurt, as which cannot happen unleſs the bone be broken, as *Celſus* hath written. Yet many have had their Skulls broken, who had no ſuch ſign immediately after the blow, but this is very ſeldom. But I do not think fit amongſt ſo many ſigns, here to omit that which is ſet down by *Guido*. If any (ſaith he) will know in what place the Skull is broke, let the Patient hold faſt between his fore-teeth one end of a Lute ſtring or thred, and the Chirurgeon hold the other in his hand, then let him lightly touch or play upon the ſtring with his fingers; for in the very inſtant of the ſound or ſtroke, the Patient will be certainly admoniſhed, or perfectly perceive the part of the Skull that is broken, and as overcome and forced by this ſenſe of pain, will by lifting up of his hand make demonſtration thereof. As yet I have not been able to find the truth hereof by experience, although I have made trial of it in many. Wherefore I cannot ſay any thing certainly of this ſign, as neither of that which is mentioned by *Hippocrates* in *Coais Præſ.* In ſuch as you doubt whether the bones of the Skull be broken or not, you muſt judge by giving them the ſtalk of the Aſphodil to chaw on both ſides of their jaws, but ſo that you bid them withall obſerve, whether they perceive any bone to crackle or make a noiſe in their heads; for thoſe which are broken ſeem to make a noiſe. *Lib. 8. cap 4.* *Hippocrates* and *Guido's* conjectural ſigns of a broken skull.

But paſſing over theſe things, now let us come to thoſe ſigns which may be obvious to our ſenſes.

CHAP. III.

Of the ſigns of a broken Skull, which are manifeſt to our ſenſe.

THoſe ſigns are here ſaid to be manifeſt to ſenſe, which when the bone is bared, manifeſt the Wound to our Eyes, Fingers, and Probe. But if the hairs ſtand upon one end in the Wound, you may know the bone is broke, becauſe the hair which yields to the violence of the blow, cannot be ſo cut, the bone which reſiſts the ſtroak being not violated, as it is obſerved by *Hippocrates*; wherefore we may by the ſight of this one thing, before any inſpection of the Wound it ſelf, ſuſpect by a probable conjecture, that the Skull is broken, and perſuade the beholders or ſtanders by ſo much. Senſible ſigns of a broken skull before the dividing of the skin. *Lib. de Vulner. cap.*

Moreover we may, before we have cut the skin acroſs, or laid bare the bone, give a gueſs by our feeling, whether the Skull be broken or no, if we by preſſing down our fingers near the Wound ſhall perceive the bone either to ſtand up, or be preſſed down otherwiſe than it ſhould naturally be.

The skin being cut croſs-wiſe, and the bone laid bare, if the fracture be not obvious to the eye, you muſt trie with your Probe, which muſt neither be too thin nor too ſharp, leſt by falling into ſome natural cranies, it may cauſe us to ſuſpect without any cauſe that the bone is broken; neither let it be too thick, leſt the little clifts may deceive you. If when your Probe comes to the bone it meets with nothing but that which is ſmooth and ſlippery, it is a ſign that it is whole. What Probe muſt be uſed in ſearching for a fracture.

But on the contrary, if you find it any thing rough, ſpecially where there is no ſuture, it ſhews the bone is broken. But let the Chirurgeon conſider, that the fractures are not ſeldom upon the ſutures; and that the ſutures have not always one and their natural ſite, as alſo it often comes to paſs that the broken clift, or cut bone, can neither be perceived by your ſight nor inſtrument: wherefore if you think there is any ſuch thing, by the rational ſigns above mentioned; anoint the place with Writing Ink and Oil, and ſo you ſhall find the crack or clift, by the means we ſhall ſhew you hereafter.

When you are certain of the fracture, then you muſt diligently conſider the greatneſs of the Diſeaſe, and apply Medicins ſpeedily. Verily when a fracture chances to light upon any ſuture, the

Lib. 5. Epid. in Autonomus of Omilum, Hippocrates was deceived by the futures.

the diſeaſe is hard to be known, unleſs the fracture be very great, becauſe the ſutures by their clifts and roughneſs reſemble fractures; wherefore *Hippocrates* ſaith, that he was deceived by them. Now having briefly delivered the differences and ſigns of a broken Skull, it is time to come to the ſeveral kinds thereof, with a Fiſſure.

CHAP. IV.

Of a Fiſſure, being the firſt kind of a broken Skull.

Upon what occaſion the hairy ſcalp muſt be cut.

IF the Chirurgeon by the fore-mentioned ſigns ſhall know that the Skull is broken, or crackt, and if the Wound made in the muſculous skin ſhall not be thought ſufficient for ordering the Fiſſure, then muſt he ſhave off the hair, and cut with a Razor or Inciſion-knife, the muſculous Skin with the *Pericranium* lying under it in a triangular or quadrangular figure to a proportionable bigneſs, always ſhunning as much as in him lies, the ſutures and temples; neither muſt he fear any harm to enſue hereof; for it is far better to bare the Bone by cutting the Skin, than to ſuffer the kind and nature of the Fracture to remain unknown by a too religious preſervation of the skin; for the skin is cured without any great ado, though pluckt off to no purpoſe.

Celſus.

Hippocrates.

For it is much more expedient (in *Hippocrates* opinion) to cure Diſeaſes ſafely and ſecurely, though not ſpeedily, than to do it in a ſhorter time with fear of relapſe and greater inconveniencies. Let this diſſection be made with a Razor or ſharp Knife, and if there be any Wound made in the skin by the Weapon, let one of your Inciſions be made agreeable thereto.

A Razor, or Inciſion-Knife.

The manner how to pull the hairy ſcalp from the broken Skull.

Now therefore the muſculous skin together with the *Pericranium* muſt be divided, and cut with a ſharp Razor preſſed and guided with a ſtrong and ſteddy hand; then it muſt be ſo pluckt from the bone or skull lying under it, that none thereof remain upon the bone; for if it ſhould be rent or torn with the Trepan, it would cauſe vehement pain with inflammations. You muſt begin to pull it back at the corners of the lines croſſing each other with right angles, with this Chiſſel whoſe figure you ſee here expreſſed.

A Chiſſel or Inſtrument to pull back or ſeparate the Pericranium *from the Skull.*

Then you muſt fill all the Wound with Bolſters of fine ſoft lint, that ſo the lips may be kept further aſunder. But you ſhall apply upon it Medicins fit to ſtanch bloud. But if it ſo come to paſs that the bloud flows forth ſo violently, that it can be ſtaid by no means, the Veſſel it ſelf muſt be bound, after this manner.

The manner to bind a Veſſel in caſe of too much bleeding. A Hiſtory.

Firſt thruſt through the muſculous skin on the outſide with a needle and thred, then thruſt the needle back again, then tie the thred on a knot on the out-ſide, but firſt put ſome lint rolled up to the bigneſs of a Gooſe-quill between the thred and the hairy ſcalp on both ſides thereof, leſt the ſtrait twitching of the thred which may ſerve to ſtay the bleeding, may cut and tear the skin, or cauſe pain: then muſt you raiſe his head ſomewhat higher.

I have lately tried, and performed this upon a certain Coach-man, who, thrown from the Coach upon his head on a pavement of Free-ſtone, exceedingly bruiſed the hinder part of the *Bregma*, for which cauſe it was fit to open the muſculous skin, with a croſs Inciſion, both that the congealed bloud might be preſſed out, as alſo that the fracture (if there were any) might be obſerved. But an Artery being cut in performance hereof, when as the Chirurgeon, who was there preſent, could not ſtay the bloud leaping out with violence; and the Coachman already had loſt ſo great a quantity thereof, that his ſtrength was ſo much decayed that he could not ſtir himſelf in his Bed, or ſcarce ſpeak: I being called, ſhewed them by experience, that whereas aſtringent Medicins were uſed before to no purpoſe, it was better to ſtay the bleeding by binding the Veſſel, than to let the Patient die for a childiſh fear of pricking him.

A way to find a fracture in the Skull, when it preſents not it ſelf to the view at the firſt.

A ſign that both the Tables are broken.

But that we may return to our former matter, the Chirurgeon ſhall the next day conſider, with what kind of fracture the bone is hurt; and if no ſigns of hurt appear to the eyes, nor be perceived with your fingers and probe, yet ſome of the rational ſigns may cauſe one to have a conjecture that there is a fracture: Then you muſt anoint, as we told you before, the bared bone with Writing Ink, and a little Oil of Roſes, that the cleft or crack may be died or coloured therewith, if that there be any there. Then the next dreſſing you muſt dry the bone with a linnen cloth, and ſcrape off the Ink and Oil with ſcraping Inſtruments made for the purpoſe, if any part thereof ſhall be ſunk into the bone, for if there be any crack, it will be black: Wherefore you muſt continue ſcraping until no ſign of the Fiſſure remain, or elſe until you come even to the *Dura Mater*. But that he may be more certain whether the Fiſſure pierce through both the Tables of the ſkull, he muſt bid the Patient, that

ſtopping

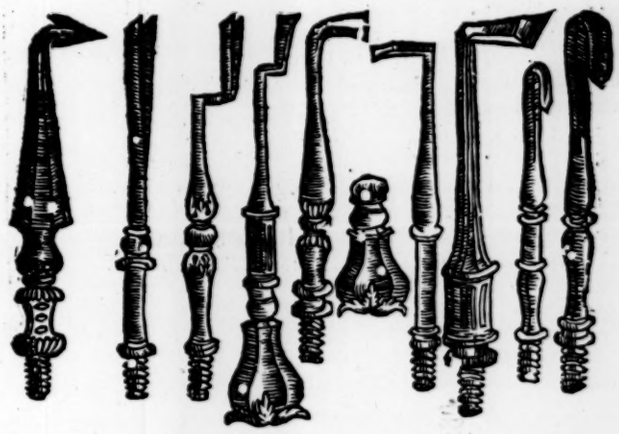
ſtopping his Noſe and Mouth he ſtrive to breath with a great indeavour. For then bloudy matter, or *ſanies*, will ſweat through the Fiſſure: For the breath driven forth of the Cheſt, and prohibited paſſage forth, ſwells and lifts up the ſubſtance of the Brain, and the *Meninges*, whereupon that frothy humidity and *ſanies* ſweats forth. Therefore then the bone muſt be cut, even to the *Dura Mater*, with a *Radula*, and other ſcraping Inſtruments fit for that purpoſe, yet ſo as you hurt not the Membrane; but if the Fiſſure ſhall be ſomewhat long, it will not be convenient to follow it all the extent thereof, for Nature will repair and reſtore the reminant of the Fiſſure by generating a *Callus*; beſides alſo, the Chirurgeon according to *Celſus* opinion, muſt take away as little of the bone as he can, becauſe there is nothing ſo fit to cover the Brain as the Skull. Therefore it ſhall ſuffice to make a paſſage, whereby the bloud and *ſanies* may paſs and be drawn forth, leſt that matter being ſuppreſt, may corrupt the bone, and cauſe an inflammation in the Brain. But the broken Bone muſt be taken forth within three days, if it be poſſible, eſpecially in Summer, for fear of inflammation. Yet I have often taken forth with a Trepan, and with Scrapers the bones of the Skull, after the ſeventeenth day, both in Winter and Summer, and that with happy ſucceſs. Which I have the rather noted, leſt any ſhould at any time ſuffer the wounded to be left deſtitute of remedy, for it is better to try a doubtful remedy than none. Yet the By-ſtanders ſhall be admoniſhed and told of the danger, for many more die, who have not the broken bones of the Skull taken out, than thoſe that have.

A ſign that both the Tables are broken.

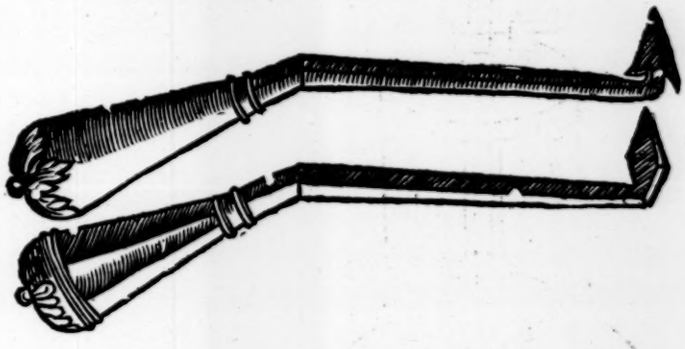
You may uſe the Trepan after the tenth day.

But the Inſtruments with which the wounded or cleft bones may be cut out, are called *Scalpri*, or *Radulæ*, of which I have cauſed divers ſorts to be here decyphered, that every one might take his choice according to his mind, and as ſhall be beſt for his purpoſe. But all of them may be ſcrued into one handle, the figure whereof I have exhibited.

Radulæ *or* Scalpri, (i.) *Shavers or Scrapers.*



Radulæ *of another form, for the better cutting of the greater Bones.*



To conclude, When the Skull ſhall be wounded or broken with a ſimple Fiſſure, the Chirurgeon muſt think he hath done ſufficient to the Patient, and in his Art, if he ſhall divide the bone, and dilate the Fiſſure, or clift, with the deſcribed Inſtruments, though he have uſed no Trepan, although the Fiſſure pierce through both the Tables. But if it doth not exceed the firſt Table, you muſt ſtay your ſcrapers as ſoon as you come to the ſecond, according to the opinion of *Paulus*: but if the bone ſhall be broken and ſhivered into many pieces, they ſhall be taken forth with fit Inſtruments, uſing alſo a Trepan, if need ſhall require, after the ſame manner as we ſhall ſhew you hereafter.

It is ſufficient in a ſimple fiſſure to dilate it with your *Scalpri* onely and not to Trepan it.

CHAP. V.

Of a Contuſion, which is the ſecond ſort of Fracture.

What an *Ecchymoſis* is.

AN *Ecchymoſis*, that is, effuſion of bloud, preſently concreting under the muſculous Skin, without any Wound, is oft cauſed by a violent contuſion. This Contuſion if it ſhall be great, ſo that the Skin be divided from the Skull, it is expedient that you may make an Inciſion, whereby the bloud may be evacuated and emptied. For in this caſe you muſt wholly deſiſt from ſuppurative Medicins (which otherwiſe would be of good uſe in a fleſhy part) by reaſon that all the moiſt things are hurtful to the Bones, as ſhall be ſhewn hereafter.

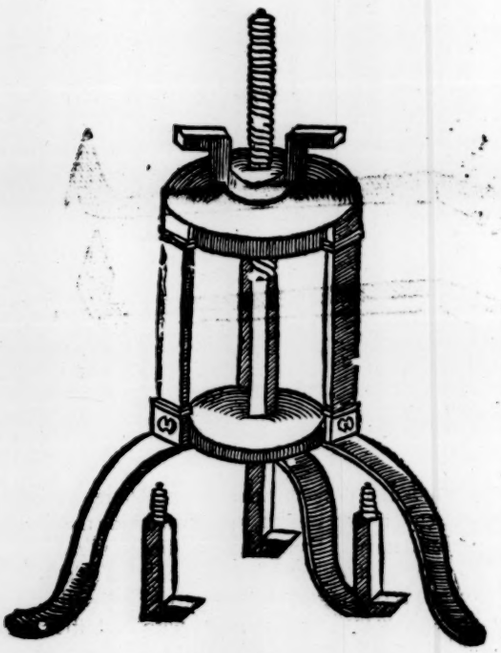
How a Contuſion of the Skull muſt be cured.

Different cures of a depreſſed Skull.

Such like Contuſions more frequently happen in Children, being eaſily perceived by the ſoftneſs and inundation of the contuſed part: forth of which oft-times when I have opened them with my Inciſion-Knife, ſerous clotted and blackiſh bloud hath iſſued. The reſidue of the Cure is perfected by moderate compreſſion of the part, and drying Medicins. Moreover the Skull of a Child may be preſſed down by a great Contuſion, even as we ſee it happens in thin Veſſels of Braſs, Lead, or Pewter, for oft-times by the preſſure of your finger, they are ſo dented in, that the print thereof remains; yet ſometimes they fly back of themſelves, and again acquire their former plainneſs and equability, which alſo happens in the bones of Children, Women, and ſuch as are ſoft, humid, and phlegmatick. But if the Bones do not ſpring back of themſelves, you muſt apply a Cupping-glaſs with a great flame; withall command the Patient to force his breath up as powerfully as he can, keeping his mouth and noſe cloſe ſhut; for thus there will be hope to reſtore the depreſſed Bone to its place, by the ſpirits forced upwards to the Brain and Skull, by the powerful attraction of the Cupping-glaſs. But if ſo be that the Bone cannot by this means be reſtored, then you muſt make an Inciſion in the skin, and faſten ſuch a Trepan as you ſee here delineated, into the depreſt or ſetled part of the Bone, and ſo pull it directly upwards; juſt as we ſee Coopers raiſe the ſtaves of their Caſk when they are ſunk too much in.

But if the Bone ſhall be too ſtrong, thick, and denſe, ſo that this Inſtrument will not ſerve to pluck it forth; then you muſt perforate the Skull in the very center of the depreſſion, and with this threefold Inſtrument or Levatory, put into the hole, lift up and reſtore the Bone to its natural ſite; for this ſame Inſtrument is of ſtrength ſufficient for that purpoſe. It is made with three feet, that ſo it may be applied to any part of the head which is round; but divers heads may be fitted to the end thereof, according as the buſineſs ſhall require, as the Figure here placed doth ſhew.

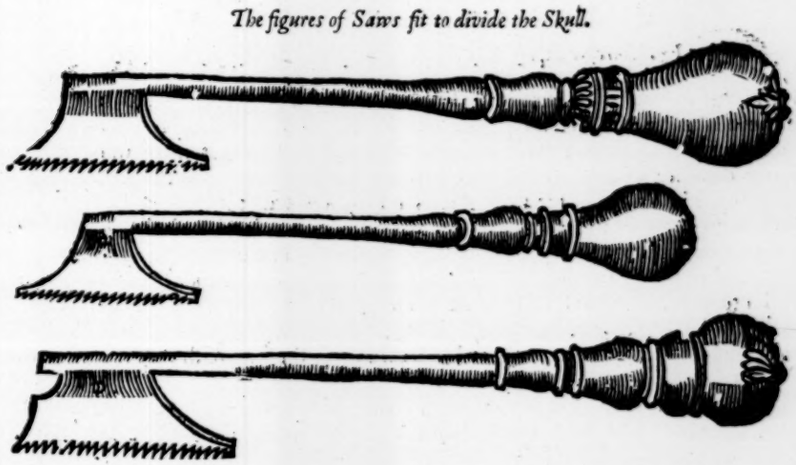
A three-footed Levatory.



But if at any time it comes to paſs that the Bone is not totally broken or depreſt, but onely on one ſide; it will be fit ſo to lift it up, as alſo to make a vent for the iſſuing out of the filth, to divide the Skull with little Saws like theſe which you ſee here expreſſed; for thus ſo much of the bone as ſhall be thought needful, may be cut off without compreſſion, neither will there be any danger of hurting the Brain or Membrane with the broken bone.

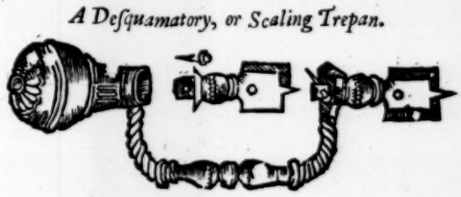
The

The figures of Saws fit to divide the Skull.



But if by ſuch ſigns as are preſent, and ſhall appear, we perceive or judge that the contuſion goes but to the ſecond Table, or ſcarce ſo far, the baring or taking away of the bone muſt go no farther than the contuſion reaches, for that will be ſufficient to eſchew and divert inflammations and divers other ſymptoms. And this ſhall be done with a ſcaling or Deſquamatory Trepan (as they term it) with which you may eaſily take up as much of the bone as you ſhall think expedient: And I have here given you the figure thereof.

A Deſquamatory, or Scaling Trepan.



A Delineation of other Levatories.

A A. *Shews the point or tongue of the Levatory, which muſt be ſomewhat dull, that ſo it may be the more gently and eaſily put between the* Dura Mater *and the Skull, and this part thereof may be lifted up ſo much by the head or handle taken in your hand, as the neceſſity of the preſent operation ſhall require.*

B *Intimates the body of the Levatory, which muſt be four ſquare, leſt the point or tongue put thereon ſhould not ſtand faſt, but the end of this body muſt reſt upon the ſound bone, as on a ſure foundation.*

The uſe thereof is thus, Put the point or tongue under the broken or depreſſed bone, then lift the handle up with your hand, that ſo the depreſſed bone may be elevated.

C *Shews the firſt Arm of the other Levatory, whoſe crooked end muſt be gently put under the depreſſed bone.*

D *Shews the other Arm, which muſt reſt on the ſound bone, that by the firm ſtanding thereof, it may lift up the depreſſed bone.*

CHAP. VI.

Of an Effracture, or depreſſion of the Bone, being the third kind of Fracture.

What a Contuſion is.

What an Effracture is.

The cauſe of Effractures.

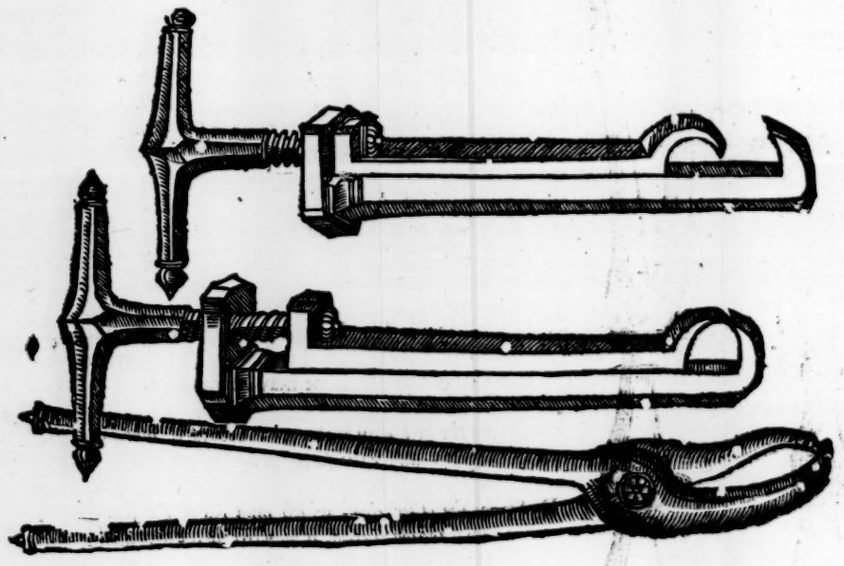
The Cure.

BEfore I come to ſpeak of an Effracture, I think it not amiſs to crave pardon of the courteous and underſtanding Reader, for this reaſon eſpecially, that as in the former Chapter, when I had determined and appointed to ſpeak of a Contuſion, I inſerted many things of a Depreſſion; ſo alſo in this Chapter of an Effracture, I intend to intermix ſomething of a Contuſion; we do not this through any ignorance of the thing it ſelf; for we know that it is called a Contuſion when the bone is depreſt and cruſht, but falls not down. But an Effracture is when the bone falls down, and is broken by a moſt violent blow. But it can ſcarce come to paſs, but that the things themſelves muſt be confounded and mixt, both as they are done, and alſo when they are ſpoken of; ſo that you ſhall ſcarce ſee a Contuſion without an Effracture, or this without that. Therefore the bones are often broken off and driven down with great and forcible blows, with clubs whether round or ſquare, or by falling from a high place directly down, more or leſs according to the force of the blow, kind of Weapon and condition of the Part receiving the ſame: Wherefore you muſt be provided with diverſity of remedies and inſtruments to encounter therewith. Wherefore admit the bone is preſſed down, and ſhivered into many pieces, now for that theſe ſplinters need not be taken out with a Trepan, you may do the buſineſs with Levatories made and neatly faſhioned for that purpoſe; ſuch as theſe, which here are expreſt.

A Levatory.

But we muſt have ſpecial care, leſt that in pulling and taking out of theſe ſcales and ſplinters we hurt the membranes. Theſe ſcales are ſometimes very rough and prickly, ſo that they cannot touch the *Meninges* without offence; but ſomewhiles the buſineſs is ſo intricate, that they cannot be taken out, unleſs by enlarging the fracture. Wherefore in this caſe, if there be a ſpace ſo large, as that the ends of theſe mullets may enter, you may eaſily ſhear off ſo much of the bone as ſhall be neceſſary and requiſite for the taking away of theſe ſcales without any aſſiſtance of the Trepan, which I have done very often, and with good ſucceſs; for the operation performed by theſe Mullets is far more ſpeedy and ſafe than that with the Trepan; and in the performance of every operation, the chief commendation is given to ſafeneſs and celerity.

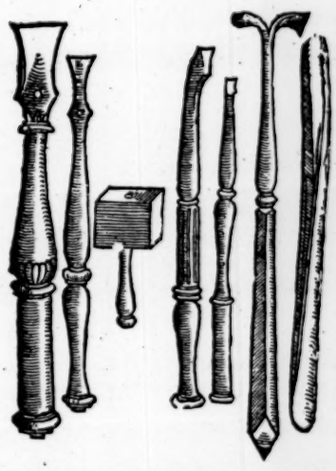
Cutting Mullets, commonly called Roſtra Pſittaci, *or Parrots Beaks.*



Moreover I have thought good here to give you the Figures of Chiſels, Scrapers, Pincers, together with a leaden Mallet, becauſe ſuch Inſtruments are not onely very neceſſary to take forth the ſcales of bones which are broken, but alſo to plain and ſmooth thoſe which remain whole.

The

The Figures of Serapers, Pincers, a leaden Mallet, &c.



But here you muſt note, that a Trepan or Levatory, muſt never be applied to a bone quite broken, leſt the membranes lying under it be hurt by the compreſſion thereof. Therefore you muſt apply them to a ſound bone, but as near as you can to the Fracture, ſo that you take away as little of the Skull as is poſſible, leſt the Brain deſpoiled of its bony cover, take ſome harm thereby. Neither Effractures, nor yet Fiſſures, if they be of ſome length, muſt be followed to their ends; but think your ſelf well, if you have made a paſſage for the iſſuing forth of the *ſanies* or filth, and have drawn forth that bone which pricked the membranes. For Nature is accuſtomed by generating a *Callus* to ſoulder, or unite the bones of the Skull, as it alſo doth thoſe of the other parts; as we have read it written by *Hippocrates* and *Galen*; for which purpoſe, it hath by ſingular providence repleniſhed both the tables of the Skull, with a certain alimentary and bloudy matter, that with this as with marrow it might repair the loſs and defect of the bone.

Hipp. lib. de vuln. cap. Gal. lib. 6. meth. cap. ult.

A Hiſtory. The truth hereof was lately manifeſted in the ſervant of Maſter *Grolo*, who had an Effracture on the coronal bone by a grievous blow given him with the foot of a Mule; which when I underſtood, I divided the muſculous skin with a three-cornered ſection in that place, with an intent to apply a Trepan there; wherefore the day following, the bone being bored, and when I thought to draw it forth, yea verily endeavoured to pluck it forth, being already divided with the Trepan, I perceived a fearful production of an Effracture, by the moveableneſs of the bone ſhaking under my hand, for it reached from the midſt of the Fore-head to the leſſer corner of the Eye. Wherefore omitting both my determination, and endeavour to pull it forth, I thought I ſhould do ſufficiently for the Patient if I ſhould onely raiſe up the bone which was depreſt, for ſo it did not trouble the *Craſſa Meninx* by preſſing it and the matter and filth were let forth by a paſſage made with a Saw. So that in concluſion, he recovered perfectly, but that he loſt one of his Eyes which was adjoining to the Fracture.

CHAP. VII.

Of a Seat, being the fourth kind of a broken Skull.

What a Seat is. HIppocrates calls a Seat that kind of Fracture of the Skull, when the Weapon ſo falls upon the Skull, that the Fracture retaining the print thereof, is neither ſtretched forth any further, nor contracted to any leſs ſpace.

The Cure. And ſeeing there be many forms hereof, they all (whether they ſhall be ſuperficiary, or ſhall pierce even to the *Diploe*, or elſe paſs through both the Tables, whether it be with any loſs of the bony ſubſtance, whether it run long ways, or elſe be but ſhort, or otherwiſe are dilated to ſome bredth or elſe be but narrow; whether they ſhall be done with a cut, or with a prick with a Dagger, Stylet-to, Lance, or other kind of Weapon, whether they ſhall have this or that accident joined with them, I ſay all of them, how many and various ſoever they be) ought and muſt be cured by ſome of the formerly deſcribed Inſtruments and means. Yet this muſt be noted which as yet we have not remembred, that if it happen by a violent ſtroak and great wound, that a portion of the bone is wholly ſo cut off that it is clean ſevered from the reſt of the Skull, and hang onely by the *Pericranium* and the muſculous skin; yet you muſt not pluck it from the *Pericranium*, and caſt it away as unprofitable, but reſtore it to its proper ſeat and place, ſo by the force of Nature, to be glewed by a *Callus*, as *Celſus* hath obſerved.

Lib. 8. cap. 4.

A Hiſtory. I have tried the truth of this experiment in Captain *Hydron*, not very long ago. He had the middle part of the *Os Coronale*, of the bredth and length of three fingers, ſo cut with a ſharp Sword that it ſtuck not to the reſt of the bone; but ſcarce adhering to the *Pericranium* and muſculous skin lay turned down over his face, ſo that the *Dura Mater* was plainly ſeen; wherefore I prepared to pluck it from the skin, and caſt it away, but that I remembred *Hippocrates* Precept, where he bids, that the Brain ſhould not be robbed of its cover and left bare. Wherefore firſt of all I wiped away the bloud which was fallen upon the *Dura Mater*, whoſe motion you might plainly ſee, then I reſtored the portion of the bone to its place, and faſtned it on the upper ſide with a Suture conſiſting of three ſtitches; and that the reſidue of the matter might have paſſage forth, I filled the places between each ſtitch with lint: by this means, he by the mercy of God recovered, though at the ſame time he received many other large wounds in his body; which is a certain experiment, that we muſt caſt away no part of the Skull nor of the *Pericranium*, no not of the muſculous skin, unleſs neceſſity urge, therefore much leſs to leave the Brain naked and deſpoiled of its coverings.

CHAP. VIII.

Of a Reſonitus, *or Counter-Fiſſure, being the fifth kind of Fracture.*

What a *Reſonitus* is.

SOmetimes the Fracture is made in the part oppoſite to that which received the blow; as if the right ſide be ſtruck, the left is cloven; this kind of Fracture is very dangerous, becauſe we cannot find it out by any certain ſign, as it is written by *Hippocrates*, *Lib. de Vuln. Capitis*. Wherefore if at any time the Patient die of ſuch a Fracture, the Chirurgeon muſt be pardoned.

Lib.6.cap.90.

And although *Paulus Ægineta* laugh at this kind of Fracture, and thinks that it cannot happen to a mans head, as that which is hard and full, as it happens in empty Glaſs Bottles, yet I have ſometimes ſeen and obſerved it.

In whom this fracture may take place in divers bones of the skull.

Neither is their reaſon of any validity, who think Nature therefore to have framed the Head of many bones knit together by ſutures; leſt the fracture of the one ſide, ſhould be ſtretched to the other. For peradventure this may take place in ſuch as have expreſs ſutures, ſeated and framed according to Nature. But it takes no place in ſuch as either want them, or have them not ſeated according to Nature, or have them very cloſe and ſo defaced that it may ſeem one Bone grown together of many; This ſhall be made manifeſt by recital of the following Hiſtory.

A Hiſtory.

A ſervant of *Maſſus* the Poſt-maſter, had a grievous blow with a ſtone upon the right *Bregma*, which made but a ſmall wound, yet a great Contuſion and Tumor. Wherefore that it might more plainly appear, whether the Bone had received any harm, and alſo that the congealed bloud might be preſſed forth, the wound was dilated, the skin being open by *Theodore Hereus* the Chirurgeon, who as he was a skilful workman, and an honeſt man, omitted nothing which Art might do for his cure. When he had divided the skin, the bone was found whole, although it was much to be feared that it was broken, becauſe he fell preſently to the ground with the blow, vomited, and ſhewed other ſigns of a fractured skull; ſo it happened that he died on the one and twentieth day of his ſickneſs. But I being called to learn, and ſearch how he came by his death, dividing the skull with a Saw, found in the part oppoſite to the blow, a great quantity of *ſanies*, or bloudy matter, and an Abſceſs in the *Craſſa Meninx*, and alſo in the ſubſtance of the very Brain, but no ſutures but the two ſcaly ones. Therefore that is certain which is now confirmed by the authority of *Hippocrates*, as alſo by reaſon and experience, that a blow may be received on the one ſide, and the bone may be fractured on the oppoſite, eſpecially in ſuch as have either no ſutures, or elſe ſo firmly united and cloſed, that they are ſcarce apparent.

The *Reſonitus* may be in the ſame bone of the skull.

Neither is it abſurd, that the part oppoſite to that which received the ſtroak, of the ſame bone and not of divers bones may be cloven, and in thoſe men who have their skulls well made, and naturally diſtinguiſhed and compoſed with ſutures; and this both was, and is the true meaning of *Hippocrates*. That this may be the better underſtood, we muſt note that the oppoſite part of the ſame bone may be underſtood two manner of ways. Firſt, When the fracture is in the ſame ſurface of the ſmitten bone, as if that part of one of the bones of the *Bregma*, which is next to the Lambdal ſuture be ſmitten, and the other part next to the Coronal ſuture be cloven. Secondly, When as not the ſame ſuperficies and table which receives the blow, but that which lies under it is cleft, which kind of fracture

A Hiſtory.

I obſerved in a certain Gentleman, a Horſeman of Captain *Stempans* Troop; He in defending the breach of the Wall of the Caſtle of *Hiſdin*, was ſtruck with a Muſquet bullet upon the *Bregma*, but had his Helmet on his head, the bullet dented in the Helmet but did not break it, no nor the muſculous skin, nor skull, for as much as could be diſcerned, yet notwithſtanding he died apoplectick upon the ſixth day after.

But I being very deſirous to know what might be the true cauſe of his death, dividing his skull, obſerved that the ſecond Table was broken, and caſt off ſcales and ſplinters, wherewith as with Needles the ſubſtance of the Brain was continually pricked, the firſt and upper table being whole for all this: I afterwards ſhewed the like example to *Capellanus* and *Caſtellanus*, the King and Queens chief Phyſicians, in the expedition of *Roan*.

Why *Hippocrates* ſet down no way to cure a *Reſonitus*.

The manner to know when the skull is fractured by a *Reſonitus*.

But *Hippocrates* preſcribes no method of curing this fifth kind of fracture, by reaſon he thinks it cannot be found out by any circumſtance, whence it happens that it is for the moſt part deadly: Yet muſt we endeavour to have ſome knowledge and conjecture of ſuch a fracture, if it ſhall at any time happen. Wherefore having firſt diligently ſhaven away the hair, we muſt apply an Emplaiſter of Pitch, Tar, Wax, Turpentine, the Powder of *Iris*, or Flower-de-luce roots and Maſtich; now if any place of the head ſhall appear more moiſt, ſoft, and ſwollen, it is ſomewhat likely that the bone is cleft in that place, ſo that the Patient, though thinking of no ſuch thing, is now and then forced to put his hand to that part of the skull. Confirmed with theſe and other ſigns formerly mentioned, let him call a Council of learned Phyſicians; and fore-tell the danger to the Patients friends which are there preſent, that there may no occaſion of calumny remain, then let him boldly perforate the skull, for that is far better than forſake the Patient ready to yield to the greatneſs of the hidden diſeaſe, and ſo conſequently to die within a ſhort while after. There are four ſorts or conditions of fractures, by which the Chirurgeon may be ſo deceived, that when the skull is broken indeed, yet he may think there is no fracture. The firſt is when the bone is ſo depreſſed, that it preſently riſes up into its true place and native equability. The ſecond is when the Fiſſure is onely capillary. The third is when the bone is ſhaken on the inſide, the utter ſurface nevertheleſs remaining whole, for aſmuch as can be diſcerned. The fourth is, when the bone is ſtricken on the one ſide, and cleft on the other.

CHAP.

CHAP. IX.

Of the moving, or concuſſion of the Brain.

BEſides the mentioned kinds of Fractures by which the Brain alſo ſuffers, there is another kind of affect beſides Nature, which alſo aſſails it by the violent incurſion of a cauſe in like manner external; they call it the commotion or ſhaking of the Brain, whence Symptoms like thoſe of a broken skull enſue. Falling from aloft upon a ſolid and hard body, dull and heavy blows, as with Stones, Clubs, Staves, the report of a piece of Ordnance, or crack of Thunder, and alſo a blow with ones hand. *Gal. lib. 2. de comp. medic. cap. 6. & com. ad Aph. 58. ſect. 7.*

Thus as *Hippocrates* tells, that beautiful Damoſel the daughter of *Nerius*, when ſhe was twenty years old, was ſmitten by a Woman, a friend of hers playing with her, with her flat hand upon the fore-part of the head, and then ſhe was taken with a giddineſs, and lay without breathing, and when ſhe came home, ſhe fell preſently into a great Fever, her head aked, and her face grew red. The ſeventh day after, there came forth ſome two or three ounces of ſtinking and bloudy matter about her right Ear, and ſhe ſeemed ſomewhat better, and to be at ſomewhat more eaſe. The Fever increaſed again, and ſhe fell into a heavy ſleepineſs, and loſt her ſpeech, and the right ſide of her face was drawn up, and ſhe breathed with difficulty, ſhe had alſo a convulſion and trembling, both her tongue failed her, and her eyes grew dull, on the nineth day ſhe died. *Lib. 5. Epidem.* But you muſt note, that though the head be armed with a Helmet, yet by the violence of a blow the Veins and Arteries may be broken, not onely theſe which paſs through the ſutures, but alſo thoſe which are diſperſed between the two Tables in the *Diploe*, both that they might bind the *Craſſa Meninx* to the skull, that ſo the Brain might move more freely, as alſo that they might carry the alimentary juice to the Brain wanting Marrow, that is, bloud to nouriſh it, as we have formerly ſhewed in our Anatomy. The Veſſels of the brain broken by the commotion thereof.

But from hence proceeds the efflux of bloud running between the skull and membranes, or elſe between the membranes and brain; the bloud congealing there, cauſeth vehement pain, and the eyes become blind, Vomiting is cauſed, the mouth of the ſtomach ſuffering together with the Brain, by reaſon of the Nerves of the ſixth conjugation, which run from the Brain thither, and from thence are ſpread over all the capacity of the ventricle; whence becoming a partaker of the offence, it contracts it ſelf, and is preſently, as it were, overturned; whence firſt thoſe things that are contained therein are expelled, and then ſuch as may flow, or come thither from the neighbouring and common parts, as the Liver and Gall; from all which choler, by reaſon of its natural levity and velocity is firſt expelled, and that in greateſt plenty; and this is the true reaſon of that vomiting, which is cauſed and uſually follows upon fractures of the Skull and concuſſions of the Brain. Signs. *Celſus.* The cauſe of vomiting when the head is wounded.

Within a ſhort while after, inflammation ſeizes upon the membranes and brain it ſelf, which is cauſed by corrupt and putrid bloud proceeding from the veſſels broken by the violence of the blow, and ſo ſpread over the ſubſtance of the Brain. Such inflammation communicated to the Heart, and whole body by the continuation of the parts, cauſes a Fever. But a Fever by altering the Brain, cauſes Doting; to which if ſtupidity ſucceed, the Patient is in very ill caſe, according to that of *Hippocrates*; Stupidity and doting, are ill in a wound, or blow upon the Head. *Aph. 14. ſect. 9.* But if to theſe evils, a Sphacel, and corruption of the Brain enſue, together with a great difficulty of breathing, by reaſon of the diſturbance of the animal faculty, which from the Brain imparts the power of moving to the Muſcles of the Cheſt, the Inſtruments of Reſpiration; then death muſt neceſſarily follow.

A great part of theſe accidents appeared in King *Henry* of happy memory, a little before he died. A Hiſtory. He having ſet in order the affairs of *France*, and entered into amity with the neighbouring Princes, deſirous to honour the marriages of his Daughter and Siſter with the famous and noble exerciſe of Tilting, and he himſelf running in the Tilt-yard, with a blunt lance received ſo great a ſtroak upon his breſt, that with the violence of the blow, the vizour of his Helmet flew up, and the trunchion of the broken Lance hit him above the left Eye-brow, and the muſculous skin of the Fore-head was torn even to the leſſer corner of the left Eye, many ſplinters of the ſame Trunchion being ſtruck into the ſubſtance of the fore-mentioned Eye, the Bones being not touched or broken, but the Brain was ſo moved and ſhaken, that he died the eleventh day after the hurt. His Skull being opened after his death, there was a great deal of bloud found between the *Dura* and *Pia Mater*, poured forth in the part oppoſite to the blow, at the middle of the ſuture of the hind-part of the head; and there appeared ſigns, by the native colour turned yellow, that the ſubſtance of the Brain was corrupted, as much as one might cover with ones Thumb. Which things cauſed the death of the moſt Chriſtian King, and not onely the wounding of the Eye, as many have falſly thought. For we have ſeen many others, who have not died of far more grievous wounds in the Eye. What was the neceſſary cauſe of the death of King *Henry* the ſecond, of *France*.

The Hiſtory of the Lord *Saint-Johns* is of late memory: He in the Tilt-yard made for that time before the Duke of *Guiſes* houſe, was wounded with a ſplinter of a broken Lance, of a fingers length and thickneſs, through the vizour of his helmet, it entering into the Orb under the eye, and piercing ſome three fingers bredth deep into the head; by my help and Gods favour, he recovered, *Valeranus* and *Duretus* the Kings Phyſicians, and *James* the Kings Chirurgeon aſſiſting me. A Hiſtory.

What ſhall I ſay of that great and very memorable wound of *Francis* of *Lorain* the Duke of *Guiſe*? He in the fight of the City of *Bologne* had his head ſo thruſt through with a Lance, that the point entering under his right Eye by his Noſe, came out at his Neck between his Ear and the *Vertebræ*, the Head or Iron being broken and left in by the violence of the ſtroak, which ſtuck there ſo firmly, that it could not be drawn or plucked forth, without a pair of Smiths Pincers. But although the ſtrength and violence of the blow was ſo great, that it could not be without a fracture of the Bones, a tearing and breaking of the Nerves, Veins, and Arteries, and other parts; yet the generous Prince by the favour of God recovered. A Hiſtory.

By which you may learn, that many die of ſmall wounds, and other recover of great, yea, very large

Why ſome die of ſmall wounds, and others recover of great.

large and deſperate ones. The cauſe of which events is chiefly and primarily to be attributed to God, the Authour and Preſerver of Mankind; but ſecondarily to the variety and condition of Temperaments. And thus much of the commotion or concuſſion of the Brain; whereby it happens, that although all the Bone remains perfectly whole, yet ſome Veins broken within by the ſtroak, may caſt forth ſome bloud upon the membranes of the Brain, which being there concrete, may cauſe great pain, by reaſon whereof it blinds the Eyes; if ſo be that the place can be found againſt which the pain is, and when the Skin is opened, the bone look pale, it muſt preſently be cut out, as *Celſus* hath written. Now it remains that we tell you how to make your Prognoſticks, in all the forementioned Fractures of the skull.

CHAP. X.

Of Prognoſticks to be made in Fractures of the Skull.

Hip. de vul. cap.

WE muſt not neglect any Wounds in the Head, no not thoſe which cut or bruiſe but onely the hairy ſcalp, but certainly much leſs, thoſe which are accompanied by a fracture in the Skull, for oft-times all horrid ſymptoms follow upon them, and conſequently death it ſelf, eſpecially in bodies full of ill humours, or of an ill-habit, ſuch as are theſe which are affected with the *Lues Venerea*, Leproſie, Dropſie, Pthyſick, Conſumption: for in theſe, ſimple wounds are hardly or never cured; for union is the cure of wounds, but this is not performed unleſs by the ſtrength of Nature, and ſufficient ſtore of laudable bloud: but thoſe which are ſick of hectick Fevers and Conſumptions want ſtore of bloud, and thoſe bodies which are replete with ill humours, and of an ill habit, have no afflux or plenty of laudable bloud: but all of them want the ſtrength of Nature; the reaſon is almoſt the ſame in thoſe alſo which are lately recovered of ſome Diſeaſe.

Whether the wounds of children, or old people are better to heal.

Thoſe Wounds which are bruiſed are more difficult to cure, than thoſe which are cut. When the Skull is broken, then the continuity of the fleſh lying over it muſt neceſſarily be hurt and broken, unleſs it be in a *Reſonitus*. The bones of children are more ſoft, thin, and repleniſhed with a ſanguin humidity than thoſe of old men, and therefore more ſubject to putrefaction; Wherefore the Wounds which happen to the bones of children, though of themſelves and their own Nature they may be more eaſily healed, (becauſe they are more ſoft, whereby it comes to paſs, that they may be more eaſily agglutinated, neither is there fit matter wanting for their agglutination by reaſon of the plenty of bloud laudable both in conſiſtence and quality) than in old men, whoſe bones are drier and harder, and ſo reſiſt union, which comes by mixture, and their bloud is ſerous, and conſequently a more unfit bond of unity and agglutination; yet oft-times through occaſion of the ſymptoms which follow upon them, that is, putrefaction and corruption, which ſooner ariſe in a hot and moiſt body, and are more ſpeedily increaſed in a ſoft and tender, they uſually are more ſuſpected, and difficult to heal.

The Patient lives longer of a deadly fracture in the Skull in Winter than in Summer, for that the native heat is more vigorous in that time than in this; beſides alſo, the humours putrefie ſooner in Summer, becauſe then unnatural heat is eaſily inflamed, and more predominant, as many have obſerved out of *Hippocrates*.

Aph. 15. *ſect.* 1.

The Wounds of the Brain and of the *Meninges* or Membranes thereof are moſt commonly deadly, becauſe the action of the Muſcles of the Cheſt, and others ſerving for reſpiration, is divers times diſturbed and intercepted, whence death enſues. If a ſwelling happening upon a Wound of the head preſently vaniſh away, it is an ill ſign, unleſs there be ſome good reaſon therefore, as Bloud-letting,

Aph. 65. *ſect.* 5.

Purging, or the uſe of reſolving local Medicins, as may be gathered by *Hippocrates* in his Aphoriſms. If a Fever enſue preſently after the beginning of a wound of the head, that is, upon the fourth or ſeventh day, which uſually happens, you muſt juge it to be occaſioned by by the generating of *Pus* or

Aph. 47. *ſect.* 2.

Matter, as it is recited by *Hippocrates*. Neither is ſuch a Fever ſo much to be feared, as that which happens after the ſeventh day, in which time it ought to be terminated; but if it happen upon the tenth or fourteenth day with cold or ſhaking, it is dangerous, becauſe it makes us conjecture that there is putrefaction in the Brain, the *Meninges* or Skull, through which occaſion it may ariſe, chiefly if other ſigns ſhall alſo concur, which may ſhew any putrefaction, as if the wound ſhall be pallid and of a faint yellowiſh colour, as fleſh looks after it is waſhed.

Wounds which are dry, rough, livid, and black, are evil.

For as it is in *Hippocrates Aphoriſ.* 2. *Sect.* 7. It is an ill ſign if the fleſh look livid, when the bone is affected; for that colour portends the extinction of the heat, through which occaſion the lively or indifferently red colour of the part, faints and dies, and the fleſh thereabout is diſſolved into a viſcid *Pus* or filth.

Commonly another worſe affect follows hereon, wherein the wound becoming withered and dry, looks like ſalted fleſh, ſends forth no matter, is livid and black, whence you may conjecture, that the bone is corrupted, eſpecially if it become rough, whereas it was formerly ſmooth and plain, for it is made rough when *Caries* or corruption invades it; but as the *Caries* increaſes, it becomes livid and black, ſanious matter withall ſweating out of the *Diploe*, as I have obſerved in many: all which are ſigns that the native heat is decayed, and therefore death at hand; but if ſuch a Fever be occaſioned

The ſigns of a Fever cauſed by an *Eryſipelas*.

from an *Eryſipelas*, which is either preſent or at hand, it is uſually leſs terrible. But you ſhall know by theſe ſigns that the Fever is cauſed by an *Eryſipelas* and conflux of cholerick matter; if it keep the form of a Tertian, if the fit take them with coldneſs and end in a ſweat, if it be not terminated before the cholerick matter is either converted into *Pus*, or elſe reſolved; if the lips of the wound be ſomewhat ſwollen, as alſo all the face; if the eyes be red and fiery; if the neck and chaps be ſo ſtiff,

Why an *Eryſipelas* chiefly aſſails the face

that he can ſcarce bend the one, or open the other; if there be great exceſs of biting and pricking pain and heat, and that far greater than in a *Phlegmon*. For ſuch an *Eryſipelous* diſpoſition generated of thin and hot bloud, chiefly aſſails the face, and that for two cauſes.

The

The firſt is, by reaſon of the natural levity of the cholerick humour, the other becauſe of the rarity of the skin of theſe parts.

The cure of ſuch an affect muſt be performed by two means, that is, evacuation, and cooling with humectation. If choler alone cauſe this tumor, we muſt eaſily be induced to let bloud, but we muſt purge him with Medicins evacuating choler. If it be an *Eryſipelas Phlegmonodes*, you muſt draw bloud from the Cephalick Vein of that ſide which is moſt affected, always uſing advice of a Phyſician. Having uſed theſe general means, you muſt apply refrigerating and humecting things, ſuch as are the Juice of Nightſhade, Houſleek, Purſlane, Lettuce, Navel-wort, Water-Lentil, or Ducks-meat, Gourds, a Liniment made of two handfulls of Sorrel boiled in fair Water, then beaten or drawn through a ſearce, with ointment of Roſes or ſome *unguent. Populeon* added thereto will be very commodious. Such and the like remedies muſt be often and ſo long renewed until the unnatural heat be extinguiſhed. But we muſt be careful to abſtain from all unctuous and oily things, becauſe they may eaſily be inflamed, and ſo increaſe the Diſeaſe. Next we muſt come to reſolving Medicins; but it is good when any thing comes from within, to without; but on the contrary, it is ill when it runs from without inwards, as experience and the authority of *Hippocrates* teſtifie: If, when the bone ſhall become purulent, puſtules ſhall break out on the tongue by the dropping down of the acrid filth or matter by the holes of the palat upon the tongue, which lies under; now when this ſymptom appears, few eſcape. Alſo it is deadly when one becomes dumb and ſtupid, that is, Apoplectick by a ſtroak or wound on the Head; for it is a ſign that not onely the Bone, but alſo the Brain it ſelf is hurt. But oft-times the hurt of the Brain proceeds ſo far, that from corruption it turns to a Sphacel, in which caſe they all have not onely puſtules on their tongues, but ſome of them die ſtupid and mute, otherſome with a Convulſion of the oppoſite part; neither as yet I have obſerved any which have died with either of theſe ſymptoms, by reaſon of a wound in the Head, who have not had the ſubſtance of their Brain tainted with a Sphacel, as it hath appeared when their Skulls have been opened after their death.

The cure of an *Eryſipelas* on the face.

Why Oily things muſt not be uſed in an *Eryſipelas* of the Face. *Aph.* 25. *ſect.* 6.

Deadly ſigns in wounds of the head.

CHAP. XI.

Why, when the Brain is hurt by a Wound of the Head, there may follow a Convulſion of the oppoſite part.

MAny have to this day enquired, but as yet as far as I know it hath not been ſufficiently explained, Why a Convulſion in wounds of the Head ſeizes on the part oppoſite to the blow. Therefore I have thought good to end that Controverſie in this place. My reaſon is this, that kind of ſymptom happens in the ſound part by reaſon of emptineſs and dryneſs; but there is a twofold cauſe, and that wholly in the wounded part, of this emptineſs and dryneſs of the ſound or oppoſite part, to wit, pain, and the concourſe of the ſpirits and humours thither by the occaſion of the Wound, and by reaſon of the Pains drawing, and Natures violently ſending help to the affected part.

A Convulſion is cauſed by dryneſs.

A two-fold cauſe of Convulſifick dryneſs.

The ſound part exhauſted by this means both of the ſpirits and humours, eaſily falls into a Convulſion. For thus *Galen* writes; God the Creator of Nature hath ſo knit together the triple ſpirituous ſubſtance of our bodies, with that tie and league of concord, by the production of the paſſages, to wit, of Nerves, Veins, and Arthries, that if one of theſe forſake any part, the reſt preſently neglect it, whereby it languiſheth, and by little and little dies through defect of nouriſhment. But if any object that Nature hath made the body double for this purpoſe, that when one part is hurt, the other remaining ſafe and ſound, might ſuffice for life and neceſſity: but I ſay this Axiom hath no truth in the veſſels and paſſages of the body. For it hath not every where doubled the veſſels, for there is but one onely Vein appointed for the nouriſhment of the Brain, and the Membranes thereof, which is that they call the *Torcular*, by which when the left part is wounded, it may exhauſt the nouriſhment of the right and ſound part, and through that occaſion cauſe it to have a Convulſion by too much dryneſs. Verily it is true, that when in the oppoſite parts the Muſcles of one kind are equal in magnitude, ſtrength, and number, the reſolution of one part makes the convulſion of the other by accident; but it is not ſo in the Brain.

Lib. 4. *de uſu Partium.*

For the two parts of the Brain, the right and left, each by it ſelf performs that which belongs thereto, without the conſent, conſpiration, or commerce of the oppoſite part; for otherwiſe it ſhould follow that the Palſie properly ſo called, that is, of half the body, which happens by reſolution, cauſed either by mollification, or obſtruction, reſiding in either part of the Brain, ſhould infer together with it a Convulſion of the oppoſite part. Which notwithſtanding, daily experience convinceth as falſe. Wherefore we muſt certainly think, that in Wounds of the Head wherein the Brain is hurt, that Inanition and want of nouriſhment are the cauſes that the ſound and oppoſite part ſuffers a Convulſion.

Francis Dalechampius in his *French* Chirurgery renders another reaſon of this queſtion; That (ſaith he) the truth of this propoſition may ſtand firm and ratified, we muſt ſuppoſe that the Convulſion of the oppoſite part mentioned by *Hippocrates*, doth then onely happen, when by reaſon of the greatneſs of the inflammation in the hurt part of the Brain, which hath already inferred corruption, and a Gangrene to the Brain and Membranes thereof, and within a ſhort time is ready to cauſe a Sphacel in the Skull, ſo that the Diſeaſe muſt be terminated by death; for in this defined ſtate of the Diſeaſe, and theſe conditions, the ſenſe and motion muſt neceſſarily periſh in the affected part, as we ſee it happens in other Gangrenes, through the extinction of the native heat. Beſides, the paſſages of the animal ſpirit muſt neceſſarily be ſo obſtructed by the greatneſs of ſuch an inflammation or phlegmon, that it cannot flow from thence to the parts of the ſame ſide lying thereunder, and to the neighbouring parts of the Brain; and if it ſhould flow thither, it will be unprofitable to carry the ſtrength and faculty of ſenſe and motion, as that which is infected and changed by admixture of putrid and Gangrenous vapours. Whereby it cometh to paſs, that the wounded part deſtitute of ſenſe, is not ſtirred up to expel that which would be troubleſom to it, if it had ſenſe; wherefore neither are the Nerves thence ariſing ſeized upon, or contracted by a Convulſion.

Opinion of *Dalechampius.*

It furthermore comes to paſs, that becauſe theſe ſame Nerves are deprived of the preſence and comfort of the animal ſpirit, and in like manner the parts of the ſame ſide, drawing from thence their ſenſe and motion, are poſſeſſed with a Palſie; for a Palſie is cauſed either by the cutting or obſtruction of a Nerve, or the madefaction, or mollification thereof, by a thin and watery humour, or ſo affected by ſome vehement diſtemper, that it cannot receive the animal ſpirit.

But for the oppoſite part and the Convulſion thereof, it is known and granted by all, that a Convulſion is cauſed either by Repletion, which ſhorten the Nerves by diſtending them into bredth; or by Inanition, when as the native and primitive heat of the Nerves being waſted, their proper ſubſtance becoming dry, is wrinkled up and contracted; or elſe it proceeds from the vellication and acrimony of ſome vapour, or ſanious and biting humour, or from vehemency of pain. So we have known the Falling-ſickneſs cauſed by a venenate exhalation carried from the Foot to the Brain. Alſo we know that a Convulſion is cauſed in the puncture of the Nerve, when as any acrid and ſanious humour is ſhut up therein, the orifice thereof being cloſed; but in Wounds of the Nerves, when any Nerve is half cut, there happens a Convulſion by the bitterneſs of the pain.

But verily in the oppoſite part, there are manifeſtly two of theſe cauſes of a Convulſion; that is to ſay, a putrid and carion-like vapour, exhaling from the hurt and gangrenate part of the Brain; and alſo a virulent, acrid, and biting *ſanies* or filth ſweating into the oppoſite ſound part, from the affected and gangrenous; the malignity of which *ſanies*, *Hippocrates* deſirous to decipher, in reckoning up the deadly ſigns of a wounded head, hath expreſſed it by the word *Ichor*; and in his Book of Fractures he hath called this humour *Dacryodes & non Pyon*, [that is, *Weeping and not digeſted.*] Therefore it is no marvail, if the oppoſite and ſound part endued with exquiſite and perfect ſenſe, and offended by the flowing thereto of both the vaporous and ſanious matter, uſing its own force, contend and labour as much as it can, for the expulſion of that which is troubleſom thereto. This labouring or concuſſion is followed (as we ſee in the Falling-ſickneſs) by a Convulſion, as that which is undertaken in vain, Death being now at hand, and Nature over-ruled by the Diſeaſe. Thus (ſaith *Dalechampius*) muſt we in my judgment determine of that propoſition of *Hippocrates* and *Avicen.*

But he adds further, In Wounds of the Head which are not deadly, Practitioners obſerve that ſometimes the hurt part is taken with the Palſie, and the ſound with a Convulſion; otherwhiles on the contrary, the wounded part is ſeized by a Convulſion, and the ſound by a Palſie; otherwhiles both of them by a Convulſion or Palſie, and ſomewhiles the one of them by a Convulſion or Palſie, the other being free from both affects; the cauſes of all which belong not to this place to explain. Thus much *Dalechampius.*

CHAP. XII.

A Concluſion of the deadly ſigns in the Wounds of the Head.

The ſigns of a deadly wound from the depraved faculties of the mind.

From the habit of the body.

From the time that ſuch ſigns appear.

NOw that we may return to our former Diſcourſe; you may certainly fore-tell the Patient will die, when his reaſon and judgment being perverted, he ſhall talk idly, when his memory fails him, when he cannot govern his tongue, when his ſight grows dark and dim, his ears deaf, when he would caſt himſelf headlong from his Bed, or elſe lies therein without any motion; when he hath a continual Fever with a *Delirium*, when the Tongue breaks out in Puſtules, when it is chopt and become black by reaſon of too much drineſs, when the Wound grows dry and caſts forth little or no matter; when as the colour of the Wound which was formerly freſh, is now become like ſalted fleſh yellow and pale; when the Urin and other excrements are ſuppreſt; when the Palſie, Convulſion, Apoplexy; and laſtly, often ſwooning, with a ſmall and unequal pulſe invade him. All ſuch ſigns ſometimes appear preſently after the wound, otherwhiles ſome few days after; therefore when as the Brain is hurt and wounded by the violence of the Inciſion or Fiſſure, of the Contuſion, Compreſſion, Puncture, Concuſſion, or any other Fracture, the fore-mentioned ſigns appear preſently in the firſt days; but when they do not appear till many days after the blow, you may know that they riſe and appear, by reaſon of an inflammation and phlegmon in the Brain, occaſioned by the putrefaction of the bloud poured forth upon it.

Celſus lib. 8. cap. 4.

But we muſt obſerve this by the way, which alſo belongs to the Prognoſticks, that fleſh is eaſily regenerated and reſtored in all parts of the Head, except in that part of the Forehead which is a little above that which lies between the Eye-brows, ſo that it will be ulcerated ever after, and muſt be covered with a Plaſter. I believe that in that place there is an internal cavity in the Bone, full of air, which goes to the ſieve-like bones of the Noſe, by which the growth of fleſh may be hindered; or elſe that the bone is very denſe or compact in that place, ſo that there can ſcarce ſufficient Juice ſweat forth, which may ſuffice for the regeneration of fleſh; add hereunto a great conflux of excrements flowing to this ulcer, which ſhould otherwiſe be evacuated by the Eyes and Noſe, which hinder by that means the drineſs of the Ulcer, and conſequently the healing thereof.

Hence certainly it comes to paſs, that if you deſire the Patient thus affected to breath, ſhutting his mouth and noſe, the air or breath will come forth of the Ulcer with ſuch force, as it will eaſily blow forth a lighted Candle of an indifferent bigneſs held thereto. Which thing, I proteſt, I obſerved in a certain man, whom I was forced to trepan in that place, by reaſon the bone of the fore-head was broken and depreſſed.

CHAP. XIII.

Of ſalutary Signs in Wounds of the Head.

But on the contrary, theſe are ſalutary ſigns; when the Patient hath no Fever, is in his right mind, is well at the application or taking of any thing; ſleeps well, hath his Belly ſoluble, the Wound looks with a freſh and lively colour, caſts forth digeſted and laudable matter, the *Craſſa Meninx* hath its motion free and no way hindered.

When the Patients are out of danger.

Yet we muſt note, which alſo is obſerved by the Ancients, and confirmed by experience, that we muſt think none paſt danger, and free from all chance, until the hundredth day be paſt. Wherefore the Phyſician ought ſo long to have a care of his Patient, that is, to conſider how he behaves and governs himſelf in meat, drink, ſleep, venery, and other things.

The Patient muſt beware of cold.

But let the Patient diligently avoid and ſhun cold, for many when they have been cured of Wounds in the head, by careleſs taking cold have been brought into danger of their lives. Alſo you muſt know that the *Callus*, whereby the bones of the Skull are knit together, requires almoſt the ſpace of forty or fifty days to its perfect coagmentation and concretion. Though in very deed one cannot ſet down a certain number of days, by reaſon of the variety of bodies or tempers: for it is ſooner finiſhed in young men, and more ſlowly in old: and thus much may ſerve for prognoſticks. Now will we treat as briefly and perſpicuouſly as we can of the cure both in general and particular; wherefore beginning with the general, we will firſt preſcribe a convenient Diet, by the moderate uſe of the ſix things not natural.

CHAP. XIV.

Of the general cure of a broken Skull, and of the Symptoms uſually happening thereupon.

How the air ought to be.

The firſt cure muſt be to keep the Patient in a temperate air; and if ſo be that it be not ſuch of it ſelf and its own proper nature, it muſt be corrected by Art. As in Winter he muſt have a clear fire made in his chamber, leſt the ſmoak cauſe ſneezing and other accidents; and the windows and doors muſt be kept ſhut to hinder the approach of the cold air and wind. All the time the wound is kept open to be dreſt, ſome body ſtanding by ſhall hold a Chafingdiſh full of Coals, or a heated Iron bar over the wound, at ſuch a diſtance, that a moderate heat may paſs thence to the Wound; and the frigidity of the encompaſſing air may be corrected by the breathing of the diffuſed heat. For cold, according to the opinion of *Hippocrates*, is an Enemy to the Brain, Bones, Nerves, and ſpinal Marrow; it is alſo hurtful to Ulcers, by ſuppreſſing their excrements, which ſuppreſt do not onely hinder ſuppuration, but alſo by corroſion makes them ſinuous. Therefore *Galen* rightly admoniſheth us, to keep cold from the Brain, not onely in the time of trepaning, but alſo afterwards. For there can be no greater, nor more certain harm befal the fractured skull, than by admitting the air, by ſuch as are unskilful. For if the air ſhould be hotter than the Brain, then it could not thence be refrigerated; but if the Brain ſhould be laid open to the air in the midſt of Summer, when it is at the hotteſt, yet would it be refrigerated; and unleſs it were relieved with hot things, take harm. This is the opinion of *Galen*, whereby you may underſtand that many who have their Skulls broken, die more through default of skill in the curing, than by the greatneſs of the fracture.

Aphor. 18. *ſect.* 5.

Lib. 2. *de uſ. part. cap.* 2.

The Air though in Summer is colder than the Brain.

But when the Wound is bound up (with the Pledgets, Cloths, and Rowlers, as is fit) if the air chance to be more hot than the Patient can well indure, let it be amended by ſprinkling, and ſtrewing the chamber with cold Water, Oxycrate, the branches of Willows and Vine. Neither is it ſufficient to ſhun the too cold air, unleſs alſo you take heed of the over light, chiefly until ſuch time as the moſt feared and malign ſymptoms are paſt.

The diſcommodities of too much light.

For a too great light diſſipates the ſpirits, increaſes pain, ſtrengthens the Fever and Symptoms. *Hippocrates* wholly forbids Wine, therefore the Patient in ſtead thereof muſt drink Barley Water, fair Water boiled and tempered with Julep of Roſes, Syrup of Violets, Vinegar, and the like, Water wherein Bread crums have been ſteeped, Water and Sugar with a little juice of Limmons or Pomecitron added thereto, and ſuch like, as the ability and taſte of the Patient ſhall require. Let him continue ſuch drinks until he be free from malign ſymptoms, which uſually happen within fourteen days.

What his drink muſt be

Almonds increaſe the pain of the Head.

His meat ſhall be Pap, Ptiſan, ſhunning Almond-milks; (for Almonds are ſaid to fill the Head with vapours and cauſe pain) ſtewed Damask Prunes, Raiſins, and Currants ſeaſoned with Sugar, and a little Cinamon, (which hath a wonderful power to comfort the Stomach, and revive and exhilarate the ſpirits) Chickens, Pigeons, Veal, Kid, Leverets, Birds of the Fields, Pheaſons, Black-birds, Turtles, Partridges, Thruſhes, Larks, and ſuch like meats of good digeſtion, boiled with Lettuce, Purſlane, Sorrel, Borage, Bugloſs, Succory, Endive, and the like, are thought very convenient in this caſe. If he deſire at any time to feed on meats roaſted, he may; onely dipping them in Verjuice, in the acid juices of Oranges, Citrons, Limmons, or Pomegranates, ſometimes in one, and ſometimes in another, according to his taſte and ability. If any have a deſire to eat fiſh, he muſt make choice of Trouts, Gudgeons, Pikes, and like, which live in running and clear Waters, and not in muddy; he ſhall eſchew all cold Sallets and Pulſe, becauſe they fly up and trouble the head: it will be convenient after meat to uſe common Dridge Powder, or Anniſeed, Fennel-ſeed, or Coriander-comfits; alſo Conſerve of Roſes, or Marmalate of Quinces to ſhut up the orifice of the Ventricle, leſt the head ſhould be offended with vapours ariſing from thence.

What fiſh he may eat.

Children muſt eat often, but ſparingly, for Children cannot faſt ſo long as thoſe which are elder, becauſe their natural heat is more ſtrong, wherefore they ſtand in need of more nouriſhment: ſo alſo in Winter all ſorts of People require more plentiful nouriſhment, for that then their ſtomachs are more hot than in Summer.

Aphor. 13, & 14. *ſect.* 1.

When

Aphor. 15. *sect.* 2. When the fourteenth day is paſt, if neither a Fever, nor any thing elſe forbids, he may drink Wine moderately, and by little and little increaſe his diet, but that reſpectively to each ones nature, ſtrength, and cuſtom. He ſhall ſhun, as much as in him lies, ſleep on the day time, unleſs it happen that a *Phlegmon* ſeize upon the Brain or the *Meninges*. For in this caſe it will be expedient to ſleep on the day time; eſpecially from morning till noon, for in this ſeaſon of the day, as alſo in the Spring, bloud is predominant in the body, according to the opinion of *Hippocrates*. For it is ſo vulgarly known, that it need not be ſpoken, that the bloud when we are awake is carried into the habit and ſurface of the body; but on the contrary, by ſleep it is called into the noble parts, the Heart and Liver, Wherefore if that the bloud by the force of the Sun caſting his beams upon the Earth at his riſing is carried into the habit of the body, it ſhould again be more and more diffuſed by the ſtrength and motion of watching, the inflammation in the Brain and *Meninges* would be much increaſed. Wherefore it will be better, eſpecially then to ſtay by ſleep the violence of the bloud running into the habit of the body, when it ſhall ſeem to rage and more violently to affect that way. Watching muſt in like manner be moderate, for too much depraves the temper of the Brain and of the habit of the whole body; it cauſes crudities, pains, and heavineſs of the head, and makes the wounds dry and malign.

Why ſleep upon the day time is good for the brain being inflamed. *Lib.* 2. *Epidem.*

The diſcommodities enſuing immoderate watching. *Gal. Meth.* 18.

But if the Patient cannot ſleep by reaſon of the vehemency of the inflammation of the Brain and *Meninges*, *Galen* wiſhes to waſh, beſmear and anoint the head, noſe, temples, and ears with refrigerating and humecting things, for theſe ſtupefie and make drowſie the Brain and Membranes thereof, being more hot than they ought to be. Wherefore for this purpoſe let the temples be anointed with *Unguentum populeon*, or *Unguentum Roſatum* with a little Roſe-Vinegar or Oxycrate; let a Sponge moiſtned in the decoction of white or black Poppy-ſeed, of the rinds of the roots of Mandrages, of the Seeds of Henbane, Lettuce, Purſlane, Plantain, Night-ſhade, and the like. He may alſo have a Broath, or Barley-cream, into which you may put an emulſion made of the Seeds of white Poppy, or let him have a potion made with ℥ i. or ℥ i. ſ. of the Syrup of Poppy, with ʒ ij. of Lettuce water; Let the Patient uſe theſe things four hours after meat, to procure ſleep. For ſleep doth much help concoction, it repairs the efflux of the triple ſubſtance cauſed by Watching, aſſwageth pain, refreſheth the weary, mitigates anger and ſorrow, reſtores the depraved reaſon, ſo that for theſe reſpects it is abſolutely neceſſary that the Patient take his natural reſt.

Medicins procuring ſleep.

The commodities of ſleep.

If the Patient ſhall be Plethorick, let the plenitude be leſſened by bloud-letting, purging and a ſlender diet, according to the diſcretion of the Phyſician who ſhall over-ſee the Cure. But we muſt take heed of ſtrong purgations in theſe kinds of Wounds, eſpecially at the beginning, leſt the Fever, Inflammation, Pain, and other ſuch like ſymptoms be increaſed by ſtirring up the humours.

Lib. 4. *Meth.* Phlebotomy, according to *Galens* opinion, muſt not onely be made reſpectively to the plenty of bloud, but alſo agreeable to the greatneſs of the preſent diſeaſe, or that which is to come, to divert and draw back that humour which flows down, by a way contrary to that which is impact in the part; and which muſt be there evacuated, or drawn to the next. Wherefore for example, if the right ſide of the head be wounded, the Cephalick-vein of the right arm ſhall be opened, unleſs a great *Plethora* or plenitude cauſe us to open the *Baſilica*, or Median; yet if neither of them can be fitly opened, the *Baſilica* may be opened, although the body be not plethorick. The like courſe muſt be obſerved in wounds of the left ſide of the head; for that is far better by reaſon of the ſtraitneſs of the fibers, than to draw bloud on the oppoſite ſide; in performance whereof you muſt have diligent care of the ſtrength of the Patient, ſtill feeling his pulſe, unleſs the Phyſician be preſent, to whoſe judgment you muſt then commit all that buſineſs. For the pulſe is, in *Galens* opinion, the certaineſt ſhewer of the ſtrength. Wherefore we muſt conſider the changes and inequalities thereof, for as ſoon as we find it to become leſſer and more ſlow, when the fore-head begins to ſweat a little, when he feels a pain at his heart, when he is taken with a deſire to vomit or to go to ſtool, or with yawning, and when he ſhall change his colour and his lips look pale, then you muſt ſtop the bloud as ſpeedily as you can, otherwiſe there will be danger leſt he pour forth his life together with his bloud. Then he muſt be refreſhed with bread ſteeped in Wine, and put into his mouth, and by rubbing his temples and noſtrils with ſtrong Vinegar, and by lying upon his back. But the part ſhall be eaſed and freed from ſome portion of the impact and conjunct humour by gently ſcarifying the lips of the wound, or applying of Leeches. But it ſhall be diverted by opening thoſe Veins which are higheſt to the wounded part, as the *Vena Puppis*, or that in the midſt of the fore-head, or of the temples, or thoſe which are under the tongue; beſides alſo Cupping-glaſſes ſhall be applyed to the ſhoulder, ſometimes with ſcarification, ſometimes without; neither muſt ſtrong and long frictions with coarſe cloths of all the body, the head excepted, be omitted during the whole time of the Cure, for theſe will be available, though but for this; that is, to draw back and diſſipate by inſenſible tranſpiration the vapours which otherwiſe would aſcend into the head; which matters certainly in a body that lies ſtill and wants both the uſe and benefit of accuſtomed exerciſe, are much increaſed.

Lib. de cur. per ſanginis miſſ.

The uſe of Frictions.

But it ſhall be made manifeſt by this following and notable example, how powerful Bloud-letting is, to leſſen and mitigate the inflammation of the Brain, or the membranes thereof, in wounds of the head. I was lately called into the Suburbs of Saint *German*, there to viſit a young man twenty eight years old, who lodged there in the houſe of *John Martial* at the Sign of St. *Michael*. This young man was one of the houſhold-ſervants of Mr. *Doucador*, the Steward of the Lady *Admiral* of *Brion*. He fell down head-long upon the left *Bregma*, upon a marble pavement, whence he received a contuſed wound, without any fracture of the Skull, and being he was of a ſanguin temperature, by occaſion of this wound, a Fever took him on the ſeventh day with a continual *Delirium* and inflammation of phlegmonous tumour of the wounded *Pericranium*. This ſame tumor poſſeſſing his whole head and neck by continuation and ſympathy of the parts, was grown to ſuch a bigneſs, that his viſage was ſo much altered, that his friends knew him not, neither could he ſpeak, hear, or ſwallow any thing but what was very liquid. Which I obſerving, although I knew that the day paſt, which was the eighth day of his Diſeaſe, he had four Sawcers of bloud taken from him by *Germain Agace* Barber-ſurgeon of the

A Hiſtory.

the ſame Suburbs; yet conſidering the integrity and conſtancy of the ſtrength of the Patient: I thought good to bleed him again, wherefore I drew from him fourteen Sawcers at that one time; when I came to him the day after, and ſaw that neither the Fever nor any of the fore-mentioned ſymptoms were any whit remitted, or aſſwaged, I forthwith took from him four Saucers more, which in all made two and twenty; the day following when I had obſerved that the ſymptoms were no whit leſſened, I durſt not preſume, by my own onely advice, to let him the fourth time bloud, as I deſired. Wherefore I brought unto him that moſt famous Phyſician Doctor *Violene*, who as ſoon as he felt his pulſe, knowing by the vehemency thereof, the ſtrength of the Patient, and moreover conſidering the greatneſs of the inflammation and tumor which offered it ſelf to his ſight, he bid me preſently take out my Lancet and open a Vein. But I lingered on ſet purpoſe, and told him that he had already twenty two Saucers of bloud taken from him; then ſaid he, grant it be ſo, and though more have been drawn, yet muſt we not therefore deſiſt from our enterpriſe, eſpecially ſeeing the two chief Indications of bloud-letting yet remain, that is, the greatneſs of the Diſeaſe, and the conſtant ſtrength of the Patient. I being glad of this, took three Saucers more of bloud, he ſtanding by, and was ready to take more, but that he wiſhed me to defer until the afternoon; wherefore returning after dinner I filled two Saucers more, ſo that in all, this young man to his great benefit, loſt twenty ſeven Saucers of bloud at five times, within the ſpace of 4 days. Now the enſuing night was very pleaſing to him, the Fever left him about noon, the tumor grew much leſs, the heat of the inflammation was aſſwaged in all parts, except in his eye-lids, and the laps of his ears, which being ulcerated caſt forth a great quantity of *Pus* or matter. I have recited this hiſtory purpoſely to take away the childiſh fear which many have to draw bloud in the conſtant ſtrength of the Patient, and that it might appear how ſpeedy and certain a remedy it is, in inflammations of the head and brain.

The two chief Indications in bloud-letting.

Now to return from whence we digreſſed, you muſt note that nothing is ſo hurtful in fractures and wounds of the head, as Venery; not only at that time the diſeaſe is preſent, but alſo long after the cure thereof. For great plenty of ſpirits are contained in a ſmall quantity of ſeed, and the greateſt part thereof flows from the Brain; hence therefore all the faculties, but chiefly the Animal, are reſolved; whence I have divers times obſerved death to enſue in ſmall wounds of the head, yea when they have been agglutinated and united. All paſſions of the mind muſt in like ſort be avoided, becauſe they by contraction and diſſipation of the ſpirits cauſe great trouble in the body and mind. Let a place be choſen for the Patient as far from noiſe as can be, as from the ringing of Bells, beatings and knockings of Smiths, Coopers, and Carpenters, and from High-ways through which they uſe to drive Coaches; for noiſe increaſes pain, cauſes a Fever, and brings many other ſymptoms.

The diſcommodity of Venery in wounds of the head.

How hurtful noiſe is to the fractures of the skull.

I remember when I was at *Hiſdin* at the time that it was beſieged by the forces of *Charles* the fifth, that when the Wall was beaten with the Canon, the noiſe of the Ordnance cauſed grievous torment to all thoſe which were ſick, but eſpecially thoſe that were wounded on their heads, ſo that they would ſay, that they thought at the diſcharging of every Cannon that they were cruelly ſtrucken with ſtaves on that part which was wounded, and verily their wounds were ſo angered herewith, that they bled much, and by their pain and Fevers increaſed, were forced with much ſighing to breathe their laſt. Thus much may ſerve to be ſpoken of the cure in general: now we will out of the monuments of Ancients, treat of the particular.

A Hiſtory.

CHAP. XV.

Of the particular cure of wounds of the head, and of the muſculous Skin.

Of a ſimple wound of the fleſh and the skin.

LEt us begin with a ſimple wound, for whoſe cure the Chirurgeon muſt propoſe one onely ſcope, to wit, Union; for unleſs the wound pierce to the skull, it is cured like other wounds of the fleſhy parts of our bodies. But if it be compound, as many ways as it is complicate, ſo many Indications ſhew themſelves. In theſe, the chiefeſt care muſt be had of the more urgent order and cauſe.

Therefore if the wound ſhall be ſimple and ſuperficiary, then the hair muſt firſt be ſhaven away, then a Plaiſter applied made of the white of an Egg, Bole Armenic, and Aloes. The following day you muſt apply *Emplaſtrum de Janua*, or elſe *de gratia Dei*, until the wound be perfectly healed. But if it be deeper and penetrate even to the *Pericranium*, the Chirurgeon ſhall not do amiſs, if at the ſecond dreſſing he apply a digeſtive Medicin (as they call it) which may be made of Venice Turpentine, the yolks of Eggs, Oil of Roſes, and a little Saffron, and that ſhall be uſed ſo long, until the wound come to maturation; for then you muſt add Honey of Roſes and Barley flour to the digeſtive. Hence muſt we paſs to theſe Medicins, into whoſe compoſition no oily or unctuous body enters, ſuch as this; R *Terebinth. venetæ* ℥ ij. *ſyrupi roſar.* ℥ j. *pul. Aloes, Myrrhæ & Maſtich. an.* ℥ ß. Let them all be incorporated and made into an unguent, which ſhall be perfectly regenerated, then it muſt be cicatrized with this following Powder. R *Aluminis combuſti, corticis granatorum combuſt. an.* ℥ j. *Miſceantur ſimul & fiat pulvis:* but if the Wound be ſo large that it require a ſuture, it ſhall have ſo many ſtitches with a Needle as need ſhall ſeem to require.

A digeſtive Medicin.

A ſarcotick Medicin.

An Epulotick.

Whileſt I was at *Hiſdin*, a certain Souldier, by falling of the Earth whileſt he undermined, had the Hairy Scalp ſo preſſed down even to the *Pericranium*, and ſo wholly ſeparated from the beginning of the hind-part of his head, even to his fore-head, that it hung over his face. I went about the cure in this manner; I firſt waſhed all the Wound with Wine a little warmed, that ſo I might waſh away the congealed bloud mixed with the Earth, then I dried it with a ſoft linnen cloth, and laid upon it Venice Turpentine mixed with a little *Aqua Vitæ*, wherein I had diſſolved ſome *Sanguis Draconis*, Maſtich and Aloes; then I reſtored the hanging skin to its former place, and there ſtaid it with ſome ſtitches, being neither too ſtrait, nor too cloſe together, for fear of pain and inflammation, (which two chiefly happen whileſt the Wound comes to ſuppuration) but onely as much as ſhould

A Hiſtory.

What things we muſt obſerve in ſewing.

ſerve to ſtay it on every ſide, and to keep forth the air, which by its entrance doth much harm to Wounds: the lower ſides of the Wound I filled with ſomewhat long and broad tents, that the matter might have paſſage forth. Then I applied this following Cataplaſm to all the head. ℞ *Farinæ hord. & fabarum an.* ℥ vj. *olei roſati* ʒ iij. *aceti quantum ſufficit, fiat cataplaſma ad formam pultis*; this hath a faculty to dry, cool, repel, mitigate pain and inflammation, and ſtay bleeding.

When we muſt not let bloud in wounds.

I did not let him bloud, becauſe he had bled much, eſpecially at certain Arteries which were broken near his Temples; he being dreſſed after this manner grew well in a ſhort time. But if the wound be made by the biting of a wild Beaſt, it muſt be handled after another manner, as ſhall appear by this following Hiſtory.

A Hiſtory.

As many people on a time ſtood looking upon the Kings Lions, who were kept in the Tilt-yard at *Paris* for the delight of King *Henry* the Second, and at his charges, it happened that one of the fierceſt of them broke the things wherein he was tied, and leaping amongſt the Company, he with his paws threw to the ground a Girl of ſome twelve years old, and taking her head in his mouth, with his teeth wounded the muſculous skin in many places, yet hurt not the skull. She ſcarce at length delivered by the Maſter of the Lions from the jaws of Death and the Lion, was committed to the cure of *Rowland Claret* Chirurgeon, who was there preſent by chance at the ſame time: ſome few days after I was called to viſit her; ſhe was in a Fever, her head, ſhoulders, breſt, and all the places where the Lion had ſet his teeth or nails, were ſwollen; all the edges of the wound were livid, and did flow with a wateriſh, acrid, virulent, cadaverous, dark, green and ſtinking matter, ſo that I could ſcarce indure the ſmell thereof: ſhe was alſo oppreſt with pricking, biting, and very great pain,; which I obſerving, that old ſaying came into my mind, which is, That all Wounds made by the bitings of Beaſts, or of Men alſo, do ſomewhat participate of poiſon. Wherefore there muſt principally great care be had of the venenate impreſſion left in the Wounds by the nails and teeth, and therefore ſuch things muſt be applied, as have power to overcome poiſon. Wherefore I ſcarified the lips of the Wounds in divers places, and applied Leeches to ſuck out the venenate bloud, and eaſe the inflammation of the parts; then I made a Lotion of *Ægyptiacum* Treacle and Mithridate, after the following manner.

The bitings of Man and Beaſts are venenate.

Theriacal topick Medicins.

℞ *Mithrid.* ℥ i. *theriac.* ℥ ij. *ægyptiac.* ℥ ß. *diſſolvantur omnia cum aqua Vitæ, & Cardui ben.* Let the Wounds be fomented and waſhed with it warm; beſides alſo Treacle and Mithridate were put in all the Medicins which were either applied, or put into the Wound; and alſo of the ſame with the Conſerves of Roſes and Bugloſs diſſolved in the Water of Sorrel and *Carduus benedictus*, potions were made to ſtrengthen the heart, and vindicate it from malign vapours.

A Cordial Epithema.

For which purpoſe alſo this following *Epithema* was applied to the region of her heart. ℞ *Aquæ roſar. & nenuphar. an.* ℥ iv. *aceti ſcillitici* ℥ i. *corallorum, ſantalorum alborum & rubrorum, roſar. rub. pulveris, ſpodii. an.* ʒ i. *Mithridatii, Theriacæ, an.* ʒ ij. *flo. cordial. pulveriſatorum p.* ij. *croci* ʒ i. diſſolve them all together, make an Epitheme and apply it to the heart with a ſcarlet cloth or ſponge, and let it be often renued. Verily, ſhe dreſt after this manner, and the former remedies but once uſed, pain, inflammation, and all the malign ſymptoms were much leſſened; to conclude, ſhe recovered, but lingred, and was lean ſome two years after, yet at length ſhe was perfectly reſtored to her health and former nature. By which you may underſtand, that ſimple Wounds muſt be handled after another manner than theſe which have any touch of poiſon.

The cure of the hairy ſcalp when it is contuſed.

A repelling Medicin.

But now that we may proſecute the other affects of the hairy ſcalp; ſay that it is contuſed with a blow without a wound, that which muſt be firſt and always done, (that ſo the affect may better appear, and the remedies which are applied may take more effect) the hair muſt be ſhaven away, and at the firſt dreſſing a repelling Medicin applied, ſuch as this following *Oxyrhodinum.* ℞ *Ol. roſ.* ℥ iij. *album ovorum nu.* ij. *pulveris nucum cypreſſi, balauſt. alumin. rochæ. roſar. rub. an* ʒ i. Let them be all incorporated, and make a medicin for the former uſe; or in ſtead thereof you may apply the cataplaſm preſcribed before, conſiſting of *Farina hordei, fabarum, aceto & oleo roſaceo.* But ſuch Medicins muſt be often renued. When the pain and defluxion are appeaſed, we muſt uſe diſcuſſing Medicins for diſſipation of that humour which remains impacted in the part; ℞ *Emplaſtri de mucilagin.* ʒ ij. *oxicrocei, & emp. de meliloto, an.* ℥ i. *olei chamæm. & anethi. an.* ℥ ß. *malaxentur ſimul, & fiat emplaſtrum ad uſum dictum.* Such a fomentation will alſo be good. ℞ *Vini rub. lib.* iv. *lixivii, com. lib.* ij. *nuces cupreſſi contuſ. nu.* x. *pul. myrtillorum* ℥ i. *roſar. rub. abſinth. fol. ſalviæ, majoranæ, ſtœchados, florum chamæm. melil. an.* M. ß. *aluminis rochæ, radicis cyperi, calami aromatici an.* ℥ ß. *bulliant omnia ſimul*, and make a decoction to foment the grieved part. After ſomewhat a long fomenting it, whereby it may the better diſcuſs, dry and exhauſt the concrete humour, the head muſt be dried and more diſcuſſing things applied, ſuch as the Cerate deſcribed by *Vigo*, called *De Minio*; which hath an emollient and digeſtive faculty in this form. ℞ *Olei chamæm. lilior. an.* ℥ x. *olei maſtich.* ℥ ij. *pinguedinis vervecis lib.* i. *litharg. auri* ℥ viij. *minii* ℥ ij. *vini boni cyathum unum, bulliant omnia ſimul baculo agitando, primum quidem lento igne, mox vero luculentiore, donec tota maſſa colorem nigrum vel ſubnigrum contrahat; adde in fine coctu-*

A diſcuſſing Fomentation.

Ceratum de Minio.

ræ Terebinth. lib. ſ. pulveris maſtich. ℥ ij. *gum. elemi.* ℥ i. *ceræ quantum ſufficit, bulliant rurſus una ebullitione & fiat empl. molle.* But if the humour be not thus diſcuſſed, but onely grow ſoft, then the tumor muſt be quickly opened, for when the fleſh is inflamed and putrefied through occaſion of the contained humour, the bone under it putrefies alſo by the contagion of the inflammation and the acrimony of the matter falling upon the bone. When you have opened it, waſh away the filth of the Ulcer with this following deterſive Medicin. ℞ *Syrupi roſ. & abſinth. an.* ʒ j. *terebinth.* ʒ ß. *pul. ireos, aloes, maſtichis, myrrhæ, farinæ hordei, an.* ʒ ß. In ſtead hereof, if there be great putrefaction, *Ægyptia*, either by it ſelf, or mixt with an equal quantity of *Unguentum Apoſtolorum* may be put into the Ulcer. When the Ulcer is cleanſed, it will be time to uſe ſarcotick and cicatrizing Medicins.

Deterſive or cleanſing Medicins.

CHAP.

CHAP. XVI.

Of the particular cure of a Fracture or broken Skull.

IF the Skull be broken, ſo that it be needful to trepan it, or to elevate and lift it up, or ſcrape it away, the muſculous skin being cut, as we formerly noted, the *Pericranium* ſhall be plucked from the skull, as we ſaid before; which becauſe it can hardly be done without great pain, by reaſon of its exquiſite ſenſe and connexion with the Membranes of the Brain, we muſt labour to mitigate the pain for fear of inflammation and other accidents. Therefore the firſt dreſſing ended, and the corners of the Wound drawn each from other; at the ſecond dreſſing put to the Wound a Digeſtive (as they term it) made of the Yolk of an Egg and Oil of Roſes, but you muſt apply no humid thing to the bone, becauſe we deſire to keep it ſound and whole. For *Galens* opinion is, that bared bones muſt not be touched with unctuous things; but rather on the contrary, all dry things muſt be applied to them, which may conſume the ſuperfluous humidity. Therefore we muſt lay ſome lint and cephalick powders which we ſhall hereafter deſcribe, upon the bone we intend to preſerve, and muſt have diligent care that it be not offended either by the air, or touch of humid Medicins. You muſt in Trepaning have a ſpecial care of the *Craſſa Meninx*. For I have often obſerved a great quantity of bloud to have flowed from ſome broken Veſſel which adhered to the ſecond Table: neither muſt we preſently and forthwith ſtay ſuch bleeding, but ſuffer it to flow according to the plenitude and ſtrength of the Patient; for thus the Fever, and together therewith the reſt of the ſymptoms are diminiſhed. For the opinion of *Hippocrates*, in every green Wound it is good to cauſe often bleeding, except in the Bellies; for thus the vehemency of pain, inflammation and other accidents will be leſs troubleſom; alſo it is not amiſs too for old Ulcers to bleed much, for ſo they are freed from the burden of the impact humours. When you think it hath bled ſufficiently, it may be ſtanched with this following Medicin deſcribed by *Galen*.

Why the *Pericranium* hath ſuch exquiſite ſenſe.

Gal. 6. meth. The bones are offended with the application of humid things.

Lib. de ulcer.

℞ *Pulveris Aloes* ʒ ij. *thuris Maſtiches, an.* ʒ i ſ. *albumina ovorum nu.* ij. *agitentur ſimul cum pilis leporinis minutim inciſis, fiat medicamentum.* When the bleeding is ſtaid, you ſhall, for the aſſwaging of pain, drop upon the *Meninx* ſome Pigeons bloud, yet warm by opening a Vein under the Wing, then it ſhall be ſtrewed over with this following Powder: ℞ *Aloes, Thuris, Myrrhæ, Sanguinis draconis an.* ʒ i. *Miſce, fiat pulvis ſubtilis.* Alſo you may make an irrigation with Roſe Vinegar, or ſome repelling Medicin ſuch as is a Cataplaſm *ex farinis, & oleo roſaceo.* Which may be applied until the fourth day to aſſwage and mitigate pain.

Gal. 6. meth.

Vigo's Cerate will be of good uſe in this caſe, as that which in my opinion is moſt fit for fractures of the skull, becauſe it draws powerfully, reſolves and dries moderately, and by reaſon of the ſmell refreſhes the animal ſpirits, and ſtrengthens the Brain and Membranes thereof, as you may eaſily perceive by things which enter into the compoſition thereof. ℞ *Olei roſ. Omph. reſinæ pini, gummi Elemi, an.* ʒ ij. *Maſtiches* ʒ i ß. *pinguedinis vervecis caſtrati* ʒ ij. ſ. *foliorum beton. caprifol. anthos, an. M.* i. *ammoniaci* ʒ ß. *granorum tinctorum* ʒ x. *liquata pinguedine; terenda terantur, & ammoniacum ſimul cum aceto ſcillitico, eliquetur; deinde bulliant. omnia ſimul in lib.* ij. *vini boni, lento igne uſque ad conſumptionem vini, deinde exprimantur; cum expreſſione addantur terebinth. Ven.* ʒ iv. *ceræ albæ quantum ſufficit, fiat cerotum molle ad uſum prædictum.* Alſo let the neck, and all the Spine of the Back be anointed with a liniment, which hath force of mollifying the Nerves, leſt they ſhould ſuffer Convulſion; ſuch is this.

Vigo's Cerate good for a broken skull.

℞ *Rutæ, marrubii, roriſmar. ebulor. ſalviæ, herb. paralyſ. an. M. ſ. rad. Ireos, cyperi, baccarum lauri, an.* ʒ i. *florum chamæmelil. hyperici, an. M.* i. *piſtentur & macerentur omnia in vino albo per noctem, deinde coquantur in vaſe duplici cum oleo lumbricorum, liliorum, de terebinthina, axungiæ anſeris & hum. an.* ʒ ij. *uſque ad conſumptionem vini, poſtea colentur, & in colatura adde terebinth. venet.* ʒ iij. *aquæ vitæ* ʒ ſ. *ceræ quantum ſufficit. Fiat linimentum ſecundum artem.*

A liniment good againſt Convulſions.

But when the pain is aſſwaged, we muſt abſtain from all ſuch unctuous things, leſt they make the Wound become ſordid and malign, and putrefie the adjacent parts, and conſequently the *Craſſa Meninx* and Skull; for the integrity of all parts may be preſerved by their like, and ſuch are dry things in a fracture of the skull. Wherefore all humid and oily things muſt be ſhunned in the cure thereof, unleſs peradventure there ſhall be ſome need to mitigate pain, and bring the humour to ſuppuration.

Gal. 4. meth.

For, according to *Galen*, we are oft forced for a time to admit the proper cure of the diſeaſe, ſo to reſiſt the ſymptoms; furthermore *Hippocrates* would have us not to foment the Skull, no not with Wine; but if we do, to let it be but with very little. *Vidius* interprets that little to be, when there is fear of inflammation; for Wine if it be red, tart, and aſtringent, hath a repreſſing, refrigerating and drying faculty: for otherwiſe all Wine, although it heats and dries by its faculty, yet it actually humects and cools, both which are very hurtful in Wounds of the head, or a fractured skull, eſpecially when the bone is bare; for from too much cooling of the Brain there is fear of a Convulſion, or ſome other evil ſymptom. Wherefore let this be rarified, that is, we muſt not uſe humid and unctuous Medicins in Wounds of the head, except for curing of inflammation, or the mitigation of pain cauſed thereby. Therefore let the bared skull be ſtrewed with catagmatick and cephalick Powders, (being ſo called by the Ancients, for that they are convenient and good in fractures of the Skull and the reſt of the Bones;) for by their drineſs they conſume the ſuperfluous humidity, and by that means help Nature in the ſeparating of the broken bones, and the regenerating of fleſh. Such Powders uſually conſiſt of ſuch things as theſe enſuing; *Thus, Radix Iridos florent. farina hordei, & Ervi, pulvis Aloes Hepaticæ, Sanguis Draconis, Maſtiche, Myrrha, rad. Ariſtolochiæ, Gentianæ*; and generally all ſuch Simples as have a drying and an abſtergent faculty without biting; but you muſt not uſe theſe things before the pain, inflammation, and apoſtumation be paſt; that is, then, when the Membranes muſt be cleanſed, the bones ſcaled, and the fleſh generated. For the skull, by how much it is the drier, by ſo much it requires and more eaſily endures more powerful

How far humid things are good for a fractured skull.

Why Cephalick or Catagmatick Powders are good.

When to be uſed.

How to be mixed when they are to be applied to the *Meninges*.

and drier Medicins than the *Dura Mater* or *Pericranium*, as that which in quickneſs of ſenſe comes far ſhort of theſe two. Wherefore when you would apply the fore-mentioned cephalick Powders to the *Meninges*, they muſt be aſſociated and mixed with Honey, Syrup of Roſes, or of Wormwood, and ſuch other like, that ſo their too violently drying faculty may be allayed and tempered.

CHAP. XVII.

Why we uſe Trepaning in the Fractures of the Skull.

THere are four cauſes of this remedy: The firſt is to raiſe up the depreſt Bones, and take forth their fragments which preſs upon the *Meninges*, or alſo upon the ſubſtance of the Brain. The ſecond is, that the *ſanies* or matter may be evacuated, cleanſed, waſted, and dried up, which by the breaking of any veſſel is poured forth upon the Membranes, whereby they, and not they onely, but the Brain alſo is in a great danger of corruption. The third is, for the fitter application of Medicins, convenient for the wound and fracture. The fourth is, that ſo we may have ſomething whereby we may ſupply the defect of a repelling Ligature, and ſuch a one as may hinder defluxions; for ſuch a Ligature cannot take place here as it may in the other parts of the body, by reaſon of the ſphærical or round figure of the head, which doth not eaſily admit binding; and then the denſity and hardneſs of the interpoſed Skull is a means that the veſſels lying under it (by which uſually the defluxion comes) cannot eaſily be bound with a rowler ſufficiently to repel the running bloud. And the external Veſſels (to whom the force of the Ligature may come) cannot be bound without great pain, and danger of inflammation. For by ſuch a compreſſion the pulſation of the Arteries would be intercepted, and the efflux of the fuliginous excrements which uſeth to paſs through the ſutures of the Skull, would be ſuppreſt, by reaſon of the conſtriction of theſe ſutures.

Why a repelling Ligature cannot be uſed in fractures of the skull.

Beſides alſo, the bloud would thus be forced from the wounded part without, to within into the Membranes and Brain; when pain, inflammation, a Fever, Abſceſs, Convulſion, Palſie, Apoplexy, and laſtly Death it ſelf would enſue.

How the Patient muſt be placed when you Trepan him.

And theſe are the chief cauſes that Trepaning is neceſſary in fractures of the Skull, and not ſo in the fractures of other Bones.

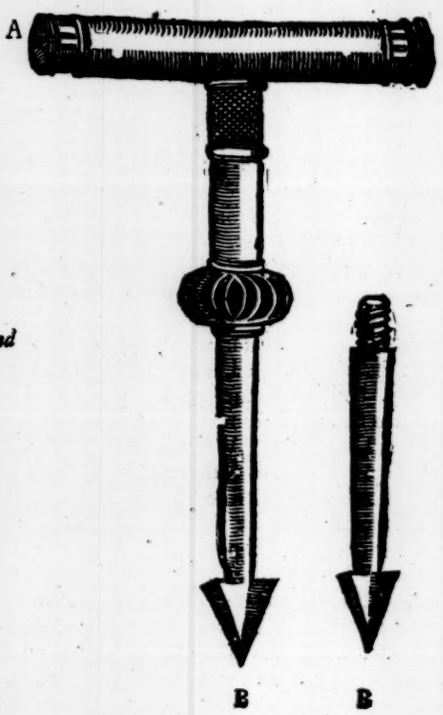
But before you apply or put to your Trepan, the Patient muſt be fitly placed or ſeated, and a double cloth muſt be many times wrapped about his head, and then his head muſt be ſo laid, or preſſed upon a Cuſhion or Pillow, that when you come to your operation, it may not ſink down any further, but remain firm and ſteddy. Then you muſt ſtop the Patients Ears with Cotton-wool, that ſo he may not hear the noiſe made by the Trepan, or any other Inſtrument.

What to be done before the application of the Trepan.

But before you put to your Trepan, the bone muſt be pierced with an Inſtrument, having a three-ſquare point, that ſo it may be the more ſpeedily and certainly perforated. The point thereof muſt be no bigger than the pin of a Trepan, that ſo the Trepan which is forthwith to be applied may ſtand the more firm, and not to play to and again in too wide a hole.

The ſhape of this Inſtrument is not much different from a Gimblet, but that the point is three-ſquare, and not twined like a ſcrew, as you may perceive by this following figure.

A Gimblet or Piercer to perforate the Skull before the ſetting of the Trepan.



A *Shews the handle.*

B *The points which may be ſcrewed and fitted into the handle.*

CHAP.

CHAP. XVIII.

A Deſcription of Trepans.

TRepans are round Saws which cut the bone circularly, more or leſs according to their greatneſs; they muſt have a pin ſtanding in the middle a little further out than the teeth, ſo to ſtay and hold faſt the Trepan that it ſtir neither to this ſide nor that, until it be entered, and you have cut through the firſt table at the leaſt: then you muſt take forth the pin, leſt going quite through the bone, it may prick or hurt the *Craſſa Meninx*. Wherefore when you have taken forth the pin, you may ſafely turn it about until you have cut through both the tables; Your Trepans muſt alſo have a cap, or ſomewhat to engirt or encompaſs them, leſt no way hindred they cut more of the bone than we would, and in concluſion run into the *Meninx*. They muſt alſo be anointed with oil, that ſo they may cut more readily and gently; for thus Carpenters uſe to greaſe their Saws. But you muſt, during the time of the operation, often dip them in cold water, leſt the bone by attrition become too hot: for all hard ſolid bodies by quick and often turning about, become hot; but the bone made more hot and dry, is altered and changeth its nature, ſo that after it is cut more off, its ſcales and falls away. Now you muſt know that the bone which is touched with the Trepan or the Air, always caſts off ſcales: for the ſpeedier helping forwards whereof, you muſt ſtrew upon it powders made of Rocket, Briony, wild Cucumber, and *Ariſtolochia*-roots. When the bone is ſufficiently ſcaled, let this following powder be put upon it, which hath a faculty to cover the bone with fleſh, and to harden it with drineſs convenient to its kind. ℞ *Pulver. Ireos Illyricæ, Aloes Mannæ thuris, Myrrhæ Ariſtolochiæ, an.* ʒ i. Fleſh being by this means generated, let it be cicatrized by ſtrewing upon it the rinds of Pomegranates and Alum burnt.

The harm the bone receives by being heated with the Trepan.

What things haſten the ſcaling of the bone.

Neither ſhall the Chirurgeon forcibly take away theſe ſcales, but commit that whole work to Nature, which uſeth not to caſt them off before that it hath generated fleſh under them. For otherwiſe if he do any thing raſhly, he brings new corruption to the bone; as we ſhall more at large declare, when we come to treat of *Caries*, or rottenneſs of Bones.

The bone muſt not be forcibly ſcaled.

He which uſeth the Trepan, muſt conſider this, that the head is of a round figure, and alſo the Trepan cuts circularly, and therefore it is impoſſible to cut the bone ſo equally on every ſide, as if it were performed upon a plain body. Furthermore the thickneſs of the skull is not alike in all places, wherefore you muſt look and mark whether the Trepan go not more deep on one ſide than on the other, which you may do by meaſuring it now and then with a Pin or Needle, and if you find that it is cut deeper on one ſide than on the other, you muſt preſs down the Trepan more powerfully upon the oppoſite part.

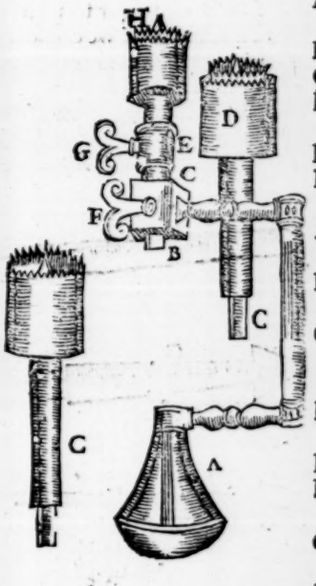
A caution in Trepaning.

But ſeeing there are many ſorts of Trepans invented and expreſſed by many men, yet if you weigh and rightly conſider them all, you ſhall find none more ſafe, than that I invented and have here delineated. For it cannot pierce one jot further into the ſkull, than he pleaſes that uſes it, and therefore it cannot hurt either the *Meninges* or the Brain. An iron head or cover, ſtays it as a bar, that it can penetrate no further than you ſhall think it requiſite. This head or cover is to be drawn up and down, and ſet higher and lower, as he which uſes it ſhall think good, and ſo it will ſtay the Trepan that it ſhall not go a hairs bredth beyond your intended depth. So that henceforwards there ſhall be no Chirurgeon, howſoever ignorant in the performance of his Art, which by the benefit of ſuch a Trepan may not perform this operation without any danger, or fear of danger, of touching the *Dura Mater*, the hurting whereof, puts the life in jeopardy.

A ſafe and convenient Trepan.

The figure of our Trepan opened and taken in pieces.

The figure of the ſame Trepan fitted and put together.

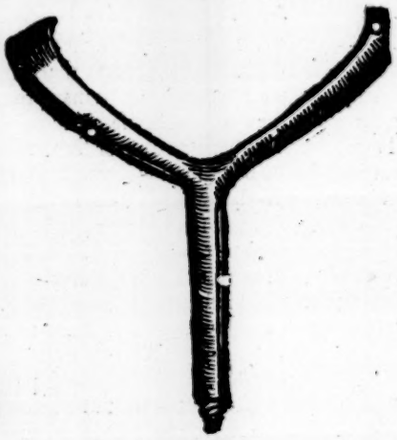


A *Shews the whole handle or Brace of the Trepan.*
B *The Cover or Cap of the Trepan.*
C *The ferule.*
D D *The Screw-pins which hold and ſtay the ferule and Trepan.*
E *The Trepan without his pin.*
F *The Trepan furniſhed with its pin.*

A *Shews the Brace and Trepan fitted in every point.*
B *The place into which the Trepan is put and fitted.*
C C C *The upper end of the Trepan which is to be fitted and put into the Brain.*
D *The Trepan with its cover or cap upon it.*
E *The ferule.*
F *A ſcrew-pin by the twining whereof the Trepan is faſtned in the Brace.*
G *Another ſcrew-pin which faſtens the ferule cloſer to the Trepan.*
H *The three-ſquare point.*

In ſtead of the other Trepan ſet forth by the Author, I have thought fit to give you the figure of that Trepan that is here moſt in uſe, and the fitteſt therefore, as it is ſet forth by Dr. *Crook*.

A Terebellum *or Gimblet conſiſting of three branches.*



A Lentil-like cutting Scraper.

All theſe particulars of the Trepan taken aſunder, you may ſee united and fitted together in the other figure. But when you cannot bring out the bone which you have cut off with your Trepan, then you may take it forth with the *Terebellum* or Gimblet here expreſt, that is, ſcrewing the point thereof into the hole made by the three-ſquare pin; the handle of this inſtrument may alſo ſerve in ſtead of a Levatory. When with the Gimblet you have drawn or taken forth that part of the Skull which was cut away by the Trepan; if there ſhall be any ſharp ſplinters in the ſecond Table which may hurt and prick the *Meninx* when it is heaved up by the motion of the brain, they muſt be ſhaved away and planted with this Lentil-faſhioned ſcraper; being ſo called, becauſe it hath the head thereof faſhioned and ſmooth like a Lentil, leſt being ſharp it ſhould hurt and prick the membrane in the ſmoothing thereof.

The uſe of a Leaden Mullet.

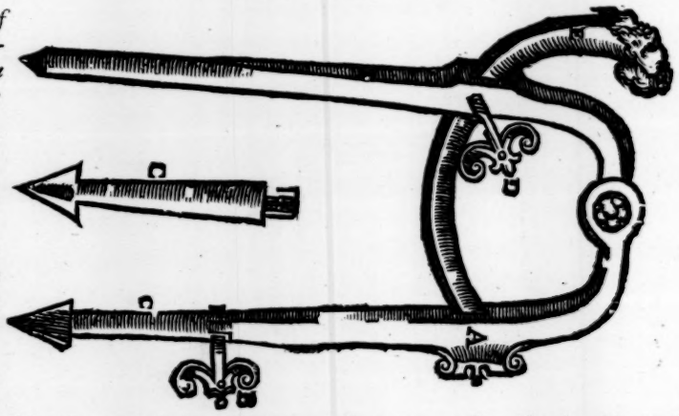
But if by reaſon of the thickneſs the Skull cannot be cut with the Lentil-like Scraper, you may uſe the cutting Scrapers and a Mallet. The Mallet muſt be of Lead, that ſo it may ſhake the Brain as little as may be. But you muſt diligently with your Mullets take forth the ſharp ſplinters, and pieces of the Bone. But if the fractured part of the Skull be ſuch, that it will not admit that Section which is requiſite for the bared bone, as when the fracture is upon the temporal muſcle, or at the ſutures; then in the ſtead of one Trepan, two or three muſt be applied, if the neceſſity of the preſent caſe ſo require, and that within a very ſmall compaſs; but they muſt not be applied to the fractured part, but nigh thereto, as we ſhall ſhew more at large in the following Chapter. But the Trepans ſhall be applied ſo near to each other, that the ring of the ſecond may be joined with the ring of the firſt and third. But if a fracture ſhall happen to light upon a ſuture, then you muſt not apply a Trepan to it, but uſe two thereto on each ſide; he that ſhall do otherwiſe ſhall tear in ſunder the nervous and membranous fibers, and alſo the Veins and Arteries by which the *Dura Mater* is faſtned to the Skull, and yields matter to the *Pericranium*. He which ſhall apply one Trepan, that is, but upon one ſide of the ſuture, he ſhall not be able to get forth all the *ſanies* which is fallen down on both ſides by reaſon of the partition of the *Craſſa Meninx*, which lies between and riſes up by the ſuture of the skull.

Why a Trepan muſt not be applied to the ſutures.

Why two Trepans are to be uſed to a fractured ſuture.

To conclude, when for what cauſe ſoever we cannot make uſe of a Trepan, we may imploy this Inſtrument, if ſo be as much of the bone be bared as is needful. It is made in form of a pair of Compaſſes, and by means of a Screw may be opened, more or leſs, as you pleaſe. You as need ſhall require may change the points, and put other into their places, for they may be fitted to one ſide of the Compaſs with a Screw.

A pair of cutting Compaſſes to cut forth the Skull.



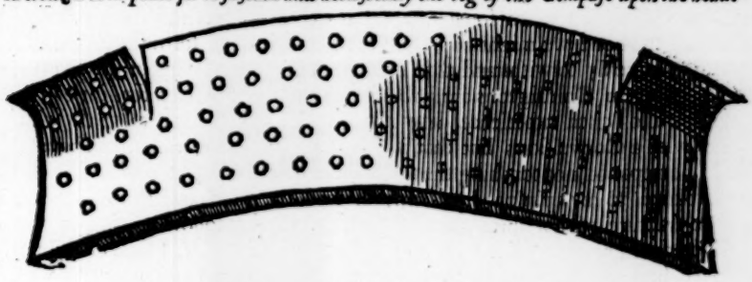
A *Shews the one leg of the cutting Compaſſes, which as you carry it about, cuts the skull.*

E *The Screw which faſtens the point to the leg of the Compaſſes.*

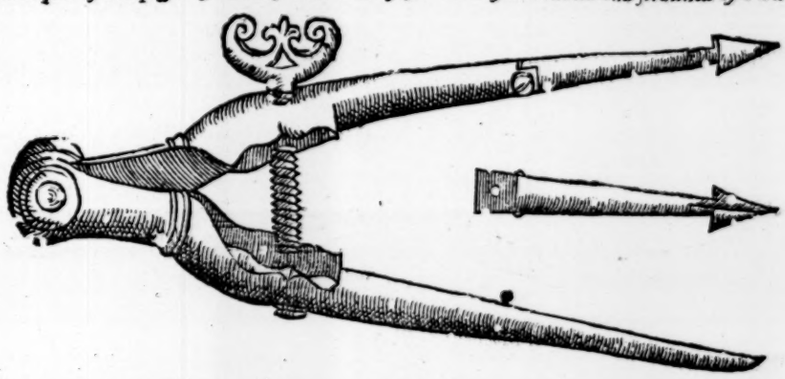
C C *Two different points which may be ſcrewed to the leg of the compaſſes, as need ſhall require.*

D *A great ſcrew which faſtens upon an Iron ſtring, alongſt which the one of the legs of the Compaſs running may be widened and ſtraitned as you pleaſe.*

A crooked Iron plate fit to ſuſtain and hold ſteddy one leg of the Compaſs upon the head.



Another pair of Compaſſes of the like nature and uſe, which may be widened and ſtraitned by a Screw.



Moreover it is fit that the one leg of ſuch cutting Compaſſes ſhould ſtand firm and ſteddy, whileſt the other is drawn circularly to cut. Wherefore it is fit you have an iron plate made full of little holes, wherein you may firmly ſtay that leg of the Compaſs, leſt it waver againſt your will; it is requiſite that this plate be crooked, (becauſe the head is round) that ſo it may be fitted to any part thereof.

CHAP. XIX.

Of the places of the Skull whereto you may not apply a Trepan.

FIrſt of all, you ſhall not apply a Trepan to a Bone that is ſo broken, that it is wholly, or in the greater part thereof, divided from the skull by the violence of the ſtroak, leſt by your weight and preſſing of the Trepan, you force it down upon the membrane. Secondly, you muſt not apply one to the fractured ſutures, for the reaſons mentioned in the former Chapter. Thirdly, nor to that part of the forehead which is a little above the eye-brows, for thoſe reaſons we gave you before in the twelfth Chapter. For there is in that place under the firſt Table of the Skull it ſelf, a large cavity repleniſhed with a certain white and tough humour, as alſo with a certain ſpirituous and airy ſubſtance, placed there by Nature, to prepare the air which aſcends to the Brain by the Noſtrils: unleſs the Chirurgeon obſerve and be mindful hereof, he may be deceived, ſuppoſing this cavity to be an Effracture of the Bone, and a depreſſion thereof. Fourthly, neither in the loweſt parts of the Skull, leſt the marrowy ſubſtance of the Brain, by reaſon of its weight, ſhould ſlide through the hole made by the Trepan. Fifthly, neither to the *Bregma*-bones of children, as thoſe which as yet have not acquired juſt ſolidity, to endure the impreſſion of a Trepan. Sixthly, nor to the temples by reaſon of the temporal muſcle, the cutting whereof, in the opinion of *Hippocrates*, cauſes convulſion of the oppoſite part. For being cut athwart it loſes its proper action, that is, to move and lift up the lower Jaw; but then the oppoſite temporal muſcle being whole and perfect, uſing its ſtrength, (his Antagoniſt ſuffering it, and not reſiſting or labouring any thing at all to the contrary) it draws the ſame Jaw to it, whereupon the mouth and all the parts of the face are drawn awry, and ſuffer a convulſion towards the ſound part, the other being reſolved according to *Hippocrates* his rule. For as often as the Muſcles of one kind are equal in number, magnitude, and ſtrength on each ſide, the reſolution of the one part, cauſes the convulſion of the other.

A bone almoſt ſevered from the skull muſt not be trepaned.

A notable cavity in the fore-head bone.

Lib. de Vul.

A rule out of *Hippocr.*

Neither doth this danger alone ariſe from the cutting of the temporal muſcle, but alſo another, which is, that this muſcle when we eat and ſpeak, is in perpetual motion, whereby it comes to paſs, that being once cut, it is ſcarce ever united again, beſide alſo the commiſſure or joyning together of the ſtony bones, lie under it. But by the ſecond caution we are forbid to trepan upon the ſutures; moreover alſo many Veins, Arteries, and Nerves are ſpread over the ſubſtance thereof, ſo that by cutting of them, there is danger of many and malign ſymptoms, as pain, inflammation, a Fever, a Convulſion not onely of the part it ſelf, but alſo of the whole body, whence laſtly death enſues. Wherefore let no Chirurgeon be ſo fool-hardy, as to attempt the cutting of this muſcle, ſo to trepan the bone which lies under it; rather let him apply his trepan above it, or on the ſide thereof, or as near to the affected part as I can, as I did in a Gentleman called *Monſieur de la Breteſche*. He in the triumphant entrance of King *Henry* the ſecond into the City of *Paris*, was ſo hurt with a ſtone, that the *Os Petroſum*, or ſcaly bone, was broken with the violence of the blow, and the temporal muſcle was vehemently contuſed, yet without any wound. I being called the next day (viewing the manner of the hurt, and the

What diſcommodities ariſe from cutting the temporal muſcles.

A Hiſtory.

the condition of the wounded part) thought good to bring ſome Phyſicians and Chirurgeons with me to conſult hereof, of whom when ſome thought it expedient preſently to divide the temporal muſcle, that baring the bone we might apply a Trepan, and ſo take forth the broken bones: I, on the contrary, began earneſtly to withſtand that opinion, citing that ſaying of *Hippocrates*, *ex libro de vulneribus Capitis*, wherein Chirurgeons are forbidden to cut ſuch muſcles, for fear of the fore-mentioned ſymptoms; alſo I cited experience, how that I had often obſerved all thoſe which had this muſcle cut died with a Convulſion; but that it ſhould be far better, that near above the fracture the bone ſhould be trepaned, not touching the temporal muſcle at all, if he could. When all of them at the laſt had inclined to my opinion, I preſently divided the muſculous skin which was over the upper part of the fracture with a three-cornered ſection: the day following, which was the third of his Diſeaſe, I trepaned him, and after I had done, ſome few days after, I took out ſome four ſplinters of the broken bone; and I put in a plain leaden pipe, by which (I wiſhing the Patient ever when I dreſt him to hold down his head, to ſtop his mouth and his noſe, and then ſtrive as much as in him lay to put forth his breath) much ſanious matter came forth, which was gathered between the Skull and *Craſſa Meninx*. Other filth which ſtuck more faſt, I waſhed out with a detergent decoction, injected with ſuch a Syringe as is here expreſt; and I did ſo much, God bleſſing my endeavours, that at length he recovered.

A plain leaden pipe for to carry forth the Sanies *gathered under the Skull.*

A little Syringe fit to make injections withall.

A Hiſtory.

The like chance and fortune befel *Monſieur de Pienne* at the ſiege of *Metz*. For he, as he fought at the breach of the Wall, had the bone of his temples broken with a ſtone ſtruck out of the adjacent Wall by a piece of Ordnance ſhot from the Emperours camp, he preſently fell down with the blow, and caſt bloud out of his mouth, noſe, and ears, with much vomiting, and remaining dumb, and as it were, ſenſleſs almoſt fourteen days, ſo that he knew none of the by-ſtanders. He had often palpitations, and convulſive twitchings, and his face was ſwollen. His fore-head bone was trepaned at the ſide of the temporal muſcle by the hand of *Peter Aubert* the Kings Chirurgeon: and although on the 25. day ſoft fleſh endued with exquiſite ſenſe grew out of the hole made with the Trepan, whoſe growth could not be hindered by Cathæretick Powders, yet at the length he recovered. The Ancients called this kind of growing fleſh, a *Fungus* [*i.* a Muſhrome] for that it is ſoft, and grows with a ſmall root and broad top like a Muſhrome: but it increaſes and decreaſes, according to the plenty of the flowing matter, and induſtry of the Chirurgeon hindering by art the growth thereof. This fleſh ſtinks exceedingly, they commonly call it *Ficus ſancti Fiacrii* [*i.* the Fig of S. *Fiacrye*.] This diſeaſe commonly hath its original after this manner. Even as in the bodies of trees from the excrements of nouriſhment, a certain half putrid, groſs and viſcous humour ſweats through the bark, and gathered together by little and little grows into a Muſhrom; ſo bloud melancholy both in temper and conſiſtence, ſprings from the broken veſſels of the skull and *Craſſa Meninx*, which alſo is ſent ſometimes by Nature for the neceſſary repairing the fleſh in theſe parts, whereupon a certain *Fungus* breeds, which in *Galens* opinion ſavours or partakes of the nature and condition of the parts to which it grows, though in general it be of the nature of malign Warts or Excreſcences. But for to take away ſuch *Fungi*, you muſt apply medicins which have a ſpecifick faculty to waſte ſuperfluous fleſh; ſuch are thoſe which ſtrongly dry, and gently waſte and eat, ſuch as this which follows. ℞ *Sabinæ* ℥ ij. *cereæ* ℥ i. *pulveriſentur ſimul, aſpergatur caro excreſcens.* Or elſe ℞ *Hermodactylorum combuſtorum* ℥ ß, make a powder for the ſame uſe. But if ſo be that this fungous fleſh come to ſuch growth, (as it often happens) as to equal the bigneſs of an Egg, it muſt be tied and ſtrait twitched cloſe to the root with a ſilken thred; and when it ſhall fall away by reaſon of this binding, the place muſt be ſtrewed with the fore-mentioned Powders, for ſo it will be more certainly cured than with more acrid Cathæreticks.

The generation of a *Fungus*.

CHAP. XX.

Of the corruption and Caries, *or rottenneſs of the Bones of the Head.*

Why when the Skull is broken, the bones ſometimes become foul or rotten.

THere ſometimes follows a corruption and Sphacel of the fractured bones of the Skull upon wounds of the Head; which happens, either becauſe they are touched by the air, which they are not ſenſible of, or for that the *ſanies* putrefying and detained under them, hath infected them with like putrefaction; or by the cure unskilfully handled, they by the raſh application of ſuppurating and oily Medicins becoming more moiſt, and ſo undergoing an unnatural change of their proper complexion and native temper, as we ſhall ſhew more at large when we ſhall treat of the reaſon of the *Caries* in the *Lues venerea*. We ſhall know this unnatural change and corruption, partly by ſight, that is, when from white they become to be yellowiſh, livid, and black; partly alſo by putting down a Probe, when as it meets with nothing ſmooth and ſlippery, but feels rough in many places, and beſides alſo when it enters and eaſily penetrates with a ſmall thruſting down into their ſubſtance, as if it were ſungous. Yet this laſt ſign may often deceive you, for I have divers times obſerved rotten bones, which being bare had long ſuffered the injury of the air, to become ſo hard, that a Trepan would ſcarce pierce them; for it is putrid humidity which makes the bones ſoft and fungous, but

The ſigns of foulneſs of the bone.

Corrupt bones are ſometimes hard.

but the air by drying them exhauſts this humidity, and laſtly dries it, whence follows ſuch contumacious hardneſs. This ſign will be far more certain, if the fleſh which is grown upon the bone be more ſoft than is fit, looſe, and have little or no ſenſe of feeling. You may correct and amend this corruption of the bone with cauteries as well actual as potential; or with powders of *Aloes*, *Gentian*, *Ariſtolochia*, *Centaury*, *Cortex pini*: as ℞ *Radic. Ireos*, *Flor. Ariſtolochiæ*, *an.* ʒ i. *centaur.* ʒ ij. *corticis pini* ʒ ℔, *Miſce & fiat pulvis ſubtiliſſimus oſſi inſpergendus*. But if it be much corrupted, it muſt be ſcraped forth with your *Scalpra*. And you muſt expect the falling or ſcaling of the corrupt bone from the ſound, and not forcibly procure it; for otherwiſe the ſound bone, which lies under it, being as yet covered with no fleſh growing over it, would be corrupted by the appulſe or touch of the air. Yet you ſhall by little and little gently move and ſhake rotten bones with your Probe, that ſo they may more eaſily ſcale, and with leſs trouble to Nature. But note by the way, that the ſcaling of the bone which hath environed the Trepan, is commonly performed in the ſpace of forty or fifty days. So long alſo will that cauſed by the unuſual appulſe or touch of the air, or application of a cautery, or the aſperſion of the Cephalick Powders; beſides alſo, in the ſame number of days broken bones may be united and joined together by a *Callus*, which is to them as a ſcar, yet ſometimes ſooner, ſomewhiles later, according to the variety of the ages, tempers, and habits of divers men. But if the *Caries* or *rottenneſs* can neither by theſe fore-mentioned remedies be overcome and amended, neither the looſed continuity agglutinated or united, you muſt give the Patient a vulnerary Potion; for hence I have found happy ſucceſs in many. But ſometimes not onely a certain portion of the bone is taken with a *Caries*, but alſo the whole is often ſeized upon with a ſphacel, and all falls out. For, in *Hippocrates* opinion, *Lib. de Vulneribus Capitis*, the bone of the Skull being broken, falls from the ſound more or leſs, according to the violence of the blow; which alſo is confirmed by experience. For which purpoſe I think good in this place to recite a Hiſtory, whereof I was an eye-witneſs, whileſt I ſerved as a Chirurgeon in *Piemont* under the Marſhal *de Montejan* (who was the Kings Lieutenant there.) It happened that a Lacquey of *Monſieur de Coulains* came to me to be cured; he had the *Bregma* bone of the left ſide broken with a Sword, neither yet did the fracture come to the ſecond Table; a few days after his recovery, the bone being agglutinated and united, it came to paſs that a company of *Gaſcoign* Souldiers (his Country-men) came to *Turin*, with whom one morning he eat plentifully Tripe fried with Onions and Spices, and drank a great quantity of ſtrong Wine. Whereupon he preſently fell into a continual Fever and loſt his Speech and underſtanding; his head ſwelled, his eyes looked red and fiery, and as though they would have ſtarted out of his head. Which things being conſidered, I let him bloud, having firſt (by the Phyſicians advice) given him a Clyſter, and applied to his head ſuch things as were fit; and alſo I laboured with Frictions and Ligatures of the extreme parts, to draw the humours downwards, yet for all this the part of the head which was formerly affected begun to apoſtumate; which being opened, there came forth a great quantity of matter, and at the length the muſculous skin and *Pericranium* ſinking down, both the Tables of the Skull became putrefied and rotten, as you might know by their blackneſs and ſtench. Now to take away this corruption, I applied at certain times actual cauteries, both to amend the corruption and ſeparate that which was altered: but mark, after ſome moneths ſpace, a great number of Worms came forth by the holes of the rotten bones from underneath the putrefied Skull; which moved me to haſten the ſeparation and falling away of the putrid bones. Which being done, upon the very *Craſſa Meninx*, which is more ſtrange, in that place which Nature had covered with fleſh, I obſerved three cavities of the largeneſs of ones thumb filled with Worms about the bigneſs of a points tag, with black heads, diverſly wrapped among themſelves. The bone which Nature ſeparated was of the bigneſs of the Palm of ones hand, ſo that it was ſtrange that ſo large a portion of the skull ſhould be caſt off by Nature, and yet the Patient not die thereof; for he recovered yet beyond all mens expectation, but after the agglutination of the wound the ſcar remained very hollow according to the decree of *Hippocrates*. For fleſh doth not eaſily grow upon a *Callus*, becauſe it is a thing ſtrange and ſuppoſititious by Nature: beſides, as a ſcar is a thing more denſe than the skin, ſo is a *Callus* than the bone, ſo that through the more compact ſubſtance thereof, the bloud can neither freely nor plentifully ſweat through for matter to regenerate fleſh. Hence it is that whereſoever any portion of the skull is wanting, you may there by putting to of your hand perceive and feel the beating of the brain, wherefore the Skull muſt needs be much weaker in that place. Now to help this infirmity, I wiſhed this Lacquey to wear a Cap made of thick Leather, ſo more eaſily to withſtand external injuries; and verily thereby he grew much better. Now I think good in this place to lay open the deceit and craft of ſome Impoſtors falſly ſtiling themſelves Chirurgeons, who when they are called to cure Wounds of the head, wherein any part of the skull is loſt, perſuade the Patient and his Friends that they muſt put a plate of Gold in the place of the skull which is wanting. Wherefore they hammer it in the preſence of the Patient, and turn it divers ways and apply it to the part, the better to fit it; but preſently after they ſlily convey it into their purſes, and ſo leave the Patient thus couzened. Others brag that they are able to put the dried rind of a Gourd in the place of a loſt bone, and faſten it on to defend the part; and thus they groſly abuſe thoſe which are ignorant in the Art. For this is ſo far from being done, that Nature will not ſuffer nor endure ſo much as an hair, or any other ſmall body to be ſhut up in a Wound when it is cicatrized; neither is the reaſon alike of a leaden bullet, which ſhot into the body lies there for many years without any harm to the Patient; for although lead have a certain familiarity with Mans Body, yet is at length (unleſs the denſity of the oppoſed fleſh, ligament, tendon, or ſome other ſuch like ſubſtance hinder) thruſt forth by Nature, impatient of all ſtrange bodies. And thus much of the rottenneſs and corruption of fractured bones; now muſt we ſpeak of the diſcommodities which befall the *Meninges* by Wounds whereby the Skull is broken.

The benefit of a vulnerary potion.

A Hiſtory.

A great falling away of a corrupt bone.

Aph. 45. *ſect.* 6.

The covetous craft of Impoſtors.

CHAP.

CHAP. XXI.

Of the diſcommodities which happen to the Craſſa Meninx *by fractures of the Skull.*

MAny diſcommodities chiefly happen to the *Craſſa Meninx* by a fracture of the skull, and raſh trepaning thereof; for it ſometimes chances to be cut and torn. Agglutination is a remedy for this diſeaſe, which *Hippocrates* wiſhes to be procured with the juice of *Nepeta*, [that is, of that Calamint, which ſmells like Penny-royal] mixed with Barley-flour. In ſtead whereof this following Powder having the like faculty, may take place.

Remedies for the lacerated *Meninx.*

℞ *Colophon* ʒ iij. *Myrrhæ, Aloes, Maſtiches, Sanguinis Dracon. an.* ʒ i. *croci, ſarcocollæ, an.* ʒ ß. *miſce & fiat pulvis ſubtilis.* But to purge the bloud and matter which is gathered and lies between the *Craſſa Meninx* and skull, you ſhall put in a Tent made of a rag twined up ſome four or five double, and ſteeped in Syrup of Roſes or Wormwood, and a little *Aqua Vitæ*; for thus you ſhall preſs down both the *Craſſa Meninx*, leſt lifted up by the accuſtomed and native pulſation of the Brain, it ſhould be hurt by the edges of the Skull, yet rough by reaſon of the ſharp ſplinters of the bone lately trepaned, and give freer paſſage forth for the matter there contained. But as oft as you ſhall dreſs the Patient, you ſhall renew the fore-mentioned Tent, untill all the matter be purged forth. And ſo often alſo you ſhall preſs down with this following Inſtrument the *Dura Mater*, and bid the Patient to ſtrive to put forth his breath, ſtopping his mouth and noſe, that ſo the matter may more eaſily be evacuated. This Inſtrument wherewith you ſhall hold down the *Dura Mater*, muſt have the end round, poliſht, and ſmooth, as it is here expreſt.

A fit Inſtrument to preſs and hold down the Dura Mater, *ſo to make way for the paſſage forth of the* Sanies *or Matter.*

A Sponge fit to foment withall.

And let there be laid upon the *Dura Mater* ſtrewed over with the formerly fore-mentioned Powder, a ſponge moiſtned and wrung forth of a drying decoction made of aromatick and cephalick things, ſuch as this which follows. ℞ *Fol. ſalviæ, majoran. betonicæ, roſar. rub. abſinth. Myrtil. florum chamæm. melil. ſtœchad. utriuſque an. M.* iij. ß. *rad. cyperi, calam. aromat. ireos, caryophyllatæ, angelicæ, an.* ʒ. ß. *bulliant omnia ſecundum artem cum aqua fabrorum & vino rubro, fiat decoctio ad uſum dictum.* An in ſtead hereof you may uſe Claret with a little *Aqua Vitæ*, that ſo the contained matter may be evacuated and dried up. A Sponge is fitter for this purpoſe to draw than a linnen rag, or any other thing, both becauſe it is good of it ſelf to draw forth the humidity, as alſo for that by its ſoftneſs it yields to the pulſation of the Brain. Then apply to the Wound and all the adjoining parts, an Emplaiſter of *Diacalcitheos* diſſolved with Vinegar or Wine, or Oil of Roſes, that ſo the Plaiſter may be the more cold and ſoft. For, in *Hippocrates* opinion, nothing which is any thing heavy or hard muſt be applied to the wounds of the head, neither muſt it be bound with too ſtrait or hard a ligature, for fear of pain and inflammation.

Lib. de vuln. cap.

Lib. de faſciis. The diſcommodities of too ſtrait binding of the head.

For *Galen* tells (as he had it from *Mantias*) that a certain man had loſt his eyes by inflammation and impoſtumation, ariſing for that an Apothecary had uſed too ſtrait a ligature to his head and face; for this ſtrait ligature ſo preſſed the ſutures, that the fuliginous vapours, which uſed to paſs through them and the pores of the skull, were ſtopped from paſſing that way; beſides, the beating of the Arteries was intercepted and hindered, by which means the pain and inflammation ſo increaſed, that his eyes were rent and broke in ſunder and fell forth of their orb. Wherefore *Hippocrates* rightly commends an indifferent ligature: alſo he fitly wiſheth us to let the Emplaiſters be ſoft which are applied to the head, as alſo the cloaths wherewith it is bound up to be of ſoft and thin Linnen, or of Cotton or Wool. When the Patient is in dreſſing, if there come much matter out of the Wound, you ſhall wiſh him if he can, to lie upon the wound, and now and then by fits to ſtrive to breathe, ſtopping his mouth and noſe, that ſo the brain lifted and ſwollen upwards, the matter may be the more readily caſt forth; otherwiſe ſuffer him to lie ſo in his bed, as he ſhall beſt like of, and ſhall be leaſt troubleſom to him. You may with good ſucceſs put upon the *Craſſa Meninx* Oil of Turpentine with a ſmall quantity of *Aqua Vitæ* and a little Aloes and Saffron finely powdered, to cleanſe or draw forth the *Sanies* or Matter, Or elſe, ℞ *Mellis roſar.* ʒ ij. *farinæ hord. pulver. aloes, maſtich. & Ireos florent. an.* ʒ ß. *Aqua Vitæ, parum*; let them be incorporated together and make a deterſive Medicin for the aforeſaid uſe.

What cloaths we muſt uſe.

How the Patient muſt lie in his bed.

Paulus lib. 6. cap. 90.

Sometimes alſo the *Craſſa Meninx* is inflamed after Trepaning, and ſwollen by a *Phlegmon*, that, impatient of its place, it riſes out of the hole made by the Trepan, and lifts it ſelf much higher than the skull, whence grievous ſymptoms follow. Wherefore to prevent death, of which then we ought to be afraid, we muſt enlarge the former hole with our cutting Mullets, that the matter contained under the Skull, by reaſon of whoſe quantity the membrane ſwells, may the more freely breathe and paſs forth, and then we muſt go about by the preſcript of the Phyſician to let him bleed again, to purge and diet him. The inflammation ſhall be reſiſted by the application of contrary remedies, as this following fomentation. ℞ *Sem. lini, althæ. fon. pſillii, roſ. rub. an.* ʒ i. *ſolani, plantag. an. M.* i. *bulliant in aqua tepida communi, ex qua fiat fotus.* Anodyne and repelling Medicins ſhall be dropped into his ears, when it is exceedingly ſwollen, that the tumor may ſubſide, you ſhall caſt upon it the meal or flour of Lentils, or Vine leaves beaten with Gooſe greaſe. With all which remedies, if the tumor do not vaniſh, and withall you conjecture that there is *Pus* or Matter contained therein, then you muſt open the *Dura Mater* with your inciſion-knife, holding the point upwards and outwards, for ſo the matter will be poured forth and the ſubſtance of the Brain not hurt nor touched. Many other Chirurgeons, and I my ſelf, have done this in many Patients with various ſucceſs. For it is better in deſperate caſes

Remedies for the inflammation of the *Craſſa Meninx.*

How we muſt open the *Craſſa Meninx* when it is impoſtumate.

to

to try a doubtful remedy than none at all; also it oft-times happens, whether by the violence of the contusion and blow, or concretion, or clotting of the bloud which is shed, or the appulse of the cold air, or the rash application of Medicins agreeing neither in temper nor complexion with the *Crassa Meninx*, or also by the putrefaction of the proper substance, that the *Dura Mater* it self becomes black. Of which symptom the Chirurgeon must have a great and special care.

The causes and remedies of the blackness of the *Dura Mater*.

Therefore that thou mayest take away the blackness, caused by the vehemency of the contusion, you shall put upon it oil of Eggs with a little *Aqua Vitæ*, and a small quantity of Saffron and Orris roots in fine powder, you shall also make a fomentation of discussing and aromatick things boiled in Water and Wine; and *Vigo*'s Cerat formerly described shall be applied. But if the harm come from congealed bloud, you shall withstand it with this following remedy. ℞ *Aqua vitæ* ℥ ij. *granor. tinctorum in tenuem pulverem tritorum* ʒ ij. ℈. *croci*, ℈ i. *Mellis rosat.* ʒ ij ℈. *sarcocol.* ʒ iij. *Leviter & simul bulliant omnia, & de colatura infundatur, quousque nigrities fuerit obliterata.* If this affect come by the touch of the air, it shall be helped with this following remedy. ℞ *Tereb. ven.* ℥ iij. *Melis ros.* ℥ ij. *Vitellum ov. unum, farin. hordei* ʒ iij. *croci* ℈ i. *sarcocol.* ʒ ij. *aq. vitæ* ʒ ij. *incorporentur simul, & bulliant paululum.* This remedy shall be used until the blackness be taken away, and the Membrane recover its pristin colour.

Remedies for contusion.

For congealed bloud.

For the hurt received by the air.

But if this affect proceed from the rash use of Medicins, it must be helped by application of things contrary. For thus the offence caused by the too long use of moist and oily Medicins, may be amended by using catagmatick and cephalick powders; but the heat and biting of acrid Medicins shall be mitigated by the contrary use of gentle things: for both humid and acrid things somewhat long used, make the part look black; that truly, by generating and heaping up filth; but this by the burning and hardning heat. But when such blackness proceeds from putrefaction, *John de Vigo* commends the following remedy. ℞ *Aqua Vitæ* ℥ ij. *mellis rosat.* ʒ ℈. But if the affect be grown so contumacious that it will not yield to this gentle remedy, then this following will be convenient. ℞ *Aqua Vitæ* ℥ iij. *mellis ros.* ℥ i. *pulver. Mercur.* ʒ ij. *unica ebullitione bulliant simul ad usum dictum.* Or, ℞ *Aq. vit.* ℥ i ℈. *syrup. absinth. & mellis rosat. an.* ʒ ij. *unguenti Ægyptiaci* ʒ i. ℈. *sarcocol. myrrhæ, aloes, an.* ʒ i. *vini albi boni & odoriferi,* ℥ i. *bulliant leviter omnia simul, colentur ad usum dictum.* But if the force of the putrefaction be so stubborn that it will not yield to these remedies, it will be helped with *Ægyptiacum* (made with Plantain Water in stead of Vinegar) used alone by it self, or with the powder of Mercury alone by it self, or mixt with the powder of Alum. Neither must we be afraid to use such remedies, especially in this extreme disease of the *Dura Mater*, for in *Galens* opinion the *Crassa Meninx*, after the skull is trepaned, delights in Medicins that are acrid, that is, strong, and very drying, especially if it have no *Phlegmon:* and this for two reasons; the first is, for that hard and dry bodies, such as membranous bodies are, be not easily affected, unless by strong Medicins; the other is, which must be the chief and prime care of the Physician, to preserve and restore the native temper of the part by things of like temper to it. But if the auditory passage not onely reaching to the hard membranes of the Brain, but also touching the Nerve which descends into it from the Brain, suffer most vehement Medicins, though it be placed so near; certainly the *Crassa Meninx* will endure them far more easily and without harm. But if by these means the putrefaction be not restrained, and the tumor be increased so much, that the *Dura Mater* rising far above the skull, remains unmovable, black and dry, and the Patients eyes look fiery, stand forth of his head and rowl up and down with unquietness and a phrensie, and these so many ill accidents be not fugitive, but constant; then know that death is at hand, both by reason of the corruption of the gangrene of a noble part, as also by extinction of the native heat.

What Medicins make the *Crassa Meninx* black.

Medicins against the putrefaction of the *Meninx*.

Why the *Crassa Meninx* easily endures acrid Medicins

Signs of death at hand.

CHAP. XXII.

Of the Cure of the Brain, being shaken, or moved.

WE have formerly declared the causes, signs, and symptoms of the concussion, or shaking of the Brain, without any wound of the musculous skin, or fracture of the bone; wherefore for the present I will treat of the Cure. Therefore in this case, for that there is fear that some Vessel is broken under the skull, it is fit presently to open the cephalick Vein, and let bloud be plentifully taken according to the strength of the Patient, as also respectively to the disease both which is present and like to ensue, taking the advice of a Physician. Then when you have shaved away the hair, you shall apply to the whole head and often renue the fore-mentioned Cataplasm, *Ex farinis, oleo rosaceo, oxymelite*, and other like cold and moist repelling Medicins. But you must eschew dry, and too astringent Medicins must be shunned, such as are *Unguentum de bolo* and the like; for they obstruct too vehemently, and hinder the passage forth of the vapours both by the sutures and the hidden pores of the skull. Wherefore they do not onely not hinder the inflammation, but fetch it when it is absent, or increase it when present. The belly shall be loosed with a Clyster, and the acrid vapours drawn from the head; for which purpose also it will be good, to make frictions from above downwards, to make straight ligatures on the extreme parts, to fasten large cupping-glasses with much flame to the shoulders and the original of the spinal marrow, that so the revulsion of the bloud running violently upwards to the brain, and ready to cause a Phlegmon, may be the greater. The following day it will be convenient to open the *Vena Puppis*, which is seated upon the Lambdal suture, by reason of the community it hath with the Veins of the brain, and shutting the mouth and nose to strive powerfully to breathe. For thus the membranes swell up, and the bloud gathered between them and the skull, is thrust forth, but not that which is shut up in the brain and membranes, of which if there be any great quantity, the case is almost desperate, unless Nature assisted with stronger force, cast it forth turned into *Pus*. But also after a few days the *Vena frontis* or fore-head Vein may be opened, as also the Temporal Arteries, and Veins under the Tongue, that the

What the concussion of the Brain is.

The opening of the *Vena Puppis*.

the conjunct matter may be drawn forth by ſo many open paſſages. In the mean ſpace the Patient muſt keep a ſpare diet, and abſtain from Wine, eſpecially until the 14. day, for that until that time the featful ſymptoms commonly reign. But repelling Medicins muſt be uſed until the 14. day be paſt, when we muſt come to diſcuſſing Medicins, beginning with the more mild, ſuch as is this following decoction. ℞ *Rad. Alth.* ℥ vj. *ireos, cypari, calam. arom. an.* ℥ ij. *fol. ſalviæ, majoran. betonic. flor. chamæm. melil. roſarub. ſtœchad. an. M.* ß. *ſalis com.* ℥ iij. *bulliant omnia ſimul ſecundum artem cum vino rub. & aquæ fabrorum, fiat decoctio.* Let the head be waſhed therewith twice a day with a Sponge. But yet when you do this, ſee that the head be not too much heated by ſuch a fomentation, or any ſuch like thing, for fear of pain and inflammation. Then you ſhall apply the Cerate of *Vigo* which hath power to diſcuſs indifferently, to dry, and draw forth the humours which are under the skull, and by its Aromatick force and power to confirm and ſtrengthen the Brain; it's thus deſcribed. ℞ *Furfuris bene triturati* ℥ iij. *farin. lentium* ℥ ij. *roſ. myrtillor. foliorum & granorum ejus, an.* ℥ i. *calam. aromat.* ℥ i. ß. *chamæmel. melil. M.* ß. *nuces cupreſſi num.* vj. *olei roſacei, & chamæm. an.* ℥ iij. *ceræ albæ* ℥ ij. ß. *thuris, maſtichis, an.* ℥ iij. *myrrhæ* ℥ ij. *in pulverem quæ redigi debent redactis, & liquefactis oleis cum cera, omnia miſceantur ſimul & fiat mixtura, quæ erit inter formam emplaſtri & ceroti.*

A diſcuſſing fomentation.

A caution in fomenting the head.

A deſcription of *Vigo*'s Cerate.

Vigo ſaith that one of the Duke of *Urbins* Gentlemen found the Urine hereof to his great good. He fell from his Horſe with his head downwards upon hard Marble, he lay as if he had been dead, the bloud guſht out of his noſe, mouth, and ears, and all his face was ſwollen, and of a livid colour; he remained dumb twenty days, taking no meat but diſſolved Gellies, and Chicken and Capon broths with Sugar; yet he recovered, but loſt his memory, and faltered in his ſpeech all his life after. To which purpoſe is that Aphoriſm in *Hippocrates*; Thoſe that have their Brain ſhaken by what cauſe ſoever, muſt of neceſſity become dumb; yea, alſo as *Galen* obſerves in his Commentary, loſe both their ſenſe and motion. That Cerate is not of ſmall efficacy, but of marvellous and admirable force, which could hinder the generating of an abſceſs, which was incident to the Brain by reaſon of the fall. Yet there be many men ſo far from yielding to reaſon, that they ſtifly deny that any impoſtumation can be in the Brain; and augmenting this errour with another, they deny that any who have a portion of the Brain cut off can recover, or riſe again; but the authority of ancient Writers and Experience, do abundantly refel the vanity of the reaſons whereon they rely. Now for the firſt, in the opinion of *Hippocrates*; If thoſe which have great pain in their heads have either *pus*, water or bloud flowing from their noſe, mouth, or ears, it helps their diſeaſe.

That there may be an abſceſs in the Brain. *Aph.* 10. *ſect.* 6.

Gal. lib. de inæqual. intemp. Rhaſ. cap. 4. *continent. Avicen cap. de exit. ſen.* 3. *lib.* 4. *cap.* 20.

But *Galen*, *Rhaſis*, and *Avicen*, affirm that *ſanies* generated in the Brain, disburdens it ſelf by the noſe, mouth, or ears; and I my ſelf have obſerved many who had the like happen to them.

A Hiſtory.

I was told by *Prothais Coulen*, Chirurgeon to *Monſieur de Langey*, that he ſaw a certain young man in the Town of *Mans*, who often uſed to ring a great Bell, he once hanging in ſport upon the rope, was ſnatcht up therewith, and fell with his head full upon the pavement; he lay mute, was deprived of his ſenſes and underſtanding, and was beſides hard bound in his Belly. Wherefore preſently a Fever and *Delirium*, with other horrid ſymptoms aſſailed him, for he was not trepanned becauſe there appeared no ſign of fracture in the skull: on the ſeventh day he fell into a great ſweat with often ſneezing, by violence whereof a great quantity of matter and *Pus* flowed forth of his ears, mouth, and noſe; then he was eaſed of all his ſymptoms, and recovered his health.

Lib. 8. *de uſu part. & com. ad Aph.* 18. *ſect.* 6.

Now for the ſecond, *Galen* affirms that he ſaw a Boy in *Smyrna* of *Ionia*, that recovered of a great wound of the Brain, but ſuch an one as did not penetrate to any of the ventricles. But *Guido* of *Cauliac* ſaith, he ſaw one which lived and recovered after a great portion of the Brain fell out by reaſon of a wound received on the hind part of his head. In the Year of our Lord 1538, while I was Chirurgeon to the Marſhal of *Montejan* at *Turin*, I had one of his Pages in cure, who playing at Quoits received a wound with a ſtone upon the right *Bregma* with a fracture, and ſo great an effracture of the bone, that the quantity of half a haſel Nut of the Brain came forth thereat. Which I obſerving, preſently pronounced the wound to be deadly; a Phyſician which was preſent, contradicted my opinion, affirming that ſubſtance was no portion of the Brain, but a certain fatty body. But I with reaſon and experience in the preſence of a great company of Gentlemen, convinced the pertinacy of the Man with reaſon; for that fat cannot be generated under the skull, for although the parts there contained be cold, yet becauſe they are heated by the abundance of the moſt hot and ſubtle animal ſpirits, and the heat of vapours riſing thither from all the body, they do not ſuffer fat to concrete about them. But with experience, for that in diſſecting of dead bodies, there was never any fat obſerved there; beſides alſo fat will ſwim on the top of water, but this ſubſtance as marrowy, caſt into the water preſently ſunk to the bottom.

Why fat cannot be generated under the skull.

Signs of a fatty ſubſtance.

Laſtly, Fat put to the fire becomes liquid and melts; but this ſubſtance being laid upon a hot iron became dry, ſhrunk up and contracted it ſelf like a piece of leather, but diſſolved not at all. Wherefore all thoſe which were preſent cried out, that my judgment was right of that ſubſtance that came forth of the skull. Yet though it was cut away, the Page recovered perfectly, but that he continued deaf all his life after.

CHAP. XXIII.

Of the Wounds of the Face.

Why we treat in particular of wounds of the Face.

HAving treated of the Wounds of the Head by their cauſes, ſigns, and cure, it follows that we now ſpeak of the wounds of the Face, if but for this, that when they are careleſly handled, they leave deformed ſcars in the moſt ſpecious and beautiful part of the body. The cauſes are the ſame which are incident to the skull, that is, external. But this may be added to the kinds nd differences of the wounds, that the life may be out of danger though any one whole part of the aFac(as the ear, eye, noſe, lip,) may be cut away by a wound, but not ſo in the Head or Skull.

Where-

Wherefore beginning at the Wounds of the eye-brows, we will proſecute in order the Wounds of the other parts of the face.

This is chiefly to be obſerved in wounds of the Eyebrows, that they are oft-times cut ſo overthwart, that the muſcles, and fleſhy pannicle which move and lift them up, are wholly rent and torn. In which caſe the eye-lids cannot be opened, and the eyes remain covered, and, as it were, ſhut up in the caſes of their lids; ſo that even after the agglutination of the Wound, if the Patient would look upon any thing, he is forced to hold up the eye-lids with his hand; with which infirmity I have ſeen many troubled, yet oft-times not ſo much by the violence of the Wound, as the unskilfulneſs of the Chirurgeon who cured them, that is, by the negligent application of the boulſters, an unfit ligature, and more unfit ſuture. In this caſe the skilful Chirurgeon, which is called to the Patient, ſhall cut off as much of the skin and fleſhy pannicle as ſhall ſerve the eye-lids, that ſo they may by their own ſtrength hold and keep open, without the help of the hand: then he ſhall ſew the Wound as is fit, with ſuch a ſtitch as the Furriers and Glovers uſe; and then he ſhall pour thereon ſome of the Balſom of my deſcription, and ſhall lay ſuch a Medicin to the neighbouring parts. ℞ *Olei roſar.* ℥ ß. *album ovor. nu.* ij. *boli armen. ſanguin. Drac. Maſtich. an.* ℥ j. *agitentur ſimul, fiat medic.* Then let the part be bound with a fitting ligature. Afterwards you ſhall uſe *Emplaſt. de gratia Dei, Empl. de Betonica, Diacalcitheos*, or ſome other like, until the Wound be cicatrized. But ſuch like, and all other Wounds of the Face may be eaſily healed, unleſs they either be aſſociated with ſome malign ſymptoms, or the Patients body be repleat with ill humours.

A thing to be obſerved in Wounds of the Eye-brows.

There ſometimes happen a quite contrary accident in Wounds of the Eye-brows, that is, when the eye-lids ſtand ſo up that the Patient is forced to ſleep with eyes open; wherefore thoſe which are ſo affected, are called by the *Greeks Lagophthalmi.* The cauſe of this affect is often internal, as a carbuncle, or other kind of abſceſs, as a blow or ſtroak. It ſhall be cured by a crooked or ſemicircular inciſion made above the eye-lids, but ſo, that the extremes of the ſemicircle bend downwards, that they may be preſſed down and joined as much as is needful to amend the ſtiffneſs of the eye-lid. But you muſt not violate the griſle with your Inſtrument, for ſo they could no more be lifted up; the reſidue of the cure muſt be performed as is fit.

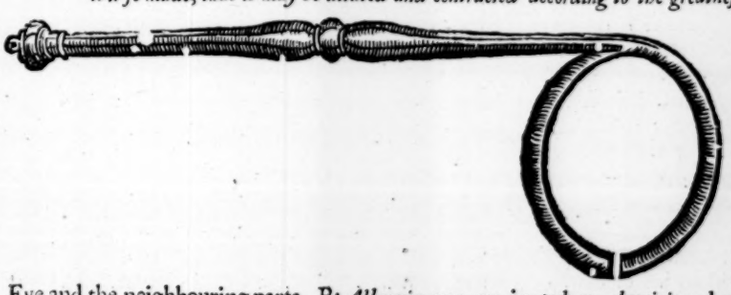
Lagophthalmia is a quite contrary accident to the falling down of the Eye-lids.

CHAP. XXIV.

Of the Wounds of the Eyes.

WOunds of the Eyes are made by the violence of things pricking, cutting, bruiſing, or otherwiſe looſing the continuity. But the cure muſt always be varied according to the variety of the cauſes and differences. The firſt head of cure is, that if any ſtrange and heterogeneous body ſhall be fallen into the eyes, let it be taken forth as ſoon as you can, lifting and turning up the eye-lid with the end of a *Spatula.* But if you cannot diſcern this mote or little body, then put three or four ſeeds of *Clary*, or *oculus Chriſti* into the pained eye. For theſe ſeeds are thought to have a faculty to cleanſe the eyes and take out the motes, which are not faſtned deep in, nor do too ſtubbornly adhere to the membranes. For in this caſe you ſhall uſe this following Inſtrument, for herewith we open the eye-lids the further, putting it between them and the Eye, and alſo keeping the Eye ſteddy by gently preſſing it, that ſo with our mullets we may pull out the extraneous body; this is the figure of ſuch an Inſtrument.

The delineation of a Speculum Oculi, *fit to dilate and hold aſunder the Eye-lids, and keep the Eye ſteddy: it is ſo made, that it may be dilated and contracted according to the greatneſs of the Eyes.*



All ſtrange bodies taken out, let this medicin be put into the Eye. Take the ſtrains of a dozen Eggs, let them be beaten in a leaden Mortar, with a little Roſe-water, and ſo put into the Eye; but let this repercuſſive be laid upon the Eye and the neighbouring parts. ℞ *Albumin. ovor. nu.* iv. *pulver. aluminis rochæ combuſti* ℥ ij. *ſanguinis Draconis* ℥ j. *aquæ roſar. & plantag. an.* ℥ ij. *agitentur ſimul*, make a repercuſſive, which you may frequently uſe. Or elſe apply Cheeſe-curds well wrung, mixed with Roſe-water, the white of an Egg, and as much *acacia* as ſhall ſuffice. This which followeth doth more powerfully ſtay the flowing humour. ℞ *gum. arab. & tragac. an.* ℥ ij. *pſillii cydon. ſem. portul. plant. ſumach. an.* ℥ ij. *fiat mucag. cum aqua plantag. ſolan. & roſar. concinnetur collyrium*, of which you may drop ſome both within and about the Eye.

A repercuſſive to be put into the Eye.

Divers repercuſſives to be applied to the Eye.

But note, that all ſuch remedies muſt be applied warm, both that they may the better penetrate by their moderate heat, as alſo for that all actual cold things are hurtful to the eyes and ſight, becauſe they dull the ſight by incruſtating the viſive ſpirits. For I have known many who have become dull of ſight by the frequent uſing of Medicins actually cold to the eyes. I have on the contrary ſeen not a few, who have recovered with the fit uſe of ſuch like Medicins, who have had any part of their eye (ſo it were not the *pupilla* or apple of the eye) ſo pricked with a Needle or Bodkin, that much of the wateriſh humour ran forth thereat.

Things actually cold are hurtful to the Eyes.

The milk of a Woman which ſuckles a Girl (for that is reputed the cooler) mitigates pain and cleanſes, if it be milked out of the Dug into the eye; to which purpoſe alſo the bloud of Turtles, Pigeons,

Anodyne Medicins for the Eyes.

Pigeons or Chickens much conduces, being dropt into the eye by opening a Vein under their Wings. Alſo this following Cataplaſm aſſwageth pain and inflammation, and hinders defluxion, being applied to the eye and the adjacent parts. ℞ *Carnis pomorum ſub cinere calido decoctorum* ℥ v. *vitel. ovorum num.* iij. *caſſiæ fiſtulæ recenter extractæ* ℥ ß. *mucaginis pſillii, altheæ, & cydon. an.* ℥ j. *farin. hordei parum; incorporentur omnia ſimul, fiat cataplaſma.* Alſo Sheeps Lungs boiled in Milk and applied warm, and changed as they grow cold, are good to aſſwage pain. But if the too violent heat and pain ſhall not yield to ſuch Medicins, but require more vehement, then *Foliorum Hyoſcyami, m.* j. *ſub. cineribus coquatur, atque in mortario cum mucagine ſeminis pſillii, & cydonior. extracti. in aquis ſolani & plantag. piſtetur:* then let this Medicin be wrapped in a linnen cloth and applied to the Eyes and Temples. The mucilages of *Pſillium* or Flea-wort, and Quince-ſeed extracted in a decoction of Poppy-heads, and mixed with a little *Opium* and Roſe-water, are uſed for the ſame purpoſe. But when there is need of detergent and ſarcotick Medicins, then ℞ *Syrup. roſar. ſiccat.* ℥ j. *aq. fœnic. & rutæ, an.* ℥ ij, *aloes lotæ, olibani, an.* ℥ ß. mix them for the foreſaid uſe. The galls of Scates, Hares, and Partridges, diſſolved in Eye-bright and Fennil Water, are fit for cleanſing ſuch Wounds: as alſo this following *Collyrium.* ℞ *Aquæ hordei* ℥ j. *mellis deſpumati,* ℥ iij. *Aloes ter lotæ in aqua plantaginis & ſacchari cand. an.* ℥ j. *fiat collyrium.* Alſo this enſuing Medicin is very ſarcotick. ℞ *Mucagin. gummi olibani arabici, tragacanth. & ſarcocol. in aq. hordei extracti. an.* ℥ iij. *aloes ter lotæ in aq. roſar.* ℥ j. *ceruſ. uſtæ & lotæ, tutiæ præpar. an.* ℥ ß. *fiat collyrium.* But here you muſt note, that the coat *Adnata* often ſwells ſo much by reaſon of a wound, or ſome other injury, and ſtands ſo forth by the falling down of humours, acceſs and mixture of flatulencies, that it hides the whole *Pupilla*, and hangs forth of the eye-lids like as if it were an unnatural fleſhy excreſcence, and it loſes, the native colour, and looks very red, ſo that the Eye can neither be ſhut nor opened.

Narcoticks.

Detergent Medicins.

A ſarcotick Medicin for the eyes.

Wherewith a young Chirurgeon being deceived, determined to cut away this protuberancy of the *Adnata*, as though it had been ſome ſuperfluous fleſh, and then to waſte it with cathæretick Powders, had I not forbidden him, telling him of the certain danger of blindneſs which would thereupon befall the Patient. Wherefore I preſcribed a Fomentation of Chamomil, Melilote, Roſe-leaves, Wormwood, Rue, Fennil and Anniſeeds, boiled in Milk with the roots of Oris and Marigolds. Then I preſently added this following Fomentation, being more powerful and drying. ℞ *Nucis cupreſſi, gallar. balauſt. an.* ℥ j. *plantagin. abſinth. hippuris, flor. chamæm. roſar. rub. an. M* ß. *bulliant ſimul, cum aqua fabrorum, & fiat decoctum pro fotu cum ſpongia.* Beſides alſo you may apply a Cataplaſm made of Barley and Bean-flour, the Powders of Maſtick, Myrrhe, and Aloes, and ſome of the laſt deſcribed Decoction. The Tumour beginning to decline, I dropt the flowing Liquor into the Eye, which hath a very aſtringent, drying and ſtrengthening faculty. Roaſt a new laid Egg in Embers until it be hard, then pill off the ſhell, take forth the Yolk, and in place thereof put a ſcruple of Roman Vitriol in fine Powder, then put it in a linnen cloth and wring it hard forth into ſome clean thing, and drop thereof for ſome days into the Eye, with a little Smiths Water wherein Sumach and Roſe-leaves have been boiled. I have found by experience the certain force of this remedy; but if notwithſtanding there be a true fleſhy excreſcence upon the coat *Adnata*, it may be taken away by this following Powder. ℞ *Oſſis ſepiæ, & teſtæ ovorum calcinatæ an.* ℥ j. *fiat pulvis.* Calcined Vitriol, burnt Alum, and the like may be commodiouſly uſed to this purpoſe. Yet you muſt warily make uſe of all ſuch things, and always lay repercuſſives about the eye, that no harm enſue thereof. For divers times acrid humours fall down into the Eye with ſuch violence, that they break the horny coat, whereupon the humours of the Eye are poured out. Remember alſo, that in diſeaſes of the Eyes the Patient lie with his head ſomewhat high, and that he keep ſhut not onely the pained, but alſo the ſound Eye, becauſe reſt is always neceſſary for the grieved part. But one Eye cannot be moved without ſome motion of the other, by reaſon of the connexion they have by their optick and moving nerves, both the *Meninges* and the *Pericranium*, Veins and Arteries; which is the cauſe that when the one ſuffers, the other in ſome ſort partakes therewith.

A drying Fomentation.

A Medicin to conſume a fleſhy excreſcence without biting.

But if we cannot prevail by all theſe formerly preſcribed Medicins fit to ſtay the defluxion, then it remains that we apply a Seton to the Neck, for it is a ſingular remedy againſt inveterate defluxions into the Eyes. For we know by daily experience., that many who have had their ſight dulled by a long and great defluxion, ſo that they were almoſt blind, have by little and little recovered their former ſplendour and ſharpneſs of ſight, when matter once began to be evacuated by the Seton.

A Seton, a good remedy againſt inveterate defluxions into the eyes.

The truth hereof appeared in *Paul* the *Italian* Goldſmith, who dwelt near the *Auſtin-Friars*. For he having uſed many Medicins of divers Phyſicians and Chirurgeons in vain, when he was almoſt blind, he applying a Seton by mine advice, began by little and little to ſee better according to the quantity of the matter which was evacuated, until at length he perfectly recovered his ſight. But at laſt growing weary of the Seton which he had worn for a Year (although matter came daily forth thereof) yet he would have it taken forth and healed up; but this way of evacuation being ſhut up, and the humour beginning to flow into his eyes, ſo that he was in danger to become blind, he called me and made me again to apply the Seton in his Neck. Whereby recovering his former ſoundneſs and perfection of ſight, he yet wears the Seton.

A Hiſtory.

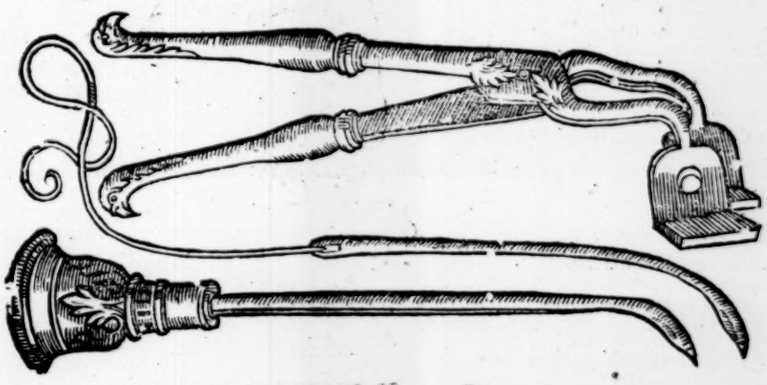
I alſo once freed by this kind of remedy, by appointment of the moſt learned Phyſician *Hollerius*, a certain young man of 20 years old, from the Falling-ſickneſs, who before had many fits thereof; the Ichorous humours, the feeders of this Diſeaſe, being by this means, as it is moſt probable, drawn away and evacuated.

A Seton good againſt the Falling-ſickneſs.

Wherefore ſeeing a Seton is of this uſe, I have thought good in this place to ſet down in Writing and by Figure, the manner of making thereof, for the behoof of young Practitioners: Wiſh the Patient to ſit on a low Stool, and to bend down his head, that ſo the skin and fleſhy pannicle may be relaxed; then muſt you with your fingers pluck up and ſever the skin from the muſcles, and

The manner of making a Seton.

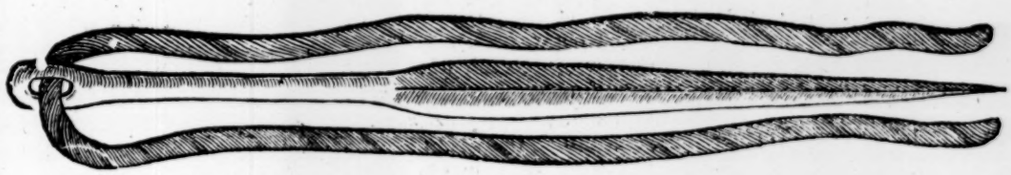
A Figure of the Pincers, actual Cautery, and Needle, uſed in making a Seton.



and take hold of as much hereof as you can with your Pincers, not touching the Muſcles of the neck for fear of a Convulſion and other ſymptoms; you ſhall then twitch the skin which is held in the Pincers moſt hard, when you ſhall thruſt the hot Iron through the holes made in the midſt of them; that alſo the nerves being ſo twitched, the dolorifick ſenſe may the leſs come to the part. The wound muſt be made or burnt in long-ways, and not thwarting that ſo the matters may be the better evacuated by the ſtrait fibers. But the Cautery or hot Iron muſt have a three or elſe a four-ſquare point, and that ſharp that ſo it may the more eaſily and ſpeedily enter. Then keeping the Pincers immoveable, let him draw through the paſſage made by the Cautery a needle and thred with a three or four-doubled thred of Cotton [or rather a skean of Silk] moiſtned in the white of an Egg and Oil of Roſes; then after you have applied pledgets dipped in the ſame Medicin, bind up the part with a convenient ligature. The day following the neck muſt be anointed with Oil of Roſes, and the pledgets dipped in the former Medicin applied for ſome days after. But it will be convenient to moiſten the Seton with a digeſtive made of the yolk of an Egg and oil of Roſes until the Ulcer caſts forth much matter; then you ſhall anoint the Cotton thred with this following remedy. ℞ *Terebinth.ven.* ʒ iv. *ſyrupi roſat. & abſinthii an.* ʒ ß. *pulv. Ireos, diacrydii, agarici trochiſc. & Rhei, an.* ʒ ß. *incorporentur omnia ſimul & fiat medic.* Which you ſhall uſe ſo long as you intend to keep open the Ulcer. For it hath a faculty to draw the humors from the face, and cleanſe without biting.

I have found not long ſince by experience, that the apertion made with a long thick Triangular needle of a good length like to a large Pack-needle, is leſs painful than that which is performed with the actual cautery which I formerly mentioned. Wherefore I would adviſe the young Chirurgeon, that he no more uſe the aforeſaid actual cautery. I have here given you the Figure of the Needle.

The Figure of a Triangular Needle.



CHAP. XXV.

Of Wounds of the Cheek.

SEeing a Wound in the Cheek ſeems to require a Suture, it muſt have a dry ſuture (as they term it) leſt that the ſcar ſhould become deformed. For that deformity is very grievous to many, as to Women who are highly pleaſed with their beauties. Therefore you ſhall ſpread two pieces of new cloth of an indifferent fineneſs, and proportionable bigneſs with this enſuing Medicin. ℞ *Pulveris Maſtichini, Sanguinis Draconis, Thuris, farinæ volatilis, tragacanthæ contuſæ, gypſi, piſis, ſarcocollæ, an* ʒ ij. *picis nigræ,* ʒ j. ß. *albumina ovorum quæ ſufficiant, fiat medicamentum.* Apply the pieces of cloth ſpread with this, on each ſide of the Wound one, ſome fingers bredth aſunder, and let it alone till it be hard dried to the skin. Then you ſhall ſo draw them together with your Needle and thred, that the fleſh by their ſticking may alſo follow, and be mutually adjoined, as you may ſee it here expreſt. The Wound ſhall be agglutinated by this means, together with the uſe of fit Medicins, Pledgets, Ligatures. But all the Ligatures and ſtays which ſhall be uſed for that purpoſe, muſt be faſtned to the Patients night-lap.

The uſe of a dry ſuture.

How to make a dry ſuture.

But when the Wound is great and deep, and the lips thereof are much diſtant the one from the other, there can be no uſe of ſuch a dry ſuture. Wherefore you muſt uſe a three or four-ſquare Needle (that ſo it may the more readily and eaſily enter into the fleſh) being thred with a waxed thred; and with this you muſt thruſt through the lips of the Wound, and leave the Needle ſticking in the Wound, and then wrap the thred to and again over the ends thereof eight or ten times, juſt after that manner which Women uſe to faſten a Needle with thred in it upon their ſleeves, or Tailors to their hats or caps, that they may not loſe them.

A ſuture fit for hare-lips. The manner thereof.

The Needle thus faſtned ſhall be there until the perfect agglutination of the Wound; this kind of ſuture is uſed in the wounds of the lips, as alſo in hare-lips, for ſo we commonly call lips which are cleft from the firſt conformation in the Womb by the errour of the forming faculty. But ſuch a ſu-

What hare-lips are.

ture will help nothing to agglutination, if there lie or remain any skin between the lips of the wound; wherefore you ſhall cut away whatſoever thereof ſhall be there, otherwiſe you muſt expect no union. Other kind of ſutures are of no great uſe in wounds of theſe parts, for out of the neceſſity of eating and ſpeaking, they are in perpetual motion, wherefore a thred would cut the fleſh; for which reaſon you ſhall take up much fleſh with ſuch Needles mentioned in this laſt deſcribed kind of ſuture, as this following Figure ſhews.

The Figure of the ſuture fit for cloven or hare-lips; as alſo the delineation of the Needle about whoſe ends the thred is wrapped over and under, to and again.

A Hiſtory.

To this purpoſe I will recite a Hiſtory, to the end, that if any ſuch thing happen to come to your hands; you may do the like. A certain Gaſcoign in the battel of Saint *Laurence*, had his upper jaw cut overthwart even to his mouth, to the great disfiguring of his face. The wound had many worms in it, and ſtank exceedingly, becauſe he could get no Chirurgeon until three days after he was hurt. Wherefore I waſhed it with a decoction of Wormwood, Aloes, and a little *Ægyptiacum*, both to kill the Worms, and to fetch away all the putrid matter; I diſcuſſed the tumor with a diſſolving fomentation and cataplaſm, I joined together the lips of the Wound with the laſt deſcribed ſuture. But I applied this following Medicin to the whole part. ℞ *Terebinth. venetæ* ʒ vj. *gummi elemi* ʒ ij. *pulv. boli armeni, ſan. drac. Maſtiches, Myrrhæ, Aloes, an.* ʒ ß. *incorporentur ſimul, fiat medicamentum.* The wound was agglutinated within a few days, but that there remained a certain little hole at the joining of the lower Jaw with the upper, wherein you could ſcarce put the head of a pin; out whereof nevertheleſs much ſerous and thin moiſture flowed, eſpecially when he either eat or ſpake; which I have alſo obſerved in many others. But for ſtaying of this wateriſh humidity I dropped *Aqua fortis* into the bottom of the ulcer, and divers times put therein a little of the powder of burnt Vitriol. Thus by Gods grace he recovered and became whole.

A decoction good to waſh away putrefaction.

A ſmall hole remaining after the cure of great wounds.

CHAP. XXVI.

Of the Wounds of the Noſe.

How many ways the noſe may be hurt.

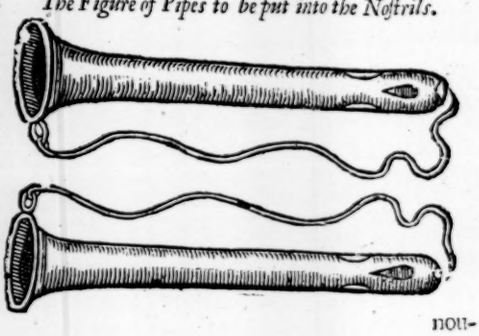
THe Noſe many ways ſuffers ſolution of continuity; as by a Wound, Fracture, and Contuſion, and it is ſometimes battered and broken on the upper part; which when it happens, you ſhall reſtore the depreſt bones to their native ſeat and figure, with the end of a *Spatula*, or fit ſtick wrapped about with Tow, Cotton, or a linnen rag. Then with pledgets dipped in an aſtringent Medicin compoſed *ex albumine ovi, Maſtich. bol. armen. ſanguin. drac. & alumine uſto*, and applied to the ſide of the Noſe, he ſhall labour to ſtrengthen the reſtored Bones, and then bind them with a convenient ligature, which may not preſs them too much, leſt the Noſe ſhould become flat, as it happens to many through the unskilfulneſs of Chirurgeons.

The cure of a broken Noſe.

The uſes of Pipes in broken Noſes.

Then muſt you put little Pipes into the Noſtrils, and theſe not exactly round, but ſomewhat flat and depreſt, tied to the night-cap on each ſide with a thred, leſt they ſhould fall out. By the help of theſe Pipes the Bones of the Noſe will be kept in their place, and there will be paſſage forth for the matter, and for inſpiration and exſpiration. But if all the Noſe, or ſome portion thereof ſhall be wholly cut off, we muſt not hope to reſtore it. But if the Noſe be ſo cut, that as yet it adheres to much of the adjacent fleſh, from whence it may receive life and

The Figure of Pipes to be put into the Noſtrils.



nou-

nouriſhment, then ſew it up. For the lower part of the Noſe, it may be ſhaken, depreſt and wreſted aſide, ſeeing it is griſly; but it cannot be broken, as the other which is of a bony Nature.

CHAP. XXVII.

Of the Wounds of the Tongue.

How many ways the continuity of the Tongue may be looſed.

THe Tongue may be ſo wounded, that either it may be wholly cut off and deprived of ſome portion of the ſubſtance, or onely ſlit long-ways, or athwart. The loſs of the ſubſtance cannot be repaired, becauſe every part ſeparated and pluckt from the living body, from whence it had life, ſpirit, and bloud, preſently dies. For, as Philoſophers ſay, *à privatione ad habitum non eſt regreſſus.* But when it is cut or ſlit long-ways or ſide-ways, it is eaſily reſtored by ſuture, if ſo be that the cloven part yet adhere to the living body from whence it may draw both matter and form of life. Therefore a careful ſervant ſhall ſtraitly hold with a ſoft and clean linnen cloth the body of the Tongue, leſt it ſhould ſlip away by reaſon of its ſlipperineſs, whileſt the Chirurgeon ſtitch it above and below; when he thinks he hath ſufficiently ſewed it, let him cut off the thred as near to the knot as he can, leſt being left too long it might be tangled with the teeth as he eats, and ſo cauſe a hurtful laceration or rending of the ſewed parts. In the mean time let the Patient eat Barley-Creams, Almond-Milks, Gellies, Culliſſes, and Broths, and the yolks of Eggs, and let him often hold in his mouth Sugar of Roſes and Syrup of Quinces; for ſuch things beſides their nouriſhing faculty, perform the part of an agglutinating and detergent Medicin. I have learned theſe things I have here ſet down, neither from my Maſters whom I have heard with attention, nor by reading of Books, but they have been ſuch as I have tried with happy ſucceſs in many; as in the ſon of Monſieur *de Marigny* Preſident of the Inquiſition, in *John Piet* a Carpenter dwelling in the Suburbs of Saint *German*.

The cure of a cloven tongue.

A Hiſtory.

But moſt apparently in a child of three years old, the ſon of the great Lawyer Monſieur *Covet*, who fell with his chin upon a ſtone, and ſo cut off a large piece of the end of his tongue, which chanced to be between his teeth; it hung but at a very ſmall fiber of fleſh, ſo that I had very little or no hope to agglutinate and unite it, which thing almoſt made me to pluck it quite away; yet I changed that determination by conſidering the loſs of the moſt noble action of ſpeaking, which would thereupon enſue, and weighing the providence of Nature often working wonders, and ſuch things as exceed the expectation of the Phyſician in curing Diſeaſes; I alſo thought thus with my ſelf, the fleſh of the Tongue is ſoft, looſe, fungous and ſpongy, neither is altogether ſpongy, neither is altogether obvious to the external injuries of the air; wherefore after that I had once or twice thruſt through the Needle and Thred upwards and downwards, and for the reſt ordered the Child to be uſed and dieted after the manner I lately mentioned, he grew well within a ſhort time, and yet remains ſo, ſpeaking well and diſtinctly.

Nature oft doth ſtrange things in the cure of Diſeaſes.

CHAP. XXVIII.

Of the Wounds of the Ears.

How many ways the unity of Ears may be violated.

THe Ears are ſometimes wholly cut off, ſometimes but in part, otherwhiles they are onely ſlit, ſo that the rent portion as yet adhering to the reſt, is joined with it in communion of life. In this laſt caſe it is fit to uſe a ſuture, but yet ſo that you touch not the Griſle with your Needle, for thence there would be danger of a Gangrene, which happens to many by fooliſh curing; therefore you ſhall take up and comprehend with your Needle onely the Skin, and that little fleſh which encompaſſes the Griſle. You ſhall perform the reſt of the cure with Pledgets and Ligatures artificially fitted, and ſhall reſiſt inflammation and other ſymptoms with fit Medicins. But you muſt take ſpecial care that no ſuperfluous fleſh grow in the auditory paſſage, which may hinder the hearing; wherefore you ſhall keep that paſſage free by ſtopping it with a piece of ſponge. But you ſhall procure agglutination and conſolidation of the griſly part (and therefore next to a bone moſt dry) with dry Medicins. But thoſe who have their Ears quite cut off, can do nothing but hide the deformity of their miſhap with a cap, ſtuffed with Cotton on that ſide.

How to ſew a wounded Ear.

CHAP. XXIX.

Of the Wounds of the Neck and Throat.

The differences of Wounds of the Neck and Throat.

THe Wounds of the Neck and Throat are ſomewhiles ſimple, as thoſe which onely uſe the continuity of the Muſcles; otherwhiles compound, ſuch as thoſe which have conjoined with them a fracture of the Bones, as of the *Vertebræ*, or hurt of the internal and external jugular Veins or ſleepy Arteries; ſometimes the *Trachea Arteria*, or Weazon, and the *Oeſophagus* or Gullet are wounded; ſometimes wholly cut off, whence preſent death enſues. Wherefore let not the Chirurgeon meddle with ſuch Wounds, unleſs he firſt foretel the danger of death, or the loſs of ſome motion to thoſe that are preſent. For it often happens that ſome notable nerve or tendon is violated by a wound in the neck, whence a Palſie enſues, and that abſolutely incurable, if the wound ſhall penetrate to the ſpinal marrow, alſo hurt therewith. Wounds of the Gullet and Weazon are difficultly cured, becauſe they are in perpetual motion; and chiefly of the latter, by reaſon it is griſly and without bloud. The wounds of the Gullet are known, by ſpitting of bloud,

The Palſie follows upon Wounds of the Neck.

Signs that the Gullet is wounded.

by the breaking forth of meat and drink by the wound; but if the Gullet be quite cut asunder, the Patient cannot swallow at all: for the cut parts are both contracted in themselves, the one upwards and the other downwards. But we know the Weazon is hurt by casting up bloud at the mouth with a continual cough, and by the coming forth of the breath or wind by the wound. The Wounds of the jugular Veins and sleepy Arteries, if they be great are usually deadly, because they cannot be straitly bound up, for you cannot bind the throat hard without danger of choaking or strangling the Patient. But for defect of a strait ligature in this case the flux of bloud proves deadly. If the recurrent Nerve of either side be cut, it makes the voice hoarse; if cut on both sides, it takes away the use of speech, by hurting those instruments which impart motion to the Muscles of the *Larinx*. For the cure, if the Wound be small, and not associated with the hurt of any notable vessel, nor of the Weazon and Gullet, it is speedily and easily cured; and if there shall be need, you shall use a suture, then you shall put therein a sufficient quantity of Venice Turpentine mixed with Bole-Armenick, or else some of my Balsam, of which this the Receipt. ℞ *Terebinth. venetæ* ℔ß *ff. gum. elemi* ℥ iv. *olei hypericonis* ℥ iij. *boli armen. & sang. draconis an.* ℥ j. *aqua vitæ* ℥ ij. *liquefiant simul omnia lento igne, & fiat Balsamum ut artis est, addendo pulveris ireos florent. aloes, masticbes, myrrhæ an.* ʒ j. I have done wonders with this Balsom in the agglutination of simple Wounds, wherein no strange body hath been. Now when you have put it in, lay upon it a plaister of *Diacalcitheos* dissolved in Oil of Roses and Vinegar, as that which hath power to repress the flowing down of humours, and hinder inflammation, or in stead thereof you may apply *Emp. de Gratia Dei*, or *Emp. de Janua*. But if the Jugular Veins and sleepy Arteries be cut, let the bleeding be staid, as we have shewed in a Chapter treating thereof. When the Weazon or Gullet are wounded, the Chirurgeon shall sew them up as neatly as he can; and the Patient shall not endeavour to swallow any hard thing, but be content to be fed with Gellies and Broths. When a Gargarism is needful, this following is very good. ℞ *Hordei M.* j. *florum rosar. p.* j. *passul. mund. jujubarum an.* ℥ ß. *glycyrrhizæ* ℥ j. *bulliant omnia simul, addendo mellis ros. & Julep. ros. an.* ℥ ij. *fiat Gargarisma, ut artis est.*

The faculty of *Diacalcitheos*.

The cure of the wounded Weazon and Gullet.

A Gargarism.

The manifold use thereof

With which being warm, the Patient shall moisten his mouth and throat, for it will mitigate the harshness of the part, asswage pain, cleanse and agglutinate, and make him breathe more freely. But that the Chirurgeon may not despair of, or leave any thing unattempted in such like wounds, I have thought good to demonstrate by some examples how wonderful the Works of Nature are, if they be assisted by Art.

A History.

A certain servant of Monsieur *de Champaigne* a Gentleman of *Anjou*, was wounded in the throat with a Sword, whereby one of the Jugular Veins was cut, together with his Weazon. He bled much and could not speak; and these symptoms remained until such time as the Wound was sewed up and covered with Medicins. But if Medicins at any time were more liquid, he, as it were, sucked them by the wound and spaces between the stitches, and presently put forth at his mouth that which he had sucked or drawn in. Wherefore more exactly considering with my self, the greatness of the Wound, the Spermatick, and therefore dry and bloudless nature unapt to agglutination of the affected part, but chiefly of the Weazon and Jugular Vein; as also for that the rough Artery is obnoxious to those motions which the Gullet performs in swallowing, by reason of the inner coat, which is continued to the coat of the Gullet, by which means these parts mutually serve each other with a reciprocal motion, even as the ropes which run to the wheel of a pulley; furthermore, weighing that the Artery was necessary for the breathing, and tempering the heat of the heart, as the Jugular Veins served for the nourishment of the upper parts; and lastly, weighing with my self the great quantity of bloud he had lost, which is, as it were, the Treasure of Nature, I told those which were present, that death was near and certainly at hand. And yet beyond expectation, rather by Divine Favour than our Art, he recovered his health.

A strange History.

Equally admirable is this History following. Two Englishmen walked out of the City of *Paris* for their Recreation to the Wood of *Vincenne*, but one of them lying in wait to rob the other of his money, and a massy chain of Gold which he wore, set upon him at unawares, cut his throat and robbed him, and so left him amongst the Vines which were in the way supposing he had killed him, having with his Dagger cut the Weazon and Gullet. This Murderer came back to the City; the other half dead, crawled with much ado to a certain Peasants house, and being dressed with such Medicins as were present, and at hand, he was brought to the City, and by his acquaintance committed to my care to be cured. I at the first, as diligently as I could, sewed up the Weazon which was quite cut asunder, and put the lips of the Wound as close together as I could; I could not get hold of the Gullet, because it was fallen down into the Stomach, then I bound up the Wound with Medicins, Pledgets, and fit Ligatures. After he was thus dressed, he begun to speak, and tell the name of the Villain the author of this fact, so that he was taken and fastned to the Wheel, and having his limbs broken, lost his wretched life, for the life of the innocent wounded man, who died the fourth day after he was hurt.

Another History.

The like hurt befel a certain German who lay at the house of one *Perots*, in the street of *Nuts*, he being frantick in the night cut his throat with a Sword; I being called in the Morning by his friends who went to see him, dressed him just after the same manner as I dressed the English man. Wherefore he presently recovered his speech, which before could not utter one syllable, freed from suspicion of the crime and prison the servant, who lying in the same Chamber with him, wrs upon suspicion committed to Prison, and confessing the thing as it was done, lived four days after the Wound, being nourished with Broths put into his Fundament like Clysters, and with the grateful vapour of comfortable things, as Bread newly drawn out of the Oven and soaked in strong Wine; I having thus by Art of Chirurgery made the dumb speak for the space of four days.

CHAP.

CHAP. XXX.

Of the Wounds of the Cheſt.

SOme Wounds of the Cheſt are on the fore-ſide, ſome behind, ſome penetrate more deep, others enter not into the capacity thereof, otherſome pierce even to the parts contained therein, as the *Mediaſtinum*, Lungs, Heart, Midriff, hollow Vein, and aſcendent Artery. Otherſome paſs quite through the body, whereby it happens that ſome are deadly, ſome not. The differences of wounds of the Cheſt.

You ſhall thus know that the wound penetrates into the capacity of the Cheſt, if that, when the Patients mouth and noſe be ſhut, the breath or wind break through the wound with a noiſe, ſo that it may diſſipate, or blow out a lighted Candle being held near it. If the Patient can ſcarce either draw, or put forth his breath, this alſo is a ſign that there is ſome bloud fallen down upon the *Diaphragma*. The ſigns.

By theſe ſigns you may know that the heart is wounded: If a great quantity of bloud guſh out, if a trembling poſſeſs all the members of the body, if the pulſe be little and faint, if the colour become pale, if a cold ſweat and frequent ſwooning aſſail him, and the extreme parts become cold, then death is at hand. Signs that the heart is wounded.

Yet when I was at *Turin*, I ſaw a certain Gentleman, who fighting a Duel with another, received a wound under his left breſt which pierced into the ſubſtance of his heart, yet for all that he ſtruck ſome blows afterward, and followed his flying enemy ſome two hundred paces until he fell down dead upon the ground; having opened his body I found a wound in the ſubſtance of the heart, ſo large as would contain ones finger; there was onely much bloud poured forth upon the Midriff. A Hiſtory.

Theſe are the ſigns that the Lungs are wounded, if the bloud comes foamy or frothy out of the wounds, the Patient is troubled with a cough, he is alſo troubled with a great difficulty of breathing and a pain in his ſide, which he formerly had not; he lies moſt at eaſe when he lies upon the wound, and ſometimes it comes ſo to paſs, that lying ſo, he ſpeaks more freely and eaſily, but turned on the contrary ſide, he preſently cannot ſpeak. Signs that the Lungs are wounded.

When the *Diaphragma* or Midriff is wounded, the party affected is troubled with a weight or heavineſs in that place, he is taken with a *Delirium*, or Raving, by reaſon of the ſympathy of the Nerves of the ſixth conjugation which are ſpread over the Midriff; difficulty of breathing, a cough and ſharp pain troubles the Patient, the Guts are drawn upwards; ſo that it ſometimes happens by the vehemency of breathing, that the Stomach and Guts are drawn through the wound into the capacity of the Cheſt, which thing I obſerved in two. Signs that the Midriff is wounded.

The one of theſe was a Maſon, who was thruſt through the midſt of the Midriff, where it is nervous, and died the third day following. I opening his lower belly, and not finding his ſtomach, thought it a monſtrous thing; but at length ſearching diligently, I found it was drawn into the Cheſt through the wound which was ſcarce an inch broad. But the ſtomach was full of wind, but little humidity in it. A Hiſtory.

The other was called Captain *Francis d' Alon* a Native of *Xantoign*, who before *Rochel* was ſhot with a Musket Bullet, entring by the breſt bone near to the ſword-like Griſle, and paſſing through the fleſhy part of the Midriff, went out at the ſpace between the fifth and ſixth baſtard ribs. The wound was healed up on the outſide, yet for all that there remained a weakneſs of the Stomach, whereupon a pain of the Guts like to the Colick took him, eſpecially in the Evening, and on the Night, for which cauſe he durſt not ſup but very ſparingly. But on the eighth moneth after, the pain raging more violently in his belly than it was accuſtomed, he died; though for the mitigating thereof *Simon Malmedy* and *Anthony du Val*, both learned Phyſitians, omitted no kind of remedy. The body of the deceaſed was opened by the skilful Chirurgeon *James Guillemeau*, who found a great portion of the Colick-gut ſwelled with much wind gotten into the Cheſt through the wound of the *Diaphragma*, for all it was ſo ſmall that you could ſcarce put your little finger in thereat. But now let us return from whence we digreſſed. Another Hiſtory.

We underſtand that there is bloud poured forth into the capacity of the Cheſt by the difficulty of breathing, the vehemency of the increaſing Fever, the ſtinking of the breath, the caſting up of bloud at the mouth, and other ſymptoms which uſually happen to thoſe who have putrified and clotted bloud poured out of the Veſſels into the Belly, infecting with the filthy vapour of the corrupt ſubſtance, the parts to which it ſhall come. But alſo, unleſs the Patient cannot lie upon his back, he is troubled with a deſire to vomit, and covets now and then to riſe, whence he often falls into a ſwound; the vital faculty which ſuſtains the body being broken and debilitated both by reaſon of the wound, and concrete or clotted bloud; for ſo putting on the quality of poiſon, it greatly diſſipates and diſſolves the ſtrength of the heart. Signs that there is bloud poured into the capacity of the Cheſt.

It is a ſign the ſpinal marrow is hurt, when a Convulſion or Palſie, that is, a ſudden loſs of ſenſe and motion in the parts thereunder, an unvoluntary excretion of the Urine and other excrements, or a total ſuppreſſion of them, ſeizes upon the Patient. When the hollow Vein and great Artery are wounded, the Patient will die in a ſhort time, by reaſon of the ſudden and abundant effuſion of the bloud and ſpirits, which intercepts the motion of the Lungs and Heart, whence the party dies ſuffocated. Signs that the Spine is wounded.

CHAP. XXXI.

Of the Cure of the Wounds of the Cheſt.

WE have read in *John de Vigo*, that it is diſputed amongſt Chirurgeons concerning the conſolidation of wounds of the Cheſt. For ſome think that ſuch wounds muſt be cloſed up, and cicatrized with all poſſible ſpeed, leſt the cold air come to the heart, and the vital ſpirits fly away and be diſſipated. Others on the contrary think that ſuch Wounds ought to be long kept open; *Vigo, tract. de Vulnerib. thorac. cap.* 10.

open; and alſo if they be not ſufficiently large of themſelves that then they muſt be enlarged by Chirurgery, that ſo the bloud poured forth into the capacity of the Cheſt may have paſſage forth, which otherwiſe by delay would putrefie, whence would enſue an increaſe of the Fever, a fiſtulous Ulcer, and other pernicious accidents. The firſt opinion is grounded upon Reaſon and Truth, if ſo be that there is little or no bloud poured forth into the capacity of the Cheſt. But the latter takes place where there is much more bloud contained in the empty ſpaces of the Cheſt. Which leſt I may ſeem raſhly to determin, I think it not amiſs to ratifie each opinion with a Hiſtory thereto agreeable.

A Hiſtory.

Whileſt I was at *Turin*, Chirurgeon to the Marſhal of *Montejan*, the King of *France* his General, I had in cure a Souldier of *Paris*, whoſe name was *Leveſque*, he ſerved under Captain *Renovart*. He had three wounds, but one more grievous than the reſt, went under the right breſt, ſomewhat deep into the capacity of the Cheſt, whence much bloud was poured forth upon the Midriff, which cauſed ſuch difficulty of breathing, that it even took away the liberty of his ſpeech; beſides through this occaſion he had a vehement Fever, coughed up bloud, and a ſharp pain on the wounded ſide. The Chirurgeon which firſt dreſſed him, had ſo bound up the wound with a ſtrait and thick ſuture, that nothing could flow out thereat. But I being called the day after, and weighing the preſent ſymptoms which threatned ſpeedy death, judged that the ſowing of the Wound muſt ſtraight be looſed, which being done, there inſtantly appeared a clot of bloud at the orifice thereof, which made me to cauſe the Patient to lie half out of his bed, with his head downwards, and to ſtay his hands on a Settle which was lower than the Bed, and keeping himſelf in this poſture, to ſhut his mouth and noſe that ſo his Lungs ſhould ſwell, the Midriff be ſtretched forth, and the intercoſtal Muſcles and thoſe of the *Abdomen* ſhould be compreſſed, that the bloud poured into the Cheſt might be evacuated by the wound; but alſo that this excretion might ſucceed more happily, I thruſt my finger ſomewhat deep into the Wound, that ſo I might open the orifice thereof being ſtopped up with the congealed bloud; and certainly I drew out ſome ſeven or eight ounces of putrefied and ſtinking bloud by this means. When he was laid in his Bed, I cauſed frequent injections to be made into the Wound of a decoction of Barley, with Honey of Roſes and red Sugar; which being injected, I wiſht him to turn firſt on the one, and then on the other, and then again to lie out of his bed as before: for thus he evacuated ſmall, but very many clots of blood, together with the liquor lately injected; which being done, the ſymptoms were mitigated, and left him by little and little. The next day I made another more detergent injection, adding thereto Wormwood, Centaury, and Aloes; but ſuch a bitterneſs did riſe up to his mouth, together with a deſire to caſt, that he could no longer endure it. Then it came into my mind that formerly I had obſerved the like effect of the like remedy in the Hoſpital of *Paris*, in one who had a fiſtulous ulcer in his Cheſt. Therefore when I had conſidered with my ſelf that ſuch bitter things may eaſily paſs into the Lungs, and ſo may from thence riſe into the Weazon and Mouth, I determined that thenceforwards I would never uſe ſuch bitter things to my Patients, for the uſe of them is much more troubleſome than any way good and advantagious. But at the length this Patient by this and the like means recovered his health beyond my expectation.

Why bitter things muſt not be caſt into the Cheſt.

Read the Hiſtory of *Maryllus* in *Galen*, *lib. 7. de Anatom. adminiſtra.*

But on the contrary, I was called on a time to a certain *German* Gentleman who was run with a Sword into the capacity of his Cheſt; the neighbouring Chirurgeon had put a great tent into the Wound at the firſt dreſſing, which I made to be taken forth, for that I certainly underſtood there was no bloud poured forth into the capacity of the Cheſt becauſe the Patient had no Fever, no weight upon the *Diaphragma*, nor ſpitted forth any bloud. Wherefore I cured him in few days by onely dropping in ſome of my balſom and laying a Plaiſter of *Diacalcitheos* upon the Wound. The like Cure I have happily performed in many others. To conclude, this I dare boldly affirm, that Wounds of the Cheſt by the too long uſe of tents degenerate into Fiſtulaes. Wherefore if you at any time ſhall undertake the cure of Wounds which penetrate into the capacity of the Cheſt, you ſhall not preſently ſhut them up at the firſt dreſſing, but keep them open for two or three days, but when you ſhall find that the Patient is troubled with none or very little pain, and that the Midriff is preſſed down with no weight, and that he breathes freely, then let the tent be taken forth, and the Wound healed up as ſpeedily as you can by covering it onely with lint dipped in ſome balſom which hath a glutinative faculty, and laid ſomewhat broader then the Wound; never apply liniments to Wounds of this kind, leſt the Patient by breathing draw them into the capacity of the Cheſt. Wherefore alſo you muſt have a care that the tent put into thoſe kinds of Wounds may be faſtned to the Pledgets, and alſo have ſomewhat a large head, leſt they ſhould be drawn (as we ſaid) into the capacity of the Cheſt; for if they fall in, they will cauſe putrefaction and death. Let *Emplaſt. Diacalcitheos*, or ſome ſuch like, be applied to the Wound. But if on the contrary, you know by proper and certain ſigns, that there is much bloud fallen into the ſpaces of the Cheſt, then let the orifice of the Wound be kept open with larger tents, until all the *ſanies* or bloudy matter, whereinto the bloud hath degenerated, ſhall be exhauſted. But if it happen at any time, as aſſuredly it ſometimes doth, that notwithſtanding the art and care of the Phyſician, the Wound degenerates into a *Fiſtula*, then the former evil is become much worſe. For *Fiſtulaes* of the Cheſt are ſcarce cured at any time, and that for divers cauſes. The firſt is, for that the muſcles of the Cheſt are in perpetual motion. Another is, becauſe they on the contrary inſide are covered onely with the membrane inveſting the ribs, which is without bloud. The third is, for that the Wound hath no ſtay, by means whereof it may be compreſſed, ſewed, and bound, whereby the lips being joined together, the Wound may at length be repleniſhed with fleſh and cicatrized.

What harm enſues the too long uſe of Tents.

No liniments muſt be uſed in wounds of the Cheſt.

Wounds of the Cheſt eaſily degenerate into a *Fiſtula*.

Why there flows ſuch plenty of matter out of wounds of the Cheſt.

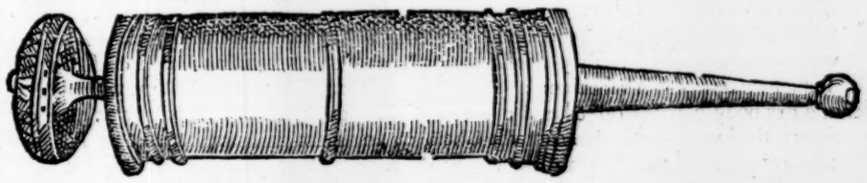
But the reaſon why Wounds of the Cheſt do every day heap up and pour forth ſo great a quantity of matter, ſeems to be their vicinity to the heart, which being the fountain of bloud, there is a perpetual efflux thereof from thence to the part affected. For this is Natures care in preſerving the affected parts, that continually and abundantly without meaſure or mean it ſends all its ſupplies, that is, bloud and ſpirits to their aid. Add hereto that the affected parts by pain, heat, and continual motion of the Lungs and Midriff, draw and allure much bloud to themſelves. Such like

bloud

bloud defiled by the malignity and filth of the wound, is ſpeedily corrupted: whence it is that from the perpetual afflux of bloud, there is a continual efflux of matter or filth, which at the laſt brings a man to a conſumption; becauſe the ulcerated part like a ravenous Wolf conſumes more bloud by the pain, heat, and motion than can be miniſtred thereto by the heart. Yet if there be any hope to cure and heal the *Fiſtula*, it ſhall be performed (after the uſe of diet and phlebotomy, according to the preſcript of the Phyſician) by a vulnerary potion, which you ſhall find deſcribed when we treat of the *Caries* or rottenneſs of the bones. Wherefore you ſhall make frequent injections therewith into the *Fiſtula*, adding and mixing with it *Syrup. de roſis ſiccis* and *mel roſarum*. Neither do I, if the putrefaction be great, fear to mix therewith *Ægyptiacum*. But you muſt have a care to remember and obſerve the quantity of the injected liquor, that you may know whether it all come forth again after it hath performed its detergent office. For if any thereof remain behind in the corners and crooked paſſages, it hurts the part, as corrupted with the contagion thereof.

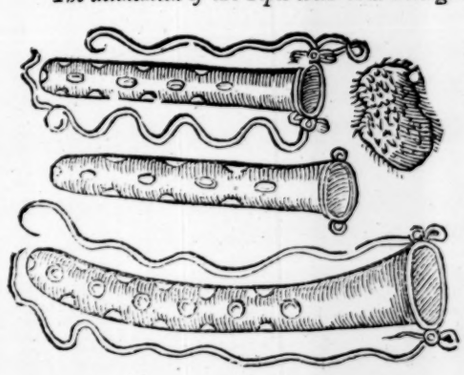
The cure of a *Fiſtula* in the Cheſt. When *Ægyptiacum* muſt be put into the injections.

The form of a Syringe fit to make injection, when a great quantity of liquor is to be injected into any part.



After the injected liquor is come forth, a Pipe of Gold, Silver, or Lead, ſhall be put into the fiſtulous ulcer, and it muſt have many holes in it, that ſo the filth may paſs forth at them; it muſt be faſt tied with ſtrings, that it may not fall into the capacity of the Cheſt. A great Sponge ſteeped in *Aqua Vitæ* and wrung forth again, ſhall be laid hot to the end or orifice thereof, both to hinder the entrance of the Air into the fiſtulous ulcer, as alſo to draw forth the filth there by its gentle heat; the which thing the Patient ſhall much further, if often-times both day and night he hold his breath, ſtopping his mouth and noſe, and lying upon the diſeaſed ſide, that ſo the *Sanies* may be the more forcibly evacuated; neither muſt we leave the putting in the pipe, before that this fiſtulous ulcer ſhall be almoſt dry, that is, whole; as when it yields little, or no matter at all, then it muſt be cicatrized. But if the orifice of this fiſtulous ulcer being in the upper part hinder the healing thereof, then by a chirurgical Section, a paſſage ſhall be made in the bottom, as we ſaid before in an *Empyema*.

The delineation of the Pipes with their Strings and Sponges.



The Reader muſt note that the Pipes which are fit for this uſe, need not have ſo many holes as theſe here expreſt; but onely two or three in their ends: for the fleſh growing and getting into the reſt, makes them that they cannot be plucked forth without much pain.

A Wound made in the Lungs admits cure, unleſs it be very large, if it be without inflammation; if it be on the skirts of the Lungs, and not on their upper parts; if the Patient contain himſelf from coughing much, and contentious ſpeaking, and great breathing: for the wound is enlarged by coughing, and thence alſo ariſes inflammation; the *Pus* and *Sanies* whereof, whilſt the lungs again endeavour to expel by coughing, by which means they are onely able to expel that which is hurtful and troubleſom to them, the ulcer is dilated, the inflammation augmented, the Patient waſtes away, and the Diſeaſe becomes inourable.

What wounds of the Lungs are curable.

The harm that enſues upon coughing, in Wounds of the Lungs.

There have been many *Eclegmaes* deſcribed by Phyſicians for to cleanſe the ulcer; which when the Patient uſeth, he ſhall lie on his back to keep them long in his mouth, ſo to relax the muſcles of the *Larinx*; for thus the Medicin will fall by little and little alongſt the coats of the Weazon, for if it ſhould fall down in great quantity, it would be in danger to cauſe coughing. Cows, Aſſes, or Goats-milk with a little Honey, leſt they ſhould corrupt in the ſtomach, are very fit remedies for this purpoſe; but Womans milk exceeds the reſt.

How *Eclegmata* muſt be ſwallowed.

But Sugar of Roſes is to be preferred before all other Medicins, in the opinion of *Avicen*, for that it hath a detergent, and alſo an aſtrictive and ſtrengthening faculty, than which nothing is more to be deſired in curing of Ulcers. When you ſhall think it time to agglutinate the cleanſed ulcer, you muſt command the Patient to uſe emplaſtick, auſtere, and aſtringent Medicins, ſuch as are *Terra ſigillata*, *bolus armenus*, *hypocyſtis*, *Plantain*, *Knot-graſs*, *Sumach*, *Acacia*, and the like, which the Patient ſhall uſe in his Broths and *Eclegmaes*, mixing therewith Honey of Roſes, which ſerving for a vehicle to the reſt, may carry away the impacted filth which hinders agglutination. But ſeeing an hective Fever eaſily follows upon theſe kinds of Wounds, and alſo upon the affects of the Cheſt and Lungs, it will not be amiſs to ſet down ſomewhat concerning the Cure thereof, that ſo the Chirurgeon may know to adminiſter ſome help to his Patient, whileſt a Phyſician is ſent for, to overcome this diſeaſe with more powerful and certain remedies.

The utility of Sugar of Roſes in ulcerated or wounded Lungs.

CHAP.

CHAP. XXXII.

Of the differences, cauſes, ſigns, and cure of an Hective Fever.

The reaſon of the name.

A Hective Fever is ſo called, either for that it is ſtubborn and hard to cure and looſe, as things which have contracted a habit, for *Hexis* in Greek ſignifies a habit; or elſe for that it ſeiſes upon the ſolid parts of our bodies called by the Greeks *Hexeis*; both which the Latin word *Habitus* doth ſignifie.

The differences thereof.

There are three kinds, or rather degrees of this Fever. The firſt is when the hectick heat conſumes the humidity of the ſolid parts. The ſecond is, when it feeds upon the fleſhy ſubſtance. The third and uncurable is, when it deſtroys the ſolid parts themſelves. For thus the flame of a Lamp firſt waſtes the Oil, then the proper moiſture of the Wiek. Which being done, there is no hope of lighting it again, what ſtore of Oil ſoever you pour upon it. This Fever very ſeldom breeds of it ſelf, but commonly follows after ſome other.

The Cauſes.

Wherefore the cauſes of a Hective Fever, are ſharp and burning Fevers not well cured, eſpecially if their heat were not repreſſed with cooling Epithems applied to the heart and *Hypochondria*. If cold Water was not fitly drunk. It may alſo ſucceed a Diary Fever which hath been cauſed and begun by ſome long great and vehement grief or anger, or ſome too violent labour, which any of a ſlender and dry body hath performed in the hot Sun. It is alſo oft-times cauſed by an ulcer or inflammation of the Lungs, an *Empyema* of the Cheſt, by any great and long continuing *Phlegmon* of the Liver, Stomach, Meſentery, Womb, Kidneys, Bladder, of the Guts *Jejunum* and *Colon*, and alſo of the other Guts, if the *Phlegmon* ſucceed ſome long *Diarrhœa*, *Lienteria*, or Bloudy-flux, whence a Conſumption of the whole body, and at laſt a Hectick Fever, the heat becoming more acrid, the moiſture of the body being conſumed.

The Signs.

This kind of Fever, as it is moſt eaſily to be known, ſo is it moſt difficult to cure; the pulſe in this Fever is hard, by reaſon of the drineſs of the Artery which is a ſolid part; and it is weak by reaſon of the debility of the vital faculty, the ſubſtance of the heart being aſſaulted. But it is little and frequent becauſe of the diſtemper and heat of the heart, which for that it cannot by reaſon of its weakneſs cauſe a great pulſe to cool it ſelf, it labours by the oftenneſs to ſupply that defect.

Why in hecticks the heat is more acrid after meat.

But for the pulſe, it is a proper ſign of this Fever, that one or two hours after meat the pulſe feels ſtronger than uſual; and then alſo there is a more acrid heat over all the Patients body. The heat of this flame laſts until the nouriſhment be diſtributed over all the Patients body; in which time the drineſs of the heart in ſome ſort tempered and recreated by the appulſe of moiſt nouriſhment, the heat increaſes no otherwiſe than Lime which a little before ſeemed cold to the touch, but ſprinkled and moiſtned with water grows ſo hot, as it ſmoaks and boils up. At other times there is a perpetual equality of heat and pulſe in ſmalneſs, faintneſs, obſcurity, frequency, and hardneſs, without any exacerbation, ſo that the Patient cannot think himſelf to have a Fever, yea, he cannot complain of any thing, he feels no pain, which is another proper ſign of an hectick Fever. The cauſe that the heat doth not ſhew it ſelf is, it doth not poſſeſs the ſurface of the body, that is, the ſpirits and humours, but lies as buried in the earthy groſsneſs of the ſolid parts. Yet if you hold your hand ſomewhat long, you ſhall at laſt perceive the heat more acrid and biting, the way being opened thereto by the skin, rarified by the gentle touch of the warm and temperate hand. Wherefore if at any time in theſe kind of Fevers the Patient feel any pain, and perceive himſelf troubled with an inequality and exceſs of heat, it is a ſign that the hectick Fever is not ſimple, but conjoined with a putrid Fever, which cauſeth ſuch inequality, as the heat doth more or leſs ſeize upon matter ſubject to putrefaction; for a hectick Fever of it ſelf is void of all equality, unleſs it proceed from ſome external cauſe, as from meat. Certainly if an Hippocratick face may be found in any diſeaſe, it may in this, by reaſon of the colliquation or waſting away the triple ſubſtance. In the cure of this Diſeaſe, you muſt diligently obſerve with what affects it is entangled, and whence it was cauſed. Wherefore firſt you muſt know whether this Fever be a Diſeaſe, or elſe a Symptom. For if it be ſymptomatical, it cannot be cured as long as the Diſeaſe, the cauſe thereof, remains uncured; as if an ulcer of the Guts occaſioned by a Bloudy-flix ſhall have cauſed it, or elſe a fiſtulous ulcer in the Cheſt, cauſed by ſome wound received on that part, it will never admit of cure, unleſs firſt the fiſtulous or dyſenterick ulcer ſhall be cured; becauſe the Diſeaſe feeds the Symptoms, as the Cauſe the Effect. But if it be a ſimple and eſſential hectick Fever, for that it hath its eſſence conſiſting in an hot and dry diſtemper, which is not fixed in the humours, but in the ſolid parts, all the counſel of the Phyſician muſt be to renew the body, but not to purge it; for onely the humours require purging, and not the defaults of the ſolid parts. Therefore the ſolid parts muſt be refrigerated and humected, which we may do by Medicins taken inwardly and applied outwardly.

The ſigns of a hectick joined with a putrid Fever.

The Cure.

A ſymptomatical hectick.

An eſſential hectick.

Things to be taken inwardly.

The things which may with good ſucceſs be taken inwardly into the body for this purpoſe, are Medicinal nouriſhments. For hence we ſhall find more certain and manifeſt good, than from altering Medicins, that is, wholly refrigerating and humecting without any manner of nouriſhment.

The benefit of Medicinal nouriſhments.

For by reaſon of that portion fit for nutriment which is therewith mixed, they are drawn and carried more powerfully to the parts, and alſo converted into their ſubſtance: whereby it comes to paſs that they do not humect and cool them lightly and ſuperficially, like the Medicins which have onely power to alter and change the body, but they carry their qualities more throughly even into the innermoſt ſubſtance. Of theſe things ſome are Herbs, as Violets, Purſlain, Bugloſs, Endive, Ducks-meat, or Water-lentil, Mallows, eſpecially when the belly ſhall be bound. Some are Fruits, as Gourds, Cucumers, Apples, Prunes, Raiſins, Sweet Almonds, and freſh or new Pine-Apple kernels; in the number of Seeds are the four greater and leſſer cold Seeds, and theſe new, for their native humidity, the Seeds of Poppies, Berberies, Quinces. The Flowers of Bugloſs, Violets, Water-lillies, are alſo convenient; of all theſe things let Broth be made with a Chicken, to be taken in the morning for eight or nine days, after the firſt Concoction.

For

For Meats; in the beginning of the Diſeaſe, when the faculties are not too much debilitated, he ſhall uſe ſuch as nouriſh much and long, though of hard digeſtion; ſuch as the extreme parts of Beaſts, as the feet of Calves, Hogs-feet not ſalted, the fleſh of a Tortois which hath lived ſo long in a Garden, as may ſuffice to digeſt the excrementitious humidity; the fleſh of white Snails, and ſuch as have been gathered in a Vineyard, of Frogs, River-Crabs, Eels taken in clear Water, and well cooked, hard Eggs eaten with the juice of Sorrel without Spices, Whitings and Stock-fiſh. For all ſuch things, becauſe they have a tough and glutinous juice, are eaſily put and glutinated to the parts of our body, neither are they ſo eaſily diſſipated by the Feveriſh heat. But when the Patient languiſheth of a long hectick, he muſt feed upon meats of eaſie digeſtion, and theſe boiled rather then roaſted; for boiled meats humect more, and roaſted more eaſily turn into choler. Wherefore he may uſe to eat Veal, Kid, Capon, Pullet, boiled with refrigerating and humecting herbs; he may alſo uſe Barly-creams, Almond-milks, as alſo Bread crummed and moiſtned with Roſe-water, and boiled in a decoction of the four cold Seeds with Sugar of Roſes; for ſuch a Panada cools the Liver, and the habit of the whole body, and nouriſheth withall. The Teſticles, Wings, and Livers of young Cocks, as alſo Figs and Raiſins. But if the Patient at length begin to loath and grow weary of boiled meats, then let him uſe roaſt, but ſo that he cut away the burnt and dried part thereof, and feed onely on the inner part thereof, and that moiſtned in Roſe-water, the juice of Citrons, Oranges, or Pomegranates. Let him abſtain from Salt and dry Fiſhes, and chuſe ſuch Fiſhes as live in ſtony Waters, for the exerciſe they are forced to undergo in ſhunning the Rocks beaten upon by the Waves. Aſſes milk newly milked and ſeaſoned with a little Salt, Sugar, Honey or Fennel, that it may not corrupt nor grow ſowre in the ſtomach; or Womans milk ſucked from the Dug by the Patient, to the quantity of half a pint, is much commended; verily Womans milk is the more wholſom, as that which is more ſweet and familiar to our ſubſtance, if ſo be that the Nurſe be of a good temper and habit of body. For ſo it is very good againſt the gnawings of the Stomach, and ulcers of the Lungs, from whence a Conſumption oft proceeds. Let your Milch Aſs be fed with Barly, Oats, Oak-leaves; but if the Patient chance to be troubled with the Flux of the Belly, you ſhall make the milk ſomewhat aſtringent by gently boiling it, and quenching therein Pebble-ſtones heated red hot. But for that all Natures cannot away with Aſſes milk, ſuch ſhall abſtain from it, as it makes to have acrid belchings, difficulty of breathing, a heat and rumbling in the *Hypochondria* and pain of the Head. Let the Patient temper his Wine with a little of the Waters of Lettuce, Purſlain, and Water-Lillies, but with much Bugloſs-Water, both for that it moiſtens very much, as alſo for that it hath a ſpecifick power to recreate the Heart, whoſe ſolid ſubſtance in this kind of Diſeaſe is grievouſly afflicted. And thus much of things to be taken inwardly.

The choice of meats.

How Aſſes milk muſt be uſed in a hectick.

Womans milk more wholeſom than Aſſes.

Theſe things which are to be outwardly applied, are inunctuous Baths, Epithems, Clyſters. Inunctions are divers, according to the various Indications of the parts whereto they are applied. For *Galen* anoints all the ſpine with cooling and moderate aſtringent things, as which may ſuffice to ſtrengthen the parts and hinder their waſting, and not let the tranſpiration; for if it ſhould be letted, the heat would become more acrid by ſuppreſſing the vapours. Oil of Roſes, Water-Lillies, Quinces, the mucilages of Gum-tragacanth and Arabick extracted into Water of Night-ſhade, with ſome ſmall quantity of Camphire, and a little Wax if need require: but on the contrary, the parts of the Breſt muſt be anointed with refrigerating and relaxing things; by refrigerating, I mean things which moderately cool, for cold is hurtful to the Breſt. But aſtringent things would hinder the motions of the Muſcles of the Cheſt, and cauſe a difficulty of breathing. Such inunctions may be made of Oil of Violets, Willows, of the Seeds of Lettuce, Poppies, Water-Lillies, mixing with them the Oil of Sweet Almonds to temper the aſtriction which they may have by their coldneſs. But you muſt have great care that the Apothecary for covetouſneſs in ſtead of theſe Oils newly made give you not old, rancid and ſalted Oils, for ſo in ſtead of refrigerating, you ſhall heat the part; Wine, Honey, and Oil, acquire more heat by Age; in defect of convenient Oils, we may uſe Butter well waſhed in Violet and Night-ſhade Water. The uſe of ſuch inunctions, is to cool, humect, and comfort the parts whereto they are uſed; they muſt be uſed Evening and Morning, chiefly after a Bath.

Things to be outwardly applied.

A caution in the choice of Oils.

Now for Baths, we preſcribe them either only to moiſten, and then plain warm Water wherein the Flowers of Violets and Water-lillies, Willow-leaves and Barly have been boiled, will be ſufficient; or elſe not onely to moiſten, but alſo to acquire them a fairer and fuller habit, and then you may add to your Bath the decoction of a Sheeps-head and Gather, with ſome Butter. But the Patient ſhall not enter into the Bath faſting, but after the firſt concoction of the Stomach, that ſo the nouriſhment may be drawn by the warmneſs of the Bath into the whole habit of the Body. For otherwiſe he which is ſick of a Conſumption, and ſhall enter the Bath with his Stomach empty, ſhall ſuffer a greater diſſipation of the triple ſubſtance, by the heat of the Bath, than his ſtrength is well able to endure. Wherefore it is fit thus to prepare the body before you put it into the Bath. The day before in the morning let him take an emollient Clyſter, to evacuate the excrements baked in the guts by the hectick dineſs; then let him eat to his dinner ſome ſolid meats about nine of the Clock, and let him about four of the Clock eat ſomewhat ſparingly, meats of eaſie digeſtion to his ſupper. A little after midnight let him ſup off ſome Chicken-broth, or Barly-cream, or elſe two rear Eggs tempered with ſome Roſe-water and Sugar of Roſes in ſtead of Salt. Some four or five hours after, let him enter into the Bath, thoſe things which I have ſet down being obſerved. When he comes out of the Bath, let him be dried and gently rubbed with ſoft linnen cloths, and anointed, as I formerly preſcribed, then let him ſleep, if he can, for two or three hours in his bed: when he wakes, let him take ſome Ptiſan or ſome ſuch like thing, and then repeat his Bath after the aforeſaid manner. He ſhall uſe this Bath thrice in ten days. But if the Patient be ſubject to crudities of the ſtomach, ſo that he cannot ſit in the Bath without fear of ſwooning, and ſuch ſymptoms, his ſtomach muſt be ſtrengthened with Oil of Quinces, Wormwood and Maſtich, or elſe with a cruſt of Bread toaſted and ſteeped in Muskadine, and ſtrewed over with the Powders of Roſes, Sanders, and ſo laid to the ſtomach, or behind near to the

The differences of Baths.

Why the Patients muſt not enter the Bath faſting.

How to prepare the body for the Bath.

Things ſtrengthening the Ventricle.

Epithems. the 13. *vertebra* of the back, under which place Anatomy teaches that the mouth of the ſtomach lies. Epithems ſhall be applied to the Liver and Heart, to temper the too acrid heat of theſe parts, and correct the immoderate drineſs by their moderate humidity. Now they ſhall be made of refrigerating and humecting things, but chiefly humecting; for too great coldneſs would hinder the penetration of the humidity into the part lying within. The Waters of Bugloſs and Violets, of each a quartern with a little white Wine, is convenient for this purpoſe. But that which is made of French Barly, the ſeeds of Gourds, Pompions, or Cucumers, of each three drams in the decoction, and mixed with much tempering with Oil of Violets, or of ſweet Almonds, is moſt excellent of all other. Let cloths be dipped and ſteeped in ſuch Epithems, and laid upon the part and renewed as oft as they become hot by the heat of the part. And becauſe in hectick bodies, by reaſon of the weakneſs of the digeſtive faculty, many excrements are uſually heaped up, and dried in the guts, it will be convenient all the time of the Diſeaſe to uſe frequently Clyſters made of the decoction of cooling and humecting Herbs, Flowers and Seeds, wherein you ſhall diſſolve *Caſſia*, with Sugar and Oil of Violets or Water-Lillies.

What a flux happening in a hectick Fever indicates. But becauſe there often happens very dangerous fluxes in a confirmed hectick Fever, which ſhew the decay of all the faculties of the body, and waſting of the corporeal ſubſtance, you ſhall reſiſt them with refrigerating and aſſiſting Medicins, and Meats of groſſer nouriſhment, as Rice, and Cicers; and application of aſtringent and ſtrengthening remedies, and uſing the decoction of Oats or parched Barly for drink. Let the Patient be kept quiet and ſleeping as much as may be, eſpecially if he be a child. For this Fever frequently invades children by anger, great and long fear, or the too hot milk of the Nurſe, over-heating in the Sun, the uſe of Wine, and other ſuch like cauſes; they ſhall be kept in a hot and moiſt air, have another Nurſe, and be anointed with Oil of Violets; to conclude, you ſhall apply Medicins which are contrary to the morbifick cauſe.

CHAP. XXXIII.

Of the Wounds of the Epigaſtrium *and of the lower Belly.*

How children be cured. THe Wounds of the lower Belly are ſometimes before, ſometimes behind, ſome onely touch the ſurface thereof, others enter in; ſome paſs quite through the Body, ſo that they often leave the Weapon therein; ſome happen without hurting the contained parts, others grievouſly offend theſe parts, the Liver, Spleen, Stomach, Guts, Kidneys, Womb, Bladder, Ureters, and great Veſſels, ſo that oft-times a great portion of the Kall falls forth. We know the Liver is wounded, when a great quantity of bloud comes forth of the Wound, when a pricking pain reaches even to the Sword-like griſle, to which the Liver adheres. Oft-times more choler is caſt up by Vomit, and the Patient lies on his Belly with more eaſe and content.

Their differences.

Signs of a wounded liver.

Signs that the Stomach and ſmaller Guts are wounded. When the Stomach or any of the ſmall Guts are wounded, the meat and drink break out at the Wound, the *Ilia* or flanks ſwell and become hard, the Hicket troubles the Patient, and oft-times he caſts up more choler, and grievous pain wrings his Belly, and he is taken with cold ſweats, and his extreme parts wax cold.

Signs to know when the greater Guts are wounded. If any of the greater Guts ſhall be hurt, the excrements come forth at the Wound: When the Spleen is wounded there flows out thick and black bloud, the Patient is oppreſſed with thirſt, and there are alſo the other ſigns which we ſaid uſe to accompany the wounded Liver. A difficulty of making water troubles the Patient whoſe reins are wounded, bloud is piſſed forth with the Urin, and he hath a pain ſtretched to his groins and the regions of the Bladder and Teſticles.

Signs that the Kidneys are hurt.

Signs that the Bladder is wounded. The Bladder or Ureters being wounded, the flanks are pained, and there is a Tenſion of the *Pecten*, or Share; Bloud is made inſtead of Urin, or elſe the Urin is very bloudy, which alſo divers times comes forth at the Wound. When the Womb is wounded, the bloud breaks forth by the Privities, and the ſymptoms are like thoſe of the Bladder.

Signs that the Womb is wounded. The Wounds of the Liver are deadly, for this part is the Work-houſe of the Bloud, wherefore neceſſary for life; beſides, by Wounds of the Liver the branches of the Gate or hollow Veins are cut, whence enſues a great flux of bloud not onely inwardly, but alſo outwardly, and conſequently a diſſipation of the ſpirits and ſtrength.

Prognoſticks. But the bloud which is ſhed inwardly amongſt the Bowels putrefies and corrupts, whence follows Pain, a Fever, Inflammation, and laſtly Death. Yet *Paulus Ægineta* writes that the lobe of the Liver may be cut away without neceſſary conſequence of death. Alſo the Wounds of the Ventricle and of the ſmall Guts, but chiefly of the *Jejunum*, are deadly; for many Veſſels run to the *Jejunum* or empty Gut, and it is of a very nervous and ſlender ſubſtance, and beſides it receives the cholerick humour from the bladder of the Gall. So alſo the Wounds of the Spleen, Kidneys, Ureters, Bladder, Womb, and Gall, are commonly deadly, but always ill, for that the actions of ſuch parts are neceſſary for life; beſides divers of theſe are without bloud and nervous, others of them receive the moiſt excrements of the whole body, and lie in the innermoſt part of the body, ſo that they do not eaſily admit of Medicins. Furthermore, all Wounds which penetrate into the capacity of the Belly, are judged very dangerous, though they do not touch the contained Bowels: for the encompaſſing, and new air entering in amongſt the Bowels, greatly hurts them, as never uſed to the feeling thereof; add hereto the diſſipation of the ſpirits which much weakens the ſtrength. Neither can the filth of ſuch Wounds be waſted away according to the mind of the Chirurgeon, whereby it happens they divers times turn into Fiſtulaes, as we ſaid of Wounds of the Cheſt, and ſo at length by collection of matter cauſe death. Yet I have dreſſed many, who by Gods aſſiſtance and favour have recovered of Wounds paſſing quite through their bodies.

Lib.6.cap.88.

A Hiſtory. I can bring as a witneſs the Steward of the Portugal Embaſſadour, whom I cured at *Melun* of a Wound made with a Sword ſo running through the body, that a great quantity of excrements came forth of the wounded Guts as he was a dreſſing, yet he recovered.

Not

Not long ago *Giles le Maiſtre*, a Gentleman of *Paris* was run quite through the body with a Rapier, ſo that he voided much blood at his mouth and fundament divers days together, whereby you know the guts were wounded; and yet he was healed in twenty days. In like ſort the wounds of the greater veſſels are mortal, by reaſon of the great effuſion of blood and ſpirits which enſues thereupon. Another Hiſtory.

CHAP. XXXIV.

The cure of Wounds of the lower Belly.

THe firſt cogitation in curing of theſe wounds ought to be, Whether they pierce into the capacity of the belly; for thoſe which paſs no further then the *Peritonæum* ſhall be cured like ſimple wounds which only require union. But thoſe which enter into the capacity muſt be cured after another manner. For oft-times the kall, or guts, or both, fall forth at them.

A gut which is wounded muſt be ſowed up with ſuch a ſeam as Furriers or Glovers uſe, as we formerly told you; and then you muſt put upon it a powder made of Maſtich, Myrrh, Aloes and Bole. Being ſowed up, it muſt not be put up boiſterouſly together and at once into its place; but by little and little, the Patient lying on the ſide oppoſite to the wound. As for example, the right ſide of the guts being wounded and falling out by the wound, the Patient ſhall lye on his left ſide, for the more eaſie reſtoring of the faln-down gut, and ſo on the contrary. If the lower part of the guts being wounded ſlide through the wound, then the Patient ſhall lye with his head low down, and his buttocks raiſed up by putting a pillow under them: If the upper part be hurt, then muſt he lye quite contrary, that the guts falling downwards, by ſuch a ſite, may give way to thoſe which are faln out through the wound. But often in this caſe, the guts having taken cold by the encompaſſing air, ſwell up and are diſtended with wind, the which you muſt diſcuſs before you put them into their place, with a Fomentation of the decoction of Camomil, Melilot, Aniſeeds, and Fennel, applied with a ſpunge, or contained in a bladder; or elſe with Chickens, or Whelps cut alive in the midſt and laid upon the ſwelling; for thus, they do not only diſcuſs the flatulency, but alſo comfort the afflicted part. But if the inflation cannot thus be diſcuſſed, the wound ſhall be dilated, that ſo the guts may return the more freely to their place. The cure of a wounded gut.

If the kall ſhall fall out, it muſt be ſpeedily reſtored to its place, for it is very ſubject to putrefie; for the fat, whereof for the moſt part it conſiſts, being expoſed to the air, eaſily loſes its native heat, which is ſmall and weak, whence a mortification enſues. Hence is that of *Hippocrates*; If the kall fall out, it neceſſarily putrefies. The Chirurgeon ſhall know whether it putrifies, or not, by the blackneſs and the coldneſs you may perceive by touching it; neither muſt you when it putrefies, preſently reſtore it to its place, for ſo the contagion of the putrefaction would ſpread to the reſt of the parts: But whatſoever thereof is putrefied ſhall be twitched and bound hard with a ſtring, and ſo cut off, and the reſt reſtored to his proper place; but its good after cutting of it away, to leave the ſtring ſtill hanging thereat, that ſo you may pluck and draw forth whatſoever thereof may by being too ſtrait bound, fall away into the capacity of the belly. Some think it better to let the kall thus bound to hang forth until that portion thereof which is putrefied fall away of it ſelf, and not to cut it off. But they are much deceived; for it hanging thus would not cover the guts, which is the proper place. The guts and kall being put up, if the wound be great and worth ſpeaking of, it muſt be ſowed with that ſuture which is termed *Gaſtroraphia*; but this kind of ſuture is thus made. The needle at the firſt putting in muſt only take hold of the *Peritonæum*, and then on the oppoſite ſide only of the fleſh, letting the *Peritonæum* alone, and ſo go along putting the needle from without inwards, and from within outwards, but ſo that you only take the muſculous fleſh and skin over it, and then only the *Peritonæum*, until you have ſowed up all the wound. He which doth otherwiſe ſhall undergo this danger, that whereas the coat *Peritonæum* is of it ſelf without blood, it being divided, or wounded, cannot of it ſelf be united to it ſelf, therefore it requires an intercourſe of fleſh: Otherwiſe unleſs it be thus united by the benefit of the fleſh intermixed therewith, there would remain an incurable tumor after the wound is cicatrized on the outſide. But that which we ſaid before, according to *Galen*'s mind, that all the wounds muſt be ſowed, it is not ſo to be taken, as if that the wound muſt be ſowed up to the very end; for in the lower part of the wound there muſt be left a certain ſmall vent by which the quitture may paſs forth, which being wholly cleanſed and exhauſted, the wound muſt be quite healed up. But the wounds which ſhall penetrate into the ſubſtance of the liver, ſpleen, ventricles, and other bowels, the Chirurgeon ſhall not ſuffer them to be without medicines, as if they were deſperate, but he ſhall ſpare neither labour nor care to dreſs them diligently. For doubtful hope is better than certain deſpair. The bladder, womb and right gut being wounded, detergent and agglutinative injections ſhall be put up by their proper paſſages. I have read nothing as yet in any Author of the wounds of the fat, for all of them refer the cure thereof to the wounds of the muſcles. Yet I will ſay this by the way, that wounds of the fat, how deep ſoever they be, if they be only ſimple, may be dreſſed without putting in of any tent, but only dropping in ſome of my Balſam, and then laying upon it plaiſter of *Gratia Dei*, or ſome ſuch like; for ſo they will heal in a ſhort time. The cure when the kall falls out. *Hip. Apo.* 58. *ſect.* 6. *Lib.* 6. *Meth. cap.* 4. The cure of the wounded fat.

CHAP. XXXV.

Of the Wounds of the Groins, Yard, and Teſticles.

WHen the groins and neigbouring parts are wounded, we muſt firſt conſider whether they pierce to within: And if they do penetrate, to what inward parts they come, whether to the bladder, the womb, or right gut; for theſe parts are ſuch near neighbours that oft-times they are all wounded with one blow. But for the wounds of the teſticles and genital parts, becauſe they are neceſſary inſtruments for the preſerving the *Species* by generation of a ſucceſſion of Individuals, and to keep all things quiet at home, therefore the Chirurgeon ought to be very diligent and careful for their preſervation. Wherefore if they ſhould chance at any time to be wounded, they ſhall be dreſſed, as we have formerly delivered, the medicines being varied according to the ſtate of the wound, and the appearing and happening ſymptoms; for it would be a thing of immenſe labour to handle all things in particular.

CHAP. XXXVI.

Of the Wounds of the Thighs and Legs.

Why wounds of the inſide o the thigh are oft-times deadly.

WOunds which have been received on the inſide of the thighs, have often cauſed ſudden death, if they have come to the vein *Saphena*, or the great artery, or the nerves, the aſſociates of theſe veſſels. But when they are ſimple, there is nothing which may alter the uſual manner of cure. Yet the Patient muſt be careful to lye in his bed; for the vulgar Italian Proverb is true, *La mano al petto, la gamba al letto*; that is, [The hand on the breaſt, and the leg on the bed.] But when they penetrate more deeply into the ſubſtance of the part, they bring horrid and fearful ſymptoms, as an inflammation, an abſceſs, from whence oft-times ſuch abundance of matter iſſues forth, that the Patient falls into an *Atrophia* and Conſumption. Wherefore ſuch wounds and ulcers require a careful and induſtrious Chirurgeon, who may fitly make Inciſions neceſſary for the corrupt parts, and calloſity of the fiſtulous ulcer. Some Chirurgeons have been ſo bold as to ſow together the end of the tendons of the ham, and of other joynts, when they have been quite cut aſunder. But I durſt never attempt it for fear of pain, convulſions, and the like horrid ſymptoms.

The large tendon of the heel hard to conſolidate.

For the wounds of that large tendon which is compoſed in the calf of the leg by the concourſe of three muſcles, and goes to the heel, I have obſerved that when it hath been cut with a Sword, that the wounds have been long and hard to cure; and beſides, when at the laſt they have been healed, as ſoon as the Patient hath got out of his bed, and endeavoured to go, they have grown ill and broke open again. Wherefore in ſuch like wounds let the Patient have a care, that he begin not to go, or too boldly to uſe his hurt leg before it be perfectly cicatrized, and the ſcar grown hard. Therefore that the Patient may be in more ſafety, I judge it altogether neceſſary, that he uſe to go with Crutches for a good while after the wound is perfectly healed up.

CHAP. XXXVII.

Of the Wounds of the Nerves and nervous parts.

Differences drawn from things wounded.

THe continuity of the nervous parts is divers ways looſed by the violent incurſion of external things; as by things which contuſe, batter, and grind in ſunder, as by the blow of a ſtone, cudgel, hammer, lance, bullet out of a Gun or Croſs-bow; by the biting of greater teeth; or the pricking of ſome ſharp thing, as a needle, bodkin, pen-knife, arrow, ſplinter; or the puncture of ſome venemous thing, as of a Sea-dragon; or the edge of ſome cutting thing, as a ſword or rapier; or of ſtretching things which violently tear aſunder the nervous bodies. Hence therefore it is, that of ſuch wounds ſome are ſimple, others compound; and the compound, ſome more compound than other. For of theſe ſome are ſuperficiary and ſhort, others deep and long; ſome run alongſt the nervous body, others run broad-ways; ſome cut the part quite aſunder, others only a portion thereof.

Their ſymptoms.

The ſymptoms which follow upon ſuch wounds are, vehement pain, and defluxion, inflammation, abſceſs, feaver, *delirium*, ſwooning, convulſion, gangrene, ſphacel; whence often death enſues by reaſon of that ſympathy which all the nervous parts have with the brain.

Why a puncture of a nerve is deadly.

Amongſt all the wounds of the nervous parts, there is none more to be feared than a puncture, or prick, nor any which cauſeth more cruel and dangerous ſymptoms. For by reaſon of the ſtraitneſs of the wound, medicines can neither be put in, nor the ſanious matter paſs forth; now the ſanious matter by long ſtay acquires virulency, whereby the nervous parts are tainted and ſwoln, ſuffer pain, inflammation, convulſions, and infinite other ſymptoms; of theſe the wounds are moſt dangerous, by which the nervous and membranous bodies are but half cut aſunder. For, the portion thereof which remains whole, by its drawing and contracting it ſelf towards the original, cauſeth great pain and convulſion by ſympathy. The truth hereof is evident in wounds of the head. as when the *Pericranium* is half cut, or when it is cut to apply a Trepan. For the cutting thereof infers far greater pain, than when it is cut quite aſunder. Wherefore it is ſafer to have the nervous body quite cut off, for ſo it hath no community, nor conſent with the upper parts, neither doth it labour, or ſtrive, to reſiſt the contraction of its ſelf; now this contrariety, and as it were fight, is the cauſe of pain; yet there ariſes another miſery from ſuch a wound, for the part whereinto the nerve which is thus cut inſnuder paſſes, thence forwards loſeth its action.

CHAP.

CHAP. XXXVIII.

Of the cure of Wounds of the nervous parts.

IT is the ancient Doctrine of the ancient Phyſicians, that the wounds of the nervous parts ſhould not preſently be agglutinated (which notwithſtanding the general and firſt indication, uſually taken from the ſolution of continuity, requires) but rather, chiefly if they be too ſtrait, that the punctures ſhould be dilated, by cutting the parts which are above them, and let them be kept long open that the filth may paſs freely forth, and the medicine enter well in. Yet I in many cures have not followed this counſel, but rather that which the common indication requires. A wound of the nervous parts indicated contrary to the general cure of wounds.

That cure is in freſh memory which I performed upon Monſieur *le Cocq*, a Proctor of the Spiritual Court, who dwelt in our *Ladies-ſtreet*; he gathering and binding up ſome looſe Papers, run a Pen-knife which was hid amongſt them, through his hand. Alſo one of his neighbours who went to ſpit a piece of Beef, thruſt the ſpit through the midſt of his hand: But I preſently agglutinated both their wounds, without any danger, dropping preſently in at the firſt dreſſing a little of my Balſom warm, and putting about it a repelling and aſtringent medicine, and by this means they were both of them healed in a ſhort time, no ſymptom thereupon happening. Yet I would not have the young Chirurgeon to run this hazard: For firſt, he muſt be well practiſed and accuſtomed to know the tempers and habit of men; for this manner of curing will not do well in a plethorick body, or in a body replete with ill humors, or indued with exquiſite ſenſe. Therefore in ſuch a caſe it will be ſafer to follow the courſe here ſet down. For wounds of the nerves do not only differ from other wounds, but alſo among themſelves in manner of curing. For although all medicines which draw from far, and waſte ſanious humors, may be reputed good for the wounds of the nerves; yet thoſe which muſt be applied to punctures, and to thoſe nerves which are not wholly laid open, ought to be far more powerful, ſharp and drying; yet ſo that they be not without biting, that ſo penetrating more deep, they may draw forth the matter, or elſe conſume and diſcuſs that which either lies about the nerves, or moiſtens their ſubſtance. On the contrary, when the ſinews are bared from fleſh and adjoyning particles, the ſtand in need but of medicines, which may only dry. Here you may furniſh your ſelves with ſufficient ſtore of medicines good for the nerves howſoever pricked. As ℞ *Terebinth. vin. & olei veteris an.* ℥ i. *Aquæ vitæ parum.* Or ℞ *olei Terebinth.* ℥ i. *Aquæ vitæ* ʒ i. *Euphor.* ℥ ß. Or, ℞ *radices Dracontiæ, Brioniæ, Valerianæ & Gentianæ exſiccatas, & in pulverem reductas, miſce cum decocto centauri, aut oleo, aut axungia veteri*; drop hereof warm into the wound as much as ſhall ſuffice. Or elſe put ſome Hogs, Gooſe, Capons, or Bears Greaſe, old Oyl, Oyl of Lilies, or the like, to *Galbanum*, pure Rozin, *opopanax* diſſolved in *Aqua vitæ* and ſtrong Vinegar. Or, ℞ *olei hypericonis ſambuci, & de euphorbio an.* ℥ i. *Sulphuris vivi ſubtiliter pulveriſati* ʒ ß, *gummi ammoni. bdellii an.* ʒ ii. *Aceti boni* ℥ ij. *Vermium terreſt. præparat.* ℥ i *bulliant omnia ſimul ad conſumptionem aceti.* Let as much hereof as ſhall ſuffice be dropped into the wound; then apply this following Cerate, which draws very powerfully. ℞ *Olei ſupra-ſcripti* ℥ i. *Terebinth. venet.* ℥ ß, *diachylonis albi cum gummi,* ℥ x. *ammoniac. bdellii in aceto diſſolutorum, an.* ʒ ij. *reſin. pini gum. elemi, picis navalis an.* ʒ v. *ceræ quod ſufficit, fiat ceratum ſatis molle.* We muſt uſe ſome whiles one, ſome whiles another of theſe medicines in punctures of the nerves with choice and judgment, according to their conditions, manner, depth, and the temperaments and habits of the wounded bodies. But if the pain yield not to ſuch remedies, but rather increaſe, with the inflammation of the affected part, a ſwelling of the lips of the wound, and ſweating forth of a ſerous, thin and virulent matter or filth, then you ſhall pour into it ſcalding Oyl, and ſhall touch three or four times not only the ſurface of the wound, but the bottom thereof with a rag dipped therein and tied to the end of *Spatula*. For this will take away the ſenſe from the nerve, tendon, or membrane, like as if they were burnt with a cautery, and ſo the pain will be eaſed. So in the moſt grievous pains of rotten teeth, the thruſting of an hot iron into their roots, or ſtopping them with cotton dipped in Oyl of Vitriol, or *Aqua vitæ*, gives moſt certain eaſe; for by burning the nerve which is inſerted into their roots, the ſenſe, and ſo conſequently, the pain is taken away. So alſo in malignant, gnawing, eating and ſpreading ulcers, which are always aſſociated with much pain, the pain ceaſes by applying an Eſcharotick, the powder of Alum or Mercury, or *Ægyptiacum* made ſomewhat more ſtrong than uſual. That the young Chirurgeon may be more ready for this practice and the uſe of the former medicines, I have thought good to inſert the following Hiſtory, both for the lateneſs of the thing, and pleaſing memory of the moſt laudable Prince.

Medicines fit for wounds of the nerves.

What wounds of the nerves muſt be burnt.

A certain Anodyne in pain of the teeth.

Why Eſcharoticks muſt be uſed to ſpreading ulcers.

Charles the ninth, the French King, being ſick of a Feaver, Monſieur *Chapellan* and *Caſtellan* his Phyſicians thought it fit he ſhould be let blood; for the performance whereof, there was called a Chirurgeon wondrous famous for that buſineſs; but when as he by chance had pricked a nerve inſtead of a vein, the King cried out, that he felt a mighty pain in that place. Then I bid, that the ligature ſhould ſtreight-ways be looſed, otherwiſe the arm would preſently be much ſwelled. But he going ſlowly about it, behold the arm began to ſwell with ſuch contraction, that he could not bend it, nor put it forth, and cruel pain moleſted not only the pricked particle; but all the whole member beſides. I forthwith laid upon the wound a plaiſter of *Baſilicon*, to hinder the agglutination thereof, and then I wrapped all the arm in a double linnen cloth dipped in Oxycrate, putting upon it an expulſive ligature, which beginning at the wriſt and ending at the top of the ſhoulder, might keep the blood and ſpirits from fear of defluxion and inflammation. This being thus performed, we went aſide to conſult what was neceſſary to be done, both to aſſwage the pain, as alſo to divert the other ſymptoms, which uſually happen upon punctures of the nerves. I being deſired, thus delivered my opinion, that in my mind, there were nothing better, then preſently to drop into the wound ſome Oyl of Turpentine warmed and mixed with a little *Aqua vitæ*. And then all the arm ſhouldbe be covered with a plaiſter of *Diacalcitheos* diſſolved in Vinegar and

A hiſtory.

A famous Hiſtory.

Oyl of Roſes, bound over and beſides with the expulſive ligature, which we formerly mentioned. For the Oyl and *Aqua vitæ* have a faculty to penetrate into the bottom of the wound, and to exhauſt and dry up the ſerous and virulent humor, which ſweats from the ſubſtance of the pricked nerve; and alſo to mitigate the pain by its actual heat. Furthermore, emplaiſter *Diacalcitheos* hath a faculty to diſſolve the humor which hath already fallen down into the arm, and to hinder the entrance and defluxion of any new matter. And the ligature is ſuch as by its moderate aſtriction would ſerve to ſtrengthen the muſcles, and to preſs out and repel the humors, which were fallen down into the upper part, and to prohibit that which is ready to fall down. Mine advice being approved of the Phyſicians both in word and deed, the pain was mitigated. But the humor ſtaid in the part, for the diſſolving and drying whereof, this following remedy was uſed. ℞ *far. hordei & orobi an.* ʒ ij. *flor. chamæm. & melilot. an.* p. ij. *butyr. recentis ſine ſale* ʒ i ſs. *Lixivii barbitonſoris quod ſufficit, fiat cataplaſma ad formam pultis.* By theſe remedies the King at laſt, after three months ſpace was perfectly healed, ſo that there remained no ſign of the depraved action in the part. But if at any time there ſhall be ſo great contumacy, that it will not yield to theſe means, but that there is imminent danger of a Convulſion; it will be better to cut it in ſunder, whether nerve, tendon, or membrane, than to expoſe the Patient to the danger of a deadly Convulſion; for thus indeed the peculiar action of that part will be loſt, but the whole body preſerved thereby; for ſo we had determined by common conſent, that if the pain which afflicted the King would not yield to the preſcribed remedies, either to pour in ſcalding Oyl, or elſe to cut the ſinew quite aſunder.

A diſcuſſing and drying cataplaſm.

A Hiſtory.

For the late and ſad memory of M^ris *Courtin* dwelling in the Street of *Holy-Croſs*, was in our minds, who of a vein not well opened in her arm fell into a Gangrene and total mortification of that whole part, of which ſhe died, becauſe ſhe was not dreſſed with the formerly mentioned medicines. Yet we muſt abſtain from theſe two powerful remedies, when the pricked nerve ſhall lye bare, for elſe the pain would be increaſed, and more grievous ſymptoms follow. Wherefore as I formerly wiſhed, more mild medicines muſt be applied, which may dry up the ſerous humor without biting acrimony; as ℞ *Terebinth. venet. in aq. roſ. lota* ʒ ij. *Boli armeni ſubtiliter pulveriſati,* ʒ ij. *Incorporentur ſimul.* Our Balſom alſo is excellent in this caſe, and this of *Vigo*'s which follows. ℞ *Olei roſar. omphacini* ʒ i ſs. *Olei de terebinth.* ʒ iij. *ſucci plant. ag.* ʒ ſs. *Semin. hypericonis aliquantulum contritim.* ſs. *Tutiæ præpar.* ʒ iij. *Calcis decies lotæ cum aqua plantagin.* ʒ ij. *antimonii* ʒ i. *ſevi hercini, & vitulini, an.* ℥ v. *vermium terreſtrium cum vino lotorum* ʒ i ſs. *Bulliant omnia ſimul dempta tutia in cyatho decoctionis hordei, ad conſumptionem aquæ & vini, colentur rurſumq; igni admoveantur, addendo tutiam, & fiat linimentum cum cera alba, &* ʒ ſs. *Croci.* This liniment aſſwages pains, and covers the bared nerves with fleſh. This cure of punctured nerves, may with choice and judgment, and obſerving the proportion of the parts, be transferred to the pricked tendons and membranes. But take this as a general and common rule, that all nervous bodies howſoever hurt, are to be comforted by anointing them with hot Oyls, ſuch as the Oyl of Bays, Lilies, of Worms, Sage, or ſome other ſuch like remedy being applied to their originals and more notable paſſages; as to the original of the ſpinal marrow, the arm-pits and groins. Neither do I think fit in this place to omit an effect which ſometimes happens to the large tendon of the heel, of which we formerly made mention. For it oft-times is rent or torn by a ſmall occaſion without any ſign of injury or ſolution of continuity apparent on the outſide, as by a little jump, the ſlipping aſide of the foot, the too nimble getting on horſe-back, or the ſlipping of the foot out of the ſtirrop in mounting into the ſaddle. When this chance happens, it will give a crack like a Coach-mans whip; above the heel, where the tendon is broken, the depreſſed cavity may be felt with your finger, there is a great pain in the part, and the party is not able to go. This miſchance may be amended by long lying and reſting in bed, and repelling medicines applied to the part affected in the beginning of the diſeaſe, for fear of more grievous ſymptoms, and then applying the Black-plaiſter, or *Diacalcitheos*, or ſome other ſuch, as need ſhall require; neither muſt we hereupon promiſe to our ſelves, or the Patient, certain or abſolute health. But on the contrary, at the beginning of the diſeaſe we muſt foretel that it will never be ſo cured, but that ſome reliques may remain, as the depreſſion of the part affected, and depravation of the action and going; for the ends of this broken or relaxed tendon by reaſon of its thickneſs and contumacy, cannot eaſily be adjoyned, nor being adjoyned, united.

An Anodyne and Sarcotick Balſom.

A general rule for all wounds of all nervous parts.

CHAP. XXXIX.

Of the Wounds of the Joynts.

Why wounds of the joynts are malignant.

BEcauſe the wounds of the Joynts have ſomething proper and peculiar to themſelves, beſides the common nature of wounds of the nerves, therefore I intend to treat of them in particular. Indeed they are always very dangerous, and for the moſt part deadly, by reaſon of the nervous productions and membranous tendons wherewith they are bound and ingirt, and into which the nerves are inſerted: Whereby it comes to paſs, that the exquiſite ſenſe of ſuch like parts will eaſily bring malign ſymptoms, eſpecially if the wound poſſeſs an internal, or, as they term it, a domeſtick part of them; as for example, the arm-pits, the bending of the arm, the inner part of the wriſt, and ham, by reaſon of the notable veins, arteries, and nerves of theſe parts, the looſed continuity of all which brings a great flux of blood, ſharp pain, and other malignant ſymptoms; all which we muſt reſiſt according to their nature and condition, as a flux of blood with things ſtaying bleeding, pain with anodynes. If the wound be large and wide, the ſevered parts ſhall be joyned with a ſuture, leaving an orifice in the lower part, by which the quitture may paſs forth. This following powder of *Vigo*'s deſcription muſt be ſtrewed upon the ſuture. ℞ *Thuris, ſang. draconis, boli armen. terræ ſigill. an.* ʒ ij. *Aloes, maſtich. an.* ʒ i. *Fiat pulvis ſubtilis.* And then the joynt muſt be wrapped about with a repercuſſive medicine compoſed of the whites of Eggs, a little oyl of Roſes, Bole, Maſtich, and Barley flower. If it be needful to uſe a Tent, let it be ſhort, and according to the wound thick,

The cure.

thick, leſt it cauſe pain, and moreover let it be anointed with the yolk of an Egg, oyl of Roſes, waſhed Turpentine and a little Saffron. But if the wound be more ſhort and narrow, it ſhall be dilated, if there be occaſion, that ſo the humor may paſs away more freely. You muſt reſt the part, and beware of uſing cold, relaxing, mollifying, humecting, and unctuous medicines, unleſs peradventure the ſharpneſs of the pain muſt be mitigated. For on the contrary, aſtringent and deſiccant medicines are good, as this following Cataplaſm. ℞ *furfur. macri, farin. hordei, & fabarum an.* ℥ iiij. *Florum chamæ. & melil. an.* m. ß *terebinth.* ℥ iij. *mellis communis* ℥ ij. *ol. myrt.* ℥ i. *Oxymelitis, vel lixivii com. quantum ſufficit; fiat cataplaſma ad formam pultis.* Or you may compoſe one of the Lees of Wine, Wheat-bran, the powder of Oaken-bark, Cypreſs-nuts, Galls and Turpentine, and ſuch like, that have an aſtringent, ſtrengthning and drying quality, and thereby aſſwaging pain, and hindering the deſluxion of humors. This following medicine is aſtringent and agglutinative. ℞ *terebinth. venet.* ℥ ij. *aq. vitæ parum, pulveris maſtich. aloes, myrrhæ, boli armen. an.* ℈ ij. And alſo our Balſam will be good in this caſe, if ſo be that you add hereto ſo much powder which dries without Acrimony, as occaſion ſhall ſerve: I admoniſhed you before to take heed of cold, and now again; for it is hurtful to all wounds and ulcers, but eſpecially to theſe of the nervous parts: Hence it is that many die of ſmall wounds in the Winter, who might recover of the ſame wounds though greater in the Summer. For cold, according to *Hippocrates*, is nipping to Ulcers, hardens the skin, and hinders them from ſuppuration, extinguiſheth natural heat, cauſes blackneſs, cold aguiſh fits, convulſions and diſtentions. Now divers excrements are caſt forth of wounds of the joynts, but chiefly albugineous, that is, reſembling the white of an Egg, and mucous, and ſometimes a very thin water, all which ſavour of the nature of that humor which nouriſheth theſe parts. For to every part there is appropriate for his nouriſhment and conſervation, a peculiar Balſam, which by the wound flows out of the ſame part; as out of the branches of the Vine, when they are pruned, their radical moiſture or juyce flows, whence alſo a *Callus* proceeds in broken bones. Now this ſame mucous, and albugineous humor, ſlow, and as it were frozen, flowing from the wounded joynts, ſhews the cold diſtemper of the parts, which cauſe pain, not to be orecome by medicines only potentially hot. Wherefore to correct that, we muſt apply things actually hot, as Beaſts and Swines bladder half full of a diſcuſſing decoction, or hot bricks quenched in Wines. Such actual heat helps Nature to concoct and diſcuſs the ſuperfluous humor impact in the joynts, and ſtrengthens them; both which are very neceſſary, becauſe the natural heat of the joynts is ſo infirm that it can ſcarce actuate the medicine, unleſs it be helped with medicines actually hot. Neither muſt the Chirurgeon have the leaſt care of the figure and poſture of the part, for a vicious poſture increaſes ill ſymptoms, uſes to bring to the very part though the wound be cured, diſtortion, numneſs, incurable contraction; which fault leſt he ſhould run into, let him obſerve what I ſhall now ſay: If the fore-part of the ſhoulder be wounded, a great boulſter muſt be under the arm-pit, and you muſt carry your arm in a ſcarf, ſo that it may bear up the lower part of the arm, that ſo the top of the ſhoulder may be elevated ſomewhat higher, and that ſo it may be thereby more ſpeedily and happily agglutinated and conſolidated. If the lower part be wounded, when fleſh begins to be generated, and the lips of the wound to meet, you muſt bid the Patient to move and ſtir his arms divers ways ever and anon; for if that be omitted or negligently done, when it is cicatrized, then it will be more ſtiff and leſs pliable to every motion; and yet there is a further danger leſt the arm ſhould totally loſe its motion. If the wound be upon the joynt of the elbow, the arm ſhall be placed and ſwathed in a middle poſture, that is, which neither too ſtraitly bows it, nor holds it too ſtiffly out; for otherwiſe, when it is cicatrized, there will be an impediment either in the contraction or extention. When the wound is in the wriſt or joynts of the fingers either externally or internally, the hand muſt be kept half ſhut, continually moving a ball therein. For if the fingers be held ſtrait ſtretched forth, after it is cicatrized, they will be unapt to take up or hold any thing, which is their proper faculty. But if after it be healed, it remain half ſhut, no great inconveniency will follow thereon: For ſo he may uſe his hand divers ways to his Sword, Pike, Bridle, and in any thing elſe. If the joynts of the hip be wounded, you muſt ſo place the Patient that the thigh-bone may be kept in the cavity of the huckle-bone, and may not part a hairs breadth there-from, which ſhall be done with linnen boulſters and ligatures applied as is fitting, and lying full upon his back. When the wound ſhall begin to cicatrize, the Patient ſhall uſe to move his thigh every way, leſt the head of the thigh-bone ſtick in the cavity of the huckle-bone without motion. In a wound of the knee, the leg muſt be placed ſtrait out, if the Patient deſire not to be lame: When the joynts of the feet and toes are wounded, theſe parts ſhall neither be bended in nor out, for otherwiſe he will not be able to go. To conclude, the ſite of the foot and leg, is quite contrary to that of the arm and hand.

An aſtringent and drying Cataplaſm.

Aphor. 20. *ſec.* 5.

What matter uſually flows from wounds of the joynts.

Why things actually hot muſt be applied to the wounded joynts.

Of the ſite and poſture of wounded joynts.

CHAP. XL.

Of the Wounds of the Ligaments.

THe wounds of the Ligaments, beſides the common manner of curing thoſe of the Nerves, have nothine peculiar, but that they require more powerful medicines, for their agglutination, deſiccation and conſolidating; both becauſe the ligamental parts are harder and drier, and alſo for that they are void of ſenſe. Therefore the foreſaid cure of nerves and joynts may be uſed for theſe wounds: For the medicines in both are of the ſame kind; but here they ought to be ſtronger and more powerfully drying. The Theory and cure of all the ſymptomes which ſhall happen thereupon, have been expreſſed in the Chapter of curing the wounds of the nervous parts, ſo that here we ſhall need to ſpeak nothing of them, for there you may find as much as you will. Wherefore here let us make an end of wounds, and give thanks to God the Author and giver of all good, for the happy proceſs of our labours: And let us pray that that which remains may be brought to a happy end, and ſecure for the health and ſafety of good people.

Ligaments more dry than nerves, and without ſenſe.

The end of the Tenth Book.

BOOK XI.

Of Wounds made by Gunſhot, other fiery Engines, and all ſorts of Weapons.

The PREFACE.

I Have thought good here to premiſe my opinion of the original, increaſe, and hurt of fiery Engines, for that I hope it will be an ornament and grace to this my whole Treatiſe: As alſo to intice my Reader, as it were with theſe junkets, to our following Banquet ſo much ſavouring of Gunpowder. For thus it ſhall be known to all whence Guns had their original, and how many habits and ſhapes they have acquired from poor and obſcure beginnings; and laſtly, how hurtful to mankind the uſe of them is.

Lib. 2. de inv. rerum. Polydore Virgil *writes, that a German of obſcure birth and condition was the Inventor of this new Engin which we term a Gun, being induced thereto by this occaſion. He kept a Mortar covered with a tile or ſlate, for ſome other certain uſes, a powder (which ſince that time for its chief and new known faculty, is named Gunpowder.) Now it chanced as he ſtruck fire with a ſteel and flint, a ſpark thereof, by accident fell into the Mortar, whereupon the powder ſuddenly catching fire, caſts the ſtone or tile which covered the Mortar up on high; he ſtood amazed at the novelty and ſtrange effect of the thing, and withal obſerved the formerly unknown faculty of the powder; ſo that he thought good to make experiment thereof in a ſmall Iron Trunk framed for that purpoſe according to the intention of his mind. When all things were correſpondent to his expectation, he firſt ſhewed the uſe of his Engine to the Venetians, when they warred with the Genoveſes about* Foſſa Clodia, *in the year of our Lord,* 1380. *Yet in the opinion of* Peter Meſſias, *this Invention muſt have been of greater antiquity; for it is read in the Chronicles of* Alphonſus XI. *King of* Caſtile, *who ſubdued the Iſles* Argezires, *that when he beſieged the chief Town, in the year of our Lord,* 1343. *the beſieged Moors ſhot, as it were, thunder againſt the Aſſailants, out of Iron Mortars. But we have read in the Chronicles written by* Peter *Biſhop of* Leons *of that* Alphonſus *who conquered* Toledo, *that in a certain Sea-fight fought by the King of* Tunis, *againſt the Mooriſh King of* Sivil, *whoſe part King* Alphonſus *favoured, the* Tunetans *caſt lightning out of certain hollow Engins or Trunks with much noiſe. Which could be no other, than our Guns, though not attained to that perfection of Art and Execution which now they have.*

Cap. 8. prim. par. var. lect.

I think the Deviſer of this deadly Engin hath this for his recompence, that his name ſhould be hidden by the darkneſs of perpetual ignorance, as not meriting for this his moſt pernitious Invention, any mention from Poſterity. Who the Inventer of Guns. *Yet* Andrew Thevet *in his Coſmography, publiſhed ſome few years agone, when he comes to treat of the* Suevi, *the Inhabitants of Germany, brings, upon the authority and credit of a certain old Manuſcript, that the German the Inventer of this Warlike Engine was by Profeſſion a Monk and Philoſopher, or Alchymiſt, born at* Friburg, *and nam'd* Conſtantine Anclzen. The reaſon of the name. *However it was, this kind of Engine was called* Bombarda (i.) *a Gun, from that noiſe it makes, which the Greeks and Latins according to the ſound call* Bombus; *then in the following ages, time, art and mans malicioufneſs, added much to this rude and unpoliſh'd invention. For firſt for the matter; Braſs and Copper, Metals far more tractable, fuſible, and leſs ſubject to ruſt, came as ſupplies to Iron. Then for the form; that rude and undigeſted Barrel, or Mortar-like maſs, hath undergone many forms and faſhions, even ſo far as it is gotten upon wheels, that ſo it might run not only from the higher ground, but alſo with more rapid violence to the ruine of mankind; when as the firſt and rude Mortars ſeemed not to be ſo nimbly traverſed, nor ſufficiently cruel for our deſtruction by the only caſting forth of Iron and fire. Hence ſprung theſe horrible Monſters of Canons, double Canons, Baſtards, Muſquets, Field-pieces; hence theſe cruel and furious Beaſts, Culverins, Serpentines, Baſiliſques, Sakers, Falcons, Falconets, and divers other names not only drawn from their figure and making, but alſo from the effects of their cruelty. Wherefore certainly I cannot ſufficiently admire the wiſdom of our Anceſtors, who have ſo rightly accommodated them with names agreeable to their natures; as thoſe who have not only taken them from the ſwifteſt Birds of prey, as Falcons, but alſo from things moſt harmful and hateful to mankind, ſuch as Serpents, Snakes, and Baſiliſques. That ſo we might clearly diſcern, that theſe Engines were made for no other purpoſe, nor with other intent, but only to be imployed for the ſpeedy and cruel ſlaughter of men; and that by only hearing them named we might deteſt and abhor them, as pernicious enemies of our lives. I let paſs other Engines of this Off-ſpring, being for their quantity ſmall, but ſo much the more pernicious and harmful, for that they nearer aſſail our lives, nay trayterouſly, and forthwith ſeiſe upon us not thinking nor fearing any ſuch thing; ſo that we can ſcarce have any means of eſcape; ſuch as Piſtols and other ſmall Hand-guns, which for ſhortneſs you may carry in your pocket, and ſo privily and ſuddenly taking them forth oppreſs the careleſs and ſecure.* The danger of Piſtols. *Fowling-pieces which men uſually carry upon their ſhoulders, are of the middle rank of theſe Engines, as alſo Muskets and Caleeveres, which you cannot well diſcharge unleſs lying upon a Reſt, which therefore may be called Breaſt-guns, for that they are not laid to the cheek, but againſt the breaſt, by reaſon of their weight and ſhortneſs: All which have been invented for the commodity of Footmen, and Light-horſemen. This middle ſort of Engine they call in Latin by a general name* Sclopus, *in imitation of the ſound, and the Italians who term it* Sclopetere; *the French call it* Harquebuſe, *a word likewiſe borrowed from the Italians, by reaſon of the touch-hole by which you give fire to the Piece, for the Italians call a hole* Buzio. *It is termed* Arcus (i.) *a Bow, for that at this preſent it holds the ſame place in Martial affairs, as the Bow did of old;*

and

and as the Archers formerly, ſo at this day the Musketiers are placed in front. From the ſame wretched Shop, and Magazine of Cruelty, are all ſorts of Mines, Countermines, Ports of fire, Trains, Fiery Arrows, Lances, Croſs-bows, Barrels, Balls of Fire, burning Fagots, Granats, and all ſuch fiery Engines and Inventions, which cloſely ſtuffed with fuel and matter for fire, and caſt by the Defendants upon the Bodies and Tents of the Aſſailants, eaſily take fire by the violence of their motion. Certainly a moſt miſerable and pernicious kind of Invention, whereby we often ſee a thouſand of heedleſs men blown up with a Mine by the force of Gunpowder; otherwhiles in the very heat of the Conflict you may ſee the ſtouteſt Souldiers, ſeiſed upon with ſome of theſe Fiery Engines, to burn in their harneſs, no water being ſufficiently powerful to reſtrain and quench the raging and waſting violence of ſuch fire cruelly ſpreading over the body and bowels. So it was not ſufficient to have Arms, Iron, and Fire to mans deſtruction, unleſs alſo that the ſtroke might be more ſpeedy, we had furniſhed them, as it were with wings, ſo to fly more haſtily to our own perdition, furniſhing Sithebearing Death with wings ſo more ſpeedily to oppreſs man, for whoſe preſervation, all things contained in the World were created by God. Verily when I conſider with my ſelf all the ſorts of warlike Engines, which the Ancients uſed, whether in the field in ſet Battels, as Bows, Darts, Croſs-bows, Slings; or in the aſſault of Cities, and ſhaking or overturning their Walls, as Rams, Horſes, Wooden-towers, Slings, and ſuch like; they ſeem to me certain childiſh ſports and games made only in imitation of the former. For theſe modern Inventions are ſuch as eaſily exceed all the beſt appointed and cruel Engines which can be mentioned or thought upon, in the ſhape, cruelty and appearance of their operations. For what in the World is thought more horrid or fearful than Thunder or Lightning? and yet the hurtfulneſs of Thunder is almoſt nothing to the cruelty of theſe infernal Engines; which may eaſily appear by comparing together both their effects. Man alone of all Creatures is not always killed by being touched with Thunder; but it immediately killeth all other things which are ſubject to be touch'd therewith. Nature beſtowing this honour upon him, ſeeing ſo many Creatures exceed him in ſtrength: For all things lye contrary to man; and man, unleſs he be overthrown with it, doth not die thereof. But theſe fire-ſpitting Engines do no more ſpare man, than they do other Creatures, and kill without difference from whence ſoever they come, whither ſoever they are carried, and howſoever they touch. There are many, but more are ſaid to be the remedies againſt Thunder; for beſide the charms whereby the ancient Romans did ſuppoſe they might be driven away, they never penetrate deeper into the ground than five foot, therefore ſuch as was fearful thought the deeper Caves the moſt ſafe. Of thoſe things which grow out of the earth, they do not touch the Bay-tree, and that was the cauſe that it was counted a ſign of Victory both in ancient and modern times. Wherefore Tiberius Cæſar, *otherwiſe a contemner of God and Religion, as he who indued with the Mathematical Sciences, thought all things governed by Fate, yet becauſe he exceedingly feared Thunder, he always carried a Laurel Wreath about his neck when the air was troubled, for that this kind of leaf is reported not to be touched with Thunder. Some report that he made him Tents of Seals skins, becauſe it toucheth not this kind of Creature of all thoſe things that live in the Sea, as neither the Eagle amongſt Birds, which for that is feigned to be* Jove's *Squire. But on the contrary, Charms, the victorious Bay, the Seal, or Sea-calf, the Eagle, or any ſuch thing, profits nothing againſt the violence of theſe fiery engines: No not a wall of ten foot thick will advantage. Laſtly, this argues the immenſe violence of braſen Canons above Thunder, for that Thunder may be diſperſed and driven away with the noiſe and ringing of Bells, the ſounding of Trumpets, the tinkling of braſen Kettles, yea alſo by the ſhooting of ſuch great Ordnance; to wit, the clouds, by whoſe colliſion and fight the Thunder is cauſed, being diſperſed by this violent agitation of the air, or elſe driven further to more remote parts of the skies. But their fury once provoked, is ſtayed by no oppoſition, appeaſed by no remedy. As there are certain ſeaſons of the year, ſo alſo there are certain Regions of the earth, wherein Thunder is ſeldom or never heard. Thunders are rare in Winter and Summer, and that for contrary cauſes; for that in Winter the denſe air is thickned with a thicker coat of clouds, and the froſty and cold exhalation of the earth extinguiſheth what fiery vapours ſoever it receives; which thing keeps* Scythia *and the cold Countreys about it free from Thunder. And on the contrary, too much heat preſerves* Egypt. *For hot and dry exhalations of the earth are condenſed into very thin, ſubtile, and weak clouds. But as the Invention, ſo alſo the harm and tempeſt of great Ordnance, like a contagious Peſtilence, is ſpread and rages over all the earth, and the skies at all times ſound again with their report. The Thunder and Lightning commonly gives but one blow or ſtroke, and that commonly ſtrikes but one man of a multitude: But one great Canon at one ſhot may ſpoil and kill a hundred men. Thunder, as a thing natural, falls by chance, one while upon a high Oak, another while upon the top of a Mountain, and ſomewhiles on ſome lofty Tower, but ſeldom upon Man. But this helliſh Engine, tempered by the malice and guidance of man, aſſails man only, and takes him for his only mark, and directs his bullets againſt him. The Thunder by its noiſe, as a Meſſenger ſent before, foretels the ſtorm at hand; but, which is the chief miſchief, this infernal Engine roars as it ſtrikes, and ſtrikes as it roars, ſending at one and the ſame time the deadly bullet into the breaſt, and the horrible noiſe into the ear. Wherefore we all of us rightfully curſe the Author of ſo pernicious an Engine; on the contrary, praiſe thoſe to the skies, who endeavour by words and pious exhortations to dehort Kings from their uſe, or elſe labour by writing and operation to apply fit medicines to wounds made by theſe Engines. Which hath moved me that I have written hereof almoſt with the firſt of the French. But before I ſhall do this, it ſeemeth not amiſs, (ſo to facilitate the way to the Treatiſe I intend to write of wounds made by Gunſhot) to premiſe two Diſcourſes, by which I may confute and take away certain erroneous opinions which have poſſeſſed the minds of divers; for that, unleſs theſe be taken away, the eſſence and nature of the whole diſeaſe cannot be underſtood, nor a fitting remedy applied by him which is ignorant of the diſeaſe.*

A compariſon of the ancient Weapons with the modern.

Pliny Lib. 2. cap. 59.

Plin. lib. 2. cap. 51.

Sueton. in Tiberio.

The wondrous force of great Ordnance.

Plin. lib. 2. cap. 50.

The firſt Diſcourſe which is dedicated to the Reader, refels and condemns, by reaſons and examples, the method of curing preſcribed by John de Vigo, *whereby he cauterizeth the wounds made by Gunſhot, ſuppoſing them venenate; and on the contrary proves the order of curing which is performed by ſuppuratives, to be ſo ſalutary and gentle, as that preſcribed by* Vigo *is full of errour and cruelty. The ſecond dedicated to the King, teaches that the ſame wounds are of themſelves void of all poyſon, and therefore that all their malignity depends upon the fault of the air, and ill humors predominant in the bodies of the Patients.*

The Arguments of the following Diſcourſes.

The

The firſt Diſcourſe wherein Wounds made by Gunſhot, are freed from being burnt, or cauterized, according to Vigo's *method.*

IN the year of our Lord, 1536. *Francis* the French King, for his acts in War and Peace ſtiled the Great, ſent a puiſſant Army beyond the Alps, under the Government and Leading of *Annas* of *Mommorancy* High Conſtable of *France*, both that he might relieve *Turin* with Victuals, Souldiers, and all things needful, as alſo to recover the Cities of that Province taken by the Marquis of *Guaſt* General of the Emperors Forces. I was in the Kings Army the Chirurgeon of Monſieur of *Montejan* General of the Foot. The Imperaliſts had taken the Straits of *Suze*, the Caſtle of *Villane*, and all the other paſſages; ſo that the Kings Army was not able to drive them from their Fortifications but by fight. In this conflict there were many wounded on both ſides with all ſorts of weapons, but chiefly with bullets. I will tell the truth, I was not very expert at that time in matters of Chirurgery; neither was I uſed to dreſs wounds made by Gunſhot. Now I had read in *John de Vigo*, that wounds made by Gunſhot were venenate or poiſoned, and that by reaſon of the Gunpowder; wherefore for their cure, it was expedient to burn or cauterize them with oyl of Elders ſcalding hot, with a little Treacle mixed therewith. But, for that I gave no great credit neither to the Author, nor remedy, becauſe I knew that cauſticks could not be poured into wounds, without exceſſive pain; I, before I would run a hazard, determined to ſee whether the Chirurgeons, who went with me in the Army, uſed any other manner of dreſſing to theſe wounds. I obſerved and ſaw that all of them uſed that method of dreſſing which *Vigo* preſcribes; and that they filled, as full as they could, the wounds made by Gunſhot with Tents and Pledgets dipped in this ſcalding Oyl, at the firſt dreſſing, which encouraged me to do the like to thoſe who came to be dreſſed of me. It chanced on a time, that by reaſon of the multitude that were hurt, I wanted this Oil. Now becauſe there were ſome few left to be dreſſed, I was forced, that I might ſeem to want nothing, and that I might not leave them undreſt, to apply a digeſtive made of the yolk of an egg, Oil of Roſes, and Turpentine. I could not ſleep all that night, for I was troubled in mind, and the dreſſing of the precedent day (which I judged unfit) troubled my thoughts; and I feared that the next day I ſhoud find them dead, or at the point of death by the poiſon of the wounds, whom I had not dreſſed with the ſcalding Oyl. Therefore I roſe early in the morning, I viſited my Patients, and beyond expectation, I found ſuch as I had dreſſed with a digeſtive only, free from vehemency of pain to have had good reſt, and that their wounds were not inflamed nor tumefied; but on the contrary, the others that were burnt with the ſcalding Oyl were feaveriſh, tormented with much pain, and the parts about their wounds were ſwoln. When I had many times tried this in divers others, I thought thus much, that neither I nor any other ſhould ever cauterize any, wounded with Gunſhot. When we firſt came to *Turin*, there was a Chirurgeon far more famous than all the reſt in artificially and happily curing wounds made by Gunſhot; wherefore I laboured with all diligence for two years time to gain his favour and love, that ſo at the length I might learn of him, what kind of medicine that was, which he honoured with the glorious title of Balſam, which was ſo highly eſteemed by him, and ſo happy and ſucceſsful to his Patients; yet could I not obtain it. It fell out a ſmall while after that the Marſhal of *Montejan* the Kings Lieutenant General there in *Piedmont* died; wherefore I went unto my Chirurgeon, and told him that I could take no pleaſure in living there, the favourer and *Mæcenas* of my ſtudies being taken away; and that I intended forthwith to return to *Paris*, and that it would neither hinder, nor diſcredit him to teach his remedy to me, who ſhould be ſo far remote from him. When he heard this, he made no delay, but preſently wiſhed me to provide two Whelps, one pound of Earth-worms, two pounds of Oyl of Lilies, ſix ounces of Venice Turpentine, and one ounce of *Aqua vitæ*. In my preſence he boiled the Whelps put alive into that Oyl, until the fleſh came from the bones; then preſently he put in the Worms, which he had firſt killed in White-wine, that they might ſo be cleanſed from the earthy droſs wherewith they are uſually repleat, and then he boiled them in the ſame Oyl ſo long, till they became dry, and had ſpent all their juyce therein: Then he ſtrained it through a towel without much preſſing; and added the Turpentine to it, and laſtly *Aqua vitæ*. Calling God to witneſs, that he had no other Balſam, wherewith to cure wounds made with Gunſhot, and bring them to ſuppuration. Thus he ſent me away as rewarded with a moſt precious gift, requeſting me to keep it as a great ſecret, and not to reveal it to any. When I came to *Paris*, I went to viſit *Silvius* the Kings Profeſſor of Phyſick, well known by name to all Scholars for his great Learning; he kept me long that ſo I might dine with him, and diligently enquires of me, if I had obſerved any new method of curing wounds made by Gunſhot, and Combuſtions, occaſioned by Gunpowder. Then I affirmed to him that Gunpower did not participate any thing of poyſon, for that none of thoſe things whereof it is compounded are poyſonous; which reaſon ought to free the whole compoſition from ſuſpicion of poyſon. And that experience confirmed this reaſon; for I had ſeen many Souldiers, who would drink a great quantity of this powder with Wine, becauſe they were perſwaded, that this drink would free them from malign ſymptoms when they were wounded; yet I give no credit to this perſwaſion; and laſtly, for that many without any harm, ſtrewed this powder upon rebellious Ulcers. For the Bullets, I affirm, that they cannot conceive ſuch heat as to become cauſtick. For if you ſhoot them out of a Gun againſt a hard ſtone, yet you may preſently take them up without any harm in your hands, though by ſtriking upon the ſtone, they ſhould become more hot. For the Combuſtions cauſed by Gunpowder, I obſerved no ſpecial nor peculiar remedy, which might make their cure different from other combuſtions. To which purpoſe I related this inſuing Hiſtory.

Lib. 1. de vulner. cap. 8.

What chance may do in finding out of remedies.

The deſcription of Oyl of Whelps.

Gunpowder not poyſonous.

Bullets ſhot out of a Gun do not burn.

A Hiſtory.

One of the Marſhal of *Montejan* his Kitchin-boys, fell by chance into a Caldron of Oyl, being even

even almoſt boiling hot; I being called to dreſs him, went to the next Apothecaries to fetch refrigerating medicines commonly uſed in this caſe: There was preſent by chance a certain old Countrey woman, who hearing that I deſired medicines for a Burn, perſwaded me at the firſt dreſſing, that I ſhould lay two raw Onions beaten with a little Salt; for ſo I ſhould hinder the breaking out of bliſters or puſtules, as ſhe had found by certain and frequent experience. Wherefore I thought good to try the force of her medicine upon this greaſie Scullion. I the next day found thoſe places of his body whereto the Onions lay, to be free from bliſters, but the other parts which they had not touched, to be all bliſtered.

A medicine hindering bliſtering in Burns or Scalds.

It fell out a while after, that a *German* of *Montejan* his Guard had his Flaſque full of Gunpowder ſet on fire, whereby his hands and face were grievouſly burnt: I being called, laid the Onions beaten, as I formerly told you, to the middle of his face, and to the reſt I laid medicines uſually applied to Burns. At the ſecond dreſſing I obſerved the part dreſſed with Onions quite free from bliſters and excoriation, the other being troubled with both; whereby I gave credit to the medicine. Beſides alſo, I laſtly told him this, that I had obſerved, that was the readieſt way to draw forth Bullets ſhot into the body, which ſets the Patient in the ſame poſture and ſite, as he was when he received his hurt. Which things when I had told him, together with many other handled at large in this Work, the good old man requeſted me to publiſh in print my opinions concerning theſe things, that ſo the erroneous and hurtful opinion of *Vigo* might be taken out of mens minds. To whoſe earneſt intreaty when I had aſſented, I firſt of all cauſed to be drawn and carved many Inſtruments fit to draw forth Bullets and other ſtrange bodes; then a ſhort while after I firſt publiſhed this Work in the year of our Lord, 1545. which when I found to be well liked and approved by many, I thought good to ſet it forth the ſecond time ſomewhat amended in the year, 1552. and the third time augmented in many particulars in the year, 1564. For I having followed many Wars, and detained as Chirurgeon in beſieged Cities, as *Mets* and *Heſden*, had obſerved many things under five Kings, whom I ſerved with diligence and content. I had learn'd many things from moſt expert Chirurgeons, but more from all learned Phyſicians, whoſe familiarity and favour for that purpoſe I always laboured to acquire with all diligence and honeſt arts; that ſo I might become more learned and skilful by their familiarity and diſcourſe, if there was any thing, eſpecially in this matter and kind of wounds, which was hid from me, or whereof I was not well aſſured. Of which number I have known very few, who have ſeen any thing in this kind of operation, either by ſtudy, or experience in Wars, have not thought that wounds made by Gunſhot ought to be dreſſed at the firſt with ſuppurative medicines, and not with ſcalding and cauſtick Oyl. For this I affirm, which then alſo I teſtified to this good man, that I have found very many wounds made in the fleſhy parts by Gunſhot, as eaſily cured as other wounds, which be made by contuſing things. But in the parts of the body where the Bullet meets with bones and nervous particles, both becauſe it tears and rends into ſmall pieces thoſe things which reſiſt, not only where it touches, but further alſo, through the violence of the blow, therefore it cauſeth many and grievous ſymptoms which are ſtubborn and difficult, and oft-times impoſſible to cure, eſpecially in bodies replete with ill humors, in an ill conſtitution of the Heaven and Air, ſuch as is hot, moiſt and foggy weather, which therefore is ſubject to putrefaction; and in like manner a freezing and cold ſeaſon, which uſes to mortifie the wounded parts not only of thoſe that are hurt with Bullets, but in like ſort with any other weapon; not only in bony and nervous particles, but alſo in muſculous. Whereby you may underſtand, that the difficulty of curing proceeds not from the venenate quality of the wounds; nor the combuſtion made by the Gunpowder, but the foulneſs of the Patients bodies, and the unſeaſonableneſs of the air.

A Hiſtory.

Wounds made by Gunſhot muſt be dreſſed with ſuppuratives.

The cauſes of difficulty in this cure.

For proof whereof, I will ſet down, that which I, not long agone, obſerved in a *Scotiſh* Nobleman the Earl of *Gordon*, Lord of *Achindon*, whom I cured at the appointment of the Queen-Mother. He was ſhot through both his thighs with a Piſtol, the bone being not hurt nor touched; and yet the two and thirtieth day after the wound he was perfectly healed, ſo that he had neither Feaver nor any other ſymptom which came upon the wound. Whereof there are worthy witneſſes, the Archbiſhop of *Glaſco*, the *Scotiſh* Ambaſſador, *Francis Brigart*, and *John Altine*, Doctors of Phyſick, as alſo *James Guillemeau*, the Kings Chirurgeon, and *Giles Buzet* a *Scotiſh* Chirurgeon, who all of them wondred that this Gentleman was ſo ſoon healed, no acrid medicine being applied. This I have thought good to recite and ſet down, that the Readers may underſtand, that I for thirty years ago had found the way to cure wounds made by Gunſhot, without ſcalding Oyl, or any other, more acrid medicine; unleſs by accident the illneſs of the Patients bodies, and of the air, cauſed any malign ſymptoms, which might require ſuch remedies beſides the regular and ordinary way of curing, which ſhall be more amply treated of in the following Diſcourſe.

A Hiſtory.

What makes Chirurgeons ſometimes uſe cauſticks in curing wounds made by Gunſhot.

Another Diſcourſe of theſe things, which King Charles *the Ninth, returning from the Expedition and Taking of* Rouen, *inquired of me concerning Wounds made by Gunſhot.*

FOr that it pleaſed your Majeſty one day, together with the Queen-Mother, the Prince of the *Rock upon Yon*, and many other Noblemen and Gentlemen, to inquire of me, What was the cauſe that the far greater part of the Gentlemen and common Souldiers which were wounded with Guns, and other warlike Engines, all remedies uſed in vain, either died, or ſcarce, and that with much difficulty recovered of their hurts, though in appearance they were not very great, and though the Chirurgeons diligently performed all things requiſite in their Art: I have made bold to premiſe this Diſcourſe to that Tractate which I determine to publiſh concerning wounds

The occaſion of writing this Diſcourſe.

Wounds made by Gunſhot; both to ſatisfie the deſires of the Princes and of many Gentlemen, as alſo the expectation they have of me, as being the Kings chief Chirurgeon (which place being given me by *Henry* II. *Charles* IX. a Son moſt worthy of ſuch a Father, had confirmed:) Neither make I any queſtion, but that many who too much inſiſt upon their own judgment, and not throughly conſider the things themſelves, will marvel, and think it far from reaſon; that I departing from the ſteps of my Anceſtors, and diſſenting wholly from the formerly received opinions, am far from their Tenents, who lay the cauſe of the malignity of wounds made by Gunſhot, upon the poyſon brought into the body by the Gunpowder, or mixed with the Bullets whilſt they are tempered or caſt. Yet for all this, if they will courteouſly and patiently weigh my Reaſons, they ſhall either think as I do, or at leaſt ſhall judge this my endeavour and pains, taken for publick good, not to be condemned nor contemned. For I ſhall make it evident by moſt ſtrong reaſons drawn out of the writings of the Ancients both Philoſophers and Phyſicians, and alſo by certain experiments of my own, and other Chirurgeons, that the malignity and contumacy which we frequently meet withal in curing wounds made by Gunſhot, is not to be attributed either to the poyſon carried into the body by the Gunpowder or Bullet, nor to burning imprinted in the wounded part by Gunpowder. Wherefore to come to our purpoſe, that opinion muſt firſt be confuted, which accuſeth wounds made by Gunſhot of poyſon, and we muſt teach, that there is neither any venenate ſubſtance, nor quality in Gunpowder: Neither, if there ſhould be any, could it empoyſon the bodies of ſuch as are wounded. Which that we may the more eaſily perform, we muſt examine the compoſition of ſuch powder, and make a particular inquiry of each of the ſimples, whereof this compoſition conſiſts, what eſſence they have, what ſtrength and faculties, and laſtly, what effects they may produce. For thus by knowing the ſimples, the whole nature of the compoſition conſiſting of them will be apparently manifeſt.

The argument of this Diſcourſe.

Gunpowder is not poyſonous.

The Simples which enter the compoſition of Gunpowder are only three, Charcoals of Sallow or Willow, or of Hemp-ſtalks, Brimſtone, and Salt-peter, and ſometimes a little *Aqua vitæ*. You ſhall find each of theſe, if conſidered in particular, void of all poyſon and venenate quality. For firſt in the Charcoal you ſhall obſerve nothing but drineſs, and a certain ſubtlety of ſubſtance, by means whereof it fires ſo ſuddenly, even as Tinder. Sulphur or Brimſtone is hot and dry, but not in the higheſt degree; it is often an oily and viſcid ſubſtance, yet ſo that it doth not ſo ſpeedily catch fire as the coal, though it retain it longer being once kindled, neither may it be ſo ſpeedily extinguiſhed. Salt-peter is ſuch, that many uſe it for Salt, whereby it is evidently apparent, that the nature of ſuch Simples is abſolutely free from all poyſon, but chiefly the Brimſtone (which notwithſtanding is more ſuſpected than the reſt.) For *Dioſcorides* gives Brimſtone to be drunk, or ſupped out of a rear Egg, to ſuch are Aſthmatick, troubled with the cough, ſpit up purulent matter, and are troubled with the yellow Jaundiſe. But *Galen* applies it outwardly to ſuch as are bitten by venemous Beaſts, to Scabs, Tetters and Leproſies. For the *Aqua vitæ*, it is of ſo tenuious a ſubſtance, that it preſently vaniſheth into the air, and alſo very many drink it, and it is without any harm uſed in trictions of the exterior parts of the body. Whence you may gather, that this powder is free from all manner of poyſon, ſeeing thoſe things whereof it conſiſts and is compoſed, want all ſuſpicion thereof. Therefore the German Horſe-men, when they are wounded with ſhot, fear not to drink off cheerfully half an ounce of Gunpowder diſſolved in Wine; hence perſwading themſelves freed from ſuch malign ſymptoms as uſually happen upon ſuch wounds; wherein whether they do right or wrong, I do not here determine. The ſame thing many French Souldiers forced by no neceſſity, but only to ſhew themſelves more couragious, alſo do without any harm; but divers with good ſucceſs uſe to ſtrew it upon Ulcers, ſo to dry them. Now to come to thoſe, who think that the venenate quality of wounds made by Gunſhot, ſprings not from the powder, but from the bullet wherewith ſome poyſon hath been commixt or joyned, or which hath been tempered or ſteeped in ſome poyſonous liquor: This may ſufficiently ſerve for a reply, that the fire is abundantly powerful to diſſipate all the ſtrength of the poyſon, if any ſhould be poured upon or added to the bullet. This much confirms my opinion which every one knows, the bullets which the Kings Souldiers uſed to ſhoot againſt the Towns-men in the ſiege of *Rouen*, were free from all poyſon; and yet for all that, they of the Town thought they were all poyſoned, when they found the wounds made by them, to be uncurable and deadly. Now on the other ſide, the Towns-men were falſly ſuſpected guilty of the ſame crime by the Kings Army, when as they perceived all the Chirurgeons labour in curing wounds made by the bullets ſhot from *Rouen*, to be fruſtrated by their contumacy and malign nature; each ſide judging of the magnitude and malignity of the cauſe, from the unhappy ſucceſs of the effect in curing. Even as among Phyſicians, according to *Hippocrates*, all diſeaſes are termed peſtilent, which ariſing from whatſoever common cauſe, kill many people; ſo alſo wounds made by Gunſhot, may in ſome reſpect be called peſtilent, for that they are more refractory and difficult to cure than others, and not becauſe they partake of any poyſonous quality, but by default of ſome common cauſe, as the ill complexions of the Patients, the infections of the air, and the corruption of meats and drinks. For by theſe cauſes wounds acquire an evil nature, and become leſs yielding to medicines. Now we have by theſe reaſons convinced of errour that opinion which held wounds made by Gunſhot for poyſonous: Let us now come to overthrow that which is held concerning their combuſtion.

Of what it is made.

Lib. 5. cap. 73. Lib. ſimp. cap. 36.

Bullets cannot be poyſoned.

As *Galen* notes *ad ſent. 20. & 21. ſect. 8. lib. 3. Epid.*

Firſt, it can ſcarce be underſtood how bullets which are commonly made of Lead, can attain to ſuch heat, but that they muſt be melted; and yet they are ſo far from melting, that being ſhot out of a Musket they will pierce through Armour and the whole body beſides, and yet remain whole, or but a little diminiſh'd. Beſides alſo, if you ſhoot them againſt a ſtone wall, you may preſently take them up in your hand without any harm, and alſo without any manifeſt ſenſe of heat; though their heat by the ſtriking upon the ſtone ſhould be rather increaſed, if they had any. Furthermore, a bullet ſhut into a barrel of Gunpowder, would preſently ſet it all on fire, if the bullet ſhould acquire ſuch heat by the ſhooting, but it is not ſo. For if any time the powder be fired

Woundsmade by Gunſhot are not burnt.

by

by ſuch an accident, we muſt not imagine that it is done by the bullet bringing fire with it, but by the ſtriking and colliſion thereof againſt ſome iron or ſtone that oppoſes or meets therewith, whence ſparks of fire proceeding as from a flint, the powder is fired in a moment. The like opinion we have of thatched houſes, for they are not fired by the bullet which is ſhot, but rather by ſome other thing, as linnen rags, brown paper, and the like, which rogues and wicked perſons faſten to their bullets. There is another thing which more confirms me in this opinion, which is, take a bullet of Wax, and keep it from the fire, for otherwiſe it would melt, and ſhoot it againſt an inch board, and it will go through it; whereby you may underſtand that bullets cannot become ſo hot by ſhooting, to burn like a cautery. But the orifices (may ſome ſay) of ſuch wounds are always black. This indeed is true, but it is not from the effect of heat brought thither by the bullet, but the force of the contuſion. Now the contuſion is exceeding great, both becauſe the bullet is round, and enters the body with incredible violence. Of which thoſe that are wounded will give you ſufficient teſtimony, for there is none of them, which thinks not preſently upon the blow, that as it were ſome poſt, or thing of the like weight, falls upon the affected member, whence great pain and ſtupidity poſſeſs the part, whereby the native heat and ſpirits are ſo much diſſipated, that a Gangrene may follow. But for the Eſchar which they affirm is made by the blow, and falls away afterwards, they are much miſtaken. For certain particles of the membranes are fleſh contuſed and torn by the violence of the bullet beguiles them; which preſently putrefying, and ſevered from the ſound parts by the power of nature and the ſeparating heat, which thing uſually happens in all great Contuſions. But for all that theſe ſo many and weighty reaſons may free the powder from all ſuſpicion of poyſon, and the bullet from all thought of burning; yet there are many who inſiſting upon Philoſophical Arguments raiſe new ſtirs. For (ſay they) the diſcharging a piece of Ordnance is abſolutely like Thunder and Lightning, which the rent and torn clouds caſt from the middle region upon the earth; wherefore the iron bullet which is ſhot out of the Canon muſt needs have a venenate and burning faculty. I am not ignorant that Lightning generated of a groſs and viſcous exhalation, breaking the cloud wherewith it is incompaſſed, never falls upon the earth, but brings fire with it, one while more ſubtile, another while more groſs, according to the various condition of the matter whence the exhalation hath ariſen. For *Seneca* writes that there are three ſeveral kinds of Lightning differing in burning, condition and plenty. One of them penetrates, or rather perforates by the tenuity of the matter of the object which it touches. The other with a violent impetuoſity breaks in ſunder, and diſſipates the objects, by reaſon it hath a more denſe, compact and forcible matter, like as Whirlwinds have. The third, for that it conſiſts of a more terreſtrial matter, burns what it touches, leaving behind it the impreſſion of the burning. Alſo I know that Lightning is of a peſtilent and ſtinking nature, occaſioned by the groſsneſs and viſcidity of the matter whereof it is; which matter taking fire, ſends forth ſo loathſom and odious a ſmell, that the very wild Beaſts cannot indure it, but leave their dens, if they chance to be touched with ſuch a Lightning. Beſides alſo we have read in the Northern Hiſtory of *Olaus Magnus*, that in ſome places after a Lightning, you ſhall find a whole Plain ſpread over with Brimſtone, which Brimſtone notwithſtanding is extinguiſhed, unprofitable, and of no efficacy. But grant theſe things to be thus, yet muſt we not therefore conclude, that the bullets of the great Ordnance carry poyſon and fire with them into the wounds. For though there be many things alike in Lightning and diſcharging great Ordnance, yet they have no ſimilitude either in matter or ſubſtance, but only in effects, whereby they ſhake, break in ſunder, and diſperſe the bodies which withſtand them: For Lightning and Thunder do it by means of fire, and oft-times of a ſtone generated in them, which is therefore termed, a Thunderbolt; but Ordnance by the bullet carried by the force of the air, more violently driving and forcing it forwards. Neither if any ſhould by more powerful Arguments force me to yield that the matter of Lightning and ſhooting of Ordnance are alike, yet will I not therefore be forced to confeſs that wounds made by Gunſhot are combuſt. For, according to *Pliny*, there are ſome Lightnings which conſiſting of a moſt dry matter, do ſhatter in ſunder all that withſtand them, but do not burn at all; others which are of ſomewhat a more humid nature, burn no more than the former, but only black ſuch things as they touch; laſtly, otherſome of a more ſubtile and tenuious matter, whoſe nature (as *Seneca* ſaith) we muſt not doubt to be divine, if but for this reaſon, that they will melt gold and ſilver, not harming the purſe; a ſword, not hurting the ſcabbard; the head of a lance, not burning the wood, and ſhed wine, not breaking the veſſel. According to which decree I can grant, that theſe Lightnings which break in ſunder, melt, and diſſipate, and perform other effects ſo full of admiration, are like in ſubſtance to the ſhot of great Ordnance; but not thoſe which carry with them fire and flame.

The reaſon why wounds made by Gunſhot look black.

The reaſons of our adverſaries refelled. *Quæſt. nat. l. 2. cap.* 49.

The ſtinking ſmell of Lightning.

Lib. 2. cap. 49.

The wonderful nature of ſome Lightning.

In proof whereof there comes into my mind a Hiſtory of a certain Souldier, out of whoſe thigh I remember I drew forth a bullet wrapped in the taffety of his breeches, which had not any ſign of tearing or burning. Beſides, I have ſeen many who not wounded, nor ſo much as touched, yet notwithſtanding have with the very report and wind of a Canon bullet, ſliding cloſe by their ears, faln down for dead, ſo that their members becoming livid and black, they have died by a Gangrene enſuing thereupon. Theſe and ſuch effects are like the effects of Lightning which we lately mentioned, and yet they bear no ſign nor mark of poyſon. From whence I dare now boldly conclude, that wounds made by Gunſhot are neither poyſoned, nor burnt. But ſeeing the danger of ſuch wounds in theſe laſt Civil-wars hath been ſo great, univerſal, and deadly to ſo many worthy perſonages and valiant men, what then may have been the cauſe thereof, if it were neither cumbuſtion, nor the venenate quality of the wound? This muſt we therefore now inſiſt upon and ſomewhat hardily explain. Thoſe who have ſpent all their time in the learning and ſearching out the myſteries of natural Philoſophy, would have all men think and believe, that the four Elements have ſuch mutual ſympathy, that they may be changed each into other; ſo that they not only undergo the alterations of the firſt qualities which are heat, coldneſs, drineſs and moiſture, but alſo the mutati-

A Hiſtory.

Why the wounds made by Gunſhot ſome few years agone were ſo deadly.

The cauſe of the tranſmutation of the Elements.

on

on of their proper substances by rarefaction and condensation. For thus the fire is frequently changed into air, the air into water, the water into air, and the water into earth; and on the contrary, the earth into water, the water into air, the air into fire; because these four first bodies have in their common matter enjoyed the contrary and fighting, yet first and principal, qualities of all.

* These Bellows here mentioned by the Author, are Balls made of Brass in form of a Pear, with a very small hole in their lesser ends: when you would fill them with water you must heat them very hot, and so the air which is contained in them will be exceedingly rarified, which by putting them presently into water will be condensate as much, & so will draw in the water to supply the place, *ne detur vacuum*. Then put them into fire, and it again rarifying the water into air will make them yield a strong continued and forcible blast. The cause of the report and blow of a Canon.

Whereof we have an example in the * Ball-bellows brought out of *Germany*, which are made of brass, hollow and round; and have a very small hole in them, whereby the water is put in, and so put to the fire; the water by the action thereof is rarified into air, and so they send forth wind with a great noise, and blow strongly assoon as they grow throughly hot. You may try the same with Chesnuts; which, cast whole and undivided into the fire, presently fly asunder with a great crack; because the watry and innate humidity turned into wind by the force of the fire, forcibly breaks his passage forth. For the air or wind raised from the water by rarefaction, requires a large place, neither can it now be contained in the narrow films, or skins of the Chesnut, wherein it was formerly kept. Just after the same manner Gunpowder being fired, turns into a far greater proportion of air according to the truth of that Philosophical Proposition, which saith, Of one part of earth, there are made ten of water; of one of water, ten of air; and of one of air, are made ten of fire. Now this fire, not possible to be pent in the narrow space of the Piece, wherein the powder was formerly contained, endeavours to force its passage with violence, and so casts forth the bullet lying in the way, yet so that it presently vanishes into air, and doth not accompany the bullet to the mark, or object, which it batters, spoils and breaks asunder. Yet the bullet may drive the obvious air with such violence, that men are often sooner touched therewith than with the bullet, and die by having their bones shattered and broken without any hurt on the flesh which covers them; which, as we formerly noted, it hath common with Lightning. We find the like in Mines, when the powder is once fired, it removes and shakes even Mountains of earth.

A History.

In the year of our Lord, 1562. a quantity of this powder which was not very great, taking fire by accident in the Arcenal of *Paris*, caused such a tempest that the whole City shook therewith, but it quite overturned divers of the neighbouring houses, and shook off the tiles and broke the windows of those which were further off; and to conclude, like a storm of Lightning, it laid many here and there for dead, some lost their sight, others their hearing, and othersome had their limbs torn asunder, as if they had been rent with wild Horses; and all this was done by the only agitation of the air into which the fired Gunpowder was turned. Just after the same manner as winds pent up in hollow places of the earth which want vents: For in seeking passage forth, they vehemently shake the sides of the earth, and raging with a great noise about the cavities, they make all the surface thereof to tremble; so that, by the various agitation one while up, another down, it overturns or carries it to another place. For thus we have read that *Megara* and *Ægina*, anciently most famous Cities of *Greece*, were swallowed up and quite over-turned by an Earthquake. I omit the great blusterings of the winds striving in the cavities of the earth, which represent to such as hear them at some distance, the fierce assailing of Cities, the bellowing of bullets, the horrid roarings of Lions, neither are they much unlike to the roaring reports of Canons. These things being thus premised, let us come to the thing we have in hand. Amongst things necessary for life, there is none causes greater changes in us than the air; which is continually drawn into the bowels appointed by nature, and whether we sleep, wake, or what else soever we do, we continual draw in and breath it out. Through which occasion, *Hippocrates* calls it Divine, for that breathing through this mundane Orb, it embraces, nourishes, defends and keeps in quiet peace all things contained therein, friendly conspiring with the Stars from whom a Divine vertue is infused therein. For the air diversly changed and affected by the Stars, doth in like manner produce various changes in these lower mundane bodies. And hence it is that Philosophers and Physicians do so seriously wish us to behold and consider the culture and habit of places, and constitution of the air, when they treat of preserving of health, or curing diseases. For in these the great power and dominion of the air is very apparent, as you may gather by the four Seasons of the year; for in Summer the air being hot and dry, heats and dries our bodies; but in Winter it produceth in us the effects of Winters qualities, that is, of cold and moisture; yet by such order and providence of nature, that although according to the varieties of Seasons our bodies may be variously altered, yet shall they receive no detriment thereby, if so be that the Seasons retain their seasonableness: From whence if they happen to digress, they raise and stir up great perturbations both in our bodies and minds; whose malice we can scarce shun, because they encompass us on every hand, and by the Law of Nature enter together with the air into the secret Cabinets of our Bodies both by occult and manifest passages. For who is he, that doth not by experience find both for the commodity and discommodity of his health, the various effects of winds, (wherewith the air is commixt) according as they blow from this or that Region, or quarter of the World. Wherefore seeing that the South-wind is hot and moist; the North-wind cold and dry; the East-wind clear and fresh; the West-wind cloudy, it is no doubt but that the air which we draw in by inspiration carries together therewith into the bowels the qualities of that wind which is then prevalent. Whence we read in *Hippocrates*, that changes of times, whether they happen by different winds, or vicissitude of Seasons, chiefly bring diseases; for northerly winds do condense, and strenghten our bodies, and make them active, well coloured and during, by resuscitating and vigorating the native heat. But southern winds resolve and moisten our bodies, make us heavy-headed, dull the hearing, cause giddiness, and make the eyes and body less agile; as the Inhabitants of *Narbon* find to their great harm, who are otherwise ranked among the most active people of *France*. But if we would make a comparison of the Seasons, and Constitutions of the year

The cause of an Earthquake.

How the air becomes hurtful.

Aphor. 17. *Sect.* 3.

by

by *Hippocrates* Decree, Draughts are more wholeſome and leſs deadly than rains; I judge, for that too much humidity is the mother of putrefaction, as you may learn by thoſe Countries which are blown upon by a wind from Sea. For in theſe fleſh which is kept for food, putrefies in the ſpace of an hour; and ſuch Ulcers as in other places are eaſily and quickly healed, do there by the conflux and collection of matter become inveterate and contumacious. Therefore as when the ſeaſons of the year ſucceſſively fall out agreeable to their nature, and when each ſeaſon is ſeaſonable, then either we are not ſick at all, or aſſuredly with leſs danger. So on the contrary, the perfect conſtitution and health of our bodies becomes worſe and decays, when the ſeaſons of the year are depraved and perverted in time and temper. Now ſeeing that theſe many years, the four ſeaſons of the year have wanted their ſeaſonableneſs, the Summer wanting his uſual heat, and the Winter its cold; and all things by moiſture and the dominion of the ſouthern winds have been humid and languid, I think there is none ſo ignorant in natural Philoſophy and Aſtrology, who will not think but that the cauſes of the malignity aud contumacy of thoſe diſeaſes which have ſo long afflicted all *France*, are to be attributed to the Air and Heavens. For otherwiſe, whence have ſo many peſtilent and contagious diſeaſes tyrannized over ſo many people of every age, ſex and condition? Whence have ſo many Catarrhs, Coughs, and heavineſſes of the head? So many Pleuriſies, Tumors, Small-poxes, Meaſſles and Itches, not admitting of digeſtion and remedies preſcribed by Art? Whence have we had ſo many venemous Creatures, as Toads, Graſhoppers, Caterpillers, Spiders, Waſps, Hornets, Beetles, Snails, Vipers, Snakes, Lizards, Scorpions, and Efts or Neuts, unleſs from exceſſive putrefaction which the humidity of the air, our native heat being liquid and dull, hath cauſed in us, and the whole Kingdom of *France*? Hence alſo proceeds the infirmity of our native heat, and the corruption of the blood and humors whereof we conſiſt, which the rainy Southwind hath cauſed with its ſultry heat. Wherefore in theſe laſt years I have drawn little blood, which hath not preſently ſhewed the corruption of its ſubſtance by the black or greeniſh colour, as I have diligently obſerved in all ſuch as I have bled by the direction of the Phyſicians, either for prevention of future, or cure of preſent diſeaſes. Whence it comes to paſs that the fleſhy ſubſtance of our bodies could not but be faulty both in temper and conſiſtence; ſeeing that the blood whence it is generated had drawn the ſeeds of corruption from the defiled air. Whence it fell out, that the wounds which hapned with loſs of ſubſtance could be ſcarce healed or united, becauſe of the depraved nature of the blood. For, ſo the wounds and ulcers of thoſe which are troubled with the Dropſie, whoſe blood is more cold or wholly wateriſh; ſo of leprous perſons, whoſe blood is corrupt; and laſtly, of all ſuch as have their bodies replete with ill juyce, or elſe are Cachectick, will not eaſily admit of cure. Yea aſſuredly, if but the very part which is hurt ſwerve from its native temper, the wound will not eaſily be cured. Therefore ſeeing all theſe things, both the putrefaction of the air, and depraved humors of the body, and alſo the diſtemper of the affected parts conſpired together to the deſtruction of the wounded; what marvel was it, if in theſe late Civil Wars, the wounds which were for their quantity ſmall, for the condition of the wounded part but little, have cauſed ſo many and grievous accidents, and laſtly death it ſelf? Eſpecially, ſeeing that the air which encompaſſeth us, tainted with putrefaction, corrupts and defiles the wounds by inſpiration and exſpiration, the body and humors being already diſpoſed, or inclined to putrefaction. Now there came ſuch a ſtink, which is a moſt aſſured ſign of putrefaction, from theſe wounds, when they were dreſſed, that ſuch as ſtood by could ſcarce endure it: Neither could this ſtink be attributed to the want of dreſſing, or fault of the Chirurgeon; for the wounds of the Princes and Nobility ſtunk as ill as thoſe of the common Souldiers. And the corruption was ſuch, that if any chanced to be undreſt for one day, which ſometimes hapned amongſt ſuch a multitude of wounded perſons, the next day the wound would be full of Worms. Beſides alſo, which furthermore argues a great putrefaction of humors, many had abſceſſes in parts oppoſite to their wounds, as in their left knee, when as the right ſhoulder was wounded; in the left arm, when as the right leg was hurt. Which I remember befel the King of *Navarre*, the Duke of *Nevers*, the Lord *Rendan*, and divers others. For all men had Nature ſo over-charged with abundance of vicious humors, that if it expelled not part thereof by Impoſthumes to the habit of the body, it certainly otherwiſe diſpoſed of it amongſt the inner parts of the body; for in diſſecting dead bodies, we obſerved that the Spleen, Liver, Lungs, and other Bowels were purulent, and hence it was that the Patients by reaſon of vapours ſent from them to the heart, were troubled with continual Feavers. But the liver and all the veinous parts being polluted, and ſo the generation of the laudable blood hindred, they languiſhed for want of fitting nouriſhment. But when the brain by vapours was drawn in to ſympathize with the reſt, they were moleſted with Ravenings and Convulſions. Wherefore if any thing ſucceeded unproſperouſly in ſo great malignancy of wounds, the Chirurgeon was not to be blamed, for that it were a crime to fight againſt God and the Air, wherein the hidden ſcourges of the divine Juſtice lye hid. Therefore if according to the mind of great *Hippocrates*, who commands to bring all contuſed wounds to ſuppuration, that ſo they may be healed, we endeavoured to cure with ſuch medicines wounds made with Gunſhot, and therefore contuſed; who can rightly be angry with us, if we performed it not ſo well, by reaſon of thoſe Putrefactions, Gangrenes and Mortifications which proceeded from the corrupt Air: For all that, we uſed not only ſuppuratives, but were oft-times forced to uſe other medicines; ſo long turning aſide from the cure of the diſeaſe, until we had orecome the ſymptoms which much indanger the Patient, and cuſtomarily happen upon ſuch wounds, as alſo upon thoſe which are made with a Sword, or any other kind of Weapon; as ſhall plainly appear in the following Treatiſe, to which it now ſeems high time that we betake our ſelves.

Fleſh quickly putrefies in maritime places.

In what bodies Ulcers and wounds are not eaſily cured.

An argument of great putrefaction of the humors.

All contuſed wounds muſt be brought to ſuppuration.

CHAP. I.

A diviſion of Wounds drawn from the variety of the wounded parts, and the Bullets which wound.

A diviſion of wounds from the variety of the wounded parts.

ALL wounds which are made in mans body by Gunſhot, whether ſimple or compound, are accompanied with contuſion, dilaceration, diſtemper and ſwelling. I ſay, all theſe poſſeſs either the noble parts, or ignoble, the fleſhy, nervous, or bony; ſome whiles with rending and tearing aſunder the larger veſſels, ſometimes without harming them. Now theſe wounds are only ſuperficiary, or elſe pierce deep and paſs quite through the Body. But there is alſo another diviſion of theſe wounds taken from the variety of the bullets wherewith they are made. For ſome bullets are bigger, ſome leſs, ſome between both; they are uſually made of Lead, yet ſometimes of Steel, Iron, Braſs, Tin, ſcarce any of Silver, much leſs of Gold. There ariſes no difference from their figure; for almoſt all kinds of wounds of this nature are round. From theſe differences, the Chirurgeon muſt take his Indications what to do, and what medicines to apply. The firſt care muſt be, that he think not theſe horrid and malign ſymptoms, which uſually happen upon theſe kinds of wounds, to ariſe from combuſtion, or poyſon carried with the bullet into the wounded part, and that for thoſe reaſons we have formerly handled at large. But rather let him judge they proceed from the vehemency of the contuſion, dilaceration and fracture, cauſed by the bullets, too violent entry into the nervous and bony bodies. For, if at any time the bullet ſhall only light upon the fleſhy parts, the wounds will be as eaſily cured, as any other wound uſually is, which is made with a contuſing and round kind of weapon, as I have often found by frequent experience, whilſt I have followed the Wars, and performed the part of a Chirurgeon to many Noblemen and common Souldiers, according to the counſel of ſuch Phyſicians as were there overſeers of the cure.

From the difference of bullets.

Wounds made by Gunſhot are uſually round.

CHAP. II.

Of the ſigns of Wounds made by Gunſhot.

Signs of wounds from their figure.

From their colour.

From the feeling of the blow.

From the bleeding.

From the heat of the wound.

Whence theſe wounds are ſo much contuſed.

WOunds made by Gunſhot are known by their figure, which is uſually round; by their colour, as when the native colour of the part decays, and inſtead thereof a livid, greeniſh, violet, or other colour ſucceeds; by the feeling or ſenſe of the ſtroke, when in the very inſtant of the receiving thereof, he feels a heavy ſenſe, as if ſome great ſtone, or piece of timber, or ſome ſuch other weighty thing had faln upon it; by the ſmall quantity of blood which iſſues out thereat, for when the parts are contuſed, within ſome ſmall while after the ſtroke they ſwell up, ſo that they will ſcarce admit a Tent, whence it is that the blood is ſtopped, which otherwiſe would flow forth of the orifice of the wound; by heat, which happens either by the violentneſs of the motion, or the vehement impulſion of the air, or the attrition of the contuſed parts, as the fleſh and nerves. Alſo you may conjecture that the wounds have been made by Gunſhot, if the bones ſhall be broken, and the ſplinters thereof by pricking the neighbouring bodies cauſe defluxion and inflammation. But the cauſe that the bullet makes ſo great a contuſion is, for that it enters the body without any points or corners, but with its round and ſpherical body, which cannot penetrate but with mighty force; whence it cometh to paſs that the wound looks black, and the adjacent parts livid: Hence alſo proceed ſo many grievous ſymptoms, as Pain, Defluxion, Inflammation, Apoſtumation, Convulſion Phrenſie, Palſie, Gangrene, and Mortification, whence laſtly Death enſues. Now the wounds do often caſt forth virulent and very much ſtinking filth, by reaſon of the great contuſion, and the rending and tearing of the neigbouring particles. A great abundance of humors flow from the whole body, and fall down upon the affected parts, which the native heat thereof being diminiſhed, forſakes, and preſently an unnatural heat ſeiſes upon it. Hitherto alſo tend an univerſal or particular repletion of ill humors, chiefly if the wounds poſſeſs the nervous parts, as the joynts. Verily neither a Stag with his horn, nor a flint out of a ſling can give ſo great a blow, or make ſo large a wound, as a leaden or iron bullet ſhot out of a Gun; as that which going with mighty violence, pierces the body like a Thunderbolt.

CHAP. III.

How theſe Wounds muſt be ordered, at the firſt dreſſing.

Strange bodies muſt firſt be pulled forth.

THe wound muſt forthwith be inlarged, unleſs the condition of the part reſiſt, that ſo there may be free paſſage forth, both for the *Sanies* or matter, alſo for ſuch things as are farced, or otherwiſe, contained therein; ſuch as are pieces of their Cloaths, Bombaſt, Linnen, Paper, pieces of Mail or Armour, Bullets, Hail-ſhot, ſplinters of Bones, bruiſed Fleſh, and the like, all which muſt be plucked forth with as much celerity and gentleneſs as may be. For preſently after the receiving of the wound the pain and inflammation are not ſo great, as they will be within a ſhort time after. This is the principal thing in performance of this work, that you place the Patient juſt in ſuch a poſture as he was in, at the receiving of the wound; for otherwiſe the various motion and turning of the muſcles will either hinder or ſtraiten the paſſage forth of the contained bodies. You ſhall, if it be poſſible, ſearch for theſe bodies with your finger, that ſo you may the more certainly and exactly perceive them. Yet if the bullet be entred ſomewhat deep in, then you ſhall ſearch for it with a round and blunt probe, leſt you put the Patient to pain; yet oftentimes you ſhall ſcarce by this means find the Bullet. As it happened to the Marſhal of *Briſſac* in the Siege of *Perpignan*, who was wounded in his right ſhoulder with a bullet, which the Chirur-

The manner how to draw them forth.

geons

geons thought to have entered into the capacity of his body. But I, wiſhing the Patient to ſtand juſt in the ſame manner as he did when he received the wound, found at length the place where the Bullet lay, by gently preſſing with my fingers, the parts near the wounds, and the reſt which I ſuſpected; as alſo by the ſwelling, hardneſs, pain and blackneſs of the part, which was the lower part of the ſhoulder near unto the eighth or ninth ſpondil of the back. Wherefore the bullet being taken forth by making inciſion in the place, the wound was quickly healed, and the Gentleman recovered. You ſhall obſerve this, and rather believe the judgment of your fingers, than of your Probe.

CHAP. IV.

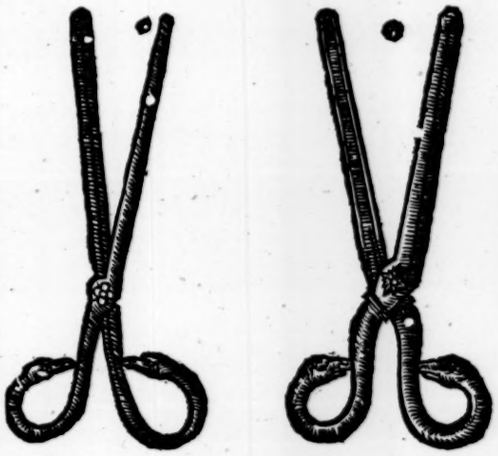
A Deſcription of fit Inſtruments to draw forth Bullets and other ſtrange Bodies.

BOth the magnitude and figure of Inſtruments fit for drawing forth of bullets and other ſtrange bodies, are various according to the diverſity of the incident occaſions. For ſome are toothed, others ſmooth, others of another figure and bigneſs; of all which ſorts the Chirurgeon muſt have divers in a readineſs, that he may fit them to the bodies and wounds, and not the wounds and bodies to his Inſtruments.

The Delineation of ſuch like Inſtruments.

The ſtrait Cranes bill being alſo toothed, fit for drawing forth hail-ſtones, pieces of armour, ſplinter of bones and ſuch things as lye deep within.

The Ducks-bill.

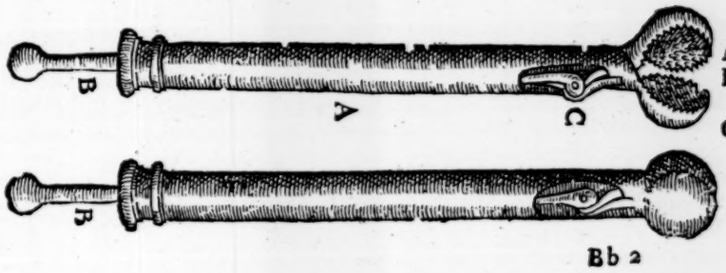


This Ducks-bill hath a large, round and toothed cavity in the end, for ſo it more eaſily taketh hold of the Bullet when it lies amongſt much fleſh.

The crooked Cranes-bill, with teeth like a Saw.

A toothed Crows-bill.

Another Inſtrument fit for drawing forth of Bullets, which may be termed a Catch-bullet.

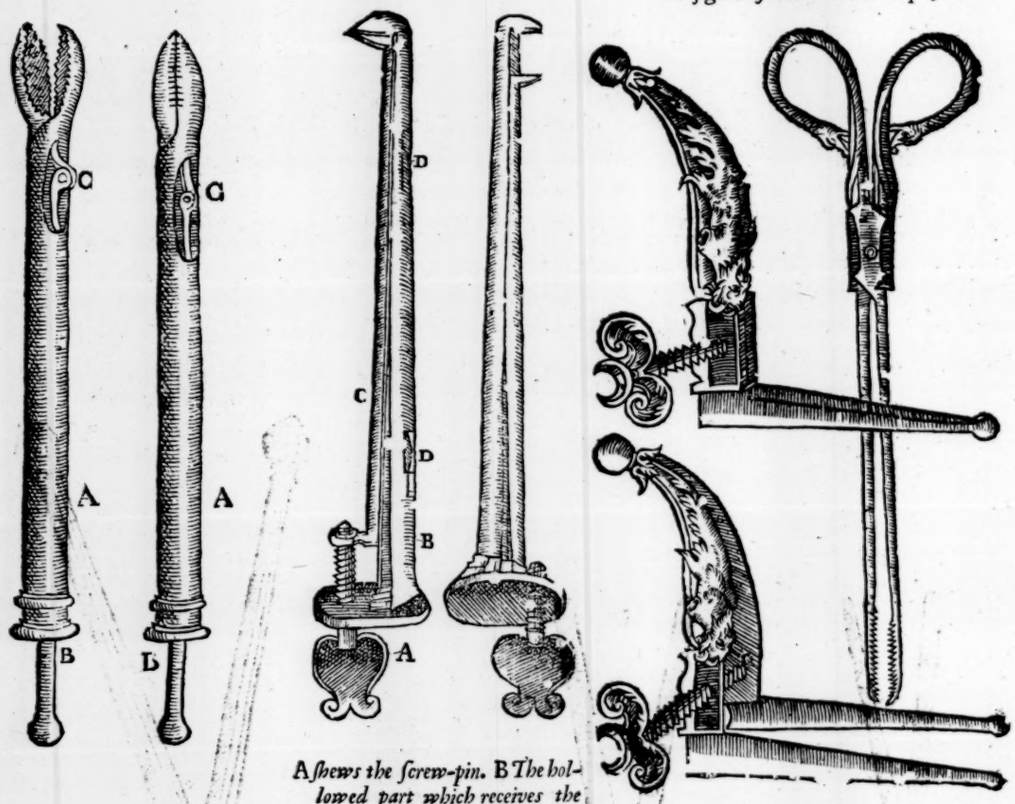


A *Shews the Trunk.*
B *Shews the rod, or ſtring, which opens and ſhuts the joynt.*
C *The joynt.*

Another Catch-bullet called a Lizards-noſe, made for drawing out of Bullets, which are ſomewhat flatted, by ſtriking upon a bone.

The Parrots-beak is made for drawing forth pieces of mail thruſt into the fleſh, or bones; and this is the figure thereof.

The Swans-bill opens with a ſcrew; you may with this dilate the wounds, and ſo put in a ſtrait Cranes-bil, as pincers to pluck forth ſtrange bodies. The figure of both are here expreſt.



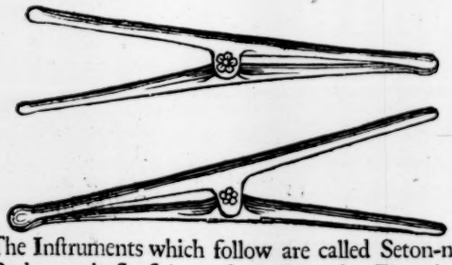
A ſhews the ſcrew-pin. B *The hollowed part which receives the round part noted with* C, *which is opened and ſhut by the ſcrew.* DD *Falls or ſtays, which govern the running branch.*

But if theſe ſtrange bodies, eſpecially Bullets and Hail-ſhot, be not too deep in the wound, they may be taken forth with your Levatory, or elſe by the help of theſe Gimblets. Theſe Gimblets are ſcrewed into their pipes, or canes, and enter with their ſcrewed points into the Bullets, if that they be of Lead or Tin, and of no harder metal; and ſo being faſtned in them, bring them out with them.

The figure of the Gimblet, with his Pipe or Cane.

Beſides the Swans-bill which we lately mentioned, there are alſo other Inſtruments fit to dilate and open the wounds, therefore called Dilaters, by whoſe help the wound may be held open, that ſo the hidden bodies may be ſeen; for when you preſs together the two ends of this Inſtrument, the other two open and dilate themſelves. You may alſo uſe them in dilating divers other parts of the body, as the Noſtrils, Fundament, and ſuch like.

Dilaters.



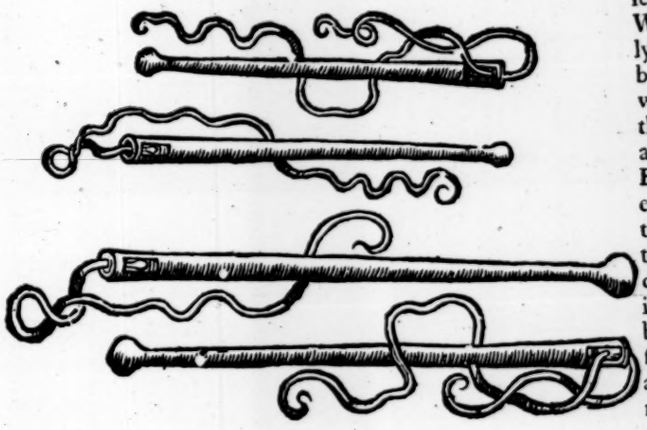
The Inſtruments which follow are called Seton-needles, or Probes; whoſe uſe is, to draw through a Flamula, ſo to keep the wound open, that you may the better take forth any ſtrange body. Beſides alſo we uſe the ſame Needles to ſearch, or as it were to ſound the deepneſs of the wounds,

and

and to find out the bullets. For they cannot put one to much pain becauſe they have ſmooth and round ends. So alſo all Probes wherewith we ſearch for bullets, muſt have ſomewhat large, ſmooth and round ends. For ſeeing that the verges of the Wound meet together preſently after the hurt, if the Probes be too ſmall or ſlender, they will ſtick in the inequality of the fleſh, neither will they be able to come to the Bullet. But if they be ſharp and pointed, they will cauſe and renew the pain by pricking the fleſh they meet withal, and ſo hinder your intention of finding the Bullet: Now you muſt be furniſhed with theſe Inſtruments of a different length, according to the various thickneſs of the parts; for you cannot put any through the thigh but ſuch as are of a good length.

What Probes fit to ſearch theſe wounds.

Probes for to put flamula's through a Wound withal.



CHAP. IX.

What dreſſing muſt firſt be uſed, after the ſtrange bodies are pluck'd or drawn out of the Wound.

WHen the ſtrange bodies are drawn or pluck'd out of the wound, by thoſe means we have formerly recited, the chief of the cure muſt be to heal the contuſion, and amend the diſtemper of the air if it be hot and moiſt, that is, ſubject to putrefaction. This ſhall be done by medicines taken inwardly, applied outwardly, and put into the wound. Things to be inwardly uſed in diet and Pharmacy I leave to the judgment of learned Phyſicians; for the particular and topick medicines, (unleſs from the preſent conſtitution of the air, the condition of the wounded part, or from ſome other cauſe, there being a danger of a Gangrene) you muſt uſe ſuppuratives as you uſually do in contuſions; ſuch as are oyls of Whelps, and that which we call a Digeſtive; you muſt chiefly forbear ſuppuratives, when as the wounded part is of a nervous nature. For all nervous parts require drier medicines then fleſhy, as we have formerly delivered ſpeaking of wounds of the joynts; wherefore in wounds of the joynts and nervous parts you ſhall uſe more Venice Turpentine than oyl. *Laurentius Jolertus* the Kings Phyſician and Chancellor of the Univerſity of *Mompelier*, in a Treatiſe which he writ of wounds made with Gunſhot, forbids the uſe of Eſcharoticks both actual and potential, in theſe wounds, if ſimple; for that they induce pain, inflammation, a feaver, gangrene, and other deadly ſymptoms. Beſides alſo, an Eſchar will hinder ſuppuration, which is to be deſired in this kind of wounds, that ſo the contuſed fleſh may be ſevered from the ſound, leſt it be drawn to putrefaction by contagion. Which eaſily happens when an Eſchar is drawn, as a bar over it, for then the excrementitious humor remains longer in the part, and the putredinous vapours, hindred from paſſing forth, are increaſed, and carried from the leſſer veſſels to the bigger, and ſo over all the Body. Wherefore, when you ſuſpect putrefaction, letting alone ſuppuratives, uſe in the firſt place ſuch things as reſiſt putrefaction, as this following Oyntment. ℞ *Pulver. alumin. rochæ, viridis æris, vitrioli Romani, mellis roſat. an.* ℥ ij. *aceti boni quantum ſufficit, bulliant omnia ſimul ſecundum artem, & fiat medicamentum ad formam mellis.* This by reaſon of the heat and ſubtlety of the ſubſtance, hath a faculty to induce and attenuate the humors, as alſo to call forth the native heat drawn in and diſſipated by the violent and forcible entrance of the bullet into the body; furthermore alſo it corrects the venemous contagion of the virulent humor. Now this medicine ſhall be uſed, diſſolved in Vinegar or *Aqua vitæ*, and be put into the wound with tents or pledgets. The tents which ſhall be uſed at the firſt dreſſing muſt be ſomewhat long and thick, that by dilating the wound, they may make way for application of other remedies; otherwiſe you may make injection with a Syringe, that ſo it may penetrate the more powerfully. But this deſcribed *Ægyptiacum* ſhall be tempered according to the condition of the affected parts, for the nervous parts will be offended with it as being too acrid; but it may be qualified by admixture of oyl of Turpentine and Saint Johns-wort. Alſo we may well be without this *Ægyptiacum* when there is no ſuch peſtilent conſtitution of the air, as was ſeen in the late Civil Wars. After the uſe of *Ægyptiacum* you ſhall with emollient and lenitive medicines procure the falling away of the Eſchar, and ſuch a medicine is this following Oyl, being ſomewhat more than warm. ℞ *Olei violati lib.* iiij. *in quibus coquantur catelli duo nuper nati, uſque ad diſſolutionem oſſium, addendo vermium terreſtrium, ut decet præparatorium,* ℔ i. *Coquantur ſimul lento igne, deinde fiat expreſſo ad uſum, addendo terebinth. venet.* ℥ iij. *Aqua vitæ* ℥ i. This Oyl hath a wonderful force to aſſwage pain, to bring the wound to ſuppuration, and cauſe the falling away of the Eſchar. This enſuing Oyl is made more eaſily. ℞ *Olei ſeminis lini, & lilior. an.* ℥ iij. *Unguent. baſilic.* ℥ i. *Liquefiant ſimul & fiat medicamentum*: Put of this a ſufficient quantity into the wound; for this being applied indifferent hot, hath power to aſſwage pain, to ſoften and humect the orifice of the wound, and help forwards ſuppuration, which is the true manner of curing theſe kinds of wounds, accor-

A caution in the uſe of ſuppuratives.

Why Eſcharoticks muſt be eſchewed in theſe kinds, if they be ſimple.

How an Eſchar may cauſe putrefaction.

The deſcription of an *Ægyptiacum.*

How and when to temper this *Ægyptiacum.*

The oil of Whelps a digeſtive. Anodyne, and fit medicine to procure the falling away of an Eſchar.

ding to the rule of *Hippocrates*, which wiſhes every contuſed wound to be preſently brought to ſuppuration, for ſo it will be leſs ſubject to a Phlegmon; and beſides, all the rent and bruiſed fleſh muſt putrefie, diſſolve and turn to quitture, that new and good fleſh may be generated inſtead thereof. *Laurentius Iaubertus* much commends this following medicine, of whoſe efficacy, as yet I have made no trial. ℞ *Pulver. mercur. bis calcinati,* ℥ i. *Adipis porci recentis, vel butyri recentis,* ℥ viij. *Camphoræ in aqua vitæ diſſolutæ,* ʒ ij. *Miſce omnia ſimul, addendo tantillum olei liliorum, aut lini.* Experience taught him, and Reaſon alſo ſhews, that this kind of remedy is very commendable; for the powder of Mercury, if mixed with a groſs and humecting matter, doth in a ſhort ſpace turn the bruiſed fleſh into *Pus*, without cauſing any great pain. For the Camphire, whether it be hot or cold, in temper, it much conduces to that purpoſe, by reaſon of the ſubtlety of the parts whereof it conſiſts. For by means of this quality the medicines enter with more facility into the affected bodies, and perform their parts; beſides alſo, Camphire reſiſts Putrefaction. Some drop into the wound *Aqua vitæ*, wherein they have diſſolved ſome calcined vitriol. Which kind of remedy is not ſuppurative, but yet much reſiſts putrefaction, ſo that we may uſe it with good ſucceſs, when the weather is hot, moiſt and foggy. But when the wound is made very near at hand, it cannot but be burnt by the flame of the powder; in which, remedies uſed for burns, will be uſeful, not omitting ſuch as are fit for contuſions. But for thoſe parts which lye next the wound, you ſhall not, unleſs at the firſt dreſſing, apply refrigerating and aſtringent things, but rather emollient and ſuppurative. For thoſe things which have a refrigerating faculty, weaken the part, and hinder ſuppuration. For aſtringents conſtipate the skin, which is the cauſe, that, the putrid vapours ſhuts up and hindred from tranſpiration and paſſage forth, a Gangrene and Mortification eaſily ſeiſe upon the part. But if the contuſion be great, and diffuſe it ſelf more largely over the fleſh, the part muſt be much ſcarified; that ſo the contuſed and concrete blood, and therefore ſubject to putrefaction, may be evacuated. But for thoſe parts, which ſomewhat farther diſtant from the wound, encompaſs the contuſed fleſh, they require refrigerating and ſtrengthening medicines, ſo to hinder the falling down and ſettling of the humor in that part, which is this enſuing medicine. ℞ *pul. boli armen. ſanguin. Dracon. Myrrhæ, an.* ℥ i. *ſucci ſolan. ſempervivi, portulac. an.* ℥ i ß. *albumin* iiij. *ovorum. oxyrhodin. quantum ſufficit; fiat linimentum, ut decet.* You may uſe this and the like until the ſuſpected ſymptom be paſt fear. Neither muſt you have leſs care, of binding up and rolling the part, than of your medicines; for it doth not a little conduce to the cure, to bind it ſo fitly up as it may be without pain. The wound at the beginning of the cure, muſt be dreſſed but once in four and twenty hours, that is, until the wound be come to ſuppuration; but when the quitture begins to flow from it, and conſequently the pain and Feaver are increaſed, it ſhall be dreſt twice a day, that is, every twelve hours. And when the quitture flows more abundantly than uſual, ſo that the collection thereof is very troubleſome to the Patient, it will be requiſite to dreſs it every eight hours; that is, thrice a day. Now when as this abundant efflux is ſomewhat ſlaked, and begins to decreaſe, it will ſuffice to dreſs it twice a day. But when the Ulcer is filled with fleſh, and conſequently caſts forth but little matter, it will ſerve to dreſs it once a day, as you did at the firſt.

How oft the wound muſt be dreſt in a day.

CHAP. VI.

How you ſhall order it at the ſecond dreſſing.

AT the ſecond and following dreſſings, unleſs you ſuſpect putrefaction, and a Gangrene, you ſhall only put into the wound ſome of the Oyls formerly deſcribed, adding to them the yolks of ſome eggs and a little Saffron; and uſe this medicine, until the wound come to perfect ſuppuration. Here you muſt note this, that theſe kinds of wounds are longer before they come to ſuppuration, than other wounds made by any other ſort of Weapon; both for that the bullet, as alſo the air which it violently carries before it, by much bruiſing the fleſh, on every ſide, diſſipates the native heat, and exhauſts the ſpirits of the part. Which things hinder digeſtion, and often cauſe the matter to ſtink, as alſo many other pernicious ſymptoms. Yet moſt uſually *Pus* or quitture appears within three or four days, ſooner and later according to the various complexion and temperament of the Patients bodies, and the condition of the ambient air in heat and cold. Then by little and little you muſt come to deterſives, adding to the former medicine ſome Turpentine waſhed in Roſe, Barley, or ſome other ſuch like water, which may waſh away the biting thereof. If the incompaſſing air be very cold, you may, to good purpoſe, add ſome *Aqua vitæ*; for by *Galen*'s preſcript, we muſt not uſe hot medicines in Winter, and leſs hot in Summer. Then in the next place uſe deterſives; as, ℞ *Aquæ decoctionis hordei quantum ſufficit, ſucci plantaginis, apii, agrimon. centaurei minoris, an.* ℥ i. *Bulliant omnia ſimul; in fine decoctionis adde terebinthinæ venetæ* ℥ iij. *Mellis roſat.* ℥ ij. *farin. hordei* ʒ iij. *Croci* ϑ i. Let them all be well mixed together and make a Mundificative of an indifferent conſiſtence. Or, ℞ *Succi clymeni, plantag. abſinth. apii, an.* ℥ ij. *Tereb. venet.* ℥ iiij. *Syrup. abſinth. & mellis roſ. an.* ℥ iij. *Bulliant omnia ſecundum artem poſtea colentur in colatura, adde pulver. aloes, maſtiches, Ireos Florent. far. hord. an* ʒ i. *Fiat Mundificativum ad uſum dictum.* Or, ℞ *Terebinth. venet. lotæ in aq. roſ.* ℥ v. *Olei roſ.* ℥ i. *Mellis roſ.* iij *myrrhæ, aloes, maſtich. ariſtoloch. rotundæ. an.* ʒ i ß. *Far. hord.* ʒ iij. *Miſce.* Make a Mundificative, which you may put into the wound with Tents, but ſuch as are neither too long, nor thick, leſt they hinder the evacuation of the quitture and vapours, whence the wounded part will be troubled with eroſion, pain, defluxion, inflammation, abſceſs, putrefaction; all which ſeverally of themſelves, as alſo by infecting the noble parts, are troubleſome both to the part affected, as alſo to the whole body beſides. Wherefore you ſhall put into the wound no Tents, unleſs ſmall ones, and of an indifferent conſiſtence; leſt (as I ſaid) you hinder the paſſing forth of the matter, or by their hard preſſing of the part, cauſe pain, and ſo draw on malign ſymptoms. But ſeeing Tents are uſed both to keep

Why wounds made by Gunſhot are ſo long before they come to ſuppuration.

Why Turpentine muſt be waſhed. *Gal. l. 3. Meth.*

A detergent medicine.

Why Tents muſt be neither too long nor thick.

keep open a wound so long, until all the strange bodies be taken forth, as also to carry the medicines, wherewithal they are anointed, even to the bottom of the wound: Now if the wound be sinuous and deep, that so the medicine cannot by that means arrive at the bottom and all the parts thereof, you must do your business by injections made of the following decoction. ℞ *aq. hord. lib.* iiij. *agrimon. centaur. minor. pimpinellæ, absinth. plantag. M.* ß. *Rad. aristoloch. rotund.* ʒ ß. *Fiat decoctio ad lib.* j. *in colatura expressa dissolve aloes hepatica* ʒ iiij. *Mellis ros.* ʒ ij. *Bulliant modicum.* Inject some of this decoction three or four times into the wound, as often as you dress the Patient; and if this shall not be sufficient to cleanse the filth, and waste the spongious, putrid and dead flesh, you shall dissolve therein as much *Ægyptiacum* as you shall think fit for the present necessity, but commonly you shall dissolve an ounce of *Ægyptiacum* in a pint of the decoction. Verily *Ægyptiacum* doth powerfully consume the proud flesh which lies in the capacity of the wound; besides also, it only works upon such kind of flesh. For this purpose, I have also made trial of the powder of Mercury and burnt Alum equally mixed together, and found them very powerful, even as sublimate, or Arsenick (but that these cause not such pain in their operation.) I certainly much wonder at the largeness of the Eschar which arises by the aspersion of these powders. Many Practitioners would have a great quantity of the injection to be left in the cavities of sinuous Ulcers, or wounds; which thing I could never allow of. For this contained humor causeth an unnatural tension in these parts, and taints them with superfluous moisture, whereby the regeneration of flesh is hindered; for that every Ulcer as it is an Ulcer, requires to be dryed, in *Hippocrates* opinion. Many also offend in the too frequent use of Tents; for as they change them every hour, they touch the sides of the wound, cause pain, and renew other malign symptoms; wherefore such Ulcers as cast forth more abundance of matter, I could wish rather to be dressed with hollow Tents, like those I formerly described to be put into wounds of the Chest. You shall also press a linnen boulster to the bottom of the wound, that so the parts themselves may be mutually condensed by that pressure and the quitture thrust forth; neither will it be amiss to let this boulster have a large hole fitted to the orifice of the wound and end of the hollow Tent and Pipe, that so you may apply a spunge for to receive the quitture, for so the matter will be more speedily evacuated and spent, especially if it be bound up with an expulsive ligature, beginning at the bottom of the Ulcer, and so wrapping it up to the top. All the the boulsters and rowlers, which shall be applied to these kinds of wounds, shall be dipped in Oxycrate or Red-Wine, so to strengthen the part, and hinder defluxion. But you must have a special care, that you do not bind the wound too hard, from hence will arise pain, hindering the passage forth of the putredinous vapours and excrements, which the contused flesh casts forth; and also fear of an *Atrophia*, or want of nourishment, the alimentary juyces being hindred from coming to the part.

CHAP. VII.

By what means strange Bodies, left in at the first dressing, may be drawn forth.

IT divers times happens, that certain splinters of bones, broken and shattered asunder by the violence of the stroke, cannot be pulled forth at the first dressing, for that they either do not yield or fall away, or else cannot be found by the formerly described Instruments. For which purpose this is an approved medicine to draw forth that which is left behind. ℞ *Radic. Ireos Floren. panac. & capper. an.* ʒ iij. *Aristoloch. rotund. mannæ, thuris, an.* ʒ i. *In pollinem redacta, incorporentur cum melle rosar. & terebinth. venet. an.* ʒ ij. Or ℞ *Resin. pini siccæ* ʒ iij. *Pumicis combusti & extincti in vino albo, radic. Ireos, aristolochiæ, an.* ʒ ß. *Thuris* ʒ i. *Squamæ æris,* ʒ ij. *in pollinem redigantur, incorporentur cum melle rosato, fiat medicamentum.*

Two causes that make strange bodies hard to be taken forth.

CHAP. VIII.

Of Indications to be observed in this kind of Wounds.

THE Ulcer being cleansed and purged, and all strange bodies taken forth; Natures endeavours to regenerate flesh, and cicatrize it, must be helped forwards with convenient remedies, both taken inwardly, and applied outwardly. To which things we may be easily and safely carried by indications drawn, first from the essence of the disease, then from the cause; if as yet present it nourish the disease. For that which *Galen* says, *Lib.* 3. *Meth.* that no Indication may be taken from the primitive cause and time; must be understood of the time past, and the cause which is absent. And then from the principal times of the disease, the beginning, increase, state, and declination; for each of these four require their remedies. Others are taken from the temperament of the Patient, so that no Chirurgeon need doubt, that some medicines are fit for cholerick, others some for phlegmatick bodies. Hither refer the indication taken from the age of the Patient; also it is drawn from his diet, for no man must prescribe any slender diet to one who is always feeding, as to him who is accustomed to eat but once or twice a day. Hence it is that a diet consisting only of Panada's is more fitter for Italians than for French men; for we must give somewhat to custom, which is as it were another nature. Vocations and daily exercises, are referred to diet: For other things befit Husbandmen and Labourers, whose flesh is dense, and skin hardned by much labour, than idle and delicate persons. But of all other, have diligent regard of that indication which is drawn from the strength of the Patient; for we must presently, (all else being neglected) succour the fainting, or decaying strength; wherefore if it be needful to cut off a member that is putrefied, the operation must be deferred if the strength of the Patient be so dejected, that he cannot have it performed without manifest danger of his life. Also indication

The Indication which is drawn from the strength of the Patient is the chiefest of all other.

may

may be drawn from the incompaſſing air, under which alſo is comprehended that, which is taken from the ſeaſon of the year, region, the ſtate of the air and ſoil, and the particular condition of the preſent and lately by-paſt time. Hence it is we read in *Guido*, that wounds of the head are cured with far more difficulty at *Paris*, than at *Avignon*; where, notwithſtanding on the contrary, the wounds of the legs are cured with more trouble, than at *Paris*; the cauſe is, the air is cold and moiſt at *Paris*; which conſtitution ſeeing it is hurtful to the brain and head, it cannot but muſt be offenſive to the wounds of theſe parts. But the heat of the ambient air at *Avignon*, attenuates and diſſolves the humors, and makes them flow from above downwards. But if any object that experience contradicts this opinion of *Guido*, and ſay, that wounds of the head are more frequently deadly in hot Countreys; let him underſtand that this muſt not be attributed to the manifeſt and natural heat of the air, but to a certain malign and venenate humor, or vapour diſperſed through the air, and raiſed out of the Seas; as you may eaſily obſerve in thoſe places of *France* and *Italy* which border upon the *Mediterranean* Sea. An indication may alſo be drawn from the peculiar temper of the wounded parts, for the muſculous parts muſt be dreſſed after one, and the bony parts after another manner. The different ſenſe of the parts, indicates and requires the like variety of remedies; for you ſhall not apply ſo acrid medicines to the nerves and tendons, as to the ligaments which are deſtitute of ſenſe. The like reaſon alſo for the dignity and function of the parts needful for the preſervation of life; for oft-times wounds of the brain, or ſome other of the natural and vital parts, for this very reaſon that they are dehixed in theſe parts, divert the whole manner of the cure, which is uſually and generally performed in wounds. Neither that without good cauſe, for oft-times from the condition of the parts, we may certainly pronounce the whole ſucceſs of the diſeaſe; for wounds which penetrate into the ventricles of the brain, into the heart, the large veſſels, the cheſt, the nervous parts of the midriff, the liver, ventricles, ſmall guts, bladder, if ſomewhat large are deadly; as alſo thoſe which light upon a joynt in a body repleat with ill humors, as we have formerly noted. Neither muſt you neglect that indication which is drawn from the ſituation of the part, and the commerce it hath with the adjacent parts, or from the figure thereof; ſeeing that *Galen* himſelf would not have it neglected. But we muſt conſider in taking theſe forementioned Indications, whether there be a compoſition, or complication of the diſeaſes; for as there is one and that a ſimple indication, of one and that a ſimple diſeaſe, ſo muſt the indication be various of a compound and complicate diſeaſe. But there is obſerved to be a triple compoſition or complication of affects beſides nature: For either a diſeaſe is compounded with a diſeaſe, as a wound, or a phlegmon with a fracture of a bone; or a diſeaſe with a cauſe, as an ulcer with a defluxion; or a diſeaſe with a ſymptom, as wound with pain or bleeding. It ſometimes comes to paſs, that theſe three, the diſeaſe, cauſe and ſymptome, concur in one caſe or affect. In artificially handling of which, we muſt follow *Galen*'s counſel, who wiſhes in complicated and compounded affects, that we reſiſt the more urgent; then let us withſtand the cauſe of the diſeaſe; and laſtly that affect, without which the reſt cannot cannot be cured. Which counſel muſt well be obſerved; for in this compoſure of affects, which diſtracts the Emperick; on the contrary, the rational Phyſician hath a way preſcribed in a few and theſe excellent words, which if he follow in his order of cure, he can ſcarce miſs to heal the Patient. Symptoms truly as they are ſymptoms, yield no indication of curing, neither change the order of the cure; for when the diſeaſe is healed, the ſymptom vaniſhes as that which follows the diſeaſe, as a ſhadow follows the body. But ſymptoms do oftentimes ſo urge and preſs; that perverting the whole order of the cure, we are forced to reſiſt them in the firſt place, as thoſe which would otherwiſe increaſe the diſeaſe. Now all the formerly mentioned indications may be drawn to two heads; the firſt is, to reſtore the parts to its native temper; the other is, that the blood offend not either in quantity or quality; for when thoſe two are preſent, there is nothing which may hinder the repletion or union of wounds nor ulcers.

Why wounds of the head at *Paris*, and of the legs at *Avignon* are hard to be cured.

An indication to be drawn from the quick and dull ſenſe of the wounded part.

Gal.l.7. Meth.

How and when we muſt take indication of curing from a ſymptome.

CHAP. IX.

What remains for the Chirurgeon to do in this kind of Wounds.

THe Chirurgeon muſt firſt of all be skilful, and labour to aſſwage pain, hinder defluxions, preſcribe a diet in thoſe ſix things we call not-natural, forbidding the uſe of hot and acrid things as alſo of Wine; for ſuch attenuate humors, and make them more aptfor defluxion. Therefore at the firſt let his diet be ſlender, that ſo the courſe of the humors may be diverted from the affected part; for the ſtomach being empty, and not well filled, draws from the parts about it, whereby it conſequently follows, that the utmoſt and remoteſt parts are at the length evacuated; which is the cauſe, that ſuch as are wounded, muſt keep ſo ſpare a diet for the next days following. Venery is very pernicious for that it inflames the ſpirits and humors far beyond other motions; whereby it happens that the humors waxing hot, are too plentifully carried to the wounded and over-heated part. The bleeding muſt not be ſtanched preſently upon receiving of the wound, for by the more plentiful efflux thereof, the part is freed from danger of inflammation and fulneſs. Wherefore if the wound bleed not ſufficiently at the firſt, you ſhall the next day open a vein, and take blood according to the ſtrength and plenitude of the Patient: for there uſually flows no great ſtore of blood from wounds of this nature; for that by the greatneſs of the contuſion and vehemency of the moved air, the ſpirits are forced in, as alſo I have obſerved in thoſe who have one of their limbs taken away with a Cannon bullet. For in the time when the wound is received; there flows no great quantity of blood, although there be large veins and arteries torn in ſunder thereby. But on the fourth, fifth, ſixth, or ſome more days after, the blood flows in greater abundance, and with more violence, the native heat and ſpirits returning into the part. The belly muſt be ſo qualified, that he may have at the leaſt one ſtool a day, either by Nature

Why ſuch as are wounded muſt keep a ſlender diet.

Why we muſt open a vein in ſuch as are wounded by Gunſhot.

ture, or Art; and if by Art, then rather with a Clyſter than purging medicines taken by the mouth, for that the agitation of humors, chiefly in the firſt days of the diſeaſe, is to be ſuſpected, leſt we increaſe the defluxion falling down upon the wounded part. Yet *Galen* writes that both the evacuations are here needful, that is, blood-letting and purging; though the Patient be neither plethorick, nor repleat with ill humors. But the care hereof muſt be committed to the judgment of the learned Phyſician; pain, if joyned with inflammation ſhall be mitigated, by anointing the parts near unto the wound with *unguent. nutritum*, compoſed with the juice of Plantain, Houſleek, Nightſhade, and the like. *Unguentum Diacalcitheos* deſcribed by *Galen* diſſolved with vinegar, oyl of Poppies and Roſes, is of no leſs efficacy; nor *unguent. de bolo*, nor divers other things of the ſame faculty, though properly no Anodynes, as thoſe which are not hot and moiſt in the firſt degree, but rather cold, but yet not ſo as to have any narcotick faculty. Now theſe forementioned things aſſwage pain, for that they correct the hot diſtemper, and ſtay the acrid and cholerick defluxions, whoſe violence is more than cold. After the uſe of repercuſſives, it will be good to apply this following Cataplaſm. ℞ *Micæ panis infuſæ in lacte vaccino* ℔ i ß. *Bulliant parum, addendo olei violacei, & roſar. an.* ʒ iij. *Vitell. ovorum nu.* iiij. *pulver. roſar. rub. flor. chamæm. & meliloti, an.* ʒ ii. *Farin. fabar. & hordei, an.* ʒ i. *miſce, fiat cataplaſma ſecundum artem.* Alſo in this caſe you may eaſily make a medicine, of bread-crums boiled in Oxycrate and oyl of Roſes. The cure of Tumors, if any aſſociate the wound, may be found in their proper place. Natures motion, whether to ſuppuration, or any ſuch thing, muſt ſtill be obſerved, and helped by the Phyſician and Chirurgeon, as the miniſters and ſervants thereof.

CHAP. X.

Of Bullets which remain in the body, for a long time after the Wound is healed up.

LEaden Bullets lye in ſome parts of the body ſome whiles ſeven, eight, or more years, ſo that they neither hinder the agglutination of the wound, neither doth any other ſymptom happen thereupon, as I have divers times obſerved; until at length by the ſtrength of Nature forcing them, and their proper weightineſs bearing them downwards, they ſhew themſelves in ſome lower part, by their ſwelling or bunching forth, and ſo muſt be taken forth by the hand of the Chirurgeon. For they ſay Lead hath a certain ſympathy and familiarity with mans body, chiefly the fleſhy parts thereof. Wherefore it neither putrefies it ſelf, nor cauſeth the fleſh to putrefie; beſides it hath an excellent faculty in cicatrizing old ulcers. But bullets of ſtone, iron, and of any other metal, are of another nature, for they cannot remain any long time in the body without hurt; for Iron will grow ruſty, and ſo corrode the neighbouring bodies, and bring other malign ſymptoms. Yet a Leaden bullet cannot remain any long time in nervous or noble parts without danger.

Why Leaden Bullets lye in the body ſo many years without doing any harm.

CHAP. XI.

How to correct the conſtitution of the Air, ſo that the noble parts may be ſtrengthened, and the whole body beſides.

BUt becauſe, as we have formerly told you, there are ſome times wherein even ſmall wounds made by Gunſhot prove deadly, not by their own fault, but the fault of the air; therefore alſo the Chirurgeon muſt have this care, that he correct the air with all diligence, and reduce it to a certain quality and moderation of ſubſtance, and ſtrengthen the noble parts and whole body beſides; which may be performed by the following medicines, which are to be taken inwardly and applied outwardly. In the morning, three hours before meat, let the Patient take ſome certain quantity, as the Phyſician ſhall think fit, of the Electuary *Diarrhodon Abbatis*, or *Aromaticum roſatum, triaſantalon, diamoſchum, lætificans Galeni*, or ſome ſuch other like. And you ſhall apply ſome ſuch Epitheme as is here deſcribed to the Heart and Liver. ℞ *Aquæ roſar.* ʒ iiij, *aquæ bugloſſæ, aceti boni, an.* ʒ ij. *coriandri præparati* ʒ ß. *caryophyll. cortic. citri an.* ʒ i. *Sant. rub.* ʒ ß. *coralli utriuſque* ʒ ß. *Camphoræ* ℈ i. *Croci* ℈ ß. *Pulver. diarrhod. abbat.* ʒ ii. *Theriacæ & Mithridat. an.* ʒ ß. *Pul. flo. chamæm. & melil. an.* ʒ iij. *miſce, fiat epithema.* Let it be applied warm by dipping a Scarlet cloth therein. You ſhall frequently put odoriferous and refrigerating things to the Patients noſe, to ſtrengthen the animal faculty; as, ℞ *Aquæ roſar. & aceti boni an.* ʒ iij. *caryophyllorum, nucis moſchat. cinamomi conquaſſatorum, & Theriacæ Galeni, an.* ʒ i. Let a linnen rag dipped herein, be now and then put to the Patients noſe; for the ſame purpoſe he ſhall carry a Pomander about him, and often ſmell thereto. As, ℞ *Roſ. rub. violar. an.* ʒ iij. *baccarum myrti, juniperi, ſantal. rub. an.* ʒ ij ß. *ſtyracis calamit.* ʒ ij. *aq. roſarum. quantum ſatis eſt: liquefiat ſimul cum ceræ albæ quod ſufficit, fiat ceratum ad comprehendendos ſupra-dictos pulveres cum piſtillo calido, & ducatur in pomum.* Or, ℞ *Rad. Ireos Florent. majoran. calam. aromat. ladani, benzoini, rad. cyperi caryophyl. an.* ʒ ij. *Moſchi. gra.* 4. *fiat pulvis cum gummi tragacanth. quod ſufficit.* Or elſe, ℞ *Ladani puri* ʒ i. *Benzoini* ʒ ß. *ſtyracis calamit.* ʒ vj. *Ireos flor.* ʒ ß. *Caryophyl.* ʒ iij. *majoran. roſ. rub. calami aromat. an.* ʒ ß. *in pollinem redigantur omnia, & bulliant cum aqua roſ. quantum ſufficit; colentur, colata, liquefiant cum juſta ceræ albæ quantitate, ſtyracis liquidæ* ʒ i. *Fiat ad modum cerati, & cum piſtillo fiat pomum, addita moſchi* ʒ i. Alſo you may corroborate the animal faculty by application of frontals, as alſo procure ſleep, and eaſe the pain of the head; as, ℞ *Aq. roſ.* ʒ ii. *olei roſ. & papav. an.* ʒ i ß. *aceti boni,* ʒ i. *trochiſ. de camphora.* ʒ ß *fit frontale.* Linnen rags dipped herein may be applied to the temples of the forehead, and often renewed, otherwiſe by their heat, drineſs, and hardneſs, they will cauſe watching inſtead of ſleep. Neither muſt you in the mean time bind the head too hard, leſt by intercepting and hindring the pulſation of the temporal Artery, you increaſe the pain of the head. You ſhall make a fire in the Patients Chamber of odoriferous woods, as Juniper, Bay-tree, the pruning or cuttings of Vines, Roſemary, and Orris roots. For the

Pomanders.

Frontals to cauſe reſt, and ſtrengthen the animal faculty.

A ſweet water. the ſame purpoſe, you may ſprinkle the floor with ſweet water; if the Patient be able to undergo ſuch coſt. As, ℞ *majoranæ, menthæ, radic. cyperi, calami aromat. ſalviæ, lavendulæ, fœnicul. thymi, ſtœchad. flor. chamæm. melilot. ſatureiæ, baccarum lauri, & juniperi. an. M.* iij. *pulv. caryophyl. nucis Moſcat. an* ʒ i. *aquæ roſar. & vitæ, an. lib.* ij. *vini albi boni & odorifici. lib.* x. *bulliant omnia in balneo Mariæ ad uſumdictum.* You may alſo make perfumes to burn in his chamber: as thus, ℞ *carbonis ſalicis* ℥ viij. *ladani puri* ℥ ij. *thuris maſculi, ligni & baccarum Juniperi, an.* ℥ i. *xyloaloes, benjoini, ſtyracis calamit. an.* ℥ ß. *Nucis moſchatæ, ſantal. citrin. an.* ʒ iij. *caryophyll. ſtyracis liquidæ, an.* ʒ ij. *zedoariæ, calami aromat. an.* ʒ i. *gummi tragacanth. aqua roſar. ſoluti, quod ſit ſatis.* Make hereof perfumes in what faſhion you pleaſe. For the rottenneſs and corruption of bones, we will treat thereof hereafter in due place.

Perfumes to burn.

CHAP. XII.

Certain memorable Hiſtories.

HEre I think good for the benefit of young practitioners, to illuſtrate by examples the formerly preſcribed method of curing Wounds made by Gunſhot. The famous and moſt valiant Count of *Mansfelt*, Governor of the Dutchy of *Luxenbourg*, Knight of the Order of *Burgundy*, coming to the aid of the French King, was at the Battel of *Moncontour*; where in the conflict he received ſo great a wound at the joynt of the left arm with a Piſtol-bullet, that the bones were ſhivered and broken in ſo many pieces, as if they had been laid upon an Anvil and ſtruck with an hammer: Hence proceeded many malign ſymptoms, as cruel and tormenting pain, inflammation, a feaver, an œdematous and flatulent tumor of the whole arm even to the fingers ends, and a certain inclination to a Gangrene: Which to reſiſt, *Nicolas Lambert*, and *Richard Hubert*, the Kings Chirurgeons, had made many and deep ſcarifications. But when I came to viſit and dreſs him, by the Kings appointment, and had obſerved the great ſtench and putrefaction, I wiſhed that they would uſe lotions of *Ægyptiacum* made ſomewhat ſtronger than ordinary, and diſſolved in Vinegar, and *Aqua vitæ*, and do other things more largely ſpoken of in the Chapter of a Gangrene. For the Patient had alſo a *Diarrhœa*, or Flux, whereby he evacuated the purulent and ſtinking filth which flowed from his wound. Which how it might come to paſs we will ſhew at large, when we come to treat of the ſuppreſſion of the Urine. For this ſeemed very abſurd to many, becauſe that if this purulent humor flowed out of the arm into the belly, it muſt needs flow back into the veins, be mixed with the blood, and by its pernicious and contagious paſſage through the heart and liver, cauſe exceeding ill ſymptoms, and laſtly death. Indeed he often ſwounded by the aſcent of the filthy vapours raiſed from the Ulcer to the noble parts; which to reſiſt, I wiſhed him to take a ſpoonful of *Aqua vitæ* with ſome Treacle diſſolved therein. I endeavoured to repreſs the œdematous and flatulent Tumor poſſeſſing all the arm with ſtoups dipped in Oxycrate, to which was put a little Salt and *Aqua vitæ*; theſe ſtoups I ſtayed and held to the part with double cloaths, ſowed as ſtrait as I could. Such a compreſſion held the broken bones in their places, preſſed their *Sanies* from the Ulcers, and forced back the humors flowing to the part into the center of the body. If at any time I omitted this compreſſion, the Tumor was ſo increaſed, that I was in a great deal of fear, leſt the native heat of the part ſhould be ſuffocated. Neither could I otherwiſe bind up the arm by reaſon of the exceſſive pain which moleſted the Patient upon the leaſt ſtirring of the arm. There were alſo many Abſceſſes about his elbow and over all his arm beſides. For the letting forth of whoſe matter I was forced to make new Inciſions; which he endured very ſtoutly. At length I cured him with uſing a vulnerary potion, and by cleanſing the Ulcers, and correcting the putrefaction with *Ægyptiacum* diſſolved in Wine and honey of Roſes, and ſo poured into the Ulcers, and repreſſing the growth of proud fleſh, with the powder of burnt Alum, drying it after the deterſion with liniments. Now this I can truly affirm and profeſs, that, during the time of the cure, I took out above threeſcore ſplinters of bones, and thoſe neceſſarily, amongſt which there was one of the length of ones finger; yet by Gods aſſiſtance at length he became ſound in all things, but that he could not put forth, or draw in his arm.

The malign ſymptoms which uſually happen upon wounds made by Gunſhot.

Matter may flow from the wounded limbs into the belly.

A brief recital of the manner of the cure.

Not long after by the Kings command I went to ſee *Charles Philip* of *Croy*, Lord of *Auret*, the Duke of *Arſchots* Brother, not far from *Mounts* a City of *Henalt*. He kept his bed ſeven months by reaſon of a wound made by a bullet the ſpace of three fingers above his knee. When I came to him, he was afflicted with theſe ſymptoms, intolerable pain, a continual feaver, cold ſweats, watchings, excoriation of the hips by reaſon of his long lying upon them, his appetite dejected with much thirſt. He oft ſunk down as if he had the Falling-ſickneſs, had a deſire to vomit, and a continual trembling or ſhaking, ſo that he could not put one hand to his mouth without the aſſiſtance of the other: He ſwounded frequently by reaſon of the vapours aſcending to the noble parts. For the thigh-bone was broken long-ways, and ſide-ways with many ſplinters of bones, whereof ſome were plucked out; and others remained ſticking faſt in. He beſides alſo had an ulcer in his groin which reached to the midſt of his thigh, and many other ſinuous ulcers about his knee. All the muſcles of his thigh and leg were ſwoln with a flegmatick, cold and flatulent humor, ſo that almoſt all the native heat of thoſe parts ſeemed extinct. All which things being conſidered, I had ſcarce any hope to recover him, ſo that I repented my coming thither. Yet at length putting ſome confidence in his ſtrength, and prime of youth, I began to have better hopes. Therefore with his good liking, firſt of all, I made two Inciſions, ſo to let forth the matter, which lying about the bone did humect the ſubſtance of the muſcles. This had happy ſucceſs, and drew out a great quantity of matter; then I with a Syringe injected much *Ægyptiacum* diſſolved in Wine, and a little *Aqua vitæ* into theſe Inciſions, ſo to reſtrain and amend the putrefaction, repreſs the ſpongy, looſe, and ſoft fleſh, reſolve the œdematous and flatulent Tumor, aſſwage the pain, and ſtir up and ſtrengthen the native heat almoſt oppreſt by the abundance of excrementitious humors,

Horrid ſymptom occaſioned by a wound made by Gunſhot.

Inciſions wherefore made.

mors, ſo that it could ſcarcely aſſimilate any nouriſhment and adjoyn it to the parts. Then I fomented the affected part with Sage, Roſemary, Thyme, Lavender, Chamomile and Melilot-flowers, and Red-roſe leaves boiled in White-white, and Lye made of Oak-aſhes, adding thereto as much Salt and Vinegar as I judged requiſite. This Fomentation did attenuate and draw forth the morbifick humor. Now we uſed them long and often, ſo to waſte the humor more by drying up and breathing through the paſſages of the skin, more thereof than fell into the part. For this ſame purpoſe, we ordained that he ſhould uſe frictions with hot linnen clothes, and that theſe ſhould be made from above downwards, from below upward, and ſo on every ſide, and ſomewhat long withal: For a ſhort friction draws more humor into the part than it can reſolve: I wiſhed that each other day they ſhould lay bricks heated hot in the fire about his leg, thigh, and ſoal of his foot; but they were to be ſomewhat quenched, and ſprinkled with Wine and Vinegar, with a ſmall quantity of *Aqua vitæ*. Much waterish moiſture by this moiſt heat, did ſweat out of theſe parts, the tumor was leſſened, and the native heat by little and little reſtored. Then ſtoups dipped in Lye made of Oak aſhes, wherein Sage, Roſemary, Lavender, Salt and Cloves, were boiled, ſome *Aqua vitæ* added, were applied thereto; but the rowlers were ſo gently and artificially wrapped about, that he did eaſily endure them without any pain, and that with ſuch happy ſucceſs, that if they were omitted but one day, the tumor became very great. But thick linnen boulſters were laid upon the lower cavities of the Ulcer; that ſo the *Sanies*, or filth, might be more eaſily preſſed forth. But I had always a ſpecial care that the orifices of the Ulcers ſhould be kept open with hollow tents or pipes put therein: And ſometimes this following Cataplaſm was applied to reſolve the tumor. ℞ *Far. hord. fabar. & orobi, an.* ℥ vj. *Mellis com. & tereb. an.* ℥ ij. *flo. chamæm. melil. & roſ. rub. an.* ℨ ſ. *Pulv. rad. Ireos, Flor. cyper. Maſt. an.* ʒ iii. *Oxymel. ſemp. quantum ſufficit*; *fiat cataplaſma ad formam pultis ſatis liquidæ.* An *emplaſtrum de Vigo* without Mercury was applied thereto, whereby the pain was much aſſwaged, and the tumor leſſened: Yet were they not applied before the parts were throughly heated by the Fomentation, Frictions and Evaporations; for otherways this Emplaiſter could never have been activated, by reaſon of the exceſſive coldneſs of the affected parts. Neither did we omit catagmatick powders, fit for the taking, and drawing forth of broken bones. He uſed a vulnerary potion for fifteen days. Alſo beſides the particular frictions of the affected parts, I appointed other general frictions of the whole body, which was become very lean; for by theſe, blood together with the ſpirit was drawn to the parts, and the acrid, and fuliginous vapours were breathed forth. To conclude, his Feaver and pains being aſſwaged, his appetite reſtored, by feeding plentifully upon good meats according to his ſtrength, he in a ſhort time became more luſty; and laſtly, by the ſingular mercy of God, recovered his health perfectly, but that he could not very well bend his knee. I thought good to recite theſe things, not to glory or brag of the happy ſucceſs of thoſe Patients, which have recovered by means, and the favour of God; but that thus I may more fully and perfectly, by familiar examples, inſtruct young practicioners, in the operations of Chirurgery.

Wherefore I uſed Fomentations.

Mixed or round frictions, as they term them.

A medicated Lye.

A diſcuſſing Cataplaſm.

CHAP. XIII.

An Apology concerning Wounds made by Gunſhot.

THere lately came to my hands a Book written by a certain Phyſician, whereby he endeavours to diſprove and overthrow, that which I have hitherto writ, of the cure of wounds made by Gunſhot. Aſſuredly, if there were no other harm, but the loſs of my credit enſuing thereon, I would willingly hold my peace, and ſtop his mouth by modeſt ſilence. But ſeeing the ſafety of ſo many men lyes upon the judgment of this point, I have thought good to withſtand this errour, leſt it, to the great deſtruction of mankind, ſpread and diffuſe it ſelf any further. The uſe (ſaith he) of ſuppurative medicines, have killed many who have been but lightly wounded with Gunſhot; but acrid medicines, as *Ægyptiacum*, have killed more. Neither is the counſel of *Hippocrates* to be obſerved in curing this ſort of wounds, who bids that every contuſed wound be brought to ſuppuration. For ſeeing this is a new kind of wound, it requires new, and not anciently uſed, medicines. Now the temper of the air, changed from the natural conſtitution, ought not to indicate change of medicines; but much leſs muſt Thunder and Lightning be compared to the ſhooting of great Ordnance. Theſe are the chief heads of this his Book; which, becauſe they diſſent from the truth, and thoſe things I have formerly delivered, I have thought good here to confute. Firſt, ſeeing leaden Bullets which are uſually ſhot out of Guns are round, obtuſe and weighty, they cannot wound the body without contuſion and attrition: Now no contuſion can be cured without ſuppuration, not only according to the opinion of *Hippocrates*, but alſo of *Galen*, and all others, who have written of Phyſick. Neither muſt we invent new remedies, for theſe new kinds of wounds; for the Laws of the ſacred and divine Art of Phyſick, are not obnoxious to change, nor ſubject to the humor of men or times, as the Decrees of Kings and Emperours are. For theſe are ſtabliſhed with immutable neceſſity, which conſtancy neither conſuming time nor age, nor tyranny can pervert. Wherefore neither thoſe who with great praiſe are Phyſicians to Kings and Princes, I mean *Joubert* and *Potallus*, think it lawful for them to depart from the rules of *Hippocrates*. And this they not only do and follow in curing and doing the works of Art, but much and highly commend, confirm, and propound to be diligently obſerved by all in their Books, which they have publiſhed concerning the cure of theſe kinds of wounds. And yet theſe Phyſicians are ſuch, as, daily converſant in Armies and Kings-houſes, have healed and daily cure as many wounded by Gunſhot as this Phyſician our Antagoniſt hath ſeen in all his life. Neither only do theſe whom I have named thus cure theſe wounds, but almoſt all that dreſs ſuch kind of wounds do the like; ſo that, if there be nothing which may hinder, or indicate to the contray, they preſently apply ſuppuratives. And I wonder that he hath not obſerved how his neighbour *Doublet* the

The occaſion of writing this Apology.

The chief heads of our adverſaries Treatiſe.

All wounds made by Gunſhot are contuſed.

A ſuppurative medicine of tried efficacy.

the Emperick, cures deſperate wounds of this nature, with no other than a ſuppurative medicine, compoſed of Lard, the yolk of an Egg, Turpentine, and a little Saffron. In the year, 1538. there was at *Turin* whilſt I was Chirurgeon there to the Marſhal of *Montejan* the Kings Lieutenant General in *Piedmont*, a certain Chirurgeon wondrous famous for curing theſe wounds, and yet he uſed nothing elſe but the Oyl of Whelps, (the Deſcription whereof I at length obtained of him with much intreaty and expence;) and he uſed it not ſcalding hot, as ſome have imagined, but poured it ſcarce warm into their wounds, and ſo did mitigate their pain, and happily bring them to ſuppuration. Which afterwards almoſt all Chirurgeons, after they had got the Deſcription hereof, when I firſt publiſhed this Work, have uſed, and daily do uſe with happy ſucceſs.

The force of *Ægyptiacum* againſt putrefaction.

But in contemning and condemning *Ægyptiacum*, I think he hath no partaker; ſeeing there as yet hath been found no medicine more ſpeedy and powerful to hinder putrefaction, if beginning; or correct it, if preſent. Now theſe wounds often degenerate into virulent, eating, ſpreading and malign Ulcers, which caſt forth a ſtinking and Carion-like filth, whence the part gangrenates, unleſs you withſtand them with *Ægyptiacum*, and other acrid medicines, being greatly approved by the formerly named Phyſicians, and all Chirurgeons. But (ſaith he) this Unguent is poyſonous, and therefore hath been the death of many who have been wounded by Gunſhot. Verily if any diligently enquire into the Compoſition of this Oyntment, and conſider the nature of all and every the ingredients thereof, he ſhall underſtand that this kind of Unguent is far from poyſon; that on the contrary, it directly oppoſes and reſiſts all poyſon and putrefaction which may happen to a fleſhy part, through occaſion of any wound.

The force of the air in breeding and augmenting diſeaſes.

It is moſt falſe and diſſonant from the doctrine of *Hippocrates* to affirm, that the Seaſons of the year ſwerving from the Law of Nature, and the air, (not truly the ſimple and elementary) but that which is defiled and polluted by the various mixture of putrid and peſtilent vapours, (either raiſed from the earth, or ſent from above) make not wounds more malign and hard to cure at ſome times than they are at other ſome. For the air either very hot, or cold, drawn into the body by inſpiration or tranſpiration, generates a condition in us like its qualities. Therefore why may it not, when defiled with the putredinous vapours of bodies lying unburied after great Battels, and Shipwracks of great Armadoes, infect with the like quality our bodies and wounds?

A Hiſtory.

In the year, 1562. when the Civil Wars concerning Religion firſt begun in *France*, at *Pene*, a Caſtle lying upon the River *Lot*, many ſlain bodies were caſt into a Well, ſome hundred cubits deep: ſo ſtinking and peſtilent a vapour aroſe from hence ſome two months after, that many thouſands of people died all over the Province of *Agenois*, as if the Plague had been amongſt them, the pernicious Contagion being ſpread twenty miles in compaſs. Which none ought to think ſtrange, eſpecially ſeeing the putrid exhalations by the force of the winds may be driven and carried into divers and moſt remote Regions, diſperſed like the ſeeds of the Peſtilence; whence proceeds a deadly corruption of the ſpirits, humors and wounds, not to be attributed to the proper malignity or perverſe cure of wounds, but to be the fault of the air. Therefore *Francis Daleſchampe*, in his French Chirurgery, in reckoning up thoſe things which hinder the healing of Ulcers, hath not omitted that common cauſe which proceeds from the air defiled or tainted with the ſeeds of Peſtilence. For he had learn'd from his Maſter *Hippocrates*, that the mutations of times chiefly bring diſeaſes, and he had read in *Guido*, that this was the chief occaſion, that wounds of the head at *Paris*, and of the legs at *Avignion*, were more difficultly healed. Laſtly, even Barbers, and ſuch as have leaſt skill in Chirurgery know, that wounds eaſily turn into a Gangrene in hot and moiſt conſtitutions of the air. Wherefore when the wind is ſoutherly, the Butchers will kill no more fleſh than to ſerve them for one day. I have formerly declared the malignity of the wounds occaſioned by the air in the ſiege of *Rouen*, which ſpared none, no not the Princes of the Blood, who had all things which were requiſite for their health. Which cauſed me, made at length more skilful by experience, to uſe *Unguentum Ægyptiacum*, and medicines of the like faculty, inſtead of Suppuratives, to wounds during all that ſeaſon, that ſo I might withſtand the putrefaction and Gangrene which ſo commonly aſſailed them. But if the various motion of the Stars, can by their reflux ſend a Plague into the air, why then may it not by depravation of their qualities infect, and as by poyſoning corrupt both wounds and wounded bodies obnoxious to their changes, and that of the air? We learn'd long ſince by experience, that all pains, but principally of wounds, grow worſe in a rainy and moiſt ſeaſon, ſpecially becauſe in that ſoutherly conſtitution the air replete with thick and foggy vapours, cauſes the humors to abound in the body, which forthwith eaſily fall upon the affected parts, and cauſe increaſe of pain. But, ſaith our Adverſary, in the Battel at *Dreux*, and at S^t *Denis* which were fought in Winter, there died a great number of men who were wounded by Gunſhot: This I confeſs is true; but this I deny, that it was occaſioned by applying ſuppuratives or corroſives, but rather the vehemency and largeneſs of their wounds, and the ſpoil the bullet made in their members; but above all, by reaſon of the cold. For cold is moſt hurtful to wounds and ulcers, (as *Hippocrates* teſtifies) it hardens the skin, and cauſes a Gangrene. If this my Gentleman had been with me in the ſiege of *Metz*, he might have ſeen the legs of many Souldiers to have rotted, and preſently taken with a Gangrene to have faln away, by the only extremity of cold: If he will not believe me, let him make trial himſelf, and go Winter to the Chappel at Mount *Senis*, oneof the *Alpine* hills, where the bodies of ſuch as were frozen to death in paſſing that way are buried, and he ſhall learn and feel how true I ſpeak. In the mean time I think it fit to confute the laſt point of his Reprehenſion.

Hip. Aph. 1. *ſect.* 3.

In our ſecond Diſcourſe.

The power of the Stars upon the air and our bodies.

Aphor. 40. *ſect.* 5.

The ſimilitude between Thunder and great Ordnance, maintained.

He cavils for that I compared Thunder and Lightning with diſcharging of Pieces of Ordnance. Firſt, he cannot deny, but that they are alike in effects. For it is certain that the flame ariſing from Gunpowder ſet on fire, reſembles Lightning; in this alſo, that you may ſee it before you hear the crack or report. I judge, for that the eye almoſt in a moment perceives its objects; but the ear cannot but in ſome certain ſpace of time, and by diſtinct gradations. But the rumbling noiſe is like

in

in both, and certainly the Report of great Ordnance may be heard ſometimes at forty miles diſtance, whileſt they make any great battery in the beſieging of Cities. Beſides alſo, Iron Bullets catt forth with incredible celerity by the fired Gun-powder, throw down all things with a horrid force, and that more ſpeedily and violently by how much they reſiſt the more powerfully by their hardneſs. They report that Lightning melts the Money not hurting the Purſe; Now many by the onely violence of the air agitated and vehemently moved by ſhooting a piece of Ordnance, as touched with Lightning, have died in a moment; their bones being ſhivered and broken, no ſign of hurt appearing in the skin. The ſmell of Gun-powder when it is fired, is hurtful, fiery and ſulphurous, juſt like that which exhales or comes from bodies killed with Lightning. For men do not onely ſhun the ſmell, but alſo wild Beaſts leave their Dens if touched with Lightnings. Now the cruelty of great Ordnance makes no leſs ſpoil amongſt Buildings, nor ſlaughter amongſt Men and Beaſts, than Lightnings do, as we have formerly ſhewn by examples, not onely horrid to ſee, but even to hear reported, as of Mines, the Arcenal of *Paris*, the City of *Malines*. Theſe may ſeem ſufficient to teach, that Thunder and Lightning have a great ſimilitude with the ſhooting of great Ordnance, which notwithſtanding I would not have alike in all things. For they neither agree in ſubſtance nor matter, but onely in the manner of violent breaking aſunder the objects.

Now let us ſee and examine what manner of cure of Wounds made by Gun-ſhot our Adverſary ſubſtitutes for ours. For he would have ſuppuratives uſed and applied, yet ſuch as ſhould not be hot and moiſt in quality, or of an Emplaſtick conſiſtence, but hot and dry things. For (ſaith he) here is not the ſame reaſon as in Abſceſſes, where the Phyſician intends nothing but ſuppuration. But here becauſe a contuſion is preſent with the wound, this requires to be ripened with ſuppuratives, but the Wound to be dried. *Our Adverſaries method, and manner of cure reproved.*

Now to anſwer this objection, I will refer him to *Galen*, who will teach him the nature of ſuppuratives; from whom alſo he may learn that great regard is to be had of the Cauſe, and more urgent order in the Cure of Compound Diſeaſes; then would I willingly learn of him, whether he can heal a wound made by Gun-ſhot, not firſt bringing that which is contuſed to perfect maturity. If he affirm he can, I will be judged by whatſoever Practitioners he will, to judge how obſcure theſe things are. Whereby you may the better underſtand there is nothing more commodious than our *Baſilicon* and Oil of Whelps to ripen wounds made by Gun-ſhot, if ſo be that putrefaction, corruption, a Gangrene, or ſome other thing do not hinder. Then would he have *Oxycrate* poured into theſe wounds to ſtay their bleeding, which if it cannot ſo be ſtaid, he would have a Medicin applied conſiſting of the white of an Egg, Bole Armenick, Oil of Roſes and Salt. But I leave it to other mens judgment, whether theſe Medicins have power to ſtay bleeding if put into the wound; certainly they will make it bleed the more. For Vinegar ſeeing it is of a tenuious ſubſtance and biting, it is no doubt but that it will cauſe pain, defluxion and inflammation. To which purpoſe, I remember I put to ſtanch bleeding, for want of another remedy, a Medicin wherein was ſome Vinegar, into a Wound received by a Moor, an attendant of the Earl of *Roiſſy*, hurt with a Lance run through his arm before *Bologne* by an Engliſh Horſeman. But he comes again to me a little after, complaining and crying out that all his arm burnt like fire; wherefore I was glad to dreſs him again, and put another Medicin into his Wound, and laid an aſtringent Medicin upon the Wound, but poured it not therein. And then above all other remedies he extols his Balſam compoſed of Oil of Wax and Myrrh beaten together with the white of an Egg, which he ſaith is equal in operation to the natural Balſam of *Peru*. For he affirms, that this hath a faculty to conſume the excrementitious humidity of Wounds, and ſo ſtrengthens the part that no ſymptom afterwards troubles them. Yet he ſaith, this doth not ſo well heal and agglutinate theſe wounds, as it doth others which are cut. Verily it is ridiculous to think that contuſed Wounds can be healed after the ſame manner, as ſimple wounds may, which onely require the uniting of the looſed continuity. *Gal. lib. 9. ſimpl. 10. Method.* *Vinegar put into a wound doth not ſtay but cauſes bleeding. A Hiſtory.* *Balms are fit to heal ſimple but not contuſed Wounds.*

Therefore neither can theſe Balſams be fit remedies to heal Wounds made by Gun-ſhot, ſeeing by reaſon of their drineſs they hinder ſuppuration, which unleſs it be procured, the Patient cannot be healed. Wherefore ſuch things ought not to be put into Wounds of this nature, before they be ripened, waſhed and cleanſed from their filth. Yet can I ſcarce conceive where we ſhall be able to find out ſo many Chymiſts which may furniſh us with theſe things ſufficiently to dreſs ſo many wounded Souldiers as uſually are in an Army, or whence the Souldiers have ſufficient means to bear the charge thereof. Alſo that which he ſaith is abſurd, that the Balſams muſt be put into the Wounds without Tents; and preſently forgetting himſelf, he ſaith it will not be amiſs if there be a little and ſlender Tent put into the Wound, which may onely ſerve to hinder the agglutination thereof. But how can theſe Balſams come to the bottoms of Wounds without Tents, when as it is their chief property to carry Medicins even to the innermoſt parts of the Wounds, and always keep open a free paſſage for the evacuation of the quitture? But it is not worthy, that after he hath rejected *Unguentum Ægyptiacum*, he nevertheleſs bids to apply it, from the beginning until the contuſion come to perfect maturation, diſſolving it it in a decoction of the tops of Wormwood, S. *Johns* Wort, the leſſer Centory and Plantain, and ſo injecting it into the Wound. Beſides alſo a little after he gives another way of uſing it, which is, to boil a quantity of Honey of Roſes in Plantain Water, carefully ſkimming it, until it be boiled to the conſiſtence of Honey, and then to add as much *Ægyptiacum* thereto, and ſo to make an Ointment moſt fit to bring theſe Wounds to ſuppuration. But I leave it for any skilful in Chirurgery to judge, whether ſuch Medicins can be ſuppuratives, or whether they be not rather deterſives. Laſt of all, he writes, that theſe Wounds muſt be dreſt but every fourth day. And if there be a fracture of the bone joined with the Wound, then to move nothing after the firſt dreſſing until the eighth day after; then preſently in another place he ſaith, it will be good and expedient to drop ten or twelve drops of the formerly deſcribed Balſam every day into the Wound. Verily ſuch doctrin which neither agrees with it ſelf, nor the truth, cannot but much puſle a Novice and young practitioner in Chirurgery, who is not yet verſed in the Art, or the operations thereof. *Ægyptiacum howſoever made, is a cleanſer, not a ſuppurative.*

CHAP. XIV.

Another Apology againſt thoſe who have laboured with new Reaſons to prove that Wounds made by Gun-ſhot are poiſoned.

The occaſion of this Apology.

SOme few Moneths ago, I viſited a Patient together with ſome learned Phyſicians and skilful Chirurgeons. Now they, as it oft-times happens, in way of diſcourſe, begun to argue of the condition and quality of Wounds made by Gun-ſhot, and endeavoured to prove that they might be poiſoned, by five reaſons. Not truly through the occaſion of the Gun-powder, for they all confeſſed that it was free from poiſon, whether you have regard to its eſſence, or to its compoſition; but by the Bullet into which the poiſon may be transfuſed and incorporated. The firſt reaſon is, that Lead ſeeing it is of a rare and ſpongious nature, which the eaſineſs of melting and ſoftneſs argues, is very fit to drink and ſoak in what liquors ſoever you pleaſe. But methinks this concluſion is very weak; for in all mixtures made by Art, ſuch as this is whereof we ſpeak, there are two things to be conſidered; that is to ſay, the Matter of the things which enter into the mixture, and the Form. For the Matter, ſuch bodies muſt be either liquid, or ſoft, or friable; and laſtly, ſuch as may be broken and divided into ſmall particles, that ſo they may eaſily in all parts concur and be conjoined and united. But for their Form, there ought to be a certain affinity, conſent, and ſympathy. You may perceive this by Water and Oil; for each of them, though of a liquid ſubſtance, and ſuch may eaſily be mixed with divers other things, yet cannot they be mixed the one with the other, by reaſon of their antipathy of Forms. For thus Gold and Silver are ſo agreeing with Lead, that as oft as they are molten, Lead is mixed with them. But Braſs ſhuns Lead, as much as Gold and Silver fly Tin and white Lead. If therefore Braſs and Lead being melted cannot be mixed together, though contained under the ſame *Genus*, and common nature of Metals; how then can it be commixt with another thing diſtinct in the whole kind, much more in *Species* and Form, to wit, poiſon? Their ſecond reaſon is this; Iron (ſay they) which is more denſe, ſolid, and leſs porous, may receive ſome venenate ſubſtance and quality, as the Arrows of the Ancients which were dipped in poiſon, teſtifie; therefore muſt Lead much more be capable thereof. I anſwer, that the ſurface of Iron may be poiſoned, but not the inner part or ſubſtance by mixture therewith. But here the queſtion is of union, but not of anointing or inunction. The third reaſon is thus framed; though (ſay they) Lead caſts off and purges it ſelf from the droſs and unpure parts, yet that is no argument that it will not commix, or ſoak it ſelf in ſome ſtrange liquor or body; for thus Steel, being the moſt ſolid Iron, receives the temper which hardens it, by the artificial pouring upon it, or quenching it in liquors contrary thereto in their whole kind. I anſwer, that Steel admits into it by that quenching and tempering, none of the juices or liquors wherewith it is watered or quenched. For if that were neceſſary, it might be better and more eaſily performed, when the Metal is firſt caſt, than when it is beaten into Plates or Bars; which anſwer ſhall ſerve to confute their fourth reaſon; wherein they ſay, that Bullets may be made ſo poiſonous by the commixture of the juices of Monks-hood, Oleander, Crow-foot, and other ſuch like things which in their whole ſubſtance are contrary to ours, that the Wound which is made with them cannot but be poiſoned. But I on the contrary affirm, that mixture is onely of thoſe things, which may not onely be put, but alſo ſtick thereto, and be mutually united; but how can Water, or any other liquid juice ſo much as onely ſtick to Lead, as that which is a ſolid and firm body, it is ſo far from being united therewith? You may give more certain judgment hereof by experience, than by reaſon; wherefore let melted Lead be put into the foreſaid juices, or the like, then when the Lead is cold, weigh each of them ſeverally and you ſhall find, that both of them retain the ſame weight they formerly had. Which is a moſt certain argument, that neither the Lead hath mixed or united it ſelf with the juices, nor the juices loſt any part of their ſubſtance. Their fifth reaſon is thus; A Bullet ſhot out of a Gun againſt ſome hard ſtone, grows not ſo hot, but that you may preſently without any harm take it up in your hand. Therefore it is falſe, that the poiſon commixt and united with the Bullet can be diſſipated by the fire and flaſh of Gun-powder. The anſwer to this objection is eaſie. For when we ſay, that although the Bullet may be infected by poiſon perfectly commixt with the Lead, yet all the force of the poiſon would be diſſipated by the fire; we would have you thus to underſtand us, that we do not mean this of that fire which is made by the powder at the diſcharging of the Piece, but of that by force whereof the molten Lead is mixed and conjoined with the venenate juice, ſo to make one of many. For this fire exerciſing its force upon the venenate juices hindered by the intercourſe of no *Medium*, and that for ſome ſpace of time, and not for an inſtant, it may, if not conſume, yet much weaken their ſtrength. If there be any, who will not be ſatisfied by theſe reaſons, let him conſult, and read *Mathiolus*. There are (ſaith he) ſome in theſe later times wholly ignorant of things, who (if we may ſay the truth) have been ſo madly fooliſh, that they ſaid it was fit and requiſite to put Treacle and Mithridate, and ſuch like Antidotes amongſt Gold and Silver that was melted to make Cups, that ſo receiving the faculties of the Antidote they might reſiſt poiſon. But how abſurd and ridiculous their opinion is, let them judge, (for it needs no clearer reproof) who have but a little knowledge in natural things, but chiefly in Metals. Theſe are my Reaſons, theſe the Authorities of men excelling in Learning and Judgment, that confirm me in my ancient and former opinion, that Wounds made by Gun-ſhot do not partake of any venenate quality.

The reaſon of our Adverſary that the Bullets may be poiſoned, ſet down and confuted.

In Præfat. l. 6. Diaſcor.

CHAP.

CHAP. XV.

How Wounds made by Arrows differ from ſuch as are made by Gunſhot.

WOunds made by Arrows and Bolts ſhot out of Croſs-Bows, and ſuch like things, differ chiefly in two things, from thoſe which are made by Gun-ſhot. The firſt is, for that they are oft-times without contuſion, which the other never are. The other is, for that they oft-times are poiſoned. In both theſe reſpects their cure is different from the other. But the cure of theſe Wounds made by Arrows is different in it ſelf, by reaſon of the variety and divers ſorts of Darts or Arrows.

Wounds made with Arrows and ſuch like things, are often without contuſion. But are oft-times poiſoned.

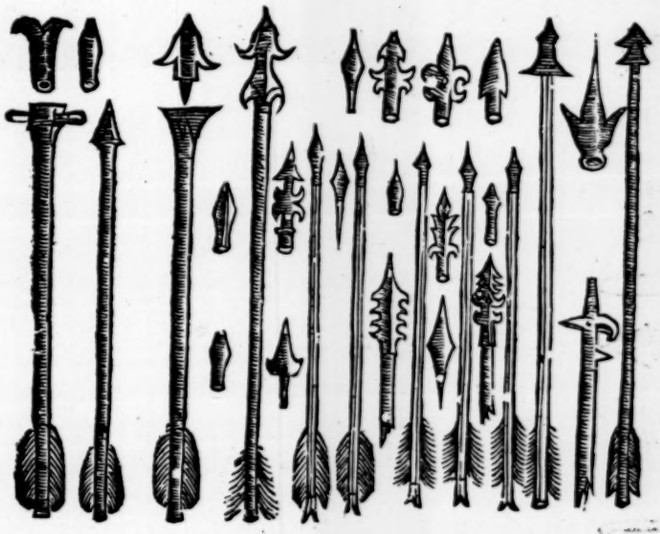
CHAP. XVI.

Of the diverſity of Arrows and Darts.

ARrows and Darts are diffetent amongſt themſelves both in manner, and in form or figure, in number, making, faculty or ſtrength. In matter, for that ſome of them are of Wood, ſome of Reeds, ſome are blunt headed, others have piles or heads of Iron, Braſs, Lead, Tin, Horn, Glaſs, Bone. In figure, for that ſome are round, others cornered, ſome are ſharp-pointed, ſome barbed, with the barbs ſtanding either to the point, or ſhafts, or elſe acroſs, or both ways, but ſome are broad and cut like a Chiſſel. For their bigneſs, ſome are three foot long, ſome leſs. For their number, they differ in that, becauſe ſome have one head, others more. But they vary in making, for that ſome of them have the ſhaft put into the head, others the head into the ſhaft; ſome have their heads nailed to the ſhaft, others not, but have their heads ſo looſly ſet on, that by gentle plucking the ſhaft, they leave their heads behind them, whence dangerous Wounds proceed. But they differ in force, for that ſome hurt by their Iron onely, others beſides that, by poiſon, wherewith they are infected. You may ſee the other various ſhapes repreſented to you in this Figure.

The differences of Arrows. In matter. In ſign. In bigneſs. In number. In making. In force.

The Figure of divers ſorts of Arrows.



CHAP. XVII.

Of the difference of the wounded parts.

THe wounded parts are either fleſhy or bony; ſome are near the joints, others ſeated upon the very joints; ſome are principal, others ſerve them; ſome are external, others internal. Now in wounds where deadly ſigns appear, it is fit you give an abſolute judgment to that effect: leſt you make the Art to be ſcandalized by the ignorant. But it is an inhumane part, and much digreſſing from Art, to leave the Iron in the Wound; it is ſometimes difficult to take it out, yet a charitable and artificial Work. For it is much better to try a doubtful remedy than none at all.

You muſt not leave the weapon in the Wound.

CHAP. XVIII.

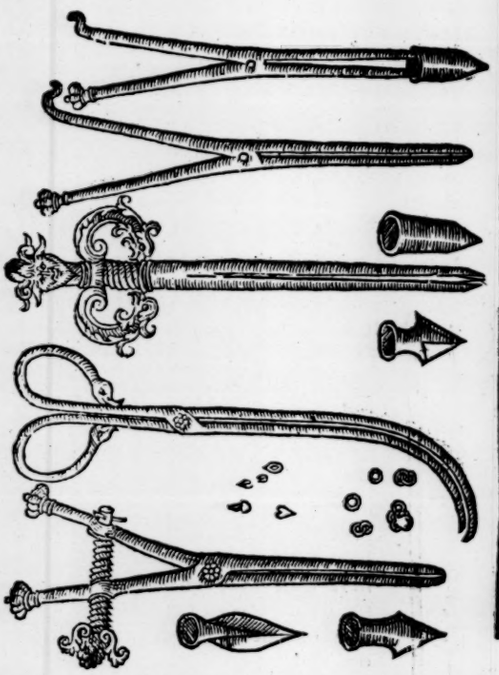
Of drawing forth Arrows.

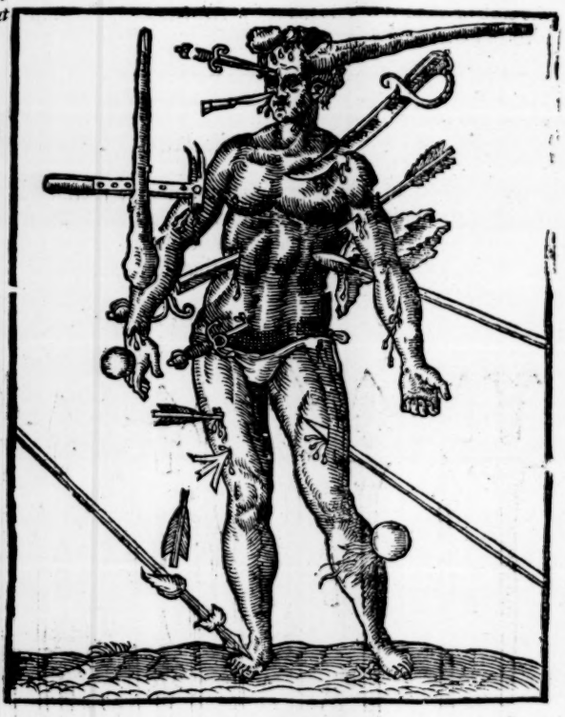
YOu muſt in drawing forth Arrows ſhun Inciſions and Dilacerations of Veins and Arteries, Nerves and Tendons. For it is a ſhameful and bungling part to do more harm with your hand than the Iron hath done. Now Arrows are drawn forth two ways, that is, either by extraction, or impulſion. Now you muſt preſently at the firſt dreſſing pull forth all ſtrange bodies: which that you may more eaſily and happily perform, you ſhall ſet the Patient in the ſame poſture as he ſtood when he received his wound; and he muſt have alſo his Inſtruments in a readineſs, chiefly that which hath a ſlit pipe and toothed without, into which there is put a ſharp iron ſtile, like the Gimblets we formerly mentioned for the taking forth of Bullets; but that it hath no ſcrew at the end, but is larger and thicker, ſo to widen the Pipe, that ſo widened it may fill up the hole of the Arrows head whereinto the ſhaft was put, and ſo bring

The manner of drawing forth Arrows and ſuch weapons.

it forth with it, both out of the fleſhy as alſo out of the bony parts, if ſo be that the end of the ſhaft be not broken, and left in the hole of the head. That alſo is a fit Inſtrument for this purpoſe, which opens the other end toothed on the out-ſide, by preſſing together of the handle. You ſhall find the Iron or head that lies hid by theſe ſigns: there will be a certain roughneſs and inequality on that part, if you feel it up and down with your hand; the fleſh there will be bruiſed, livid, or black; and there is a heavineſs and pain felt by the Patient both there and in the Wound.

A delineation of Inſtruments fit to draw forth the heads of Arrows and Darts which are left in the Wounds without ſhafts.





A hooked Inſtrument fit for to draw forth ſtrange bodies, as pieces of Male, and ſuch other things as it can catch hold of, which may alſo be uſed in Wounds made by Gun-ſhot.

But if by chance either Arrows, Darts or Lances, or any winged head of any other weapon, be run through and left ſticking in any part of the Body, as the Thigh, with a portion of the ſhaft, or ſtaff ſlivered in pieces, or broken off; then it is fit the Chirurgeon with his cutting Mullets ſhould cut off the end of the ſtaff or ſhaft, and then with his other Mullets pluck forth the head, as you may ſee by this Figure.

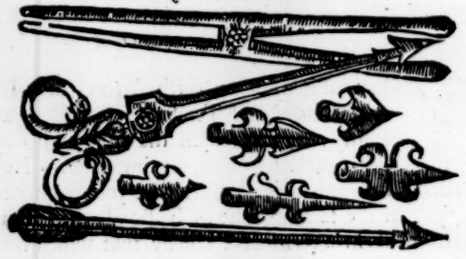
CHAP. XIX.

How Arrows broken in a Wound may be drawn forth.

When to draw forth the weapon on the contrary ſide.

But if it chance that the weapon is ſo broken in the wound that it cannot be taken hold on by the formerly mentioned Mullets, then muſt you draw, or pluck it out with your Crane, or Crows-bill, and other formerly deſcribed Inſtruments. But if the ſhaft be broken near the head, ſo that you cannot take hold thereof with your Cranes-bill, then you ſhall draw it forth with your Gimblet, which we deſcribed before to draw forth Bullets; for if ſuch a Gimblet can be faſtned in Bullets, it may far better take hold of Wood. But if the head be barbed, as uſually the *Engliſh* Arrows are, then if it may be conveniently done, it will be very fitting to thruſt them through the parts. For if they ſhould be drawn out the ſame way they went in, there would be no ſmall danger of breaking or tearing the Veſſels and Nerves by theſe hooked barbs. Wherefore it is better to make a ſection on the other ſide whither the head tended, and ſo give it paſſage forth if it may be eaſily done; for ſo the Wound will be the more eaſily cleanſed and conſolidated.

A Delater hollowed on the inſide with a Cranes-bill to take hold on the barbed head.



When by the ſame way it went in.

But on the contrary, if the point tend to any bone, or have many muſcles or thick fleſh againſt the head thereof, as it happens ſometimes in the Thighs, Legs, and Arms, then you muſt not thruſt the head through, but rather draw it out the ſame way it came in, dilating the Wound with fit Inſtruments, and by skill in Anatomy ſhunning the larger Nerves and Veſſels. Therefore for this

purpoſe

purpoſe put a hollow Dilater into the Wound, and therewith take hold of both the barbs or wings of the head; and then take faſt hold of the head with your Cranes-bill, and ſo draw them forth all three together.

CHAP. XX.

What to be done when an Arrow is left faſtned or ſticking in a Bone.

BUt if the Weapon be ſo depact and faſtned in a Bone that you cannot drive it forth on the other ſide, neither get it forth by any other way than that it entered in by; you muſt firſt gently move it up and down, if it ſtick very faſt in; but have a ſpecial care that you do not break it, and ſo leave ſome fragment thereof in the bone; then take it forth with your Crows-bill, or ſome other fit Inſtrument formerly deſcribed. Then preſs forth the bloud, and ſuffer it to bleed ſomewhat largely, yet according to the ſtrength of the Patient and nature of the wounded part. For thus the part ſhall be eaſed of the fulneſs and illneſs of humours, and leſs moleſted with inflammation, putrefaction, and other ſymptoms which are cuſtomarily feared. When the Weapon is drawn forth, and the wound once dreſſed, handle it, if ſimple, as you do ſimple wounds; if compound, then according to the condition and manner of the complication of the effects; Certainly the Oil of Whelps, formerly deſcribed is very good to aſſwage pain. To conclude, you ſhall cure the reſt of the ſymptoms according to the Method preſcribed in our Treatiſe of Wounds in general, and to that we have formerly delivered concerning Wounds made by Gunſhot.

A Caution.

The benefit of bleeding in Wounds.

CHAP. XXI.

Of poiſoned Wounds.

IF theſe Wounds at any time prove poiſoned, they have it from their primitive cauſe, to wit, the impoiſoned Arrows or Darts of their Enemies. You may find it out both by the property of the pain, if that it be great and pricking, as if continually ſtung with Bees, for ſuch pain uſually enſues in Wounds poiſoned with hot poiſon, as Arrows uſually are: Alſo you ſhall know it by the condition of the wounded fleſh; for it will become pale and grow livid, with ſome ſigns of mortification. To conclude, there happen many and malign ſymptoms upon Wounds which are impoiſoned, being ſuch as happen not in the common nature of uſual Wounds. Therefore preſently after you have pluckt forth the ſtrange bodies, encompaſs the Wound with many and deep ſcarifications, apply ventoſes with much flame, that ſo the poiſon may be more powerfully drawn forth; to which purpoſe the ſucking of the Wound, performed by one whoſe mouth hath no ſoreneſs therein, but is filled with Oil, that ſo the poiſon which he ſucks may not ſtick nor adhere to the part, will much conduce. Laſtly, it muſt be drawn forth by rubefying, veſicatory, and cauſtick Medicins, and aſſailed by Ointments, Cataplaſms, Emplaiſters, and all ſorts of local Medicins.

The ſigns of poiſoned Wounds.

Remedies in poiſoned Wounds.

The End of the Eleventh Book.

BOOK XII.

Of CONTUSIONS and GANGRENES.

CHAP. I.

Of Contuſions.

A Contuſion, according to *Galen*, is a ſolution of continuity in the Fleſh or Bone, cauſed by the ſtroke of ſome heavy and obtuſe thing, or a fall from on high. The ſymptom of this Diſeaſe is by *Hippocrates* called *Peliosis*, and *Melaſma*, that is to ſay, blackneſs and blueneſs; the *Latins* term it *Sugillatum*. There are divers ſorts of theſe Sugillations or blackneſſes, according as the bloud is poured forth into the more inward or outward part of the body. The bloud is poured forth into the body, when any (for example) falls from an high, or hath any heavy weight falls upon him, as it often happens to ſuch as work in Mines, or are extremely wracked or tortured; and ſometimes by too loud and forcible exclamations. Beſides alſo, by a Bullet ſhot through the body, bloud is poured forth into the belly, and ſo often evacuated by the paſſages of the Guts and Bladder. The ſame may happen by the more violent and obtuſe blows of a hard Truncheon, Club, Stone, and all things which may bruiſe and preſs the bloud out of the Veſſels either by extending or breaking them. For which cauſes alſo the exteriour parts are contuſed, or bruiſed ſometimes with a Wound, ſometimes without, ſo that the Skin being whole, and as far as one can diſcern, untoucht, the bloud pours it ſelf forth into the empty ſpaces of the Muſcles, and between the Skin and Muſcles; which affect the Ancients have termed *Ecchymoſis*; *Hippocrates* calls it by a peculiar name *Nauſioſis*, for that in this affect the ſwollen Veins ſeem as it were to vomit, and verily do vomit or caſt forth the ſuperfluous bloud which is contained in them. From theſe differences of Contuſions are drawn the Indications of curing, as ſhall appear by the enſuing diſcourſe.

Gal. lib. de artis conſtitut. Sect. 2. lib. de fracturis.

Cauſes of Bruiſes and Sugillations.

Sect. 2. lib. de fract.

CHAP. II.

Of the general Cure of great and enormous Contuſions.

THe bloud poured forth into the body, muſt be evacuated by viſible and not viſible evacuation. The viſible evacuation may be performed by Bloud-letting, Cupping-glaſſes, Horns, Scarification, Horſleeches, and fit purgative Medicins; if ſo be the Patient have not a ſtrong and continual Fever. The not viſible evacuation is performed by reſolving and ſudorifick potions, baths, and a ſlender diet. Concerning Bloud-letting, *Galens* opinion is plain, where he bids, in a fall from an high place, and generally for bruiſes upon what part ſoever they be, to open a Vein, though the parties affected are not of a full conſtitution; for that, unleſs you draw bloud by opening a Vein, there may inflammations ariſe from the concrete bloud, from whence without doubt evil accidents may enſue. After you have drawn bloud give him four ounces of Oxycrate to drink; for that by the tenuity of its ſubſtance hinders the coagulation of the bloud in the Belly, or in ſtead thereof you may uſe this following Potion. ℞ *Rad. Gentianæ* ℥ iij. *bulliant in Oxycrato; in colatura diſſolve rhei electi* ℥ j. *fiat potio.* Theſe Medicins diſſolve, and caſt forth by ſpitting and vomit the congealed bloud, if any thereof be contained in the Ventricle or Lungs; it will be expedient to wrap the Patient preſently in a Sheeps skin, being hot and newly taken from the Sheep, and ſprinkled over with a little Myrrhe, Creſſes and Salt, and ſo to put him preſently in his Bed, and then cover him ſo that he may ſweat plentifully. The next day take away the Sheeps skin, and anoint the body with the following Anodyne and reſolving Unguent. ℞ *Unguent. de althæa* ℥ vj. *olei Lumbric. chamæm. anethi, an.* ℥ ij. *terebinth. venetæ,* ℥ iv. *farinæ fœnugræ. roſar. rub. pulveriſat. pul. myrtillorum, an.* ℥ j. *fiat litus ut dictum eſt.* Then give this potion which is ſudorifick, and diſſolves the congealed bloud. ℞ *Ligni guajaci,* ℥ viij. *radicis enulæ camp. conſolid. majoris, ireos Florent. polypod. querni, ſeminis coriandri, aniſi, an.* ℥ ß. *glycyrrhiz.* ℥ ij. *nepetæ, centaureæ, caryophyl. cardui benedict. verbenæ, an. m. ſ. aquæ fontanæ lib.* xij. Let them be all beaten and infuſed for the ſpace of twelve hours, then let them boil over a gentle fire until the one half be conſumed; let the Patient drink ſome half a pint of this drink in the morning, and then ſweat ſome hours upon it in his bed, and do this for ſeven or eight days. If any poor man light upon ſuch a miſchance, who for want of means cannot be at ſuch coſt, it will be good, having wrapped him in ſheet, to bury him up to the chin in Dung mixed with ſome hay or ſtraw, and there to keep him, untill he have ſweat ſufficiently. I have done thus to many with very good ſucceſs. You ſhall alſo give the Patient Potions made with ſyrups which have power to hinder the coagulation and putrefaction of the bloud; ſuch as ſyrup of Vinegar, or Lemmons, of the juice of Citrons and ſuch others to the quantity of an ounce diſſolved in Scabious, or *Carduus* Water. You may alſo preſently after the fall give this drink, which hath power to hinder the coagulation of the bloud, and ſtrengthen the bowels. ℞ *Rhei elect. in pul. redacti* ℈ j. *aquæ rubiæ majoris, & plantagin. an.* ℥ j. *theriacæ* ℥ ß. *ſyrupi de roſis ſiccis,* ℥ ß. *fiat potus.* Let him take it in the morning for four or days. In ſtead hereof you may make a potion of one dram of *Sperma ceti* diſſolved in Bugloſs or ſome other of the Waters formerly mentioned and half an ounce of ſyrup of Maiden-hair; if the diſeaſe yield not at all to theſe formerly preſcribed Medicins, it will be good to give the Patient for nine days, three or four hours before meat, ſome of the following Powder. ℞ *Rhei torrefacti, rad. rub. majoris, centaurei, gentianæ, ariſtolo. rotundæ, an.* ℥ ß. give ℥ j. hereof with ſyrup of Vinegar and *Carduus* Water. They ſay that the Water of Green Walnuts diſtilled by an Alembick, is good to diſſolve congealed and knotted bloud. Alſo you may uſe baths made of the decoction of the roots of Orris, Elecampane, Sorrel, Fennel, Marſh-mallows, Water-fern, or *Oſmund* the Water-man, the greater Comfrey, the ſeeds of Fænugreek, the leaves of Sage, Marjerom; the flowers of Camomile, Melilote, and the like. For a Warm Bath hath power to rarifie the skin, to diſſolve the clotted bloud, by cutting the tough, and mitigating the acrid humours, by calling them forth into the ſurface of the body, and relaxing the paſſages thereof; ſo that the rebellious qualities being overcome, there enſues an eaſie evacuation of the matter by Vomit or Expectoration, if it flote in the Stomach, or be contained in the Cheſt; but by Stool and Urin, if it lie in the lower parts; by ſweats and tranſpiration, if it lie next under the Skin. Wherefore Baths are good for thoſe who have a *Peripneumonia* or inflammation of their Lungs, or a Pleuriſie, according to the mind of *Hippocrates*, if ſo be that they be uſed, when the Fever begins to be aſſwaged; for ſo they mitigate pain, help forwards ſuppuration, and haſten the ſpitting up of the purulent matter. But we would not have the Patient enter into the Bath, unleſs he have firſt uſed general remedies, as Bloud-letting and Purging; for otherwiſe there will be no ſmall danger, leſt the humours diffuſed by the heat of the Bath, cauſe a new defluxion into the parts affected: Wherefore do not thou by any means attempt, to uſe this or the like remedy, having not firſt had the advice of a Phyſician.

Ad ſentent. 62. ſect. 3. lib. de Articulis.

A Potion to diſſolve and evacuate clotted bloud.

A hot Sheeps skin.

A diſcuſſing Ointment.

A Sudorifick Potion to diſſolve congealed bloud.

Syrups hindering putrefaction and congealing of bloud.

A drink for the ſame purpoſe.

A Powder for the ſame.

The diſtilled water of green Walnuts.

Baths.

Lib. 3. de Vict. acut. & lib. 3. de morb.

CHAP. III.

How we muſt handle Contuſions when they are joined with a Wound.

EVery great Contuſion forthwith requires Bloud-letting, or purging, or both; and theſe either for Evacuation or Revulſion. For thus *Hippocrates* in a contuſion of the heel, gives a Vomitory Potion, the ſame day, or elſe the next day after the heel is broken. And then if the Contuſion have a Wound aſſociating it, the defluxion muſt be ſtaid at the beginning with an Ointment made of Bole-Armenick, the White of Eggs and Oil of Roſes, and Myrtles, with the Powders of Red Roſes, Alum, and Maſtich. At the ſecond dreſſing apply a digeſtive made of the Yolk of an Egg, Oil of Violets and Turpentine. This following Cataplaſm ſhall be applied to the near parts to help for-

Sect. lib. fract.

forwards ſuppuration. ℞ *Rad. althææ, & lilii, an.* ℥ iv. *ſol. malv. violar. ſenecionis, an. M.* ß. *coquantur complete, & paſſentur per ſetaceum, addendo butyri recentis & olei viol. an.* ℥ iij. *farinæ volatilis quant. ſufficit; fiat cataplaſma ad formam pultis liquidæ.* Yet have a care in uſing of Cataplaſms, that you do not too much exceed, for too frequent and immoderate uſe of them makes wounds phlegmonous, ſordid, and putrid. Wherefore the Wound, after it is come to ſuppuration, muſt be cleanſed, filled with fleſh and cicatrized; unleſs happily the contuſed fleſh ſhall be very much torn, ſo that the native heat forſake it, for then it muſt be cut away. But if there be any hope to agglutinate it, let it be ſewed, and other things performed according to Art; but the ſtitches muſt not be made ſo cloſe together, as when the Wound is ſimple, and without contuſion; for ſuch Wounds are eaſily inflamed and ſwell up, which would occaſion either the breaking of the thred or fleſh, or tearing of the skin.

A ſuppurative Cataplaſm.

A Caution to be obſerved.

How contuſed Wounds muſt be ſewed.

CHAP. IV.

Of thoſe Contuſions which are without a Wound.

IF the Skin being whole and not hurt, as far as can be diſcerned, the fleſh which lies under it be contuſed, and the bloud poured forth under the Skin make an *Ecchymoſis*, then the Patient muſt be governed according to Art, until the malign ſymptoms, which commonly happen, be no more to be feared. Wherefore in the beginning draw bloud on the oppoſite ſide, both for evacuation and revulſion. The contuſed part ſhall be ſcarified with equal ſcarifications; then ſhall you apply Cupping-glaſſes, or Horns, both for evacuation of the bloud, which cauſes the tumour and tenſion in the part; as alſo to ventilate and refrigerate the heat of the part, leſt it turn into an Abſceſs. Neither muſt we, in the mean while omit gentle purging of the Belly. The firſt Topick Medicins ought to be aſtrictives, which muſt lie ſome ſhort while upon the part, that ſo the Veins and Arteries may be, as it were, ſtraitned and cloſed up, and ſo the defluxion hindered, as alſo that the part it ſelf may be ſtrengthened. This may be the form of ſuch a remedy, ℞ *Albumina ovorum nu.* iij. *olei myrtini & roſ. an.* ℥ j. *boli armeni, & ſang. drac. an.* ℥ ß. *nucum cupreſ. gallar. pul. alum. uſti, an.* ʒ ij. *incorporentur omnia addendo aceti parum, fiat medicamentum.* Then you ſhall reſolve it with a fomentation, cataplaſm, and diſcuſſing Emplaiſters.

Phlebotomy. Scarifying Cupping-glaſſes.

Aſtrictives how good in Contuſions.

After aſtrictives muſt follow diſcuſſives.

CHAP. V.

By what means the contuſed part may be freed from the fear and imminent danger of a Gangrene.

GReat Contuſions are dangerous even for this cauſe, for that a Gangrene and mortification ſometimes follow them; which *Hippocrates* teacheth to happen, when as the affected part is grown very hard and liquid. Wherefore when the part grows livid and black, and the native colour thereof, by reaſon of the efflux of the concrete bloud is almoſt extinct; chiefly to eaſe the part of that burden, Cupping-glaſſes and Horns ſhall be applied to the part it ſelf being firſt ſcarified with a Lancet, or elſe the following Inſtrument termed a *Scarificator*, which hath 18 little wheels ſharp and cutting like a Razor, which may be ſtraitned and ſlacked by the pins noted by *D* and *P*. This Inſtrument is to be commended for that it performs the operation quickly and gently, for it makes 18 Inciſions in the ſpace that you make one with a Lancet, or Knife.

Sect. 2. lib. de fract. The cauſe of a Gangrene.

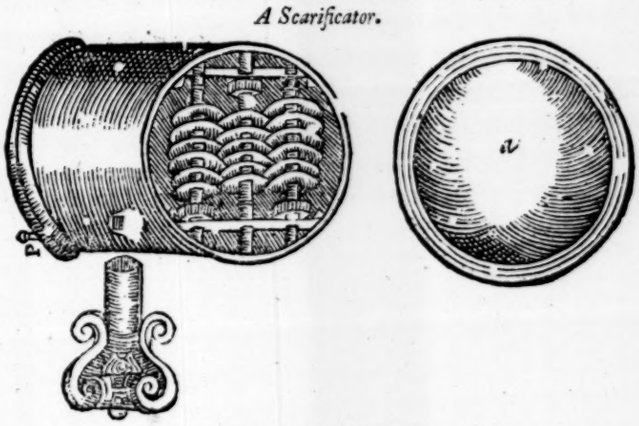
The uſe of a *Scarificator.*

Then ſhall you foment the part with ſtrong Vinegar wherein the Roots of Radiſh, or of Dragons, Cuckow-pint, *Solomons* Seal, *Auripigmentum*, and the like, have been boiled; for ſuch acrid things do powerfully heat, reſolve, and draw the concrete bloud from the inner part of the body unto the Skin, which by its ſetling in the part affected, prohibits the entrance of the vital ſpirits, the preſervers of its integrity, yea alſo extinguiſheth the native heat of the ſame part. Now we muſt not uſe theſe things but with great diſcretion, leſt ſo we draw not onely that bloud which is poured forth of the Veſſels, but alſo the other which is contained in the Veſſels. Moreover alſo we muſt not uſe them, unleſs when the defluxion is ſtaid. For ſmall Contuſions (which *Galen* judgeth by the ſoftneſs of the contuſed part) it will be ſufficient to apply to diſcuſs them, Virgins-wax diſſolved and mixed with Cummin-ſeeds, Cloves, the Root of the black Briony, (which hath a wonderful faculty to diſcuſs all blackneſs and ſugillation:) for the ſame purpoſe, you may alſo apply Wormwood bruiſed, and ſo warmed in a diſh and ſprinkled over with a little white Wine. Alſo fry Wormwood with Oil of Camomil, Bran, the Powder of Cloves and Nutmegs, adding thereto a little *Aqua vitæ*; then put all in a linnen cloth, and apply it hot to the part. The following Emplaiſter doth powerfully diſcuſs congealed bloud.

A fomentation to diſcuſs and draw to the Skin.

Inſect. 2. lib. de fract.

A Scarificator.



A *Shews the Cover.* B *The Box, or Caſe.*

℞ *Picis nigræ* ℥ ij. *Gum. Elemi* ʒ j. ß. *ſtyracis liquidæ & terebinth. com. an.* ℥ ß. *ſulphuris vivi* ʒ j. *Liquefiant ſimul, fiat Empl.* and let it be ſpread upon Leather, and ſo applied.

A diſcuſſing Plaiſter.

CHAP. VI.

Of that ſtrange kind of Symptom which happens upon Contuſions of the Ribs.

Hip. ſect.3. lib. de art. ſent.58. & 65.

THe fleſh contuſed ſometimes by great violence, becomes mucous and ſwoln, or puffed up like Veal which the Butchers blow up, the Skin remaining whole. This is ſeen and happens chiefly in that fleſh which is about the ribs; for this being bruiſed either by a blow or fall, or renitency, or any other ſuch like cauſe; if you preſs it with your hand, a certain windineſs goeth out thereof with a ſmall whizzing, which may be heard, and the print of your fingers will remain, as in *œdemaes*. Unleſs you quickly make fit proviſion againſt this ſymptom, there is gathered in that ſpace, which the fleſh departing from the bones leaves empty, a certain purulent *ſanies*, which divers times fouls and corrupts the ribs. It will be cured, if the mucous tumor be preſently preſſed, and ſtraitly bound with ligatures, yet ſo, that you hinder not the breathing, when as the affect happens upon the Ribs and parts of the Cheſt. Then apply to the part a Plaiſter of *Oxycroceum*, or *Diachylon Ireatum* with the Emplaiſter *de meliloto*; alſo diſcuſſing fomentations ſhall be uſed. The cauſe of ſuch a tumour is a certain mucous flegm, ſeeing that Nature is ſo weak that it cannot well digeſt the nouriſhment, and aſſimilate it to the part, but leaves ſomething, as it were half concocted. No otherwiſe than the conjunctive coat of the eye is ſometime ſo lifted up, and ſwoln by a ſtroak, that it ſtarts, as it were, out of the orb of the eye, leaving ſuch filth, or matter, as we ſee thoſe which are blear-eyed to be troubled withall; becauſe the force and natural ſtrength of the eyes is become more weak, either by the fault of the proper diſtemperature, or the abundance of moiſture which flows thither, as it happens in thoſe tumours which are againſt Nature. For flatulencies are eaſily raiſed from a wateriſh and phlegmatick humour wrought upon by weak heat, which mixed with the reſt of the humour, the tumour becomes higher.

Remedies for a mucous and flatulent humour of the Ribs.

The cauſe.

CHAP. VII.

A Diſcourſe of Mumia, *or Mummy.*

Mummy a frequent and uſual Medicin in Contuſions.

The reaſon that the Author makes no mention there of amongſt his Medicins.

PEradventure it may ſeem ſtrange what may be the cauſe why in this Treatiſe of curing Contuſions or Bruiſes, I have made no mention of giving Mummy either in Bole or Potion to ſuch as have fallen from high places, or have been otherwiſe bruiſed; eſpecially ſeeing it is ſo common and uſual, yea the very firſt and laſt Medicin of almoſt all our practitioners at this day in ſuch a caſe. But ſeeing I underſtood, and had learnt from learned Phyſicians, that in uſing remedies, the Indication muſt always be taken from that which is contrary to the Diſeaſe, How could I? or how can any other give Mummy in this kind of Diſeaſe, ſeeing we cannot as yet know what Mummy is, or what is the nature and eſſence thereof? So that it cannot certainly be judged, whether it have a certain property contrary to the nature and effects of Contuſions. This, how it may have, I have thought good to relate ſomewhat at large; neither do the Phyſicians who preſcribe Mummy, nor the Authors that have written of it, nor the Apothecaries that ſell it, know any certainty thereof. For if you read the more ancient *Serapio* and *Avicen*, or the Modern *Matthiolus* and *Thevet*, you ſhall find quite different opinions. Ask the Merchants who bring it to us, ask the Apothecaries who buy it of them to ſell it to us, and you ſhall hear them ſpeak diverſly hereof, that in ſuch variety of opinions, there is nothing certain and manifeſt. *Serapio* and *Avicen* have judged Mummy to be nothing elſe but *Piſſaſphalthum*; now *Piſſaſphalthum* is a certain froth or foam riſing from the Sea, or Sea-waters; this ſame foam as long as it ſwims upon the Water is ſoft, and in ſome ſort liquid; but being driven upon the ſhore by force of tempeſt and working of the Sea, and ſticking in the cavities of the Rocks, it concretes into ſomewhat a harder ſubſtance than dried Pitch, as *Dioſcorides* ſaith. *Bellonius* ſaith, that Mummy is onely known to *Ægypt* and *Greece*. Others write that it is mans fleſh, taken from the Carcaſes of ſuch as are dead and covered over in the Sands in the Deſarts of *Arabia*; in which Countrey they ſay the Sands are ſometimes carried and raiſed up with ſuch force and violence of the Winds, that they overthrow and ſuffocate ſuch paſſengers as they meet withall; the fleſh of theſe, dried by the Sand and Wind, they affirm to be Mummy. *Matthiolus* following the more uſual and common opinion, writes that Mummy is nothing elſe than a liquor flowing from the Aromatick Embalments of dead Bodies, which becomes dry and hard. For underſtanding whereof you muſt know from all manner of antiquity, that the *Ægyptians* have been moſt ſtudious in burying and embalming their dead; not for that end, that they ſhould become Medicins for ſuch as live, for they did not ſo much as ſuſpect or imagine ſo horrid a wickedneſs; but either for that they held an opinion of the general Reſurrection, or that in theſe Monuments they might have ſomething whereby they might keep their dead friends in perpetual remembrance. *Thevet* not much diſſenting from his own opinion, writes that the true Mummy is taken from the Monuments and ſtony Tombs of the anciently dead in *Egypt*, the chinks of which Tombs were cloſed and cemented with ſuch diligence, the encloſed bodies embalmed with pretious Spices, with ſuch Art, for eternity; that the linnen veſtures which were wrapt about them preſently after their death, may be ſeen whole even to this day; but the bodies themſelves, are ſo freſh, that you would judge them ſcarce to have been three days buried. And yet in thoſe Sepulchres and Vaults from whence theſe Bodies are taken, there have been ſome Corps of two thouſand years old. The ſame, or their broken members are brought to *Venice* from *Syria* and *Egypt*, and thence diſperſed over all Chriſtendom. But according to the different condition of men, the matter of their embalments were divers; for the bodies of the Nobility or Gentry were embalmed with Myrrh, Aloes, Saffron, and other pretious Spices, and Drugs; but the bodies of the common ſort, whoſe poverty and want of means could not undergo ſuch coſt, were embalmed with *Aſphaltum* or *Piſſaſphaltum*.

The opinion of the *Arabians* concerning it.

Lib.4.cap.84. Another opinion of Mummy.

Another.

Now

Now *Mathiolus* ſaith, that all the Mummy which is brought into theſe parts, is of this laſt kind and condition. For the Noble-men and chief of the Province, ſo religiouſly addicted to the Monuments of their Anceſtors, would never ſuffer the bodies of their friends and kindred to be tranſported hither for filthy gain, and ſuch deteſted uſe, as we ſhall ſhew more at large at the end of this Work. Which thing ſometimes moved certain of our *French* Apothecaries, men wondrous audacious and covetous, to ſteal by night the bodies of ſuch as were hanged, and embalming them with Salt and Drugs, they dried them in an Oven, ſo to ſell them thus adulterated in ſtead of true Mummy. Wherefore we are thus compelled both fooliſhly and cruelly to devour the mangled and putrid particles of the carkaſſes of the baſeſt people of *Ægypt*, or of ſuch as are hanged, as though there were no other way to help or recover one bruiſed with a fall from a high place, than to bury Man by an horrid inſertion in their, that is, in Mans Guts. Now if this Drug were any way powerful for that they require, they might perhaps have ſome pretence for this their more than barbarous inhumanity. But the caſe ſtands thus, that this wicked kind of Drug, doth nothing help the diſeaſed, in that caſe, wherefore and wherein it is adminiſtred, as I have tried a hundred times; and as *Thevet* witneſſes, he tried in himſelf, when as he took ſome thereof by the advice of a certain *Jewiſh* Phyſician in *Egypt*, from whence it is brought; but it alſo infers many troubleſom ſymptoms, as the pain of the heart, or ſtomach, vomiting and ſtink of the mouth.

What our Mummy uſually is.

Mummy is no way good for contuſions.

I, perſuaded by theſe reaſons, do not onely my ſelf not preſcribe any hereof to my Patients, but alſo in conſultations, endeavour what I may, that it be not preſcribed by others. It is far better, according to *Galen*'s opinion, in *Method. med.* to drink ſome Oxycrate, which by its frigidity reſtrains the flowing bloud, and by its tenuity of ſubſtance diſſolves and diſcuſſes the congealed clots thereof. Many reaſons of learned Phyſicians (from whom I have learned this Hiſtory of Mummy) drawn from Philoſophy, whereby they make it apparent, that there can be no uſe of this or that Mummy in contuſions, or againſt flowing or congealed bloud, I willingly omit; for that I think it not much beneficial to Chirurgeons to inſert them here. Wherefore I judge it better to begin to treat of Combuſtions or Burns.

But hurtful, and how.

The effects of Oxycrate in Contuſions.

CHAP. VIII.

Of Combuſtions and their Differences.

ALl Combuſtions whether occaſioned by Gun-powder, or by ſcalding Oil, Water, ſome Metal, or what things ſoever elſe, differ onely in magnitude. Theſe firſt cauſe pain in the part, and imprint in it an unnatural heat. Which ſavouring of the fire, leaves that impreſſion, which the Greeks call *Empyreuma*. There are more or leſs ſigns of this impreſſion, according to the efficacy of the thing burning, the condition of the part burned, and ſtay upon the ſame. If the combuſtion be ſuperficiary, the skin riſes into puſtules and bliſters, unleſs it be ſpeedily prevented. If it be low or deep in, it is covered with an *Eſchar* or Cruſt, the burnt fleſh by the force of the fire turning into that cruſty hardneſs. The burning force of the fire, upon whatſoever part it falls, leaves a hot diſtemper therein, condenſates, contracts, and thickens the skin, whence pain proceeds; from pain there comes an attraction of humours from the adjacent and remote parts. Theſe humours preſently turn into wateriſh or ſerous moiſture, whileſt they ſeek to paſs forth, and are hindred thereof by the skin condenſated by the action of the fire, they lift it up higher, and raiſe the bliſters which we ſee. Hence divers Indications are drawn, whence proceeds the variety of Medicins for burns. For ſome take away the *Empyreuma*, that is, the heat of the fire, (as we term it) and aſſwage the pain; other hinder the riſing of bliſters, otherſome are fit to cure the ulcer, firſt to procure the falling away of the *Eſchar*, then to cleanſe, generate fleſh, and cicatrize it. Remedies fit to aſſwage pain, and take away the fiery heat, are of two kinds; for ſome do it by a cooling faculty, by which they extinguiſh the preternatural heat, and repreſs or keep back the bloud and humours, which flow into the parts by reaſon of heat and pain. Others endued with contrary faculties, are hot and attractive; as which by relaxing the skin, and opening the pores, reſolve and diſſipate the ſerous humours, which yield both begining and matter to the puſtules, and ſo by accident aſſwage the pain and heat. Refrigerating things are cold Water, the Water of Plantain, Nightſhade, Henbane, Hemlock; the juices of cooling Herbs, as Purſlane, Lettuce, Plantain, Houſleek, Poppy, Mandrake, and the like. Of theſe ſome may be compounded, as ſome of the fore-named juices beaten with the white of an Egg, Clay beaten and diſſolved in ſtrong Vinegar, Roch-Alum diſſolved in Water, with the Whites of Eggs beaten therein, Writing-Ink mixed with Vinegar, and a little Camphire, *Unguentum nutritium*, and alſo *Populeon* newly made. Theſe and the like ſhall be now and then renewed, chiefly at the firſt, until the heat and pain be gone. But theſe ſame remedies muſt be applied warm, for if they ſhould be laid, or put to cold, they would cauſe pain, and conſequently defluxion; beſides alſo, their ſtrength could not paſs, or enter into the part, or be brought into action; but ſo applied they aſſwage pain, hinder inflammation and the riſing of bliſters.

The reaſon and ſymptoms of Combuſtions.

The cauſe of the bliſters riſing upon Burns.

Variety of Medicins to take away the heat and aſſwage the pain

CHAP. IX.

Of hot and attractive Medicins to be applied to Burns.

AMongſt the hot and attractive things which by rarifying, drawing out, and diſſolving, aſſwage the pain and heat of combuſtions, the fire challenges the firſt place, eſpecially when the burning is but ſmall. For the very common people know and find by daily experience, that the heat of the lightly burnt part vaniſhes away, and the pain aſſwaged, if they hold the part which was burnt ſome pretty while to the heat of a lighted Candle or burning Coals, for the ſimi-

How fire may aſſwage the pain of burning.

litude

litude cauſeth attraction. Thus the external fire, whileſt it draws forth the fire which is internal and inuſt into the part, is a remedy againſt the diſeaſe it cauſed and bred. It is alſo an eaſily made and approved remedy, if they preſently after the Burn, apply to the grieved part raw Onions beaten with ſome Salt. Now you muſt note that this Medicin takes no place, if it be once gone into an ulcer, for it would increaſe the pain and inflammation; but if it be applied when the skin is yet whole and not excoriated, it doth no ſuch thing, but hinders the riſing of puſtules and bliſters. *Hippocrates* for this cauſe alſo uſes this kind of remedy in procuring the fall of the *Eſchar*. If any endeavour to gain-ſay the uſe of this remedy by that principle in Phyſick, which ſays, that Contraries are cured by Contraries, and therefore affirm that Onions, according to the authority of *Galen*, being hot in the fourth degree, are not good for combuſtions; let him know that Onions are indeed potentially hot, and actually moiſt, therefore they rarifie by their hot quality, and ſoften the skin by their actual moiſture, whereby it comes to paſs that they attract, draw forth, and diſſipate the imprinted heat, and ſo hinder the breaking forth of Puſtules. To conclude, the fire, as we formerly noted, is a remedy againſt the fire. But neither are diſeaſes always healed by their contraries (ſaith *Galen*) but ſometimes by their like; although all healing proceed from the contrary; this word *contrary*, being more largely and ſtrictly taken: for ſo alſo a Phlegmon is often cured by reſolving Medicins, which healeth it by diſſipating the matter thereof. Therefore Onions are very profitable for the burnt parts, which are not yet exulcerated or excoriated. But there are alſo many other Medicins good to hinder the riſing of bliſters, ſuch as new Horſe-dung fried in Oil of Wal-nuts or Roſes, and applied to the parts. In like manner the leaves of Elder or Dane-wort boiled in Oil of Nuts, and beaten with a little Salt. Alſo quenched Lime powdered and mixed with *Unguentum Roſatum*. Or elſe the leaves of Cuckow-pint and Sage, beaten together with a little Salt. Alſo Carpenters Glue diſſolved in Water and anointed upon the part with a feather, is good for the ſame purpoſe. Alſo thick Verniſh which Poliſhers or Sword-Cutlers uſe. But if the pain be more vehement, theſe Medicins muſt be renewed three or four times in a day and a night, ſo to mitigate the bitterneſs of this pain. But if if ſo be we cannot by theſe remedies hinder the riſing of bliſters, then we muſt preſently cut them as ſoon as they riſe, for that the humour contained in them, not having paſſage forth, acquires ſuch acrimony that it eats the fleſh which lieth under it, and ſo cauſeth hollow ulcers: So by the multitude of cauſes and increaſe of matter the inflammation groweth greater, not onely for nine days (as the common people prattle) but for far longer time; alſo ſomewhiles for leſs time, if the body be neither replete with ill humours, nor plethorick, and you have ſpeedily reſiſted the pain and heat by fit remedies. When the combuſtion ſhall be ſo great as to cauſe an *Eſchar*, the falling away muſt be procured by the uſe of emollient and humective Medicins, as of Greaſes, Oils, Butter with a little *Baſilicon*, or the following Ointment. ℞ *Mucagin. pſillii & cydon. an.* ℥ iv. *gummi trag.* ℥ ij. *extrahantur cum aqua parietaria, olei liliorum* ℥ ij. ß. *ceræ novæ q.ſ. fiat unguentum molle.* For ulcers and excoriations you ſhall apply fit remedies; which are thoſe that are without acrimony, ſuch as *Unguentum album camphoratum, deſiccativum rubrum, unguentum roſatum*, made without Vinegar, or *nutritum*, compoſed after this manner. ℞ *Lithargyri auri* ℥ iv. *ol. roſat.* ℥ iij. *ol. de papaver.* ℥ ij. ß. *ung. populeon.* ℥ iv. *camphoræ* ℥ j. *fiat unguentum in mortario plumbeo ſecundum artem.* Or Oil of Eggs tempered in a Leaden Mortar. Alſo unquenched Lime many times waſhed and mixed with *unguentum roſatum*, or freſh Butter without Salt, and ſome yolks of Eggs hard roaſted. Or ℞ *Butyri recent. ſine ſale, uſtulati, & colati* ℥ vj. *vitell. ovor.* iv. *ceruſ. lotæ in aqua plantag. vel roſar.* ℥ ß. *tuthiæ ſimiliter lotæ* ℥ iij. *plumbi uſti, & loti* ℥ ij. *Miſceantur omnia ſimul, fiat linimentum ut decet.* Or elſe, ℞ *cort. ſambuc. viridis, & olei roſat. an. lib.* j. *bulliant ſimul lento igne, poſtea colentur, & adde olei ovorum* ℥ iv. *pul. ceruſ. & tuthiæ præpar. an.* ℥ j. *ceræ albæ quantum ſufficit. fiat unguentum molle ſecundum artem.* But the quantity of drying Medicins may always be increaſed or diminiſhed, according as the condition of the Ulcer ſhall ſeem to require. The following remedies are fit to aſſwage pain, as the mucilages of Lin-ſeeds, of the ſeeds of *Pſillium*, or Flea-wort, and Quinces extracted in Roſe-water, or fair water, with the addition of a little Camphire; and leſt that it dry too ſpeedily, add thereto ſome Oil of Roſes. Alſo five or ſix yolks of Eggs mixed with the mucilages of Lin-ſeed, the ſeed of *Pſillium*, and Quinces often renewed, are very powerful to aſſwage pain. The Women which attend upon the people in the Hoſpital in *Paris*, do happily uſe this Medicin againſt Burns. ℞ *Lard. conſciſſi libram unam*; let it be diſſolved in Roſe-water, then ſtrained through a linnen-cloth, then waſh it four times with the Water of Henbane, or ſome other of that kind, then let it be incorporated with eight yolks of new laid Egs, and ſo make an Ointment. If the ſmart be great, as uſually it is in theſe kinds of Wounds, the Ulcer or Sores ſhall be covered over with a piece of Tiffany, leſt you hurt them by wiping them with ſomewhat a coarſe cloth, and ſo alſo the matter may eaſily come forth, and the Medicins eaſily enter in. Alſo you muſt have a care when the eye-lids, lips, ſides of the fingers, neck, the arm-pits, hams, and bending of the elbow are burnt, that you ſuffer not the parts to touch one the other, without the interpoſition of ſome thing; otherwiſe in continuance of time they would grow and ſtick together Therefore you ſhall provide for this, by fit placing the parts, and putting ſoft linnen rags between them. But you muſt note that deep combuſtions, and ſuch as cauſe a thicker *Eſchar*, are leſs painful than ſuch as are but onely ſuperficiary. The truth hereof you may perceive by the example of ſuch as have their limbs cut off, and ſeared and cauterized with an hot Iron: for preſently after the cauterizing is performed they feel little pain. For this great combuſtion takes away the ſenſe; the vehemency of the ſenſory or thing affecting the ſenſe, depriving the ſenſitive parts of their ſenſe: as we have formerly noted when we treated of Wounds and Pains of the Nerves. The falling away of ſuch *Eſchars* ſhall be procured by ſomewhat a deep ſcarification which may pierce even to the quick, that ſo the humours which lie under it may enjoy freer perſpiration, and emollient Medicins may the freelier enter in, ſo to ſoak, moiſten and ſoften the *Eſchar*, that it may at length fall away. The reſt of the Cure ſhall be performed by detergent and ſarcotick Medicins, adding to the former Ointments Metalline Powders, when the preſent neceſſity ſhall ſeem ſo to require. But we cannot

Medicins for an *Eſchar*.

A deſcription of *Nutritum*.

A remedy for Burns commonly uſed in the Hoſpital of *Paris*.

Why deep combuſtions are leſs painful than ſuperficiary.

juſtly

juſtly ſay in what proportion and quantity each of theſe may be mixed, by reaſon of that variety which is in the temper and conſiſtence of bodies, and the ſtubbornneſs and gentleneſs of Diſeaſes. After a Burn the Scar which remaineth is commonly rough, unequal, and ill-favoured: therefore we will tell you in our Treatiſe of the Plague, how it muſt be ſmoothed and made even.

I muſt not here omit to tell you, that Gun-powder ſet on fire doth often ſo penetrate into the fleſh, not ulcerating or taking off the skin, and ſo inſinuate and throughly faſten it ſelf into the fleſh by its tenuity, that it cannot be taken or drawn out thence by any remedies, no not by *Phœnigmes*, nor Veſicatories, nor Scarification, nor Ventoſes, nor Horns, ſo that the Prints thereof always remain, no otherwiſe than the marks which the *Barbarians* burn in their Slaves, which cannot afterwards be taken away or deſtroyed by any Art.

Marks or ſpots made in the face by corns of Gun-powder cannot be taken away.

CHAP. X.

Of a Gangrene and Mortification.

CErtainly the malign ſymptoms which happen upon Wounds, and the ſolutions of Continuity, are many, cauſed either by the ignorance or negligence of the Chirurgeon; or by the Patient, or ſuch as are about him; or by the malignity and violence of the Diſeaſe: but there can happen no greater than a Gangrene, as that which may cauſe mortification and death of the part, and oft-times of the whole body; wherefore I have thought good in this place to treat of a Gangrene, firſt giving you the definition, then ſhewing you the cauſes, ſigns, prognoſticks, and laſtly, the manner of the Cure. Now a Gangrene is a certain diſpoſition, and way to the mortification of the part, which it ſeizeth upon, dying by little and little. For when there is a perfect mortification, it is called by the Greeks *Sphacelos*, by the Latins *Syderatio*, our Countrey-men term it the Fire of S. *Anthony*, or S. *Marcellus*.

Gal. 2. ad Glauconem.

CHAP. XI.

Of the general and particular cauſes of a Gangrene.

THe moſt general cauſe of a Gangrene is, when by the diſſolution of the harmony and joint temper of the four firſt qualities, the part is made unapt to receive the Faculties, the Natural, Vital, and Animal Spirits, by which it is nouriſhed, lives, feels, and moves. For a part deprived by any chance of theſe, as of the light, languiſhes, and preſently dies. Now the particular cauſes are many: and theſe either primitive or antecedent. The primitive or external are combuſtions cauſed by things either actually or potentially burning; actually, as by Fire, ſcalding Oil, or Water, Gun-powder fired, and the like. But potentially by acrid Medicins, as Sublimate, Vitriol, potential Cauteries, and other things of the ſame nature: for all theſe cauſe a great inflammation in the part. But the ambient air may cauſe great refrigerations, and alſo a Gangrene, which cauſed *Hippocrates lib. de Aer.* to call great refrigerations of the Brain *Sphaceliſm*. Therefore the unadviſed and unfit application of cold and narcotick things, a fracture, luxation, and great contuſion, too ſtrait bandages, the biting of Beaſts, eſpecially of ſuch as are venemous, a puncture of the Nerves and Tendons, the wounds of the nervous parts and joints, eſpecially in bodies which are plethorick and replete with ill humours, great wounds whereby the Veſſels which carry life are much cut, whence an *Aneuriſma*, and laſtly, many other cauſes, which perturb that harmony of the four prime qualities which we formerly mentioned, and ſo infer a Gangrene.

The general cauſe of a Gangrene.

The particular cauſes.

Cold cauſeth a Gangrene.

CHAP. XII.

Of the Antecedent Cauſes of a Gangrene.

NOw the Antecedent or Internal and Corporeal cauſes of a Gangrene, are plentiful and abundant defluxions of humours, hot, or cold, falling into any part. For ſeeing the faculty of the part is unapt and unable to ſuſtain and govern ſuch plenty of humours, it comes to paſs that the native heat of the part is ſuffocated and extinct for want of tranſpiration. For the Arteries are hereby ſo ſhut or pent up in a Strait, that they cannot perform their motions of contraction and dilatation, by which their native heat is preſerved and tempered. But then the Gangrene is chiefly uncurable when the influx of humours firſt takes hold of the Bones, and inflammation hath its beginning from them. For in the opinion of *Galen*, all theſe kinds of affects which may befall the fleſh, are alſo incident to the bones. Neither onely a Phlegmon or Inflammation, but alſo a rottenneſs and corruption doth oft-times firſt invade and begin at the bones; for thus you may ſee many who are troubled with the Leproſie and French diſeaſe, to have their skin and fleſh whole and fair to look on, whoſe bones notwithſtanding are corrupt and rotten, and oft-times are much decayed in their proper ſubſtance. This miſchief is cauſed by a venemous matter, whoſe occult quality we can ſcarce expreſs by any other name than poiſon inwardly generated. Oft-times alſo there is a certain acrid and ſtinking filth generated in fleſh with a malign and old ulcer, with which if the bones chance to be moiſtned they become foul, and at length mortified: of which this ſaying of *Hippocrates* is extant, Ulcers of a years continuance, or longer, muſt neceſſarily foul the bone, and make the ſcars hollow. Whither alſo belongs this ſaying of the ſame party; An *Eryſipelas* is ill in the laying bare of a bone. But this flowing venenate and gangrenous matter is ſomewhiles hot, as in peſtilent Carbuncles, which in the ſpace of four and twenty hours by cauſing an *Eſchar*, bring the part to mortification: otherwhiles cold, as we ſee it divers times happens in parts which are poſſeſt with a Gan-

How defluxions cauſe a Gangrene.

An uncurable Gangrene.

Lib. de tumor. præter natur.

Aph. 5. ſect. 6.

A Gangrene by efflux of a cold matter.

Gangrene, no pain, tumor, blackneſs, nor any other precedent ſign of a Gangrene going before. For *John de Vigo* ſaith, that happened to a certain Gentlewoman of *Genoa* under his cure.

A notable Hiſtory.

I remember the ſame happened to a certain man in *Paris*, who ſupping merrily, and without any ſenſe of pain, went to bed, and ſuddenly in the night time a Gangrene ſeized on both his legs, cauſed a mortification without tumour, without Inflammation; onely his legs were in ſome places ſpred over with livid, black, and green ſpots, the reſt of the ſubſtance retaining his native colour: yet the ſenſe of theſe parts was quite dead, they felt cold to the touch; and if you did thruſt your Lancet into the skin no bloud came forth. A Council of Phyſicians being called, they thought good to cut the skin and fleſh lying under it, with many deep ſcarifications; which when I had done, there came forth a little black, thick, and as it were, congealed bloud; wherefore this remedy, as alſo divers other, proved to no purpoſe; for in concluſion, a blackiſh colour coming into his face and the reſt of his body, he died frantick. I leave it to the Readers judgment, whether ſo ſpeedy and ſuddenly cruel a miſchief could proceed from any other than a venenate matter; yet the hurt of this venenate matter is not peculiar, or by its ſelf. For oft-times the force of cold, whether of the encompaſſing air, or the too immoderate uſe of Narcotick Medicins is ſo great, that in few hours it takes away life from ſome of the members, and divers times from the whole body, as we may learn by their example who travel in great Snows, and over Mountains congealed, and hoared with Froſt and Ice. Hence alſo is the extinction of the native heat, and the ſpirits reſiding in the part, and the ſhutting forth of that which is ſent by Nature to aid or defend it. For when as the part is bound with rigid cold, and as it were frozen, they cannot get nor enter therein. Neither if they ſhould enter into the part, can they ſtay long there, becauſe they can there find no fit habitation, the whole frame and government of Nature being ſpoiled, and the harmony of the four prime qualities deſtroyed by the offenſive dominion of predominant Cold their Enemy; whereby it cometh to paſs, that flying back from whence they firſt came, they leave the part deſtitute and deprived of the benefit of nouriſhment, life, ſenſe, and motion.

Simple cold may cauſe a Gangrene.

A Hiſtory.

A certain *Briton* an Hoſtler in *Paris*, having drunk ſoundly after Supper, caſt himſelf upon a Bed; the cold air coming in at a Window left open, ſo took hold upon one of his legs, that when he waked forth of his ſleep, he could neither ſtand nor go. Wherefore thinking onely that his leg was numb, they made him ſtand to the fire; but putting it very nigh, he burnt the ſole of his foot without any ſenſe of pain, ſome fingers thickneſs; for a mortification had already poſſeſſed more than half his leg. Wherefore after he was carried to the Hoſpital, the Chirurgeon who belonged thereto, endeavoured by cutting away of the mortified leg to deliver the reſt of the body from imminent death; but it proved in vain, for the mortification taking hold upon the upper parts, he died within three days, with troubleſom belching and hicketing, raving, cold ſweat, and often ſwounding. Verily all that ſame Winter the Cold was ſo vehement that many in the Hoſpital of *Paris*, loſt the wings or ſides of their noſtrils, ſeized upon by a mortification without any putrefaction. But you muſt note that the Gangrene which is cauſed by cold, doth firſt and principally ſeize upon the parts moſt diſtant from the heart, the fountain of heat, to wit, the feet and legs; as alſo ſuch as are cold by nature, as griſly parts, ſuch as the Noſe and Ears.

What parts are uſually taken by a Gangrene proceeding of cold.

CHAP. XIII.

Of the Signs of a Gangrene.

THe ſigns of a Gangrene, which inflammation or a Phlegmon hath cauſed, are pain and pulſation without manifeſt cauſe, the ſudden changing of the fiery and red colour into a livid or black, as *Hippocrates* ſhews where he ſpeaks of the Gangrene of a broken heel. I would have you here to underſtand the pulſifick pain, not onely to be that which is cauſed by the quicker motion of the Arteries, but that heavy and pricking which the contention of the natural heat doth produce by raiſing a thick cloud of vapours from theſe humours which the Gangrene ſets upon. The ſigns of a Gangrene cauſed by cold, are, if ſuddenly a ſharp pricking and burning pain aſſaileth the part; for *penetrabile frigus adurit, (i.)* piercing cold doth burn: if a ſhining redneſs, as if you had handled Snow, preſently turn into a livid colour; if in ſtead of the accidental heat which was in the part, preſently cold and numbneſs ſhall poſſeſs it, as if it were ſhook with a Quartan Fever. Such cold, if it ſhall proceed ſo far as to extinguiſh the native heat, bringeth a mortification upon the Gangrene; alſo oft-times Convulſions and violent ſhaking of the whole body, are wondrous troubleſome to the Brain and the Fountains of life. But you ſhall know Gangrenes cauſed by too ſtrait bandages, by fracture, luxation, and contuſion, by the hardneſs which the attraction and flowing down of the humours hath cauſed, little pimples or bliſters ſpreading or riſing upon the skin by reaſon of the great heat, as in a combuſtion; by the weight of the part occaſioned through the defect of the ſpirits not now ſuſtaining the burden of the member; and laſtly from this, the preſſing of your finger upon the part, it will leave the print thereof as in an *œdema*; and alſo from this, that the skin cometh from the fleſh without any manifeſt cauſe.

Sect. 6. lib. de fractur.

What a pulſifick pain is.

Signs of a Gangrene proceeding from cold.

Signs of a Gangrene proceeding from ſtrait bandages, or ligatures, &c.

Now you ſhall know Gangrenes ariſing from a bite, puncture, *aneuriſma*, or wound in plethorick and ill bodies, and in a part indued with moſt exquiſite ſenſe, almoſt by the ſame ſigns as that which was cauſed by inflammation. For by theſe and the like cauſes, there is a far greater defluxion and attraction of the humours than is fit, when the perſpiration being intercepted, and the paſſages ſtopt, the native heat is oppreſſed and ſuffocated. But this I would admoniſh the young Chirurgeon, that when by the fore-mentioned ſigns he ſhall find the Gangrene preſent, that he do not defer the amputation, for that he finds ſome ſenſe or ſmall motion reſiding in the part. For oft-times the affected parts are in this caſe moved not by the motion of the whole Muſcle, but onely by means, that

Signs of a Gangrene occaſioned by a bite, puncture, &c.

that the head of the Muſcle is not yet taken with the Gangrene: which moving it ſelf by its own ſtrength, alſo moves its proper and continued tendon and tail though dead already; wherefore it is ill to make any delay in ſuch caſes.

CHAP. XIV.

Of the Prognoſticks in Gangrenes.

HAving given you the ſigns and cauſes to know a Gangrene, it is fit we alſo give you the Prognoſticks. The fierceneſs and the malignity thereof is ſo great, that unleſs it be moſt ſpeedily withſtood, the part it ſelf will die, and alſo take hold of the neighbouring parts by the contagion of its mortification: which hath been the cauſe that a Gangrene by many hath been termed an *Eſthiomenos*. For ſuch corruption creeps out like poiſon, and like fire eats, gnaws, and deſtroys all the neighbouring parts, until it hath ſpread over the whole body. For as *Hippocrates* writes, *Lib. de Vulner. capitis*; *Mortui & viventis nulla eſt proportio, (i.)* there is no proportion between the dead and living. Wherefore it is fit preſently to ſeparate the dead from the living; for unleſs that be done, the living will die by the contagion of the dead. In ſuch as are at the point of death, a cold ſweat flows over all their bodies: they are troubled with ravings, and watchings, belchings and hickettings moleſt them, and often ſwoundings invade them by reaſon of the vapours abundantly and continually raiſed from the corruption of the humours and fleſh, and ſo carried to the bowels and principal parts by the Veins, Nerves, and Arteries. Wherefore when you have foretold theſe things to the friends of the Patient, then make haſte to fall to your work.

Why a Gangrene is called *Eſthiomenos*.

The quick impatient of the dead.

CHAP. XV.

Of the general Cure of a Gangrene.

THe Indications of curing Gangrenes are to be drawn from their differences, for the cure muſt be diverſly inſtituted according to the eſſence and magnitude. For ſome Gangrenes poſſeſs the whole member, others onely ſome portion thereof; ſome are deep, other-ſome ſuperficial onely. Alſo you muſt have regard to the temper of the body. For ſoft and delicate bodies, as of Children, Women, Eunuchs, and idle perſons require much milder Medicins than thoſe who by Nature and Cuſtom, or Vocation of life are more ſtrong and hardy, ſuch as Huſbandmen, Labourers, Mariners, Huntſmen, Porters, and men of the like nature who live ſparingly and hardly. Neither muſt you have reſpect to the body in general, but alſo to the parts affected; for the fleſhy and muſculous parts are different from the ſolid, as the Nerves and Joints, or more ſolid, as the *Vertebræ*. Now the hot and moiſt parts, as the Privities, Mouth, Womb, and Fundament, are eaſilier and ſooner taken hold of by putrefaction, wherefore we muſt uſe more ſpeedy means to help them. Wherefore if the Gangrene be chiefly occaſioned from an internal cauſe, he muſt have a diet preſcribed for the decent and fitting uſe of the ſix things not Natural. If the body be plethorick, or full of ill humours, you muſt purge, or let bloud by the advice of a Phyſician. Againſt the aſcending up of vapours to the noble parts, the heart muſt chiefly be ſtrengthened with Treacle diſſolved in Sorrel or *Carduus* Water, with a bole of Mithridate, the Conſerve of Roſes and Bugloſs, and with Opiates made for the preſent purpoſe according to Art; this following Apozeme ſhall be outwardly applied to the region of the heart. ℞ *Aquæ Roſar. & nenuphar. an.* ℥ iv. *aceti ſcillitici,* ℥ j. *corallorum, ſantalorum alborum & rubrorum, roſar. rub. in pulver. redactarum, & ſpodii, an.* ℥ j. *mithrid. & theriacæ, an.* ℥ ij. ℔. *trochiſcorum de Caphura* ℥ ij. *flor. cardial. in pollin. redactarum, p.* ij. *croci* ℥ j. *Ex omnibus in pollinem redactis, fiat Epithema.* Which may be applied upon the region of the heart with a ſcarlet cloth or ſponge. Theſe are uſually ſuch as happen in the Cure of every Gangrene.

Various Indications of curing a Gangrene.

What parts ſooneſt taken hold by a Gangrene.

A cordial *Epithema*.

CHAP. XVI.

Of the particular Cure of a Gangrene.

THe cure of a Gangrene cauſed by the too plentiful and violent defluxion of humours ſuffocating the native heat, by reaſon of great Phlegmons is performed by evacuating and drying up the humours, which putrefie by delay and collection in the part. For this purpoſe Scarifications and Inciſions, great, indifferent, ſmall, deep, and ſuperficiary, according to the condition of the Gangrene, are much commended, that ſo the burdened part may enjoy the benefit of perſpiration; and the contained humours of diſſlation, or evacuation, of their ſooty excrements. Let Inciſions be made when the affect is great, deep in, and near to mortification. But Scarifications may be uſed when the part firſt begins to putrefie, for the greatneſs of the remedy muſt anſwer in proportion to that of the diſeaſe. Wherefore if it penetrate to the bones, it will be fit to cut the skin and fleſh with many and deep inciſions, with an Inciſion-knife made for that purpoſe; yet take heed of cutting the larger Nerves and Veſſels, unleſs they be wholly putrefied, for if they be not yet putrefied, you ſhall make your Inciſions in the ſpaces between them; if the Gangrene be leſs, we muſt reſt ſatisfied with onely ſcarifying it. When the Scarifications and Inciſions are made, we muſt ſuffer much bloud to flow forth, that ſo the conjunct matter may be evacuated. Then muſt we apply and put upon it ſuch Medicins as may by heating, drying, reſolving, cleanſing and opening, amend and correct the putrefaction, and by piercing to the bottom may have power to overcome the virulency already impact in the part. For this purpoſe, Lotions made

The cure of a Gangrene made by inflammation.

of the Lie of the Aſhes of Fig-tree, or Oak, wherein Lupins have been throughly boiled, are good. Or you may with leſs trouble make a Medicin with Salt-water, wherein you may diſſolve Aloes and *Ægyptiacum*, adding in the concluſion a little *Aqua vitæ*, for *Aqua vitæ* and calcined Vitriol are ſingular Medicins for a Gangrene. Or ℞ *Acet. opimi* ℔ j. *mel. roſ.* ʒ iv. *ſyrup. acetoſi* ʒ iij. *ſalis com.* ʒ v. *bulliant ſimul, adde aqua vitæ*, ℔. ſ. Let the part be frequently waſhed with this Medicin, for it hath much force to repreſs Gangrenes. After your Lotion, lay *Ægyptiacum* for a Liniment, and put it into the Inciſions, for there is no Medicine more powerful againſt putrefaction, for by cauſing an *Eſchar*, it ſeparates the putrid fleſh from the ſound. But we muſt not in this kind of affect expect that the putrid fleſh may of it ſelf fall from the ſound; but rather cut off with your Inciſion-knife, or Sciſſers, whatſoever thereof you can, and then put to it *Ægyptiacum* as oft as need ſhall require. The knowledge hereof may be acquired from the colour, ſmell, and ſenſibleneſs of the fleſh it ſelf. The deſcription of the *Ægyptiacum*, whoſe wondrous effects I have often tried in theſe cauſes, is this. ℞ *Floris æris, aluminis roch. mellis com. an.* ʒ iij. *aceti acerrimi* ʒ v. *ſalis com.* ʒ j. *vitrioli Rom.* ʒ ß. *ſublimati pul.* ʒ ij. *bulliant omnia ſimul ad ignem, fiat unguent.* If the force of the putrefaction in the part be not ſo great, a weaker *Ægyptiacum* may ſerve. When you have put in the *Ægyptiacum*, then preſently lay the following Cataplaſm thereupon. For it hinders putrefaction, reſolves, cleanſes and dries up the virulent *ſanies*, and by the dry ſubtlety of the parts penetrates into the member, ſtrengthens it, and aſſwages the pain. ℞ *Farin. fabar. hordei orobi, lent. lupin. an.* ℔ ſ. *ſal. com. mellis roſat. an.* ʒ iv. *ſucci abſinth. marrub. an.* ʒ j. ß. *aloes, maſtiches, myrrhæ, & aquæ vit. an.* ʒ ij. *oxymelitis ſimpl. quantum ſufficit; fiat Cataplaſma molle ſecundum artem*; Somewhat higher than the part affected, apply this following aſtringent, or defenſative, to hinder the flowing down of the humours into the part, and the riſing up of the vapours from the putrid part into the whole body. ℞ *Olei roſati, & myrtill. an.* ʒ iv. *ſucci plantag. ſolani, ſempervivi an.* ʒ ij. *album. ovorum* v. *boli armeni, terræ ſigillatæ ſubtiliter pulveriſatorum, an.* ʒ j. *oxycrati quantum ſufficit, miſce ad uſum dictum.* But theſe Medicins muſt be often renewed. If the grief be ſo ſtubborn, that it will not yield to the deſcribed remedies, we muſt come to ſtronger, to wit, Cauteries, after whoſe application *Galen* bids to put upon it the juice of a Leek with Salt beaten and diſſolved therewith, for that this Medicine hath a piercing and drying faculty, and conſequently to hinder putrefaction. But if you prevail nothing with Cauteries, then muſt you come to the laſt remedy and refuge, that is, the amputation of the part; for according to *Hippocrates*, to extream diſeaſes exquiſitly extreme remedies are beſt to be applied. Yet firſt be certain of the mortification of the part; for it is no little or ſmall matter to cut off a member without a cauſe.

The deſcription of an *Ægyptiacum.*

Aſtringents that may be uſed in cure of a Gangrene.

Gal. 2. ad Glauconem.

Aphor. 6. ſect. 11

Therefore I have thought it fit to ſet down the ſigns whereby you may know a perfect and abſolute mortification.

CHAP. XVII.

The ſigns of a perfect Necroſis, *or Mortification.*

A note concerning the unſenſibleneſs of the part.

You ſhall certainly know, that a Gangrene is turned into a Sphacel, or mortification, and that the part is wholly and throughly dead, if it look of a black colour, and be colder than ſtone to your touch, the cauſe of which coldneſs is not occaſioned by the frigidity of the air; if there be a great ſoftneſs of the part, ſo that if you preſs it with your finger it riſes not again, but retains the print of the impreſſion; if the skin come from the fleſh lying under it; if ſo great and ſtrong a ſmell exhale (eſpecially in an ulcerated Sphacel) that the ſtanders by cannot indure or ſuffer it; if a ſanious moiſture, viſcid, green or blackiſh, flow from thence; if it be quite deſtitute of ſenſe and motion, whether it be pulled, beaten, cruſhed, pricked, burnt, or cut off. Here I muſt admoniſh the young Chirurgeon, that he be not deceived concerning the loſs or privation of the ſenſe of the part. For I know very many deceived as thus; the Patients pricked on that part, would ſay, they felt much pain there. But that feeling is oft deceitful, as that which proceeds rather from the ſtrong apprehenſion of great pain which formerly reigned in the part, than from any faculty of feeling as yet remaining. A moſt clear and manifeſt argument of this falſe and deceitful ſenſe appears after the amputation of the member; for a long while after they will complain of the part which is cut away.

A wondrous ſymptom.

Verily it is a thing wondrous ſtrange and prodigious, and which will ſcarce be credited, unleſs by ſuch as have ſeen with their eyes and heard with their ears the Patients, who have many months after the cutting away of the Leg, grievouſly complained that they yet felt exceeding great pain of that Leg ſo cut off. Wherefore have a ſpecial care leſt this hinder your intended amputation; a thing pitiful, yet abſolutely neceſſary for to preſerve the life of the Patient and all the reſt of his body, by cutting away of that member which hath all the ſigns of a Sphacel and perfect mortification; for otherwiſe the neglected fire will in a moment ſpread over all the body, and take away all hope of remedy; for thus *Hippocrates* wiſheth, That Sections, Uſtions, and Terebrations muſt be performed as ſoon as need requires.

Sect. 7. lib. 6. Epidem.

CHAP. XVIII.

Where Amputation muſt be made.

The controverſie decided.

It is not ſufficient to know that Amputation is neceſſary, but alſo you muſt learn in what place of the dead part it muſt be done, and herein the wiſdom and judgment of the Chirurgeon is moſt apparent. Art bids to take hold of the quick, and to cut off the member in the ſound fleſh; but the ſame Art wiſheth us, to preſerve whole that which is ſound as much as in us lies.

I will ſhew thee by a familiar example how thou mayeſt carry thy ſelf in theſe difficulties. Let us ſuppoſe, that the foot is mortified even to the ankle; here you muſt attentively mark in what place you muſt cut it off. For unleſs you take hold of the quick fleſh in the amputation, or if you leave any putrefaction, you profit nothing by amputation, for it will creep and ſpread over the reſt of the body. It befits Phyſick, ordained for the preſervation of Mankind, to defend from the Iron or Inſtrument, and all manner of injury, that which injoyeth life and health. Wherefore you ſhall cut off as little of that which is ſound as you poſſibly can; yet ſo that you rather cut away that which is quick, than leave behind any thing that is periſhed, according to the advice of *Celſus*. Yet oft- *Lib. 7. cap. 33.* times the commodity of the action of the reſt of the part, and as it were a certain ornament thereof, changes this counſel. For if you take theſe two things into your conſideration they will induce you, in this propounded caſe and example, to cut off the Leg ſome five fingers bredth under the Knee. For ſo the Patient may more fitly uſe the reſt of his leg and with leſs trouble, that is, he may the better go on a wooden leg; for otherwiſe, if according to the common Rules of Art, you cut it off cloſe to that which is periſhed, the Patient will be forced with trouble to uſe three legs in ſtead of two.

For I ſo knew Captain *Francis Clark*, when as his foot was ſtricken off with an iron bullet, ſhot forth of a man of War, and afterwards recovered and healed up, he was much troubled and wearied with the heavy and unprofitable burden of the reſt of his leg, wherefore, though whole and ſound, he cauſed the reſt thereof to be cut off, ſome five fingers bredth below his Knee; and verily he uſed it with much more eaſe and facility than before in performance of any motion. We muſt do otherwiſe if any ſuch thing happen in the Arm; that is, you muſt cut off as little of the ſound part as you can. For the actions of the legs much differ from thoſe of the arms, and chiefly in this that the body reſts not, neither is carried upon the arms, as it is upon the feet and legs. An obſervable Hiſtory.

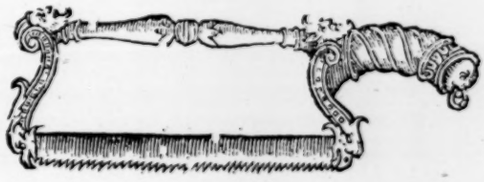
CHAP. XIX.

How the Section or Amputation muſt be performed.

THE firſt care muſt be of the Patients ſtrength: wherefore let him be nouriſhed with meats of good nutriment, eaſie digeſtion, and ſuch as generate many ſpirits; as with the yolks of Eggs, and Bread toſted and dipped in Sack or Muskadine. Then let him be placed as is fit, and drawing the Muſcles upwards towards the ſound parts, let them be tied with a ſtrait ligature a little above that place of the member which is to be cut off, with a ſtrong and broad fillet, like that which women uſually bind up their hair withall. This ligature hath a threefold uſe; the firſt is, that it hold the muſcles drawn up together with the skin, ſo that retiring back preſently after the performance of the work, they may cover the ends of the cut bones, and ſerve them in ſtead of bolſters or pillows when they are healed up, and ſo ſuffer with leſs pain the compreſſion in ſuſtaining the reſt of the body: beſides alſo by this means the Wounds are the ſooner healed and cicatrized; for, by how much more skin or fleſh is left upon the ends of the bones, by ſo much they are the ſooner healed and cicatrized. The ſecond is, for that it prohibits the flux of bloud by preſſing and ſhutting up the Veins and Arteries. The third is, for that it dulls the ſenſe of the part by ſtupefying it, the animal ſpirits by the ſtrait compreſſing being hindered from paſſing in by the Nerves. Wherefore when you have made your ligature, cut the fleſh even to the bone with a ſharp and well-cutting inciſion-knife, or with a crooked knife, ſuch as is here expreſſed. The Ligature of the part.

A crooked Knife fit for diſmembring, or a diſmembring Knife.

The Figure of ſuch a Saw.



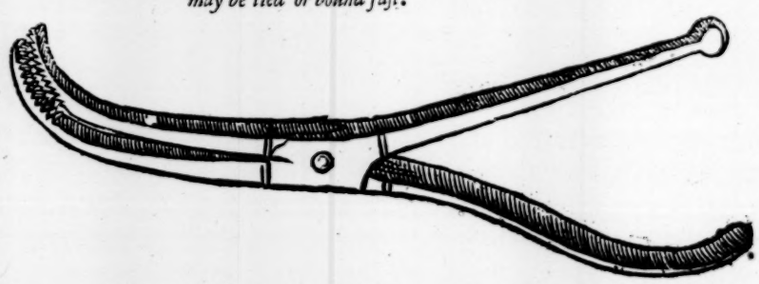
Now you muſt note, that there uſually lies between the bones, a portion of certain muſcles which you cannot eaſily cut with a large inciſion or diſmembring knife; wherefore you muſt carefully divide it and ſeparate it wholly from the bone, with an inſtrument made neatly like a crooked Inciſion-knife. I thought good to advertiſe thee hereof; for if thou ſhouldeſt leave any thing beſides the bone to be divided by the Saw, you would put the Patient to exceſſive pain in the performance thereof; for ſoft things, as fleſh, tendons, and membranes, cannot be eaſily cut with a Saw. Therefore when you ſhall come to the bared bone, all the other parts being wholly cut aſunder and divided, you ſhall nimbly divide it with a little Saw about ſome foot and three inches long, and that as near to the ſound fleſh as you can. And then you muſt ſmooth the front of the bone which the Saw hath made rough. A Caution to be obſerved.

CHAP. XX.

How to ſtanch the bleeding when the member is taken off.

WHen you have cut off and taken away the member, let it bleed a little, according to the ſtrength of the Patient, that ſo the reſt of the part may afterwards be leſs obnoxious to inflammation and other ſymptoms; Then let the Veins and Arteries be bound up as ſpeedily and ſtraitly as you can; that ſo the courſe of the flowing bloud may be ſtopped and wholly ſtaid. Which may be done by taking hold of the Veſſels with your Crows-beak, whereof the Figure follows.

The Crows-beak fit for to draw the Veſſels forth of the fleſh, wherein they lie hid, that ſo they may be tied or bound faſt.



How to draw forth the Veſſels and bind them.

The ends of the Veſſels lying hid in the fleſh, muſt be taken hold of and drawn with this Inſtrument forth of the muſcles, whereinto they preſently after the amputation withdraw themſelves, as all parts are ſtill uſed to withdraw themſelves towards their originals. In performance of this work, you need take no great care, if you together with the Veſſels comprehend ſome portion of the neighbouring parts, as of the fleſh, for hereof will enſue no harm; but the Veſſels will ſo be conſolidated with more eaſe, than if they being bloudleſs parts ſhould grow together by themſelves. To conclude, when you have ſo drawn them forth, bind them with a ſtrong double thred.

CHAP. XXI.

How, after the bloud is ſtanched, you muſt dreſs the wounded member.

How the lips of the diſmembred part are to be joined together.

WHen you have the tied Veſſels, looſe your Ligature which you made above the place of amputation, then draw together the lips of the Wound with four ſtitches made acroſs, having taken good hold of the fleſh; for thus you ſhall draw over the bones that part of the skin and cut muſcles drawn upwards before the amputation, and cover them as cloſe as you can, that ſo the air may the leſs come at them, and that ſo the Wound may be the more ſpeedily agglutinated. But when we ſay, draw together the lips of the Wound with four ſtitches, you muſt not ſo underſtand it, as that you muſt endeavour to draw them ſo cloſe as to touch each other, for that is impoſſible; for the ſtitches would ſooner break out, and ſo the part would lie bare. Wherefore it will be ſufficient to draw them indifferent cloſe together, that ſo you may ſuffer the skin and fleſh thereunder to enjoy its former liberty which it poſſeſt before the drawing up; and ſo in fine, by Natures aſſiſtance, the Wound may be the more eaſily agglutinated.

CHAP. XXII.

How you muſt ſtop the bleeding, if any of the bound-up Veſſels chance to get looſe.

The Hæmorrhagy of ſmall Veſſels is not to be regarded.

THe buſineſs hitherto being performed as we ſaid, if peradventure it happen that any bandage of any of the Veſſels be unlooſed, then muſt you again bind the member with that kind of Ligature which you did before the amputation thereof. Or elſe which is better, more eaſie and leſs painful, let your ſervant take hold of the member with both his hands, preſſing his fingers ſtrait, ſtop the paſſage of the looſed Veſſel, for ſo he may ſtanch the bleeding. Then let the Workmaſter take a needle ſome four fingers long, ſquare, and having ſharp edges, drawing after it a three or four doubled ſtrong thred. With this let him bind the Veſſel after the following manner. Let him thruſt his Needle on the outſide into the fleſh, ſome half fingers bredth from the looſed Veſſel until he come to the end thereof, then let him put it about it, and bring it back again, but ſo that there be no more than the ſpace of a fingers bredth between the going in and coming forth of the Needle. In this ſpace let him put a linnen rag three or four times doubled, and thereupon bind ſomewhat ſtraight the two ends of the thred together. For ſo he ſhall hinder the knot from hurting the fleſh which lies under it in the bindings, and alſo add ſtrength thereto. For ſo the bound up orifice of the Veſſel will in ſhort ſpace be agglutinated to the adjoyning fleſh, and that ſo firmly, that there hath never been ſeen any one drop of bloud to have flowed from a Veſſel ſo bound up. But if the bloud which flows forth proceed from any ſmall Veſſel, you muſt not uſe this ſuture and ligature, nor make any ſuch great matter thereof, for it will quickly be ſtanched by the onely application of Aſtringents, preſently to be mentioned.

CHAP. XXIII.

How to perform the residue of the Cure of the amputated Member.

NOw must we shew what Medicins are fitting to be applied after the amputation of a member; which are Emplasticks, as those which exceedingly conduce to green Wounds. As, An emplastick Medicin.
℞ *Bol. arm.* ℥ iv. *farin. vol.* ℥ iij. *picis, resinæ, an.* ℥ ij. *pulverisentur omnia subtilissime & simul mixtis fiat pulvis*; herewith let the Wound be strewed, and lay thereupon dry Lint; but let the following repercussive or defensative be applied to the member. A repercussive
℞ *Albumen ovorum* vj. *boli arm. sang. drac. gypsi, terræ sigill. aloes, masticches, gallar. combust. an.* ℥ ij. *in pollinem redigantur omnia, & bene agitentur, addendo olei rosarum & myrtill. an.* ℥ j. *fiat defensativum ad formam mellis.* This ointment must be applied upon stoops dipped in Oxycrate, and that so that it may not onely cover the cut member, but also be spred further and cover the neighbouring parts; as when the Leg is cut off, it must be laid upon the joint, and spred higher than the Knee, some four fingers upon the Thigh, for it hath not onely a repercussive faculty, but it also strengthens the part, hinders the defluxion by tempering the bloud, asswaging pain, and hindering inflammation. It will also be good to moisten your double cloths and bandages in Oxycrate; then must you place the member in an indifferent posture upon a pillow stuffed with Oaten husks or chaff, Stags hair, or Wheat bran. It must not be stirred after the first dressing (unless great necessity urge) for four days in Winter, but somewhat sooner in Summer. For the ligatures wherewith the Vessels are bound, they must not be loosed, or otherwise taken away, before the mouths of the Vessels are covered with their glue or flesh, lest by too much haste you cause a new flux of bloud. This agglutination will be performed by applying refrigerating, astringent, and emplastick Medicins, such as this following powder. How to place the member and how often to dress it.
An emplastick Powder.
℞ *Boli arm. farin. hord. picis, res. gypsi, an.* ℥ iv. *Aloes, nucum cup. cort. granat. an.* ℥ j. *incorporentur omnia simul, fiat pulvis subtilis:* herewith let the whole Ulcer be strewed over for three or four days space; which being ended, let onely the seats of the Vessels be powdred therewith, and that for eight or ten days, so that we need no further doubt of the agglutination of the Vessels. In the mean space let the digestive be applied to the rest of the Ulcer until it be come to suppuration; for then you shall give over your digestive, and betake to your detersive and munditicative Medicins: As Detersives.
℞ *Terebinth. ven. lotæ in aqua vitæ* ℥ vj. *mellis ros. colati* ℥ iv. *succi plantag. Apii, centaur. minoris, an.* ℥ ij. *bulliant omnia simul usque ad consumptionem succorum, auferantur ab igne, addendo farinæ fab. & hord. an.* ℥ j. *theriac. Gal.* ℥ ß. *aloes, myrrhæ, aristoloch. an.* ℥ iij. *croci* ʒ j. *fiat mundificativum.* But seeing the case stands so that the Patients imagine they have their members yet entire, and yet do complain thereof (which I imagin to come to pass, for that the cut nerves retire themselves towards their original, and thereby cause a pain like to Convulsions; for as *Galen* writes in his Book, *De Motu Musculorum*, that contraction is the true and proper action of a Nerve and Muscle: and again, extension is not so much an action as a motion: now we must endeavour to give remedy to this symptom. Which may be done by anointing the spine of the back and all the affected part with the following Liniment, which is very powerful against Convulsions, the Palsie, Numness, and all cold effects of the nervous bodies. Why after dismembring the Patients complain of pain as if the part was yet remaining on.
An ointment for the spine of the back against all affects of the Nerves.
℞ *Salviæ, chamæpithyos, majoranæ, rorismar. menth. rutæ, lavendulæ, an. m.* j. *flor. chamæmel. melilot. summit. aneth. & hyperici, an. p.* ij. *baccarum lauri & juniperi, an.* ʒ ij. *radicis pyrethri* ʒ ij. *mastic. assæ odorat. an.* ʒ i. *terebinth. venet.* ℔ j. *olei lumbr. æneth. catell. an.* ℥ vj. *olei terebinth.* ℥ iij. *axung. hum.* ℥ ii. *croci* ʒ j. *vini albi odoriferi* ℔ j. *ceræ quantum sufficit, contundenda contundantur, pulverisanda pulverisentur, deinde macerentur omnia in vino per noctem, postea coquantur cum oleis & axungia prædictis in vase duplici, fiat linimentum secundum artem, in fine adde aquæ vitæ* ℥ iv. Besides, in dressing these wounds the Chirurgeon must use diligence to procure the falling away of the ends or scales of the bones which the Saw and the appulse of the Air never before coming hereto, have tainted; which may be done by applying to their ends actual Cauteries, that is, hot irons; in using of which you must have a special care that you touch not the sensible parts with fire; neither must the bones themselves be forcibly plucked off, but gently moved by little and little, so that you shall think that you and the Patient have exceedingly well performed your parts if they fall away at the thirtieth day after the Amputation. All these things being performed, you shall hinder the growth of proud flesh with the cathæreticks, such as are burnt Vitriol, the Powder of Mercury, and other things, amongst which is Alum burnt and powdered, which is excellent in these kinds of Wounds, whether by it self or mixed with others. You shall use these, and such like, even unto the perfect agglutination and cicatrization of the Wound, and you may of your self devise other things, such as these; as occasion shall offer it self. How to procure the falling away of the ends of the bones.
Cathæreticks.

CHAP. XXIV.

What just occasion moved the Author to devise this new form of remedy, to stanch the bloud after the amputation of a member, and to forsake the common way used almost by all Chirurgeons; which is by application of actual Cauteries.

VErily I confess, I formerly have used to stanch the bleeding of members, after amputation, after another manner than that I have a little before mentioned: Whereof I am ashamed, and aggrieved; But what should I do? I had observed my Masters, whose Method I intended to follow, always to do the like; who thought themselves singularly well appointed to stanch a flux of bloud, when they were furnished with various store of hot irons and caustick Medicins, which they would use to the dismembred part, now one, then another, as they themselves thought meet. Which thing cannot be spoken, or but thought upon without great horrour, much less acted. For this kind of remedy could not but bring great and tormenting pain to the Patient, Hot Irons not to be used.

ſeeing ſuch freſh wounds made in the quick and ſound fleſh, are endued with exquiſite ſenſe: Neither can any cauſtick be applied to nervous bodies, but that this horrid impreſſion of the fire will be preſently communicated to the inward parts; whence horrid ſymptoms enſue, and oft-times death it ſelf. And verily of ſuch as were burnt, the third part ſcarce ever recovered, and that with much ado, for that combuſt Wounds difficultly come to cicatrization; for by this burning are cauſed cruel pains, whence a Fever, Convulſion, and oft-times other accidents worſe than theſe. Add hereunto that when the eſchar fell away, oft-times a new hæmorrhage enſued, for ſtanching whereof they were forced to uſe other cauſtick and burning Inſtruments. Neither did theſe good men know any other courſe; ſo by this repetition, there was great loſs and waſte made of the fleſhy and nervous ſubſtance of the part: Through which occaſion the bones were laid bare, whence many were out of hope of cicatrization, being forced for the remainder of their wretched life, to carry about an ulcer upon that part which was diſmembred; which alſo took away the opportunity of fitting or putting to of an artificial leg or arm, in ſtead of that which was taken off. Wherefore I muſt earneſtly intreat all Chirurgeons, that leaving this old and too too cruel way of healing, they would embrace this new, which I think was taught me by the ſpecial favour of the ſacred Deity; for I learnt it not of my Maſters, nor of any other; neither have I at any time found it uſed by any: Onely I have read in *Galen* that there was no ſpeedier remedy for ſtanching of bloud than to bind the Veſſels (through which it flowed) towards their roots; to wit, the Liver and Heart. This precept of *Galen*, of binding and ſowing the Veins and Arteries in the new wounds, when as I thought it might be drawn to theſe which are made by the amputation of members, I attempted it in many; yet ſo, that at firſt in my budding practice thereof, I always had my Cauteries and hot Irons in a readineſs, that if any thing happened otherwiſe than I expected in this my new work, I might fetch ſuccour from the ancient practice; until at length confirmed by the happy experience of almoſt an infinite number of particulars, I bid eternally adieu to all hot Irons and Cauteries which were commonly uſed in this work. And I think it fit that Chirurgeons do the like. For Antiquity and Cuſtom in ſuch things as are performed by Art, ought not to have any ſway, authority or place contrary to reaſon, as they oft-times have in civil affairs; wherefore let no man ſay unto us, that the Ancients have always done thus.

Lib. 5. Meth.

CHAP. XXV.

The practice of the former precepts is declared, together with a memorable Hiſtory of a certain Souldier whoſe Arm was taken off at the Elbow.

A Hiſtory.

I Think it fit to confirm by an example, the preſcribed Method of curing a Gangrene and Mortification. Whileſt I was a Chirurgeon to the Marſhal of *Montejan* at *Turin*, a certain common Souldier received a Wound on his wriſt with a Musket-bullet, by which the bones and tendons being much broken, and the nervous bodies cruelly torn, there followed a Gangrene, and at length a Mortification even to the Elbow; beſides alſo an inflammation ſeized upon the middle part of his Cheſt, and there was as it were a certain diſpoſition to a Gangrene; whereby it followed, that he was painfully and dangerouſly troubled with belchings, hicketings, watchings, unquietneſs, and frequent ſwoundings, which occaſioned many Chirurgeons to leave him as deſperate. But it ſo fell out, that I (overcome by his Friends intreaty) undertook the cure of this wretched perſon, deſtitute of all humane help. Wherefore knowing the mortification by its ſigns, I cut off the Arm by the Elbow as ſpeedily as I could, making firſt the ligature, whereof I made mention; I ſay I took it off not with a Saw, but onely with an Inciſion-Knife, cutting in ſunder the ligaments which held the bones together, becauſe the ſphacel was not paſſed the joint of the Elbow. Neither ought this Section to be counted ſtrange, which is made in a joint; for *Hippocrates* much commends it, and ſaith that it is eaſily healed, and that there is nothing to be feared therein beſides ſwounding, by reaſon of the pain cauſed by cutting the common tendons and ligaments. But ſuch inciſion being made, the former ligature could not hinder, but much bloud muſt flow from thence, by reaſon of the large Veſſels that run that way; Wherefore I let the bloud to flow plentifully, ſo to disburden the part, and ſo afterwards to free it from the danger and fear of inflammation and a Gangrene; then preſently I ſtanched the bloud with an hot Iron, for as yet I knew no other courſe. Then (gently looſing the ligature) I ſcarified that part of the brawn of the Arm which was gangrenated, with many and deep inciſions, ſhunning and not touching the inner part, by the reaſon of the multitude of the large Veſſels and Nerves which run that way; then I preſently applied a Cautery to ſome of the Inciſions, both to ſtanch the bleeding, and draw forth the virulent *ſanies* which remained in the part. And then I aſſailed and overcame the ſpreading putrefaction, by putting and applying the formerly preſcribed Medicins; I uſed all ſorts of reſtrictive Medicins to ſtay the inflammation of the Cheſt; I alſo applied Epithemaes to the region of the heart, and gave him cordial potions and boles, neither did I deſiſt from uſing them until ſuch time as his belching, hicketing, and ſwoundings had left him. Whileſt I more attentively intended theſe things, another miſchief aſſails my Patient; to wit, Convulſions, and that not through any fault of him or me, but by the naughtineſs of the place wherein he lay, which was in a Barn every where full of chinks, and open on every ſide; and then alſo it was in the midſt of Winter, raging with Froſt and Snow and all ſorts of cold; neither had he any fire or other thing neceſſary for preſervation of life, to leſſen theſe injuries of the air and place: Now his joints were contracted, his teeth ſet, and his mouth and face were drawn awry, when as I pitying his caſe made him to be carried into the neighbouring Stable, which ſmoaked with much Horſe-dung; and bringing in fire in two Chafingdiſhes, I preſently anointed his neck and all the ſpine of his back, ſhunning the parts of the Cheſt, with liniments formerly deſcribed for Convulſions; then ſtraitway I wrapped him in a warm linnen cloth, and buried him even to the neck in hot dung, putting

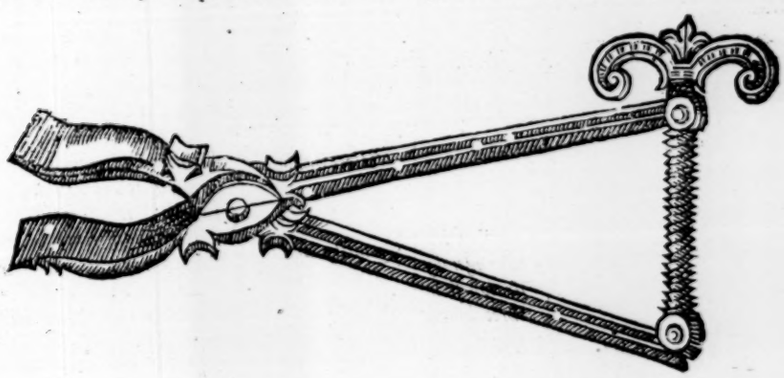
Diſmembring at a joint.

Sect. 4. Lib. de Art.

Burying in hot horſe-dung helps Convulſions.

ting a little freſh ſtraw about him; when he had ſtaid there ſome three days, having at length a gentle ſcouring or flux of his belly, and plentiful ſweat, he begun by little and little to open his mouth and teeth, which before were ſet and cloſe ſhut. Having got by this means ſome opportunity better to do my buſineſs, I opened his mouth as much as I pleaſed, by putting this following Inſtrument between his teeth.

A Dilator made for to open the Mouth and Teeth by the means of a Screw in the end thereof.



Now drawing out the Inſtrument I kept his mouth open by putting in a Willow ſtick on each ſide thereof, that ſo I might the more eaſily feed him with meats ſoon made, as with Cows milk and rear Eggs, until he had recovered power to eat, the convulſion having left him. He by this means freed from the Convulſion, I then again begun the cure of his arm, and with an actual Cautery ſeared the end of the bone, ſo to dry up the perpetual afflux of corrupt matter. It is not altogether unworthy of your knowledge, that he ſaid, how that he was wondrouſly delighted by the application of ſuch actual cauteries, a certain tickling running the whole length of the arm by reaſon of the gentle diffuſion of the heat by the applying the cauſtick; which ſame thing I have obſerved in many others; eſpecially in ſuch as lay upon the like occaſion in the Hoſpital of *Paris*. After this cauterizing there fell away many and large ſcales of the bone, the freer appulſe of the air than was fit making much thereto; beſides when there was place for fomentation, with the decoction of red Roſe leaves, Wormwood, Sage, Bay-leaves, Flowers of Camomil, Melilote, Dill, I ſo comforted the part, that I alſo (at the ſame time by the ſame means) drew and took away the virulent *ſanies*, which firmly adhered to the fleſh and bones. Laſtly, it came to paſs, that by Gods, aſſiſtance theſe means I uſed, and my careful diligence, he at length recovered. Wherefore I would admoniſh the young Chirurgeon, that he never account any ſo deſperate, as to give him for loſt, content to have let him go with prognoſticks; for as an ancient Doctor writes, that as in Nature, ſo in Diſeaſes there are alſo Monſters.

A fomentation for a Convulſion.

Monſters or miracles in Diſeaſes.

The End of the Twelfth Book.

BOOK XIII.

Of Ulcers, Fiſtulaes, and Hæmorrhoides.

CHAP. I.

Of the Nature, Cauſes, and Differences of Ulcers.

HAving already handled and treated of the Nature, Differences, Cauſes, Signs and Cure of freſh and bloudy Wounds, Reaſon and Order ſeem to require that we now ſpeak of Ulcers; taking our beginning from the ambiguity of the name. For according to *Hippocrates*, the name of Ulcer moſt generally taken may ſignifie all or any ſolution of Continuity; in which ſenſe it is read that all Pain is an Ulcer. Generally, for a Wound and Ulcer properly ſo called; as appears by his Book *De Ulceribus*. Properly, as when he ſaith it is a ſign of death when an Ulcer is dried up through an *Atrophia*, or defect of nouriſhment. We have here determined to ſpeak of an Ulcer in this laſt and proper ſignification. And according thereto we define an Ulcer to be the ſolution of Continuity in a ſoft part, and that not bloudy, but ſordid and unpure, flowing with quitture, *ſanies* or any ſuch like corruption, aſſociated with one or more affects againſt Nature, which hinder the healing and agglutination thereof; or that we may give it you in fewer words according to *Galens* opinion; An Ulcer is a ſolution of Continuity, cauſed by Eroſion. The cauſes of Ulcers are either internal or external. The internal are through the default of humours peccant in quality rather than in quantity, or elſe in both, and ſo making eroſion in the skin and ſofter parts by their acrimony and malignity; now theſe things happen either by naughty and irregular diet, or by the ill diſpoſition of the entrails, ſending forth and emptying into the habit of the body this their ill diſpoſure. The external cauſes are, the exceſs of cold ſeizing

The diverſe acceptions of an Ulcer. *Sent. 34. ſect. 3. lib. de fract.*

The external cauſes.

ſeizing upon any part, eſpecially more remote from the fountain of heat, whence follows pain, whereunto ſucceeds an attraction of humours and ſpirits into the part, and the corruption of theſe ſo drawn thither by reaſon of the debility or extinction of the native heat in that part, whence laſtly ulceration proceeds. In this number of external cauſes may be ranged, a ſtroke, contuſion, the application of ſharp and acrid Medicins, as Cauſticks, Burns, as alſo impure contagion, as appears by the virulent Ulcers acquired by the filthy copulation or too familiar converſation of ſuch as have the *French* Diſeaſe. How many and what the differences of Ulcers are, you may ſee here deſcribed in this following Scheme.

A Table of the Differences of Ulcers.

An Ulcer is an impure ſolution of continuity in a ſoft part, flowing with filth and matter or other corruption, whereof there are two chief differences; for one

- *Is ſimple and ſolitary without complication of any other affect againſt Nature, and this varies in differences, either*
  - *Proper, which are uſually drawn from three things, to wit,*
    - *Figure, whence one Ulcer is called*
      - *Round or Circular.*
      - *Sinuous, and variouſly ſpread.*
      - *Right or Oblique.*
      - *Cornered as Triangular.*
    - *Quantity, and that either according to their*
      - *Length; when an Ulcer is long, ſhort, indifferent.*
      - *Breadth; whence an Ulcer is broad, narrow, indifferent.*
      - *Profundity; whence an Ulcer is deep, ſuperficiary, indifferent.*
    - *Equality or Inequality; which conſiſts.*
      - *In thoſe differences of dimenſions whereof we laſt treated, I ſay in length, bredth, and profundity, wherein they are either alike or of the ſame manner, or elſe unlike and ſo of a different manner.*
  - *Or Common and accidental, and theſe drawn either*
    - *From their time; whence an Ulcer is termed new, old, of ſhort or long, cure and curation.*
    - *From their appearance; whence one is called an apparent Ulcer, another a hidden and occult Ulcer.*
    - *From their manner of generation; as if it be made by a heavy, bruiſing, cutting, pricking or corroding thing; whence a cut, torn and mixt Ulcer.*
    - *From their Site; whence an Ulcer before, behind, above, below in the head, tail, or belly of a Muſcle.*
    - *From that part it ſeizes upon; whence an Ulcer in the fleſh and skin, or feeding upon the griſtles or bones, ſuch as theſe of the Noſe, the Palat of the mouth, and Ears.*
    - *From other common accidents; whence a Telephian Ulcer, that is, ſuch an Ulcer as* Telephus *had. A Chironian, which needs the hand and art of* Chiron. *A Cancrous which reſembles a Cancer.*
- *Is Compound, and many and various ways complicated, as*
  - *With the cauſe whence an Ulcer*
    - *Is Cacochymick, Catarrhoick or venenate, that is, which a* Cacochymia *or Repletion of ill humours, a Catarrh, or poiſon cheriſhes or feeds.*
  - *With the Diſeaſe, as from*
    - *Diſtempers, whether ſimple or compound, whence an Ulcer is*
      - *Hot.*
      - *Cold.*
      - *Dry.*
      - *Moiſt.*
      - *Mixt.*
    - *Swelling or Tumour, whence a*
      - *Phlegmonous*
      - *Eryſipelous*
      - *Oedematous*
      - *Scirrhous*
      - *Cancrous*

      Ulcer.
    - *Solution of Continuity, or any other diſcommodity, whence a rough, callous, fiſtulous, cavernous, ſinuous Ulcer, with luxation, fracture, &c.*
  - *With the Symptom, whence a corroding, eating, painful, ſordid and virulent Ulcer.*
  - *With the cauſe and diſeaſe,*
    With the cauſe and Symptom,
    With the diſeaſe and Symptom,
    With the cauſe, diſeaſe and Symptom.

    Examples whereof may be taken from that we have formerly delivered.

CHAP.

CHAP. II.

Of the Signs of Ulcers.

THere are various signs of Ulcers according to their differences. For it is the sign of a putrid Ulcer, if it exhale a noisom, grievous, stinking and carion-like vapour, together with filthy matter. An eating Ulcer is known by the eating in, hollowness and wearing away of the part wherein it resides, together with the adjoining parts. A sordid Ulcer may be known by the grosness and viscidity of the excrements it sends forth, and by the loose and spongy softness, or the crusted inequality of the flesh which grows over it. A cavernous Ulcer, by the straitness of the orifice, and largeness and deepness of the windings within. A fistulous Ulcer, if to the last mentioned signs there accrew a callous hardness of the lips or sides of the Ulcer. A cancrous Ulcer is horrible to behold, with the lips turned black, hard and swollen; flowing with virulent and stinking corruption, and sometimes also with bloudy matter, together with the swelling and lifting up of the adjacent Veins. An untemperate, or as they term it, a distempered Ulcer, is such as is nourished by some great distemper, whether hot or cold, moist or dry, or compounded of these. An ill *natured or malign Ulcer is known by the difficulty of curing and rebellious contumacy to remedies appointed according to Art and Reason. We know a catarrhous Ulcer, if the matter which feeds it flow to it from some *varices* thereunto adjoining; or dilated, swollen and broken Veins, or from some entrail, or from the whole body being ill affected. An Apostematous Ulcer is perceived by the presence of any tumor against Nature, whose kind may be found out by sight and handling. *Telephian* Ulcers are such as affected *Telephus*; and *Chironian* (in whose cure *Chiron* excelled) are Ulcers which may be known by their magnitude, not much putrid, and consequently not sending forth any ill smell, not eating, not tormenting with pain, but having their lips swollen and hard, and therefore ill to be healed. For although they may be sometimes cicatrized, yet it being but slender may easily be broken, and the Ulcer renewed. They are almost like an ulcerated Cancer, but that they are accompanied with swelling in the adjacent parts; they are also worse than these which are termed *Cacoethe*, that is, ill-natured, or malign; whence it is that *Fernelius* thought they had a hidden cause of malignity, besides the common default of the humour, and that such as can scarce be driven away; such commonly are felt after the Plague. Wherefore *Galen* thinks such to be malign as will not suppurate or yield any quitture.

The signs of a putrid Ulcer

Com. ad aphor. 22. sect. 5.

CHAP. III.

Of the Prognosticks of Ulcers.

THe bone must necessarily scale, and hollow scars be left by malign Ulcers of a years continuance or longer, and rebellious to Medicins fitly applied. The bone must scale by reason of the continual efflux, and wearing by the acrimony of the humour, which looses the composure and glue by which the parts thereof are joined together. But the scars must become hollow, for that the bone (whence all the flesh takes its first original) or some portion thereof, being taken from under the flesh, as the foundation thereof, so much of the bulk of the flesh must necessarily sink down, as the magnitude of the portion of the wasted bone comes unto.

Aph. 45. sect. 6.

You may know that death is at hand, when the Ulcers that arise in or before diseases, are suddenly either livid or dried, or pale and withered. For such drineſs sheweth the defect of Nature, which is not able to send the familiar and accustomed nutriment to the part ulcerated. But the livid or pale colour is not onely an argument of the over-abundance of choler and melancholy, but also of the extinction of the native heat. In Ulcers where tumors appear, the Patients suffer no convulsions, neither are frantick; for the tumor being in the habit of the body possessed with an Ulcer, argues that the nervous parts and their original are free from the noxious humours. But these tumors suddenly vanishing and without manifest cause, as without application of a discussing Medicin or bleeding, those who have them on their backs have convulsions and distensions, for that the spine of the back is almost wholly nervous; but such as have them on their fore-parts, become either frantick, or have a sharp pain of their side, or pleurisie, or else a dysentery if the tumors be reddish: for, the fore-part of the body is replenished and over-spread with many and large Vessels, into whose passages the morbifick matter being translated, is presently carried to those parts which are the seats of such diseases. Soft and loose tumors in Ulcers are good, for they shew a mildness and gentleness of the humours, but crude and hard swellings are naught, for all digestion in some measure resembles elixation. Ulcers which are smooth and shining are ill, for they shew that there resides an humour malign by its acrimony, which frets asunder the roots of the hairs, and depraves the natural construction of the pores of the skin; whence it is, that such as are troubled with Quartan Agues, the Leprosie, or *Lues Venerea*, have their hair fall off. A livid flesh is ill in Ulcers which cause a rottenness or corruption of the bones lying under the flesh; for it is an argument of the dying heat and corruption of the bone, whence the flesh hath its original and integrity.

Hipp. progn. lib. 1. cap. 8. Aph. 65. sect. 5.

Aph. 97. sect. 5.

Aph. 4. sect. 6.

Those Ulcers which happen by occasion of any Disease, as a Dropsie, are hard to be cured; as also those whereinto a *varix* or swollen Vessel continually casts in matter, which a present distemper foments; which have swollen, hard and callous lips; and such as are circular or round. An *Hypersarcosis*, or fleshy excrescence usually happens to Ulcers not diligently mundified; and if they possess the Arms or Legs, they cause a Phlegmon or some other tumor in the groins, chiefly if the body be full of ill humours, as *Avicen* hath noted. For these parts by reason of their rarity and weakness are fit and subject to defluxions. *Albucrasis* writes that for nine causes Ulcers are difficultly replenished with flesh and cicatrized. The first, for want of bloud, in a bloudless body; the second, by reason

Hip. lib. de ulc. Gal. cap. 2. & 5. lib. Meth. 4.

For what causes Ulcers are hard to heal.

of

of ill humours and the impurity of the bloud; the third, by the unfit application of unconvenient Medicins; the fourth, by reaſon of the ſordidneſs of the Ulcer; the fifth, by the putrefaction of the ſoft and carion-like fleſh encompaſſing the Ulcer; the ſixth, when they take their original from a common cauſe which every where rages with fury, ſuch as are thoſe which are left by the peſtilence; the ſeventh, by reaſon of the callous hardneſs of the lips of the Ulcer; the eighth, when the Heavens and Air are of ſuch condition as miniſters fuel to the continuance of the Ulcer, as at *Saragoſa* in *Aragon*; the ninth, when the bones which lie under it are waſted by rottenneſs. An Ulcer that caſts forth white, ſmooth, equal quitture, and little or no ſtinking, is eaſily healed; for it argues the victory of the native heat, and the integrity of the ſolid parts. We term that ſmooth quitture which is abſolutely concocted, neither yields any aſperity to the touch, whereby we might ſuſpect that as yet any portion of the humour remains crude; we call that equal, wherein you can note no diverſity of parts; and white, not that which is perfectly ſo, but that which is of an aſh colour, as *Galen* obſerves. But it is ill, if when the cure is indifferently forward, a flux of bloud ſuddenly break forth in thoſe Ulcers which beat ſtrongly by reaſon of the great inflammation adjoined therewith. For, as *Hippocrates* obſerves, an effuſion of bloud happening upon a ſtrong pulſation in Ulcers is evil; for the bloud breaking out of an Artery cannot be ſtaid but by force, and alſo this bloud is ſo furious by reaſon of the heat and inflammation the nouriſhers of this Ulcer, that it breaks its receptacles, and hence enſues the extinction of the native heat, whence the defect of ſuppuration and a Gangrene enſues. Now for that there flows two ſorts of excrements from malign Ulcers, the more thin is termed *Ichor* or *Sanies*, but the more groſs is named *Sordes*, that is virulent and flows from pricked Nerves, and the *Perioſtea* when they are evil affected; but the other uſually flows from the Ulcers of the joints, and it is the worſer, if it be black, reddiſh, aſh-coloured, if muddy or unequal like Wine Lees, if it ſtink. *Sanies* is like the Water wherein fleſh hath been waſhed; it argues the preternatural heat of the part; but when it is pale coloured it is ſaid to ſhew the extinction of the heat.

What *Pus* or Matter is ſmooth, equal, and white. *Ad ſentent.* 32. *ſect.* 2. *de fract. Aph.* 21. *ſect.* 7.

Two ſorts of excrements flow from a malign Ulcer.

CHAP. IV.

Of the general Cure of Ulcers.

The curing of a ſimple Ulcer conſiſts in exſiccation. *Gal.* 7. *Meth. cap.* 12.

AN Ulcer is either ſimple or compound. A ſimple Ulcer, as an Ulcer, hath one and that a ſimple indication, that is, exſiccation; and that more than in a Wound, by how much an Ulcer is moiſter than a Wound. There are many indications propoſed for the cure of a compound Ulcer, in reſpect of which *Galen* would have us to keep this order, that we have the firſt regard of the moſt urgent, then of the cauſe, then of that, which unleſs it be taken away, the Ulcer cannot be healed. By giving you an example you may eaſily underſtand the meaning hereof. Imagine on the inſide of the leg, a little above the ancle, an Ulcer very painful, hollow, putrid, aſſociated with the rottenneſs of the bone, circular, having hard and ſwollen lips, and engirt with the inflammation and *varices* of the neighbouring parts. If you take this to cure, before you do any thing about the Ulcer, unleſs you be called upon by that which urges, as by vehemency of pain, you muſt firſt uſe general means by calling and adviſing with a Phyſician. For in *Galens* opinion, if the whole body require a preparation, then muſt that be done in the firſt place; for in ſome Ulcers purgation onely will be ſufficient, in ſome bloud-letting, others are better by uſing both means, which is as the cauſe of the Ulcer proceeds from a repletion or illneſs of humours. Now by theſe means having taken away the cauſe of the Ulcer, you muſt come to the particular cure thereof, beginning with that which is moſt urgent. Wherefore you muſt firſt aſſwage the pain by application of things contrary to the cauſe thereof: as, if it proceeded from a phlegmonous diſtemper, which hath long poſſeſt, diſtended, and hardned the part, it muſt be eaſed by evacuation. Firſt, bathing it with warm water, to mollifie and relax the skin, that ſo you may the more eaſily evacuate the contained humours; then ſhall you draw away a portion of the matter cauſing the ſwelling and pain by ſcarification, if the Patient ſhall be of ſufficient courage, or elſe by application of Horſe-leaches, if he be more faint-hearted; and then you ſhall temper the heat thereof by applying *Unguentum refrigerans Galeni*. To conclude, you ſhall attempt all things which we have formerly delivered (in our Treatiſe of Tumors) to take away the ſwelling thereof. When you have brought this to that paſs you deſire, you ſhall come to thoſe which are ſuch, that it cannot be taken away or healed without them, which ſhall be done by orderly helping the defects againſt Nature which were conjoined with the Ulcer, to wit, the rottenneſs of the bone, which you ſhall help by actual cauteries; and in the mean while you ſhall draw the Ulcer into another form, to wit, cornered, and you ſhall cut away the callous hardneſs, and help the rottenneſs; then muſt you procure the falling away of the Eſchar, and then provide for the ſcaling of the bone by the means formerly preſcribed; laſtly, the mundified Ulcer muſt be filled with fleſh. For generating of fleſh two cauſes muſt concur, the efficient, and material; the efficient is, the good temper both of the whole body, as alſo of the ulcerated part. For, this prevailing, there will be an attraction, digeſtion, oppoſition and aſſimulation of the laudable juice to the part affected; verily the laudable temper is preſerved by like things, but the vicious is amended by contraries. The matter to be ſpent upon fleſh is laudable bloud, which offends neither in quality nor quantity. In this regeneration of the fleſh there appear two kinds of excrements, the one more thin and humid called *Sanies*, the other more groſs termed *Sordes*. Both of theſe for that they are contrary to nature, do therefore hinder the regeneration of fleſh, and therefore muſt be taken away by applying their contraries, as by things drying in the firſt degree, and more ſtrongly or weakly detergent, according to the complexion of the part and the whole body, and the plenty and quality of the excrementitious humour, and the uncleanneſs of the Ulcer. For the part muſt be preſerved by the

Gal. lib. 4. *de comp. med. ſecund. gen.*

The things conducing to the generating of fleſh.

uſe

uſe of the like, but the Ulcer overcome by application of things contrary thereto. After that by Natures endeavour and the Chirurgeons help the Ulcer is replete with fleſh, it muſt be cicatrized, that is, covered with a callous skin in ſtead of the true and native skin. It may be cicatrized by ſtrewing of very drying powders having very little or no acrimony. Thus Alum and Vitriol being burnt and made into Powder, and thinly ſtrewed upon the part, do quickly cicatrize the former fleſhy Work. To this purpoſe alſo ſerve the root of *Ariſtolochia*, Aloes, burnt Lead, Pomegranat Pills burnt, Litharge, *Tutia*, and alſo plates of Lead beſmeared with Quick-ſilver, whoſe efficacy for this purpoſe Chirurgeons ſometimes find more certain and powerful than any other remedies.

What a Scar is.

Things cauſing cicatrization.

CHAP. V.

Of a diſtempered Ulcer.

BEfore we ſpeak of a diſtempered Ulcer, it is meet, leſt that the Chirurgeon take one diſtemper for anotner, briefly to relate the ſigns of each. You may know that an Ulcer is aſſociated with a dry diſtemper by your ſight, as if the Ulcer be as it were wrinkled, if it ſend forth little or no moiſture; alſo it is known by touch, if it feel rough and hard. You ſhall correct this diſtemper by humecting Medicins, as fomenting it with warm water according to *Galens* opinion, or elſe with *Hydrelæum (i.)* Oil and Water mixt: but always you muſt firſt purge, if the body ſhall abound with ill humours, or uſe Phlebotomy if the body be plethorick; otherwiſe you ſhall draw more humours into the part than it can bear. Now you ſhall ſo long foment it, untill the fleſh which is about it begin to look red, wax ſoft and moiſt, and the part it ſelf be a little ſwollen. If you proceed further, you will reſolve all the humour which you have drawn thither, and ſo your labour is in vain. After the fomentation, apply ſuch a remedy to the ulcerated part. ℞ *Cremoris hordei* ℥ ij. *fol. malvæ in aq. coct.* ℥ j. *pingued. porci* ℥ j. ß. *mellis com.* ℥ ſ. *miſce in mort. & fiat unguentum.*

Signs of a diſtempered Ulcer.

Remedies for a dry diſtempered Ulcer.

You ſhall know a moiſt diſtemper aſſociates the Ulcer by the plenty of the excrementitious humour, which the Ulcer ſends forth, by the ſpongy and fungous ſoftneſs and growth of the fleſh about it. You ſhall amend this by drying remedies, ſuch as thoſe are, which we term Sarcoticks, having always regard to the plenty of the humour, the proper temper of the part, and other indications formerly mentioned. Amongſt other remedies *Galen* much commends Alum Water, for it dries, cleanſes and corroborates the affected part. Alſo this enſuing fomentation may be applied to good purpoſe. ℞ *Roſar. rub. abſinth. beton. tapſi barbati an. m.* j. *gallarum, nucum cupreſſi, an.* ℥ ij. *aluminis rochæ* ℥ j. *fiat decoctio in vino auſtero, inſtituatur fotus.* Then let *Empl. de ceruſſa* or *de minio* be applied to the Ulcer. Alſo I have found by experience that the Powder of burnt Alum lightly ſtrewed upon the Ulcer is very effectual in this caſe. You ſhall know that an hot diſtemper aſſociates the Ulcer by the redneſs or yellowneſs thereof, by the heat manifeſt to your touch, and the propriety of your pain. Then muſt you have recourſe to refrigerating things, ſuch as *Ung. Roſatum Meſ. Refrigerans Gal. Populeon*; ſtoops and cloths dipped in Plantain Water, Nightſhade Water, or Oxycrate. I have oft found by experience that ſcarification, or Leaches being applied, did more conduce than any other remedy. For ſo the chafed bloud, which by that means is apt to corrupt, is drawn away, and the part it ſelf is alſo freed of that burden.

Gal. lib. 1. *ſimp. cap.* 7.

Signs of too moiſt an Ulcer

Signs of a hot diſtempered Ulcer.

We know a cold diſtemper by the whitiſh or pale colour, by the touch of the Chirurgeon, and ſpeech of the Patient complaining of the coldneſs of the ulcerated part. You ſhall correct this by applying and putting bottles filled with Water about the part, or elſe Swines bladders half filled with the following decoction. ℞ *Origani, pulegii, chamæm. meliloti, an. m.* j. *abſinth. majoranæ, ſalviæ, roriſmar. an. m.* ſ. *fiat decoctio in vino generoſo, addendo aquæ vitæ quod ſufficit.* Alſo the Ulcer may be conveniently fomented with Sponges dipped in the ſame decoction, and let there be applied thereto *Empl. Oxycroceum, emp. de meliloto, de Vigo cum mercurio*, and *ſine mercurio*. But if a mixt and compound diſtemper be joined to the Ulcer, the Medicins muſt in like manner be mixt and compoſed. The reſidue of the Chirurgeons care and pains muſt be ſpent upon the proper and peculiar cure of the Ulcer, as it is an Ulcer; which we ſaid in the former Chapter was contained in deterſion, regenerating fleſh, and cicatrization thereof.

Signs of a cold diſtempered Ulcer.

CHAP. VI.

Of an Ulcer with pain.

THere oft-times ſo great pain accompanieth Ulcers, that it calls thereto the counſel of the Phyſician. Wherefore if it proceed from any diſtemper, it ſhall be taken away by remedies proper againſt that diſtemper, ſuch as we mentioned in the former Chapter. But if it do not ſo ceaſe, we muſt go on to Narcoticks. Such are cataplaſms of the leaves of Mandrakes, Water-lillies, Henbane, Nightſhade, Hemlock, the ſeeds of Poppy and Oils of the ſame; to which alſo may be added *Opium*, *Populeon*, and other things of like faculties. But if a malign acrimony and virulency of an humour corroding and eating the fleſh lying under it and the lips about it, cauſe and make the pain, you ſhall neither aſſwage it by Anodynes nor Narcoticks; for by application of gentle Medicins it will become worſe and worſe. Wherefore you muſt betake you to Cathæreticks; for ſtrong Medicins are fitteſt for ſtrong diſeaſes. Wherefore let a Pledget dipped in ſtrong and more than ordinarily powerful *Ægyptiacum*, or in a little Oil of Vitriol, be applied to the Ulcer; for theſe have power to tame this raging pain, and virulent humours. In the mean ſeaſon let refrigerating things be put about the Ulcer; leſt the vehemency of acrid Medicins cauſe a defluxion.

The matter of Narcotick Cataplaſms.

Cathæreticks have power to aſſwage pain.

CHAP.

CHAP. VII.

Of Ulcers, with over-growing or proudneſs of fleſh.

Things waſting ſuperfluous fleſh.

ULcers have oft-times proud or over-growing fleſh in them, either by the negligence of the Chirurgeon, or fault of the Patient. Againſt this, drying and gently eating or conſuming Medicins muſt be applied, ſuch as are Galls, *Cortex thuris*, Aloes, *Tutia*, Antimony, *Pompholix*, Vitriol, Lead, all of them burnt and waſht if need require. Of theſe Powders you may alſo make Ointments with a little Oil and Wax; but if the proud fleſh, as that which is hard and denſe, yield not to theſe remedies, we muſt come to cauſticks, or elſe to iron, ſo to cut it off. For in *Galens* opinion, the taking away of proud fleſh is no work of Nature, (as the generating, reſtoring and agglutinating of the fleſh is) but it is performed by Medicins which dry vehemently, or elſe by the hand of the Chirurgeon; wherefore amongſt the remedies fit for this operation, the Powder of Mercury with ſome ſmall quantity of burnt Alum, or burnt Vitriol alone, ſeem very effectual to me. Now for the hard and callous lips of the Ulcer, they muſt be mollified with Medicins which have ſuch a faculty, as with Calves, Gooſe, Capons, or Ducks greaſe, the Oils of Lillies, ſweet Almonds, Worms, Whelps, *Oeſipus*, the mucilages of Marſh-mallows, Linſeed, Fænugreck-ſeed, Gum *Ammoniacum*, *Galbanum*, *Bdellium*, of which being mixed may be made Emplaiſters, Unguents, and Liniments: or you ſhall uſe *Empl. Diachylon*, or *de Mucilaginibus*, *De Vigo cum Mercurio*. To conclude, after you have for ſome few days uſed ſuch like remedies, you may apply to the Ulcer a plate of Lead rubbed over with Quickſilver, for this is very effectual to ſmooth an Ulcer and depreſs the lips: if you ſhall prevail nothing by this means, you muſt come to the Cauſticks, by which if you ſtill prevail nothing, for that the lips of the Ulcer are ſo callous lous that the cauſticks cannot pierce into them, you muſt cleave them with a gentle Scarification, or elſe cut them to the quick, ſo to make way, or as it were open a Window, for the Medicin to enter in, according to *Galen*. Neither in the interim muſt you omit *Hippocrates* his advice, which is, that by the ſame operation we reduce the Ulcer, if round, into another figure, to wit, long or triangular.

For the callous lips of Ulcers.

Lib.3. Meth. cap.6.

Lib.4. Meth. cap.2.

CHAP. VIII.

Of an Ulcer putrid and breeding Worms.

The cauſe of Worms breeding in Ulcers

WOrms are divers times bred in Ulcers, whence they are called Wormy Ulcers; the cauſe hereof is the too great excrementitious humidity prepared to putrefie by unnatural and immoderate heat. Which happens, either for that the Ulcer is neglected, or elſe by reaſon of the diſtemper and depraved humours of all the body, or the affected part; or elſe for that the excrementitious humour collected in the Ulcer, hath not open and free paſſage forth; as it happens to the Ulcers of the Ears, Noſe, Fundament, Neck of the Womb, and laſtly, to all ſinuous and cuniculous Ulcers. Yet it doth not neceſſarily follow that all putrid Ulcers muſt have Worms in them; as you may perceive by the definition of a putrid Ulcer, which we gave you before. For the cure of ſuch Ulcers after general means, the Worms muſt firſt be taken forth, then the excrementitious humour muſt be drawn away whence they take their original. Therefore you ſhall foment the Ulcer with the enſuing decoction, which is of force to kill them; for if any labour to take forth all that are quick, he will be much deceived; for they oft-times do ſo tenaciouſly adhere to the ulcerated part, that you cannot pluck them away without much force and pain. ℞ *Abſinth. centaur. majoris, marrubii, an. M.* j. *fiat decoctio ad* ℔ ſ. *in aqua diſſolve aloes* ʒ ſ. *unguenti Ægyptiaci* ʒ j. Let the Ulcer be fomented and waſhed with this Medicin, and let pledgets dipped herein be put into the Ulcer; or elſe, if the Ulcer be cuniculous or full of windings, make injection therewith which may go into all parts thereof.

A fomentation to kill the Worms.

Achigenes much commends this following Medicin. ℞ *Ceruſæ, polii montani, an.* ʒ ß. *picis navalis liquidæ quantum ſufficit, miſce in mortario pro linimento.* If the putrefaction be ſuch that theſe Medicins will not ſuffice for the amendment thereof, you muſt come to more powerful, or to Cauteries alſo, or hot Irons, or to Section; yet you muſt ſtill begin with the more gentle, ſuch as this of *Galens* deſcription. ℞ *Ceræ,* ʒ ij. *ceruſæ* ʒ j. *olei roſ.* ʒ ij. *ſalis ammon.* ʒ ſ. *ſquam. æris* ʒ ij. *thur. alum. æruginis malicor. calcis vivæ, an.* ʒ j. *fiat emplaſtrum.* Or ℞ *terebinth. lotæ* ʒ ij. *ceræ albæ* ʒ ß. *liquefiant ſimul addendo ſublimati* ʒ ſ. *ſalis torrefacti & vitrioli calcinati, an.* ʒ j. *fiat mundificativum.* Or you muſt uſe our *Ægyptiacum* alone, which hath ſublimate entering into the compoſition thereof; but in the interim the circuit of the Ulcer muſt be defended with refrigerating and defenſative things for fear of pain.

Gal.4. comp. Med.

CHAP. IX.

Of a Sordid Ulcer.

A Sordid Ulcer after the cure of the body in general, ſhall be healed with detergent Medicins; the Indication being drawn from the groſs and tough excrement, which with the excrementitious *Sanies*, as it were beſieging and blocking up the ulcerated parts, weakens and as it were dulls the force of Medicins though powerful, which cauſeth us to begin the Cure with Fomentations and Lotions; as thus: ℞ *Lixivii com.* ℔ j. *abſinth. marrub. apii, centaur. utriuſque, hypericonis, an. M. ſſ. coquantur, colaturæ, quæ ſufficiat, adde mellis roſati* ʒ j. *unguenti Ægyptiaci* ʒ ß. *fiat fotus.* Then uſe the following deterſive Medicin: ℞ *Succi apii, & plantag. an.* ʒ ij. *mellis com.* ʒ j. *terebinth.* ʒ j. ſ. *pul. Iridis Florent. & aloes an.* ʒ ſ. *fiat medicamentum.* The Chirurgeon muſt

A detergent Lotion.

well

well conſider, at how many dreſſings he ſhall be able to waſh away the groſs *ſordes*, or filth ſticking cloſe to the Ulcer, and dry up the excrementitious *ſanies*. For oft-times theſe things may be done at one dreſſing; but in others who have more quick ſenſe or feeling, not ſo ſoon. But when the Ulcer is freed of ſuch groſs *ſordes* or filth, you muſt forbear to uſe more acrid things for fear of pain, defluxion, inflammation and eroſion, whereby the Ulcer would become more hollow. Wherefore then we ſhall be content to apply remedies which dry and cleanſe without acrimony, that we may ſo help Natures endeavours in generating fleſh. Such remedies are, the powders of Aloes, Maſtick, Myrrh, Orris, Litharge, Antimony, roots of Gentian, Barley-flower, and the like, which being ſtrewed upon the Ulcer, you ſhall cover it with lint, and put over that a plate of Lead, rubbed over with quick-ſilver; and you ſhall put on theſe deterſives and deſiccatives more or leſs ſtrong, as you ſhall find it requiſite and neceſſary. For the too plentiful uſe of drying and deterſive things, doth in time hollow the Ulcer, whereby it comes to paſs that in ſhort time in like ſort, a great quantity of *ſanies* flows from the Ulcer, the proper ſubſtance of the fleſh being diſſolved by the force or acrimony of deterſive medicines; as alſo the proper alimentary humor, which flowed to the part, being in like ſort defiled: Which thing beguiles the unskilful Chirurgeon. For by how much he ſees the Ulcer flow more plentifully with *ſanies*, he endeavours by ſo much the more to exhauſt and dry up with more acrid medicines theſe humidities, as if they were excrementitious: But *Galen* hath long ago admoniſhed us to take heed hereof, ſetting forth a Hiſtory of a certain Emperick who dreſſing a ſordid Ulcer with a green, acrid and eating medicine, diſſolved the fleſh; and ſo conſequently made the Ulcer more hollow, and cauſed more pain and defluxion; whereby it hapned, that continually adding more acrid medicines, he continually (by his ignorance and unskilfulneſs) increaſed the colliquation of the fleſh, the largeneſs of the Ulcer and excrementitious humidity: Wherefore we muſt take ſpecial care whether the ſordid Ulcer grows each day worſe, by its proper fault, and the impurity of the whole body beſides, or elſe by the colliquation of the fleſh, and corruption of the benign and alimentary humor ſent thither for the nutrition of the part, by the too frequent and unskilful uſe of too acrid a medicine. You may conjecture this by the increaſe of the pain without reaſon, and by the heat and redneſs of the lips of the Ulcer. Therefore you muſt principally have regard to this, that you give each of your Patients his fit meaſure; that is, a convenient and agreeable medicine to each of their ſtrengths, taking indication from the ſtrength, diſtemper and conſiſtence of the whole body and affected part; for there is a great deal of difference whether you apply a medicine to a Plow-man or labourer, or to an Eunuch and woman; or whether to the leg or eyes: For theſe medicines which to a denſe and hard body and part are only detergent and drying, the ſame are to delicate and tender bodies and parts cathæretick and eating, by colliquation of the fleſh, and corruption of the nouriſhment, making an increaſe of *ſordes* or filth; on the contrary, thoſe things which do laudably and ſufficiently cleanſe the fleſh in a ſoft body, and dry up the *ſanies*, theſe ſame things applied to a hard body, increaſe the *ſordes* and *ſanies* by ſuffering them to breed, neither are they of ſufficient power to waſh away the tenacious impurity of a denſe body. Wherefore the skilful Chirurgeon will ſee when he muſt betake himſelf from too ſtrongly cleanſing and eating medicines to theſe which are more mild.

Detergent medicines without acrimony.

A caution very obſervable in uſe of detergent things.

A diſtinction to be obſerved concerning the impurity of Ulcers.

Diligent regard muſt be had of the Patients bodies, and the affected part.

CHAP. X.

Of a virulent, eating and malign Ulcer, which is termed Cacoethes, *and of a Chironian Ulcer.*

VIrulent and eating Ulcers differ not, unleſs in *magis* and *minus*, for we term it a virulent Ulcer, which ſends forth a virulent *ſanies*, which is properly called *Virus*. This *Virus* or virulency, when it becomes more malign, gnaws and feeds upon the parts which lie under, and are adjoyned to the Ulcer, and makes an eating Ulcer. Such Ulcers are by *Galen* called *Dyſepulotica*, that is, difficultly to be cicatrized; for, ſaith he, it happens that the Ulcer is Dyſepulotick, either for that the part affected may be vitiated, either in the habit or temper thereof ſo that it may corrupt the humor which flows thither; ſuch an Ulcer is by a particular name termed *Cacoethes*; or for that by reaſon of the evil quality of the blood flowing thither and eating the part, the part affected being too moiſt cannot heal up. He further adds, that a Chironian Ulcer is far more malign than theſe Ulcers, which are termed *Cacoethe*. For the cure; by reaſon that all theſe Ulcers have a large extent, for ſome are more malign and ill to be cicatrized than other ſome, it is alſo neceſſary to have divers medicines ready and at hand, diſtinct both in their faculties and the degrees thereof, ſo that it is no marvel if they oft fail of their purpoſe, who with the ſame medicine dreſs (and think they ſhall heal) all malign Ulcers. This following medicine deſcribed by *Aſclepiades*, is much commended by *Galen*. ℞ *Squammæ æris, æruginis raſæ, an.* ʒ i. *Ceræ* ℔ ß. *Reſinæ laricis* ʒ i ß. *Quæ liquari poſſunt aridis affundantur*, and make an Emplaiſter to be laid only upon the Ulcer; for you muſt lay a defenſative about the Ulcer, for fear of inflammation. But *Galen* ſaith, that the following Epulotick of *Primon* excels the reſt, as that which to deſperate Ulcers (which many have taken in hand and left as uncurable,) was of certain and approved uſe. ℞ *Soreos* ʒ iij. *Aluminis ſciſſilis; calcis vivæ, an.* ʒ ij. *Thuris gallarum, an.* ʒ iiij. *Ceræ* ℔ i. & ʒ iij. *Sevi vitulini* ℔ i. & ʒ vij. *Olei veteris quantum ſufficit, fiat emplaſtrum.*

CHAP. XI.

An Advertiſement to the young Chirurgeon, touching the diſtance of times wherein malign Ulcers are to be dreſſed.

Gal. lib. 4. de comp. med. See *Gen. cap. 5.*

TO ſhew the uſe of *Aſclepiades* his medicines, deſcribed in the former Chapter, and convince the error of thoſe Chirurgeons, who think they do well for their Patients, if they twice or thrice on a day dreſs malign Ulcers; I have here thought good to digreſs a little from my purpoſe, and to interpoſe *Galen*'s authority. Rightly (ſaith *Galen*) hath *Aſclepiades* added theſe words to the formerly deſcribed medicine: And looſe this after three days, and foment the Ulcer, and faſten the ſame emplaſter being waſhed, and apply it again; for unleſs the medicine adhere long to the skin, it will do no good. Which thing notwithſtanding many Phyſicians have been ignorant of; thinking, if they wiped away the *ſanies* from the Ulcer thrice on a day, they ſhould do better than thoſe who did the ſame but twice a day. But thoſe who dreſs it but once a day, are reproved by the Patients, as negligent. But they are much miſtaken; for you muſt remember, as we have delivered in moſt of our Writings, that the qualities of all neighbouring bodies do mutually actuate and affect each other in ſome degree, although the one thereof be much more powerful; for by this reaſon in ſpace of time they become ſomewhat alike, though they otherwiſe differ much: But when the quality of the medicine ſhall be like the *ſpecies* to the body to be cured, there follows the better ſucceſs. Wherefore he wich moved firſt by theſe reaſons, firſt appointed to uſe the emplaſter formerly applied, is worthy of commendations; and we ought to follow him much the rather, ſeeing that which he found out by reaſon, is approved by experience. Neither did he unadviſedly command, to foment the wound every third day, that is, every dreſſing; for, ſeeing it is a powerful medicine, therefore it ſtands in need of mitigation. Thus much *Galen*, whoſe opinion grounded on reaſon, he can again confirm with another reaſon. It is already ſufficiently known, that medicines can do nothing in us unleſs by the force of the native heat, which ſtirs up the faculty of the medicine to operation. But in Ulcers which are abſolutely malign, the native heat of the affected part is very languid, being broken and debilitated by the preſence of the preternatural heat; ſo that it ſtands in need of a great ſpace of time to actuate the virtue and faculty of the medicine Wherefore, if in that time, when as the native heat hath much moved and ſtirred up the faculty of the medicine, the Ulcer be looſed or opened, and that emplaſter caſt away which was laid upon the part, and a freſh one laid inſtead thereof; the heat implanted in the part, is either diſſipated by the contract of the air, or is weakned and driven in; and that endeavour which was made by the emplaiſter was to no purpoſe, being, as it were, ſtopped in the midſt of the courſe: But a new emplaiſter being laid on, the heat of the part muſt undergo a new labour, ſo to ſtir up the faculty to bring it to act.

Galen's reaſon further explained.

Medicines are only ſuch in faculty.

For all medicines are what they are in faculty. Equal to this is their errour, who by too oft renewing their emplaiſters on the ſame day, do too powerfully cleanſe; for ſo they do not only take away the excrementitious humous, both *ſordes* and *ſanies*, but alſo the alimentary juice; to wit, the *Rob*, *Cambium* and *Gluten*, which are the next matter for procreating of laudable fleſh. Wherefore, it is not good to dreſs Ulcers ſo often in one day, and to looſe them to apply new emplaiſters, unleſs ſome grievous ſymptom (as pain) force us to do it, which requires to be aſſwaged and mitigated by the often changing and renewing of Anodyne medicines.

CHAP. XII.

How to bind up Ulcers.

The beginning of your binding muſt be at the Ulcer.

FOr the binding up of Ulcers, you muſt always begin your bandage at the Ulcer. Now the rowler muſt be ſo large, that it may not only cover and comprehend the Ulcer, but alſo ſome portion of the adjacent parts above and below; and let it preſs the Ulcer with that moderation, that it may only preſs out the excrementitious humors. For ſo the Ulcer will become dry, and conſequently more near to healing, as it is obſerved by *Hippocrates*. Let this be the meaſure of your binding, that it be neither too ſtrait, for hence would enſue pain and defluxion; nor too lax, for ſuch is of no uſe. You may moiſten your boulſters and rollers in Oxycrate, or in red and aſtringent Wine, eſpecially in Summer; when you have bound it up, the part muſt be kept quiet: For according to *Hippocrates*, thoſe who have an Ulcer in the leg, ought neither to ſtand nor ſit, but to lie on a bed. Wherefore, when the legs are ulcerated, the arms muſt be exerciſed, by handling, lifting up and caſting down of divers things. But on the contrary, if the arms be ulcerated, the legs muſt be exerciſed with walking, or frictions from above downwards, if the Patient cannot endure to walk. So the humors and ſpirits which with more violence and greater plenty run down to the part affected, may be drawn back and diverted.

Revulſion into contrary parts.

CHAP. XIII.

Of the cure of particular Ulcers, and firſt of thoſe of the Eyes.

4. Meth.

FOr that (in *Galen*'s opinion) the divers Indications in curing diſeaſes are drawn from the condition of the part, to wit, the temper, complexion, ſite, figure, uſe, dull or quick ſenſe; Therefore having briefly handled the general cure both of ſimple and compound, and implicit Ulcers, I think it fit to treat of them now as they are diſtinguiſhed by the parts, beginning

ning with theſe of the eyes. Theſe according to *Celſus*, are ſometimes cauſed by puſtules, or a ſharp defluxion which frets or eats in ſunder the coats thereof, or elſe by a ſtroke.

Paulus ſets down theſe differences of the Ulcers of the eyes: If (ſaith he) a ſmall, little and hollow Ulcer be upon the horny-coat, it is by the Greeks termed *Botryon*; but if it be broader and leſs deep, it is termed *Cæloma*; about the circle of the *Iris* or Rain-bow, it is called *Argemon*; if it be cruſty and ſordid, it is termed *Epicauma*. Theſe in general require the ſame cure as the former, that is, to be mundified, incarnated, dried and cicatrized; but the part affected indicates more gentle medicines. Wherefore having purged the Patient, and taken ſome blood both from his arm, as alſo from his veins and temporal arteries, and bathed him if it be needful, to divert the defluxion, you ſhall to his ſhoulders apply Cupping-glaſſes with Scarifications; or elſe bread newly drawn out of the Oven, and ſprinkled with *Aqua vitæ*; or ſome good Wine ſhall be applied to the original of the ſpinal marrow. But you ſhall apply to the forehead and temples an aſtringent emplaiſter made of *emplaſtrum contra rupturam*, *ung. Comitiſſæ*, and *reſiccativum rubrum* mixed together. But this enſuing *Collyrium* deſcribed by *Celſus* and approved by *Hollerius*, ſhall be dropped into the eye. ℞ *Æris uſti, cadmiæ uſtæ & lotæ, an.* ʒ i. *ex aqua fingatur collyrium quod liquore ovi diſſolvatur.* But in the mean time you muſt diligently obſerve whether you put the eye to any great pain. Wherefore now and then by putting anodyne medicines thereto, it will be good to comfort it. Alſo you may make *collyria* of the decoction of Plantain, Fenugreek, Wormwood, with a little quantity of Sugar-candy, *tutia*, gum *tragacanth*, Myrrh and Vitriol diſſolved therein. When the Ulcer is mundified, the following Sarcotick will be of good uſe. ℞ *Sarcocollæ in lacte muliebri nutritæ,* ʒ iij. *pul. diaireos ſimplicis, gum. arabici, tragacanth, an.* ʒ ß. *Mucilaginis fœnugræci quantum ſufficit ut inde fiat collyrium.* But you muſt note, that for moiſt Ulcers, Powders are more convenient than *Collyria*. When the Ulcer is plained or filled with its proper fleſh, it may be cicatrized with the following *collyrium*. ℞ *Tutiæ; cadmiæ ut decet præparatæ, ceruſæ, antimonii, olibani, an.* ʒ ß. *Myrrhæ, ſarcocollæ, ſanguinis Draconis, aloes, opii, an.* ʒ ß. *Cum aqua plantaginis fiat collyrium*; or the powder only may be conveniently ſtrewed thereon.

Celſus hath noted, that the cicatrizing of the eyes is incident to two dangers; that is, leſt they be too hollow, or elſe too thick. If too hollow, they muſt be filled by the following remedy. ℞ *Papaveris lacrymæ,* ʒ ß. *Sagapeni, opopanacis, an.* ʒ ß. *æruginis* ʒ i. *Cumini* ʒ iij. *Piperis* ʒ ij. *cadmiæ lotæ & ceruſæ, an.* ʒ i ß. *Cum aqua pluviali fiat collyrium.* But if the ſcars be thick or groſs, the following remedy will extenuate them. ℞ *Cinamomi, acaciæ, an.* ʒ ß. *Cadmiæ elotæ, croci, myrrhæ, papaveris lacrymæ, gum. arabici, an.* ʒ i. *Piperis albi, thuris, an.* ʒ i ß. *Æris combuſti,* ʒ iij. *Cum aqua pluviali fiat collyrium.* But if the ſcar be upon the *Cornea* or horny coat, ſo that it cover the *pupilla* or ſight, the ſight will be intercepted by the denſeneſs of the membrane. Here you muſt alſo obſerve, that the ſcars that are on the *Cornea* are white, but theſe on the *Adnata* are red, becauſe this is ſpread over with more little veins than that.

The cure.

A *Collyrium* to cleanſe the ulcers of the eyes.

A ſarcotick *Collyrium.*

An epulotick *Collyrium. Lib. 6. cap. 6.*

A *Collyrium* for hollow ſcars.

The ſcars of the hornycoat are white, and theſe of the *Adnata* red.

CHAP. XIV.

Of the Ozæna *and Ulcers of the Noſe.*

THe *Ozæna* is a deep and ſtinking Ulcer in the inſide of the noſe, ſending forth many cruſty and ſtinking excrements: *Celſus* ſaith that ſuch Ulcers can ſcarcely be healed. It is cauſed (as *Galen* ſaith) by the diſtillation of acrid and putrid humors from the head into the noſtrils about the mammillary proceſſes. For the cure, the Patient muſt eat ſparingly; and his meat muſt neither be ſharp nor ſtrong; the humor being prepared, muſt be purged; the head dried and ſtrengthned, that ſo it may neither admit the excrementitious humors, nor ſend them down; then muſt we come to the part affected with the Ulcer. The Ulcer muſt be dried with a repelling medicine; ſuch as is the juice of Pomegranats boiled to the half in a braſs veſſel; the powder of Calamint, Creſſes, white Hellebore, the juice of Creſſes with Alum and other things which you may read in *Celſus*. *Galen* out of *Archigenes* wiſhes, to draw up into the noſtrils the juice of Calamint, or that the Calamint it ſelf being dried, and made into powder, may be blown with a quill into the noſe. Others uſe this following powder. ℞ *Roſ. rub. mint. calam. arom. rad. angelicæ, gentian. macis, caryop. an.* ʒ ß. *Camph. ambræ, an. gr.* iiij. *Moſch. gr.* vj. *fiat pulvis ſubtiliſſimus. Manardus* writes, that the urine of an Aſs, though a naſty medicine, is an excellent remedy in this affect. But if the inveterate and contumacious evil do not yield to theſe remedies, then you muſt have recourſe to Coperas, Verdigreece, *ſal ammoniacum*, and Alum with Vinegar. It divers times happens, that the Ulcer ſpreading on, comes to take hold of the *Oſſa ethmoidæa*, or ſive-like bones; in which caſe, you muſt not forcibly pluck them out, but refer the whole buſineſs to Nature, and expect when they ſhall come away of themſelves, making in the mean while injections into the noſtrils, of *Aqua vitæ*, wherein Cephalick powders have been ſteeped for the greater drying.

The cure.

Lib. 20. epiſt. 5. An injection when the *Ozæna* ſhall come to the *Oſſa Ethmoidæa.*

CHAP. XV.

Of the Ulcers of the Mouth.

OF this Tribe are the *Aphthæ*, Ulcers familiar to little children, according to *Hippocrates*. They oft-times begin in the gums, and by the palat of the mouth creep into the *Uvula*, throtle, and over all the mouth, as *Celſus* ſaith. *Galen* makes two kinds of *Aphtha's*; the one of eaſie cure, ſuch as that which uſually troubles children by reaſon of the acrimony of the nurſes milk; the other is malign by reaſon of an afflux of an evil humor (that is, venenate and malign) into the mouth. For the cure, it ſhall be good to abſtain from all acrid things, and if it be a ſucking child, it will not be amiſs to temper the nurſes milk with refrigerating meats, bathing

Aph. 24. ſect. 3. Celſus lib. 6. cap 11. Gal. com ad 3. lib. epidem.

The cure.

the whole body, and fomenting the dugs with warm water; for all the members in children are moſt tender, and as it were mucous, and their mouths are unaccuſtomed to meats and drinks. For topick medicines, you muſt make choice of ſuch, which may quickly and readily work the effect; for here the condition of the affected part is ſuch, that they cannot long remain and adhere thereto. Therefore if the Ulcer be malign, it muſt be lightly touched with *Aqua fortis*, which hath been uſed in ſeparating metals, and which beſides is tempered with ſix parts of common water. You may for the ſame purpoſe uſe the Oyls of Vitriol, Sulphur, Antimony, Mercury-water, and the like. *Aetius* wiſhes you to touch and correct ſuch Ulcers with a lock of Wooll dipped in ſcalding Oyl, and ſo faſtned to the end of a Probe, until they wax white and become ſmooth or plain: For ſo their eating and ſpreading force will at length be bridled, and laudable fleſh grow up in place of that which is eaten. After ſuch burning, it will be good to waſh the mouth with the following Gargariſm, which alſo of it ſelf alone will ſerve to cure Aphtha's, which are not malign. ℞ *Hordei integri p.* i. *plant. ag. ceterach. piloſellæ, agrimoniæ, an. M.* i. *fiat decoctio ad* ℔ i. *In qua diſſolve mellis roſati* ℥ i. *Diamoron.* ʒ ſ. *Fiat gargariſma.* You may alſo make other gargles, of Pomegranate-Pills, Balauſtines, Sumach, Berberries, Red-roſes being boiled, and diſſolved in the ſtrained liquor *Diamoron* and *Dianucum*, with a little Alum: For *Galen* writes, that ſimple Ulcers of the mouth are healed with things which dry with moderation; now *Diamoron* and *Dianucum* are ſuch. But others ſtand in need of ſtrong medicines, with ſuch like. If the palat be ſeiſed upon, we muſt uſe the more diligence and care; for there is danger, leſt (being the part is hot and moiſt,) the bone (which lies under which is rare and humid) may be corrupted by the contagion, and fall away; and the voice or ſpeech be ſpoiled. If the Ulcer be pocky, omitting the common remedies of Ulcers, you muſt ſpeedily betake your ſelf to the proper Antidote of that diſeaſe, to wit, quick-ſilver. Fiſtulous Ulces often take hold on the gums, whence the root of the next tooth becomes rotten; and ſo far, that the acrimony of the *Sanies* oft-times makes its ſelf a paſſage forth on the outſide under the chin; which thing puts many into a falſe conceit of the *Scrophula*, or Kings-evil, and conſequently of an uncurable diſeaſe. In ſuch a caſe *Aetius* and *Celſus* counſel is, to take out the rotten tooth, for ſo the Fiſtula will be taken away, the gum preſſing and thruſting it ſelf into the place of the tooth which was taken forth; and ſo the cauſe nouriſhing, the putrefaction being taken away, (that is, the tooth) the reſt of the cure will be more eaſie. The Ulcers of the tongue may be cured by the ſame remedies by which the reſt of the mouth; yet thoſe which breed on the ſide thereof endure very long, and you muſt look whether or no there be not ſome ſharp tooth over againſt it, which will not ſuffer the Ulcer in that place to heal; which if there be, then muſt you take it away with a file.

A Gargariſm for the *Aphthæ*.

Lib. 6. Meth. cap. 10.

Ulcers of the palat muſt be quickly and carefully dreſſed.

Aetius lib. 6. cap. 3.

Celſus lib. 6. cap. 13.

CHAP. XVI.

Of the Ulcers of the Ears.

Their cauſes.

ULcers are bred in the auditory paſſage both by an external cauſe, as a ſtroke, or fall; as alſo by an internal, as an abſceſs there generated. They oft-times flow with much matter not there generated, for ſuch Ulcers are uſually but ſmall, and beſides in a ſpermatick part; but for that the brain doth that way disburthen its ſelf.

The cure.

A Maſticatory.

For the cure, the chief regard muſt be had of the antecedent cauſe, which feeds the Ulcer, and it muſt be diverted by purging medicines, Maſticatories and Errhines. This is the form of a Maſticatory. ℞ *Maſtich.* ʒ i. *ſtaphiſagr. & pyreth. an.* ℈ i. *Cinam. & caryoph. an.* ʒ ſ. *Fiant Maſticatoria, utatur mane & veſpere.* But this is the form of an Errhin. ℞ *Succi betonic. mercurial. & meliſſæ, an.* ʒ ſ. *Vini albi* ʒ i. *miſce & frequenter naribus attrahatur.* For topick medicines, we muſt ſhun all fatty and oily things, as *Galen* ſets down in *Method. medendi*, where he finds fault with a certain follower of *Theſſalus*, who by uſing *Tetrapharmacum*, made the Ulcer in the ear grow each day more filthy than other, which *Galen* healed with the Trochiſces of *Andronius* diſſolved in Vinegar, whoſe compoſure is as followeth. ℞ *Balaut.* ʒ ij. *Alumin.* ʒ i. *Atrament. ſutor.* ʒ ij. *Myrrhæ* ʒ i. *Thur. Ariſtoloch. gallarum. an.* ʒ ij. *Salis Ammon.* ʒ i. *Excipiantur omnia melicrato, & fiant trochiſci. Galen* in the ſame place witneſſeth, that he hath healed inveterate Ulcers, and of two years old of this kind, with the ſcales of Iron made into powder, and then boiled in ſharp Vinegar until it acquired the conſiſtence of Honey: Moreover, an Oxes gall diſſolved in ſtrong Vinigar, and dropped in warm, amends and dries up the putrefaction wherewith theſe Ulcers flow. Alſo the ſcales of Iron made into powder, boiled in ſharp Vinegar, dried and ſtrewed upon them. But if the ſtraitneſs of the paſſages ſhould not give leave to the matter contained in the windings of the ears to paſs forth, then muſt it be drawn out with an Inſtrument thereupon called a *Pyoulcus*, or Matter-drawer, whereof this is the figure.

An Errhin.

The compoſition of *Andronius* his trochiſces.

Scales of Iron.

The Figure of a Pyoulcus, *or Matter-drawer.*

Of the *Pyoulcus Galen* makes mention 2. *ad Glauconem.*

CHAP.

CHAP. XVII.

Of the Ulcers of the Wind-pipe, Weazon, Stomach and Guts.

THeſe parts are ulcerated either by an external cauſe as an acrid medicine, or poyſon ſwallowed down; or by an internal cauſe, as a malign fretting humor, which may equal the force of poyſon generated in the body, and reſtrained in theſe parts. If the pain be increaſed by ſwallowing or breathing, it is the ſign of an Ulcer in the weazon, or wind-pipe joyning thereto. But the pain is moſt ſenſibly felt whenas that which is ſwallowed is either ſour or acrid, or the air breathed in, is more hot or cold than ordinary: But if the cauſe of pain lie faſtned in the ſtomach, more grievous ſymptoms urge; for ſometimes they ſwound, have a nauſeous diſpoſition and vomiting, convulſions, gnawings, and pain almoſt intolerable, and the coldneſs of the extreme parts; all which when preſent at once, few ſcape unleſs ſuch as are young, and have very ſtrong bodies. The ſame affect may befal the whole ſtomach, but becauſe both for the bitterneſs of pain, and greatneſs of danger, that Ulcer is far more grievous which takes hold of the mouth of the ventricle, honoured by the Ancients with the name of the Heart; therefore Phyſicians do not make ſo great a reckoning of that which happens in the lower part of the ſtomach. Now we know that the guts are ulcerated, if *Pus*, or much purulent matter come forth by ſtool; if blood come that way with much griping; for by the *Pus* ſtaying, and as it were gathered together in that place, there is, as it were, a certain continual *Teneſmus*, or deſire to go to ſtool. Now all ſuch Ulcers are cured by meats and drinks, rather than by medicines, according to *Galen*: Therefore you muſt make choice of all ſuch meats and drinks as are gentle, and have a lenitive faculty, ſhunning acrid things; for *Tutia*, Litharge, Ceruſe, Verdigreece and the like, have no place here, as they have in other Ulcers: But when as the Ulcer ſhall be in the gullet or weazon, you muſt have a care that ſuch things may have ſome viſcidity or toughneſs, and be ſwallowed by little and little, and at divers times; otherwiſe they will not much avail, becauſe they cannot make any ſtay in theſe common ways of breath and meat; therefore they preſently ſlip down and flow away; wherefore all ſuch things ſhall be uſed in form of an *Eclegma*, to be taken lying on the back, and ſwallowed down by little and little, opening the muſcles of the throat, leſt the medicine paſſing down ſuddenly, and in great quantity, cauſe a Cough, a thing exceeding hurtful to theſe kinds of Ulcers. When they muſt be cleanſed, you ſhall have crude honey, which hath a ſingular faculty above all other detergent things, in theſe kinds of Ulcers: But when they can conveniently ſwallow, you ſhall mix Gum Tragacanth diſſolved in ſome aſtringent decoction. In Ulcers of the ſtomach, all acrid things (as I have formerly adviſed) muſt be ſhunned; as thoſe which may cauſe pain, inflammation and vomit, and beſides, hinder the digeſtion of the meat: Therefore let them frequently uſe a Ptiſan, and ſugred Gellies wherein Gum Tragacanth, and Bole-Armeniack have been put, the decoction of Prunes, Dates, Figs, Raiſins, Honey, Cows-milk boiled with the yolks of Eggs, and a little common Honey. When they are to be agglutinated, it will be convenient to make uſe of auſtere, aſtringent and agglutinative things, which want all acrimony, and ungateful taſte, ſuch as are *Hypociſtis*, Pomegranate-flowers and pills, *terra ſigillata*, *ſumach*, *acacia*, a decoction of Quinces, the Lentisk-wood, the tops of Vines, of Brambles, Myrtles, made in aſtringent Wine, unleſs there be fear of inflammation: Their drink ſhall be *Hydromel* water with ſugar, ſyrup of Violets and Jujubes. Honey mixed with other medicines is a very fitting remedy for Ulcers of the guts and other parts more remote from the ſtomach; for if you ſhall uſe aſtringent medicines alone of themſelves, they will ſtick to the ſtomach; neither will they carry their ſtrength any further; but honey mixed with them, beſides that it diſtributes them to the reſt of the body, and helps them forwards to the affected parts, alſo cleanſes the Ulcers themſelves. Here alſo Aſſes milk may with good ſucceſs be uſed inſtead of Goats or Cows milk; The uſe of a vulnerary potion is alſo commendable, if ſo be that it be made of ſuch Herbs and Simples, as by a certain tacit familiarity have reſpect to the parts affected: But the Ulcers of the guts have this difference amongſt themſelves, that if the greater guts be affected, you may heal them with a Clyſter and Injections, made alſo ſharp to correct the putrefaction; ſuch as are thoſe which are made of Barley-water, or Wine with *Ægyptiacum*. But if the ſmall guts be ulcerated, they muſt be rather healed by potions and other things taken at the mouth; for that (as *Galen* ſaith) theſe things which are put up into the body by the fundament, do not commonly aſcend to the ſmall or ſlender guts, but ſuch as are taken at the mouth cannot come unleſs with the loſs of their faculty, ſo far as the great guts.

CHAP. XVIII.

Of the Ulcers of the Kidneys and Bladder.

ULcers are cauſed in the Kidneys and Bladder, either by the uſe of acrid meats drinks, or medicines, as *Cantharides*; or elſe by thecollection of an acrid humor, bred in that place, ſent or faln thither; or elſe by the rupture of ſome veſſel, or an abſceſs broken and degenerated into an Ulcer, as it ſometimes comes to paſs. They are diſcerned by their ſite, for the pain and heavineſs of Ulcers of the reins comes to the loins, and the *Pus* or matter is evacuated well and throughly mixed with the urine.

Cauſes.

Signs.

Neither doth the *Pus* which flows from the reins ſtink ſo ill, as that which is caſt forth of the bladder; the reaſon is, for that the bladder being a bloodleſs, fleſhleſs and membranous part, hath not ſuch power to reſiſt putrefaction. That *Pus* which flows from the kidneys, never

flows without water; and although by long keeping in an urinal, it at length ſubſides or falls to the bottom, and may be ſeen ſeparated; yet when it is firſt made, you may ſee it perfectly mixed with the Urine; but that *Pus* which flows from the bladder is oft-times made alone without urine; and uſually it comes to paſs that the *Pus*, or matter which flows from the ulcerated kidneys, hath in it certain caruncles, or as it were hairs according to the rule of *Hippocrates*. Thoſe who in a thick urine have little caruncles, and, as it were, hairs come forth together therewith, they come from their kidneys; but on the contrary, thoſe who have certain brain-like ſcales come from them in a thick urine, their bladder is ſcabby, or troubled with a ſcabby ulcer.

The cure.

For the cure; it is expedient that the belly be ſoluble either by Nature or Art, and the uſe of mollifying Clyſters. And it is good to vomit ſometimes, ſo to draw back the humors by whoſe conflux into the affected part the ulcer might be fed and made more ſordid and filthy. You muſt beware of ſtrong purgations, leſt the humors being moved and too much agitated, the matter fit to nouriſh the ulcer may fall down upon the kidneys or bladder. The enſuing potion is very effectual to mundifie thoſe kind of ulcers. ℞ *Hordei integri, M.* ij. *Glycyrrhizæ raſ. & contuſ.* ʒ ſs. *Rad. acetoſæ & petroſel. a n.* ʒ vi. *Fiat decoctio ad* ℔ i. *in colatura diſſolve mellis diſtum.* ʒ ij. Let him take every morning the quantity of four ounces. *Gordonius* exceedingly commends the following Trochiſces. ℞ *Quatuor ſem. frig. maj. mundatorum, ſem. papaveris albi, ſem. malvæ, portul. cydon. baccarum myrti, tragacanth. gum. arab. nucum pinearum mund. piſtach. glycyrrhizæ mund. mucilaginis ſem. pſilii, amygd. dulc. hordei mund. an.* ʒ ij. *Bol. armeni. ſang. drac. ſpodii, roſarum, myrrhæ, an.* ʒ ſs. *Exciſi untur hydromelite, & fingantur trochiſci ſinguli ponderis* ʒ ij. Let him take one thereof in the morning diſſolved in Barley-water or Goats-milk. *Galen* bids to mix honey and diuretick things with medicines made for the ulcers of the reins and bladder, for that they gently move urine, and are as vehicles to carry the medicines to the part affected. Ulcers of the bladder are either in the bottom thereof, or at the neck and urinary paſſage. If they be in the bottom, the pain is almoſt continual; if in the neck, the pain then pricks, and is moſt terrible when they make water and preſently after. The ulcer which is in the bottom ſends forth certain ſcaly or skinny excrements together with the urine; but that which is in the neck, cauſes almoſt a continual *Tentigo*. Thoſe which are in the bottom are for the moſt part incurable, both by reaſon of the bloodleſs and nervous nature of the part, as alſo for that the ulcer is continually chafed and troubled by the acrimony of the urine, ſo that it can hardly be cicatrized. For even after making of water ſome reliques of the urine always remain in the bottom of the bladder, which could not therefore paſs forth together with the reſt of the urine, for that for the paſſing forth of the urine, the bladder being diſtended before, falls and is complicated in its ſelf. Ulcers of the bladder are healed with the ſame medicines as thoſe of the reins are; but theſe not only taken by mouth, but alſo injected by the urinary paſſage. Theſe injections may be made of *Gordonius* his Trochiſces formerly preſcribed, being diſſolved in ſome convenient liquor; but becauſe ulcers of the bladder cauſe greater and more ſharp pain than thoſe of the kidneys, therefore the Chirurgeon muſt be more diligent in uſing Anodynes. For this purpoſe, I have often by experience found, that the Oyl of Henbane made by expreſſion, gives certain help. He ſhall do the ſame with Cataplaſms and Liniments applied to the parts about the *Pecten* and all the lower belly with *Perinæum*, as alſo by caſting in of Clyſters. If that they ſtink, it will not be amiſs to make injection of a little *Ægyptiacum* diſſolved in Wine, Plantain or Roſe-water. For I have often uſed this remedy in ſuch a caſe with very proſperous ſucceſs.

Signs to know what part of the bladder is ulcerated.

Why Ulcers in the bottom of the bladder are uncurable.

Ægyptiacum for the ulcers of the bladder.

CHAP. XIX.

Of the Ulcers of the Womb.

The cauſes.

ULcers are bred in the womb, either by the conflux of an acrid, or biting humor, fretting the coats thereof, or by a tumor againſt nature degenerating into an abſceſs, or by a difficult and hard labour; they are known by pain at the *Perinæum*, and the efflux of *Pus* and *Sanies* by the privity. All of them in the opinion of *Avicen*, are either putrid, when as the *Sanies* breaking forth is of a ſtinking ſmell, and in colour reſembles the water wherein fleſh hath been waſhed; or elſe ſordid, when as they flow with many virulent and crude humours; or elſe are eating or ſpreading ulcers, when as they caſt forth black *Sanies*, and have pulſation joyned with much pain. Beſides they differ amongſt themſelves in ſite, for either they poſſeſs the neck and are known by the ſight, by putting in a *ſpeculum*, or elſe are in the bottom, and are manifeſted by the condition of the more liquid and ſerous excrements, and the ſite of the pain. They are cured with the ſame remedies wherewith the ulcers of the mouth, to wit, with *Aqua fortis*, the Oyl of Vitriol and Antimony, and other things made ſomewhat more mild, and corrected with that moderation, that the ulcerated parts of the womb may be ſafely touched with them; it is requiſite that the remedies which are applied to the ulcers of the womb, do in a moment that which is expected of them, for they cannot long adhere or ſtick in the womb, as neither to the mouth. *Galen* ſaith, that very drying medicines are exceeding fit for ulcers of the womb, that ſo the putrefaction may be hindred or reſtrained, whereto this part as being hot and moiſt is very ſubject; beſides that, the whole body, unto this part, as unto a ſink, ſends down its excrements. If an ulcer take hold of the bottom of the womb, it ſhall be cleanſed, and the part alſo ſtrengthened, by making this following Injection. ℞ *Hordei integri p.* ij. *Guajaci* ʒ i. *Rad. Ireos.* ʒ ſs. *Abſinth. plant: centaur. utriuſque, an. M* i. *Fiat decocti. in aqua fabrorum ad* ℔ ij. *in quibus diſſolve mellis roſati, & ſyrupi de abſinthio, an.* ʒ iij. *Fiat injectio.* For amending the ſtinking ſmell, I have often had certain experience of this enſuing remedy. ℞ *vini rub.* ℔ i. *Unguent. ægyptiaci* ʒ ij. *Bulliant. parum.* Thus the putrefaction may be corrected, and the painful maliciouſneſs of the humor abated. Ulcers when they are cleanſed, muſt preſently be cicatrized; that may be done with Alum-water, the water of Plantain

wherein

wherein a little Vitriol or Alum have been diſſolved. Laſtly, if remedies nothing availing, the ulcer turn into a Cancer, it muſt be dreſſed with Anodynes and remedies proper for a Cancer, which you may find ſet down in the proper Treatiſe of Cancers. The cure of ulcers of the fundament was to be joyned to the cure of theſe of the womb; but I have thought good to refer it to the Treatiſe of Fiſtula's, as I do the cure of theſe of the urinary paſſage to the Treatiſe of the *Lues Venerea*.

CHAP. XX.

Of the Varices, *and their cure by cutting.*

A *Varix* is the dilatation of a vein, ſome whiles of one, and that a ſimple branch, other whiles of many. Every *Varix* is either ſtrait or crooked, and as it were infolded into certain windings within its ſelf. Many parts are ſubject to *Varices*; as, the temples, the region of the belly under the navil, the teſticles, womb, fundament, but principally the thighs and legs. The matter of them is uſually melancholy blood, for *Varices* often grow in men of a melancholy temper, and which uſually feed on groſs meats, or ſuch as breed groſs and melancholy humors. Alſo women with child are commonly troubled with them, by reaſon of the heaping together of their ſuppreſſed menſtrual evacuation. The precedent cauſes are a vehement concuſſion of the body, leaping, running, a painful journey on foot, a fall, the carrying of a heavy burthen, torture or racking. This kind of diſeaſe gives manifeſt ſigns thereof by the largeneſs, thickneſs, ſwelling and colour of the veins. It is beſt not to meddle with ſuch as are inveterate; for of ſuch being cured there is to be feared a reflux of the melancholy blood to the noble parts, whence there may be imminent danger of malign ulcers, a Cancer, Madneſs or Suffocation. When as many *Varices* and diverſly implicit are in the legs, they often ſwell with congealed and dried blood, and cauſe pain, which is increaſed by going and compreſſion. Such like *Varices* are to be opened by dividing the vein with a Lancet, and then the blood muſt be preſſed out, and evacuated by preſſing it upwards and downwards; which I have oft-times done, and that with happy ſucceſs to the Patients, whom I have made to reſt for ſome few days, and have applied convenient medicines. A *Varix* is often cut in the inſide of the leg a little below the knee, in which place commonly the original thereof is ſeen. He which goes about to intercept a *Varix* downwards from the firſt original, and as it were fountain thereof, makes the cure far more difficult. For hence it is divided, as it were, into many rivulets, all which the Chirurgeon is forced to follow.

What a *Varix* is, and what be the differences thereof.

The matter.

The cauſes.

Signs.

The cure.

The cutting of *Varices*.

A *Varix* is therefore cut or taken away ſo, to intercept the paſſage of the blood and humours mixed together therewith, flowing to an ulcer ſeated beneath; or elſe leſt that by the too great quantity of blood, the veſſel ſhould be broken, and death be occaſioned by a hæmorrhagie proceeding from thence. Now this is the manner of cutting it. Let the Patient lye upon his back on a bench or table, then make a Ligature upon the leg in two places the diſtance of ſome four fingers each from other, wherein the exciſion may be made, for ſo the vein will ſwell up and come more in ſight; and beſides, you may alſo mark it with ink; then taking the skin up between your fingers, cut it long-ways according as you have marked it; then free the bared vein from the adjacent bodies, and put thereunder a blunt-pointed needle (leſt you prick the vein) thred with a long double thred, and ſo bind it faſt; and then let it be opened with a Lancet in the middle under the Ligature, juſt as you open a vein, and draw as much therehence as ſhall be fit: Then ſtreight make a Ligature in the lower part of the forementioned vein, and then cut away as much of the ſaid vein as is convenient between the Ligatures, and ſo let the ends thereof withdraw themſelves into the fleſh above and below; let theſe Ligatures alone until ſuch time as they fall away of themſelves. The operation being performed, let an aſtringent medicine be applied to the wound and the neighbouring parts; neither muſt you ſtir the wound any more for the ſpace of three days. Then do all other things as are fit to be done to other ſuch affects.

For what intention a *Varix* muſt be cut. *Paulus cap.* 82. *lib.* 6.

The manner how to cut it.

CHAP. XXI.

Of Fiſtula's.

A Fiſtula is a ſinuous, white, narrow, callous, and not ſeldom unperceivable Ulcer: It took its denomination from the ſimilitude of a reeden (Fiſtula) that is, a pipe, like whoſe hollowneſs it is. A Fiſtula is bred in ſundry parts of the body, and commonly follows upon abſceſſes or ulcers not well cured.

What a Fiſtula is.

A *Callous* is a certain fleſhy ſubſtance, white, ſolid, or denſe and hard, dry and without pain, generated by heaping up of dried excrementitious phlegm, or elſe aduſt melancholy encompaſſing the circuit of the ulcer, and ſubſtituting it ſelf in the place of the laudable fleſh. The *Sinus* or cavity of a Fiſtula is ſometimes dry, and other while drops with continual moiſture: Sometimes the dropping of the matter ſuddenly ceaſes, and the orifice thereof is ſhut up, that ſo it may deceive both the Chirurgeon and the Patient with a falſe ſhew of an abſolute cure; for within a while after it will open again, and run as formerly it did. Some Fiſtula's are bred by the corruption of a bone, others of a nerve, others of membranes, and others of other parts of the body. Some run ſtrait in, others, and that the greater part, have turnings and windings; ſome have one, others have more cruches and windings; ſome are at the joynts, others penetrate into ſome capacity of the body, as into the cheſt, belly, guts, womb, bladder; ſome are eaſily, others difficultly cured, and ſome wholly uncurable. There are divers ſigns of Fiſtula's, according to the variety of the parts they poſſeſs; for if that which you touch with the end of your Probe make reſiſtance,

What a *Callous* is.

The differences of Fiſtula's.

The ſigns.

ſiſtance, and reſound, then you may know that it is come to the bone; and then if the end of the Probe ſlip up and down as on a ſmooth and polite ſuperficies, it is a ſign that the bone is yet ſound; but if it ſtop and ſtay in any place as in a rough way, then know the bone is eaten, rough and periſhed; ſometimes the bone lies bare, and then you need not uſe the Probe. Beſides alſo it is a ſign that the bone is affected, if there be a purulent efflux of an unctuous or oily matter, not much unlike that marrow wherewith the bone is nouriſhed. For every excrement ſhews the condition of the nouriſhment of the part whence it is ſent; in a Fiſtula which penetrates to a nerve, the Patient is troubled with a pricking pain, eſpecially when you come to ſearch with a Probe, eſpecially if the matter which flows down be more acrid: Oft-times if it be cold, the member is ſtupified, the motion being weakened; beſides alſo the matter which flows from thence is more ſubtle, and ſomewhat like unto that which flows from the bones, yet not oily nor fat, but ſanious and viſcous, reſembling the condition of the alimentary humour of the nerves. The ſame uſually appears and happens in Fiſtula's which penetrate to the tendons and thoſe membranes which involve the muſcles. If the Fiſtula be within the fleſh, the matter flowing thence is more thick and plentiful, ſmooth, white and equal. If it deſcend into the veins or arteries, the ſame happens as in thoſe of the nerves; but that there is no ſuch great pain in ſearching with your Probe, nor no offence or impediment in the uſe of any member: Yet if the matter of the fiſtulous Ulcer be ſo acrid, as that it corrode the veſſels, blood will flow forth; and that more thick if it be from a vein, but more ſubtle and with ſome murmuring if from an artery. Old Fiſtula's, and ſuch as have run for many years, if ſuddenly ſhut up, cauſe death, eſpecially in an ancient and weak body.

The ſign that the bone is bare from the condition of the matter which is caſt forth.

Actius tetr 4. *ſect.* 2. *cap.* 55.

Old Fiſtula's if cloſed prove mortal.

CHAP. XXII.

Of the cure of Fiſtula's.

FOr the cure; in the firſt place it will be expedient to ſearch the Fiſtula; and that either with a wax ſize, a Probe of Lead, Gold or ſilver to find out the depth and windings or corners thereof. But if the Fiſtula be hollowed with two or more orifices, and thoſe cuniculous, ſo that you cannot poſſibly and certainly ſearch or find them all out with your probe; then muſt you caſt an Injection in ſome one of theſe holes, and ſo obſerve the places where it comes forth, for ſo you may learn how many, and how deep or ſuperficiary cavities there be; then by making inciſions you muſt lay open and cut away the callous parts. You muſt make inciſions with an Inciſion-knife or Razor, or elſe apply actual or potential cauteries; for nature cannot, unleſs the callous ſubſtance be firſt taken away, reſtore or generate fleſh, or agglutinate the diſtant bodies: For hard things cannot grow together, unleſs by the interpoſition of glue, ſuch as is laudable blood; but a callous body on all ſides poſſeſſing the ſurface of the ulcerated fleſh, hinders the flowing of the blood out of the capillary veins, for the reſtoring of the loſt ſubſtance, and uniting of the diſ-joynted parts. If you at any time make cauſtick Injections into the Fiſtula, you muſt preſently ſtop the orifice thereof, that ſo they may have time to work the effect, for which they are intended. Which thing we may conjecture by the tumor of the part, the digeſture of the flowing matter, and its leſſer quantity. Then you muſt haſten the falling away of the Eſchar, and then the Ulcer muſt be dreſſed like other Ulcers. But oft-times the *Callus* which poſſeſſes the ſinuous cavity of a Fiſtula, overcome by the power of acrid and eſcarotick medicines, comes whole forth, and falls out like a pipe, and ſo leaves a pure Ulcer underneath it. Which I obſerved in a certain Gentleman, when I had waſhed with ſtrong *Ægyptiacum* divers times a fiſtulous Ulcer in his thigh, ſhot through with a bullet; then preſently by putting in my Balſam formerly deſcribed, he grew well in a ſhort time. Fiſtula's which are near great veſſels, nerves or principal intrails, muſt not be meddled with unleſs with great caution. When a Fiſtula proceeds by the fault of a corrupt bone, it is to be conſidered whether that fault in your bone be ſuperficiary or deeper in, or whether it is wholly rotten and periſhed: For if the default be ſuperficiary, it may eaſily be taken away with a deſquammatory *Trepan*; but if it penetrate even to the marrow, it muſt be taken forth with cutting mullets, firſt having made way with a *Terebellum*. But if the bone be quite rotten and periſhed, it muſt be wholly taken away, which may be fitly done, in the joynts of the fingers, the *radius* of the cubit and leg; but no ſuch thing may be attempted in the ſocket of the huckle-bone, the head of the thigh-bone, or any of the rack-bones when they are mortified, neither in thoſe Fiſtula's, which are of their own nature incurable; but you ſhall think you have diſcharged your duty and done ſufficiently for the Patient, if you leave it with a prognoſtick. Of this nature are Fiſtula's which penetrate even to the bowels, which come into the parts oreſpread with large veſſels or nerves, which happen to effeminate and tender perſons, who had rather die by much, than to ſuffer the pain and torment of the operation. Like caution muſt be uſed, when by the cutting of a Fiſtula there is fear of greater danger, as of convulſion, if the diſeaſe be in a nervous part. In theſe and the like caſes, the Chirurgeon ſhall not ſet upon the perfect cure of the diſeaſe, but ſhall think it better to prevent, by all means poſſible, that the diſeaſe by freſh ſupplies become no worſe, which may be done, if he prevent the falling down of any new defluxion into the part; if by an artificial diet he have a care that excrementitious humors be not too plentifully generated in the body; or ſo order it, that being generated, they may be evacuated at certain times, or elſe diverted from the more noble to the baſe parts. But in the mean ſpace it ſhall be requiſite to waſte the faulty fleſh, which grows up more than is fitting in the Ulcer, and to cleanſe the *ſordes* or filth, with medicines which may do it without biting or acrimony and putrefaction.

How to find out the windings and cavities of Fiſtula's.

A palliative cure of a Fiſtula.

CHAP.

CHAP. XXIII.

Of the Fiſtula's in the Fundament.

FIſtula's in the Fundament are bred of the ſame cauſes as other kinds of Fiſtula's are; to wit, of a wound or abſceſs not well cured, or of a hæmorrhoid which is ſuppurated. Such as are occult, may be known by dropping down of the *ſanious* and purulent humor by the fundament, and the pain of the adjacent parts. But ſuch as are manifeſt, by the help of your probe you may find whither they go, and how far they reach. For this purpoſe the Chirurgeon ſhall put his finger into the fundament of the Patient, and then put a leaden Probe into the orifice of the Fiſtula; which if it come to the finger without interpoſition of any *medium*, it is a ſign it penetrates into the capacity of the gut. Beſides alſo, then there flows not only by the fundament, but alſo by the orifice which the malign humour hath opened by its acrimony, much matter, ſome whiles ſanious, and oft-times alſo breeding Worms. Fiſtula's may be judged cuniculous, and running into many turnings and windings, if the Probe do not enter far in, and yet notwithſtanding more matter flows there-hence than Reaſon requires ſhould proceed from ſo ſmall an Ulcer. You may in the orifices of all Fiſtula's, perceive a certain callous wart, which the common Chirurgeons term a Hens-arſe. Many ſymptoms accompany Fiſtula's which are in the fundament, as a *Teneſmus*, ſtrangury and falling down of the fundament. If the Fiſtula muſt be cured by manual operation, let the Patient lye ſo upon his back, that lifting up his legs, his thighs may preſs his belly; then let the Chirurgeon, having his nail pared, put his finger, beſmeared with ſome oyntment, into the Patients fundament; then let him thruſt in at the orifice of the Fiſtula, a thick leaden needle, drawing after it a thread conſiſting of thread and horſe-hairs woven together, and then with his finger taking hold thereof, and ſomewhat crooking it, draw it forth at the fundament, together with the end of the thread: Then let him knit the two ends of the thread with a draw or looſe-knot, that ſo he may ſtraiten them at his pleaſure. But before you bind them, you ſhall draw the thread ſomewhat roughly towards you, as though you meant to ſaw the fleſh therein contained, that you may by this means cut the Fiſtula without any fear of a Hæmorrhage, or flux of blood. It ſometimes happens, that ſuch Fiſtula's penetrate not into the gut; ſo that the finger by interpoſition of ſome callous body, cannot meet with the Needle or Probe. Then it is convenient to put in a hollow iron or ſilver Probe, ſo through the cavity thereof to thruſt a ſharp pointed needle, and that by pricking and cutting may deſtroy the *Callus*; which thing you cannot perform with the formerly deſcribed leaden Probe, which hath a blunt point, unleſs with great pain.

The cauſes.

C *The Needle with the Probe.*

D *The leaden Needle drawing a thread after it.*

The *Callus* being waſted, the Fiſtula ſhall be bound as we formerly mentioned. That which is ſuperficiary needs no binding, only it muſt be cut with a crooked *ſcalprum*, and the *Callus* being conſumed, the reſt of the cure muſt be performed after the manner of other Ulcers. But you muſt note, that if any parcel of the Callous body remain untouch'd by the medicine or Inſtrument, the Fiſtula reviving again, will cauſe a relapſe.

CHAP. XXIV.

Of Hæmorrhoides.

HÆmorrhoides as the word is uſually taken, are Tumors at the extremities of the veins encompaſſing the fundament, cauſed by the defluxion of an humor commonly melancholick, and repreſenting a certain kind of *Varices*. Some of theſe run at an hole being opened, which ſometimes in ſpace of time contracts a *Callus*; others only ſwell, and caſt forth no moiſture; ſome are manifeſt; others lye only hid within. Thoſe which run, commonly caſt forth blood mixed with yellowiſh ſerous moiſture, which ſtimulates the blood to break forth, and by its acrimony

What they are.

Their differences.

acrimony opens the mouths of the veins. But ſuch as do not run, are either like bliſters, ſuch as happen in burns, and by Practicioners are uſually called *Veſicales*, and are cauſed by the defluxion of a phlegmatick and ſerous humor; or elſe repreſent a Grape, whence they are called *Uvales*, generated by the afflux of blood, laudable in quality, but over-abundant in quantity; or elſe they expreſs the manner of a diſeaſe, whence they are termed *Morales*, proceeding from the ſuppreſſion of melancholick blood; or elſe they repreſent Warts, whence they are ſtiled *Verrucales*, enjoying the ſame material cauſe of the generation as the *Morales* do. This affect is cauſe of many accidents in men; for the perpetual efflux of blood extinguiſheth the vivid and lively colour of the face, calls on a Dropſie, overthrows the ſtrength of the whole body. The flux of Hæmorrhoides is commonly every month, ſometimes only four times in a year. Great pain, inflammation, an abſceſs which may at length end in a Fiſtula, unleſs it be reſiſted by convenient remedies, do oft-times fore-run the evacuation of the Hæmorrhoides. But if the Hæmorrhoides flow in a moderate quantity, if the Patients brook it well, they ought not to be ſtayed, for that they free the Patients from the fear of eminent evils, as Melancholy, Leproſie, Strangury, and the like. Beſides, if they be ſtopped without a cauſe. they by their reflux into the lungs cauſe their inflammation, or elſe break the veſſels thereof; and by flowing to the liver, cauſe a Dropſie by the ſuffocation of the native heat; they cauſe a Dropſie and univerſal leanneſs on the contrary, if they flow immoderately, by refrigerating the liver by loſs of too much blood; wherefore when as they flow too immoderately, they muſt be ſtayed with a pledget of Hares-down dipped in the enſuing medicine. ℞ *Pul. aloes, thuris, balauſt. ſang. draconis, an.* ʒ ß. *Incorporentur ſimul cum ovi albumine, fiat medicamentum ad uſum.* When they are ſtretched out and ſwoln without bleeding, it is convenient to beat an Onion roaſted in the embers with an Oxes gall; and apply this medicine to the ſwoln places, and renew it every five hours. This kind of remedy is very prevalent for internal Hæmorrhoides; but ſuch as are manifeſt, may be opened with Horſe-leaches, or a Lancet. The juice or maſs of the Herb called commonly Dead-nettle, or Arch-angel, applied to the ſwoln Hæmorrhoids, opens them, and makes the congealed blood flow there-hence. The *Fungus* and *Thymus*, being diſeaſes about the fundament, are cured by the ſame remedy. If acrimony, heat and pain, do too cruelly afflict the Patient, you muſt make him enter into a bath, and preſently after apply to the Ulcers (if any ſuch be) this following remedy. ℞ *Olei roſ.* ʒ iiij. *Ceruſæ* ʒ i. *Litharg.* ʒ ß. *Ceræ novæ*, ʒ vj. *Opii* ℈ i. *Fiat unguent. ſecundum artem.* Or elſe, ℞ *Thuris, myrrhæ, croci, an.* ʒ i. *Opii* ℈ i. *Fiat unguentum cum oleo roſarum & mucilagine ſem. pſillii, addendo vitellum unius ovi.* You may eaſily proſecute the reſidue of the cure according to the general rules of Art.

BOOK XIV.

Of Bandages, or Ligatures.

CHAP. I.

Of the differences of Bandages.

Lib. de faſciis.

BAndages, wherewith we uſe to bind, do much differ amongſt themſelves: But their differences (in *Galen*'s opinion) are chiefly drawn from ſix things, to wit, their matter, figure, length, breadth, making, and parts whereof they conſiſt. Now the matter of Bandages is threefold; membranous or of skins, which is accommodated peculiarly to the fractured griſles of the noſe; of woollen, proper to inflamed parts, as thoſe which have need of no aſtriction; of linnen, as when any thing is to be faſt bound; and of linnen cloaths, ſome are made of flax, other ſome of hemp, as *Hippocrates* obſerves. But Bandages do thus differ amongſt themſelves in ſtructure, for that ſome thereof conſiſt of that matter which is ſufficiently cloſe and ſtrong of it ſelf, ſuch are the membranous; others are woven, as the linnen ones. But that linnen is to be made choice of for this uſe, and judged the beſt, not which is new and never formerly uſed, but that which hath already been worn, and ſerved for other uſes; that ſo the Bandages made thereof, may be the more ſoft and pliable: Yet muſt they be of ſuch ſtrength, that they may not break with ſtretching, and that they may ſtraitly contain and repel the humor ready to flow down, and ſo hinder it from entring the part. Theſe, beſides, muſt not be hemmed nor ſtitched, muſt have no lace nor ſeam; for hems and ſeams by their hardneſs preſs into, and hurt the fleſh that lies under them. Lace, whether in the midſt or edges of the rowler, makes the Ligature unequal. For the member where it is touched with the lace, as that which will not yield, is preſſed more hard; but with the cloth in the middle more gently, as that which is more lax. Furthermore, theſe Ligatures muſt be of clean cloth, that if occaſion be, they may be moiſtened or ſteeped in liquor appropriate to the diſeaſe, and that they may not corrupt, or make worſe that liquor by their moiſtening therein. Now the Bandages which are made of of linnen clothes muſt be cut long-ways, and not athwart, for ſo they will keep more firm and ſtrong that which they bind, and beſides, they will be always alike, and not broader in one place than in another: But they thus differ in figure, for that ſome of them are rolled up, to which nothing muſt be ſowed, for that they ought to be of a due length to bind up the member; others are cut or divided, which truly conſiſt of one piece, but that divided in the end (ſuch are uſually taken to bind up the breaſts)

Sect. 3. de Chir. offic.

What doth beſt for rowlers.

or

or else in the midst; others are sowed together, which consist of many branches sowed together, and ending in divers heads, and representing divers figures, such are the Bandages appropriated to the head. But they thus differ in length, for that some of them are shorter, others longer: so in like sort for breadth; for some are broader, others narrower. Yet we cannot certainly define nor set down, neither the length nor breadth of rowlers, for that they must be various, according to the different length and thickness of the members or parts. Generally they ought both in length and breadth to fit the parts, whereunto they are used. For these parts require a binding different each from other, the head, the neck, shoulders, arms, breasts, groins, testicles, fundament, hips, thighs, legs, feet and toes. For the parts of Bandages, we term one part their body, another their heads. By the body we mean their due length and breadth; but their ends, whether they run long-ways or a-cross, we according to *Galen*, term them their heads. *Com. ad sect. 22. sect. 2. de offic. chir.*

CHAP. II.

Sheweth the Indications and general Precepts of fitting Bandages and Ligatures.

THere are, in *Hippocrates* opinion, two Indications of fitting Bandages or Ligatures; the one whereof is taken from the part affected; the other from the affect it self. From the part affected: So the leg, if you at any time bind it up, must be bound long-ways, for if you bind it over-thwart, the binding will loosen as soon as the Patient begins to go, and put forth his leg, for then the muscles take upon them another figure. On the contrary, the arm or elbow must be bound up, bending in and turned to the breast; for otherwise at the first bending, if it be bound when it it is stretched forth, the Ligature will be slacked, for that (as we formerly said) the figure of the muscles is perverted. Now for this Indication, let each one perswade himself thus much, that the part must be bound up in that figure, wherein we would have it remain. *1 & 2 sect. lib. de fract.*

Now for that Indication which is drawn from the disease, if there be a hollow Ulcer, sinuous and cuniculous, casting forth great store of *Sanies*; then must you begin the ligature and binding from the bottom of the *sinus*, and end at the orifice of the Ulcer; and this Precept must you always observe, whether the *sinus* be seated in the top, bottom, middle, or sides of the Ulcer: For thus the filth therein contained shall be emptied and cast forth, and the lips of the Ulcer too far separated, shall be joyned together; otherwise the contained filth will eat into all that lies near it, increase the Ulcer, and make it uncurable, by rotting the bones which lie under it within this acrid *Sanies* or filth. But some Ligatures are remedies of themselves; as those which perform their duties of themselves, and whereto the cure is committed; as are these which restore to their native unity, those parts which are disjoyned: Others are not used for their own sakes, but only to serve to hold fast such medicines as haye a curative faculty. This kind of Ligature is either yet a doing, and is termed by *Hippocrates*, *Diligatio operans*; or else done and finished, and is called *Diligatio operata:* For the first, that the Ligature may be well made, it is fit that it be close rowled together; and besides, that the Surgeon hold it stiff and strait in his hand, and not carelesly; for so he shall bind up the member the better. Also he must in the binding observe, that the ends of the rowler, and consequently their fastning, may not fall to be on the affected or grieved part; for it is better that they come above or below, or else on the side: Besides also, he must have a special care, that there be no knot tied upon the same place, or upon the region of the back, buttocks, sides, joynt, or back-part of the head, or to conclude, in any other part upon which the Patient uses to lean, rest or lie. Also on that part where we intend to sow or fasten the rowlers, you must double in their ends, that so the fastning or suture may be the stronger, otherwise how close soever they shall be wrapped or rowled about the member, yet will they not remain firm, especially if they be of a great breadth. For the second kind of Ligature, to wit, that which is already done and finished; the Surgeon, the performer thereof, must consider to what end it was done, and whether he hath performed it well and fitly, as also neatly and elegantly, to the satisfaction both of himself and the beholders. For it is the part of a skilful workman every where handsomely and rightly to perform that which may so be done.

We must always begin our ligatures at the bottom of a *sinus*.

Hip. cent. 4. sect. 2. offic. Initio 2 sect. off.

Ligatures must not be only lightly, but also neatly performed.

In fractures, and luxations, and all dislocations of bones, as also in wounds and contusions, you must begin your Bandage with two or three windings, or wraps about upon the place, and that (if you can) more straitly than in other places, that so the set bones may be the better kept in their places, and that the humors, if any be already fallen thither, may by this strait compression be pressed forth; as also to hinder and prevent the entrance in of any other, which may be ready to fall down. But in fractures (as those which never happen without contusion) the blood flows, and is pressed forth of its proper vessels; as those which are violently battered and torn, which causes sugillation in the neighbouring flesh, which first looks red, but afterwards black and blue, by reason of the corruption of the blood poured forth under the skin. Wherefore after these first windings, which I formerly mentioned, you must continue your rowling a great way from the broken or luxated part; he which does otherwise, will more and more draw the blood and humors into the affected part, and cause imposthumes, and other malign accidents. Now the blood which flows, goes but one way downwards, but that which is pressed, is carried as it were in two paths, to wit, from above downwards, and from below upwards. Yet you must have a care that you rather drive it back into the body and bowels, then towards the extremities thereof, as being parts which are uncapable of so much matter, and not furnished with sufficient strength to suffer that burthen, which threatens to fall upon it, without danger, and the increase of preternatural accidents. But when this mass and burthen of humors is thrust back into the body, it is then ruled and kept from doing harm by the strength and benefit of the faculties remaining in the bowels, and the native heat. *Gal. com. ad sent. 25. sect. 1. lib. de fract.*

CHAP.

CHAP. XXIV.

Of the three kinds of Bandages neceſſary in Fractures.

Sent. 24. ſect. 2. offic. TWo ſorts of Ligatures are principally neceſſary for the Surgeon, according to *Hippocrates*, by which the bones as well broken as diſlocated may be held firm when they are reſtored to their natural place.

Hypodeſmides. Of theſe, ſome are called *Hypodeſmides*, that is, Under-binders; others, *Epideſmi*, that is, Over-binders. There are ſometimes but two Under-binders uſed, but more commonly three. The firſt muſt firſt of all be caſt over the Fracture, and wrapped there ſome three or four times about, then the Surgeon muſt mark and obſerve the figure of the Fracture; for as that ſhall be, ſo muſt he vary the manner of his binding: For the Ligature muſt be drawn ſtrait upon the ſide oppoſite to that whereto the Luxation or Fracture moſt inclines; that ſo the bone which ſtands forth may be forced into its ſeat, and ſo forced, may be the more firmly there contained. Therefore, if the right ſide be the more prominent or ſtanding forth, thence muſt you begin your ligation, and ſo draw your Ligature to the left ſide. On the contrary, if the left ſide be more prominent, beginning there, you ſhall go towards the oppoſite ſide in binding and rowling it. Here therefore would I require a Surgeon to be *Ambidexter*, (i.e.) having both his hands at command, that ſo he may the more exquiſitely perform ſuch variety of ligations: But let him in rowling, bend or move this firſt Ligature upwards, that is, towards the body, for the former reaſons. But neither is this manner of ligation peculiar to Fractures, but common to them with luxations: For, into what part ſoever the luxated bone flew, then when it is reſtored, that ſide muſt be bound the more looſly and gently whence it departed, and that on the contrary more hard unto which it went: Therefore the Ligature muſt be drawn from the ſide whereunto the bone went; ſo that on this ſide it be more looſe and ſoft, and not ſtraitly preſſed with boulſters or rowlers, that ſo it may be more inclined to the ſide oppoſite to the luxation. If the ligation be otherwiſe performed, it ſucceeds not well; for the part is relaxed and moved out of its natural ſeat: Wherefore there will be no ſmall danger, leſt the bone be forced out again, and removed from its place, whereinto it was reſtored by art and the hand: Which thing *Hippocrates* ſo much feared, that on the contrary he willed that the ſet-bone ſhould be drawn ſomewhat more unto the part contrary to that whereunto it was driven by force, than the natural and proper ſite thereof ſhould require. But to return to our former diſcourſe of the three Ligatures: The firſt Under-binder being put on, we then take the ſecond, with which we in like ſort begin at the Fracture; but having wrapped it once or twice about there, for that, as we formerly ſaid, we muſt not force back, and preſs ſo much blood towards the extremities, as we muſt do towards the body and bowels: Wherefore this Ligature ſhall be drawn from above downwards, gently ſtraining it to preſs forth the blood contained in the wounded part: When by rowling you ſhall come to the end of the part, then you ſhall carry back again that which remains thereof, to wit, upwards: But otherwiſe you may take the third Under-binder, wherewith you may begin to rowl, whereas you left with the ſecond, and you may carry it thus, rowling it from below upwards. Theſe Under-bindings thus finiſhed, apply your boulſters, after them your over or Upper-bindings, which are oft-times two, but ſometimes three. The firſt hath two heads, and is wrapped both from the right hand and the left, for the preſervation of the firſt Under-binder and the boulſters, and reſtoring the muſcles to their native figure. The two other which remain, conſiſt of one head, and the one of them muſt be rowled from below upwards, the other from above downwards, after ſuch a manner, that they may be directly contrary to the Under-binders: as if they were rowled from the right hand, then theſe muſt be from the left. Now this is the manner of *Hippocrates* his Ligation, which, for that it is now grown out of uſe, we muſt here ſet down that which is in common uſe. They do not at this time uſe any Over-binders, but that which we termed the third Under-binder, ſerves our Surgeons inſtead of the three fore-mentioned Over-binders. Wherefore they carry this third Under-binder, wrapped from below upwards (as we formerly ſaid) contrary to the firſt and ſecond Under-binder; as if theſe begun on the right ſide, this ſhall be rowled from the left, and ſhall end whereas the firſt Under-binder ended. And you muſt not only draw it indifferently hard, but alſo make the ſpires and windings more rare. This third rowler is of this uſe in this manner of ligation; that is, it reſtores the muſcles to their native figure, from whence they were ſomewhat altered by the drawing and rowling of the two former Ligatures. But you muſt always have regard, that you obſerve that meaſure in wrapping your Ligature, which Reaſon, with the ſenſe of the Patient, and eaſe in ſuffering, preſcribes; having regard, that the tumor become not inflamed. Alſo the habit of the body ought to preſcribe a meaſure in ligation; for tender bodies cannot away with ſo hard binding as hard. Verily, in Fractures and Luxations, the humors by too ſtrait binding are preſſed into the extreme parts of the body; whence grievous and oft-times enormous Oedema's proceed; for healing whereof the Ligature muſt be looſed, and then the tumified parts preſſed by a new rowling, which muſt be performed from below upwards, and ſo, by forcing the matter of the tumor thither, it may be helped; for there is no other hope or way to drive the humor back again. He which doth this, forſakes the proper cure of the diſeaſe, ſo to reſiſt the ſymptom, which the Surgeon ſhall never refuſe to do, as often as any neceſſary cauſe ſhall require it. For this cauſe *Hippocrates* bids, that the Bandages be looſed every three days, and then to foment the part with hot water, that ſo the humors, which (drawn thither by the vehemency of pain) have ſettled in the part, may be diſſolved and diſperſed; and itching and other ſuch like ſymptoms prevented. The fear of all accidents being paſt, let the ligation be ſooner or later looſed, and more ſlacked than it formerly was accuſtomed; that ſo the blood and laudable matter, whereof a *Calus* may enſue, may flow more freely to the affected part.

CHAP.

CHAP. IV.

Of the binding up of Fractures aſſociated with a Wound.

How to bind up a fracture with a wound.

IT ſometimes happens that a fracture is aſſociated by a wound, and yet for all this it is fit to bind the part with a ligature; otherwiſe there will be no ſmall danger of ſwelling, inflammation, and other ill accidents, by reaſon of the too plentiful afflux of humors from the neighbouring parts. But it is not fit to endeavour to uſe that kind of binding which is performed with many circumvolutions or wrappings about. For ſeeing the wound muſt be dreſſed every day, the part muſt each day neceſſarily be ſtirred, and the ligature conſiſting of ſo many windings, looſed; which thing will cauſe pain, and conſequently hinder the knitting and uniting, which is performed by reſt: Therefore this kind of binding may be performed by one only rowling about the wound, and that with a rowler which conſiſts of a twice or thrice doubled cloth, made in manner of a boulſter, and ſewed with as much conveniency as you can, that it may be ſo large as to encompaſs and cover all the wound, for theſe reaſons which ſhall be delivered at large in our Treatiſe of Fractures. But if the wound run long-ways, let the boulſters and ſplints be applied to the ſides of the wound, that ſo the lips of the wound may be preſſed together, and the contained filth preſſed forth. But if it be made overthwart, we muſt abſtain from boulſters and ſplints: For that in *Galen*'s opinion, they would dilate the wound, and the purulent matter would be preſſed out, and caſt back into the wound.

Ad ſent. 12. ſect. de fract.

CHAP. V.

Certain common Precepts of the binding up of Fractures and Luxations.

IN every Fracture and Luxation, the depreſſed, hollow and extenuated parts, ſuch as are near unto the joynts, ought to be filled up with boulſters, or clothes put about them, ſo to make the part equal, that ſo they may be equally and on every ſide preſſed by the ſplints, and the bones more firmly contained in their ſeats. So when the knee is bound up, you muſt fill the ham or that cavity which is there, that ſo the ligation may be the better and ſpeedilier performed. The ſame muſt be done under the arm-pits, above the heel, in the arm near the wriſt; and to conclude, in all other parts which have a conſpicuous inequality by reaſon of ſome manifeſt cavity. When you have finiſhed your binding, then enquire of the Patient, whether the member ſeem not to be bound too ſtrait. For if he ſay that he is unable to endure it ſo hard bound, then muſt the binding be ſomewhat ſlackned. For, too ſtrait binding cauſes pain, heat, defluxion, a gangrene, and laſtly, a ſphacel or mortification: But too looſe is unprofitable, for that it doth not contain the parts in that ſtate we deſire. It is a ſign of a juſt ligation that is neither too ſtrait nor too looſe, if the enſuing day the part be ſwoln with an œdematous tumor, cauſed by the blood preſſed forth of the broken place; but of too ſtrait ligation, if the part be hard ſwoln; and of too looſe, if it be no whit ſwollen, as that which hath preſſed no blood out of the affected part. Now if a hard tumor, cauſed by too ſtrait binding, trouble the Patient, it muſt preſently be looſed for fear of more grievous ſymptoms, and the part muſt be fomented with warm *Hydræleum*, and another indifferent, yea verily, more looſe ligature muſt be made inſtead thereof, as long as the pain and inflammation ſhall continue; in which time, and for which cauſe, you ſhall lay nothing upon the part which is any thing burthenſome. When the Patient begins to recover, for three or four days ſpace, eſpecially if you find him of a more compact habit and a ſtrong man, the ligature muſt be kept firm and not looſed. If on the third day, and ſo until the ſeventh, the ſpires or windings be found more looſe, and the part affected more ſlender, then we muſt judge it to be for the better. For hence you may gather, that there is an expreſſion and digeſtion of the humors, cauſing the tumor made by force of the ligation. Verily, broken bones fitly bound up, are better ſet, and more firmly agglutinated, which is the cauſe, why in the place of the fracture, the ligation muſt be made the ſtraiter, in other places more looſly. If the fractured bone ſtand forth in any part, it muſt there be more ſtraitly preſſed with boulſters and ſplints. To conclude, the ſeventh day being paſt, we muſt bind the part more ſtraitly than before: For that then inflammation, pain, and the like accidents are not to be feared. But theſe things which we have hitherto ſpoken, of the three kinds of Ligatures, cannot take place in each fractured part of the body, as in the chaps, collar-bones, head, noſe, ribs: For, ſeeing ſuch parts are not round and long, a ligature cannot be wrapped about them, as it may on the arms, thighs and legs, but only be put on their outſides.

Hipp. ſent. 37. & 38. ſect. 1. de fract.

The ſigns of too ſtrait and looſe binding up.

Why we muſt make more ſtrait ligation on the broken part.

CHAP. VI.

The uſes for which Ligatures ſerve.

BY that which we have formerly delivered, you may underſtand that ligatures are of uſe to reſtore thoſe things which are ſeparated and moved forth of their places, and joyn together thoſe which gape; as in fractures, wounds, contuſions, ſinewous ulcers, and other like affects againſt Nature, in which the ſolution of continuity ſtands in need of the help of Bandages, for the reparation thereof. Beſides alſo, by the help of Bandages theſe things are kept aſunder or ſeparated, which otherwiſe would grow togethrr againſt Nature; as in burns, wherein the fingers and the hams would mutually grow together; as alſo the arm-pits to the cheſt, the chin to the breaſt, unleſs they be hindred by due ligation. Bandages do alſo conduce to refreſh emaciated

The firſt benefit of ligatures

The ſecond.

The third.

part: Wherefore if the right leg waſte for want of nouriſhment, the left leg, beginning at the foot, may be conveniently rowled up even to the groin. If the right arm conſume, bind the left with a ſtrait Ligature, beginning at the hand, and ending at the arm-pit. For thus a great portion of blood from the bound-up part is ſent back into the *Vena cava*, from whence it regurgitates into the almoſt empty veſſels of the emaciated part. But I would have the ſound part to be ſo bound, that thereby it become not painful; for a dolorifick ligation cauſes a greater attractation of blood and ſpirits, as alſo exerciſe: Wherefore I would have it during that time to be at reſt, and keep Holy-day.

The fourth. Ligatures alſo conduce to the ſtopping of bleedings: Which you may perceive by this, that when you open a vein with your lancet, the blood is preſently ſtayed, laying on a boulſter,

The fifth. and making a ligature. Alſo ligatures, are uſeful for women preſently after their delivery for their womb being bound about with ligatures, the blood wherewith their womb was too much moiſtened, is expelled, the ſtrength of the expulſive faculty being by this means ſtirred up to the expulſion thereof: And it alſo hinders the empty womb from being ſwoln up with wind, which

The ſixth. otherwiſe would preſently enter thereinto. This ſame ligature is a help to ſuch are with child, for the more eaſie carrying of their burthen; eſpecially thoſe whoſe child lies ſo far downwards, that lying, as it were, in the den of the hips, it hangs between the thighs, and ſo hinders the free going of the mother. Therefore the woman with child is not only eaſed by this binding of her womb with this ligature, which is commonly termed, the Navil-ligature; but alſo, her child be-

The ſeventh. ing held up higher in her womb, ſhe hath freer and more liberty to walk. Ligatures are in like ſort good for revulſion and derivation; as alſo for holding of medicines which are laid to a part, as the

The eighth, the particular uſe of ligatures in the amputation of members. neck, breaſt or belly. Laſtly, there is a triple uſe of ligatures in amputation of members, as arms and legs. The firſt to draw and hold upwards the skin and muſcles lying under it, that the operation being performed, they may, by their falling down again, cover the ends of the cut-off bones; and ſo by that means help forwards the agglutination and cicatrization; and when it is healed up, cauſe the lame member to move more freely, and with leſs pain; and alſo to perform the former actions, this, as it were, cuſhion or boulſter of muſculous fleſh lying thereunder. The ſecond is, they hinder the bleeding by preſſing together the veins and arteries. The third is, they by ſtrait binding intercept the free paſſage of the animal ſpirits, and ſo deprive the part which lyes thereunder of the ſenſe of feeling, by making it, as were, ſtupid or num.

CHAP. VII.

Of Boulſters or Compreſſes.

The firſt uſe of Boulſters. BOulſters have a double uſe, the firſt is to fill up the cavities and thoſe parts which are not of an equal thickneſs to their end. We have examples of cavities in the arm-pits, clavicles, hams and groins; and of parts which grow ſmall towards their ends, in the arms towards the wriſts, in the legs towards the feet, in the thighs towards the knees. Therefore you muſt fill theſe parts with boulſters and linnen clothes, that ſo they may be all of one bigneſs to their ends.

The ſecond uſe of them. The ſecond uſe of Boulſters, is to defend and preſerve the firſt two or three rowlers or underbinders, the which we ſaid before muſt be applied immediately to the fractured part. Boulſters, according to this twofold uſe, differ amongſt themſelves, for that when they are uſed in the firſt mentioned kind, they muſt be applied athwart; but when in the latter, long-ways or down-right.

The third uſe of them. You may alſo uſe Boulſters, leſt the too ſtrait binding of the ligatures cauſe pain and trouble to the new-ſet bones. A three or four times doubled cloth will ſerve for the thickneſs of your boulſters, but the length and breadth muſt be more or leſs, according to the condition of the parts and diſeaſe for which they muſt be applied.

CHAP. VIII.

Of the uſe of Splints, Junks and Caſes.

The matter of Splints. HAving delivered the uſes of ligatures and boulſters, it remains that we ſay ſomewhat of the other things, which ſerve to hold the bones in their places; as Splints, Junks, Caſes, and ſuch other like. Splints are made and compoſed of paſt-board, of thin ſplinters of wood, of leather, ſuch as ſhooe-ſoals are made with; of the rinds of trees, or plates of lattin, or lead, and ſuch other like, which have a gentle and yielding ſtiffneſs; yet would I have them made as light as may be, leſt they by their weight become troubleſome to the affected part. But for their length, breadth and number, let them be fitted, agreeable to the part whereto they muſt be uſed. Let alſo their figure be ſtrait or crooked according to the condition of the member whereto they muſt be applied. You muſt have a ſpecial care, that they run not ſo far as the ſwellings out, or eminencies of the bones; as the ankles, knees, elbows, and the like, leſt they hurt them by their preſſure: alſo you muſt have a care, that they be ſmaller at their ends, and

Their uſe. thicker in their middles, whereas they lye upon the broken bone. The uſe of Splints is, to hold faſt and firm, that they may ſtir no way the broken and luxated bones, after they be ſet and reſtored to their places. That they perform this uſe, it is fit there be no thick boulſters under them, nor over-many rowlers, for ſo through ſo thick a ſpace, they would not ſo ſtraitly preſs the part.

What Junks are. Junks are made of ſticks, the bigneſs of ones finger, wrapped about with ruſhes, and then with linnen cloth: They are principally uſed in fractures of the thighs and legs.

The matter and uſe of Caſes. Caſes are made of plates of lattin, or elſe ſome light wood; their uſe is, to contain the bones in their due figure, when the Patient is to be carried out of one bed or chamber into another, or elſe hath need to go to ſtool: Laſtly, if we muſt reſt ſomewhat more ſtrongly upon the broken or luxated members,

theſe

theſe caſes will hinder the bones from ſtirring or flying out on the right ſide or left, above or below, we ſleeping or waking, being willing or unwilling; and in like ſort left being not as yet well knit, or more looſly bound up for fear of Pain, Inflammation, or a Gangrene, they hang down, fall, or fly in ſunder by reaſon of the inequalities of the bed. Such Caſes, Junks, and the like, which ſerve for reſtoring and faſt holding of broken and luxated bones, we may, according to *Hippocrates* his mind, call them in general *Gloſſocomia*. All which things, the young Surgeon, which is not as yet exerciſed in the works of Art, can ſcarce tell what they are. But in the mean time, whilſt that he may come to be exerciſed therein, or ſee others perform theſe operations, I, as plainly as poſſibly I could, have in words given him their portraiture or ſhape.

Gloſſocomium, a general name for ſuch things.

The End of the Fourteenth Book.

BOOK XV.

Of Fractures.

CHAP. I.

What a Fracture is, and what the differences thereof are.

A Fracture, in *Galen*'s opinion, is the ſolution of continuity in a bone, which by the Greeks is called *Catagma*. There are many ſorts of hurting or offending the bones; as, the drawing them aſunder, luxation, or putting them out of joynt; their unnatural growing together, their cutting or dividing aſunder; contuſion, abſceſs, putrefaction, rottenneſs, laying bare the *Periſteum*, being violated or loſt; and laſtly, that whereof we now treat, a Fracture. Again, the varieties of Fractures are almoſt infinite. For one is complete and perfect, another imperfect; one runs long-wiſe, another tranſverſe, another oblique; one while it is broken into great pieces, another while into little and ſmall ſcales, which have either a blunt, or elſe a ſharp end, and prick the adjacent bodies of the muſcles, nerves, veins or arteries. It ſometimes happens, that the bone is not broken into ſplinters, that is, long-ways, but together, and at once into two pieces overthwart, which Fracture is called *Raphanedon*, that is, after the manner of a Radiſh. *Lib. 6. method.* What it is for a bone to be broken *Raphanedon.*

A Fracture is made *Caryedon*, or like a nut, when as the bone flies into many ſmall pieces, ſevered each from other, as when a nut is broken with a hammer, or mallet, upon an Anvile: Which fracture is alſo termed *Alphitidon*, by reaſon of the reſemblance it hath to meal or flour; and ſuch is often ſeen in fractures made by bullets, ſhot out of Guns and ſuch fiery Engines. Contrary to theſe are thoſe fractures which are called *Schidacidon*, as rent into ſplinters, or after the manner of a board or piece of timber, that is, right-down, and alongſt the bone: And theſe fractures either are apparent to the eye, or elſe not apparent, and therefore called Capillary, being ſo ſmall, as that they cannot be perceived by the eye, unleſs you put ink upon them, and then ſhave them with your Scrapers. Sometimes the bone is only preſſed down with the ſtroke; ſometimes on the contrary it flies up, as if it were vaulted. They call it Attrition, when the bone is broken into many ſmall fragments, and, as it were ſcales or chips. The fragments of fractured bones are ſometimes ſmooth and poliſhed, otherwhiles unequal, and, as it were ſharp and rough with little teeth or pricks. Some fractures touch only the ſurface of the bone, fetching off only a ſcale: otherſome change not the ſite of fractured bones, but only cleaves them length-ways, without the plucking away of any fragment; otherſome penetrate even to their marrow. Furthermore, ſome fractures are ſimple and alone by themſelves; otherſome are accompanied with a troop of other affects and ſymptoms, as a Wound, Hæmorrhagy, Inflammation, Gangrene, and the like. Hereunto you may alſo add the differences drawn from the parts which the fractures poſſeſs; as from the head, ribs, limbs, joynts, and other members of the body. Add alſo theſe which are taken from the habit of bodies, aged, young, full of ill humours, well tempered; almoſt all which have their proper and peculiar indications for curing. Now the cauſes of fractures, are the too violent aſſaults or ſtrokes of all external things, which may cut, bruiſe, break or ſhake: In this number of cauſes may alſo be reckoned, falls from high places, and infinite other things, which would be long and tedious to reckon up. What *Caryedon*, or *Alphitidon*. What *Schidacidon*. The cauſes of fractures.

CHAP. II.

Of the ſigns of a Fracture.

We may know by evident ſigns that a bone is broken: The firſt whereof and moſt certain, is, when by handling the part which we ſuſpect to be broken, we feel pieces of the bone ſevered aſunder, and hear a certain crackling of theſe pieces under our hands, cauſed by the attrition of the ſhattered bones. Another ſign is taken from the impotency of the part, which chiefly bewrays it ſelf, when both the bones, the leg, and brace-bones, the ell and wand are broken: For if only the brace-bone or wand be broken, the Patient may go on his leg, and ſtir his arm; for the brace-bone ſerves for the ſuſtaining of the muſcles, and not of the body, as the leg-bone doth. The third ſign is drawn from the figure of the part changed beſides Nature: For it it is there hollow, from whence the bone is flown or gone. but gibbous or bunching out whi- The firſt ſign of a broken bone. Another. A third.

ther it is run. Great pain in the interim torments the Patient by reason of the wronged *Periosteum*, and that membrane which involves the marrow and the sympathy of the adjacent parts, which are compressed or pricked.

CHAP. III.

Of Prognosticks to be made in Fractures.

WE must prognosticate in fractures whether they are to end in the destruction or welfare of the Patient; or whether their cure shall be long or short, easie, or else difficult and dangerous; and lastly, what accidents and symptoms may happen thereupon. He shall easily attain to the knowledge of all these things, who is not only well seen in the anatomical description of the bones, but also in the temper, composition and complexion of the whole body. Wherefore in the first place, I think good to admonish the Surgeon of this, that in Winter when all is stiff with cold, by a little fall, or some such sleight occasion, the bones may be quickly and readily broken. For then the bones, being dried, by the driness of the air encompassing us, become more brittle; which every one of the vulgar usually observe to happen both in waxen and tallow-candles: But when the Season is moist, the bones are also more moist, and therefore more flexible and yielding to the violence of the obvious and offending body. Wherefore also you may gather this to the framing of your Prognosticks, That bones by reason of their natural driness are not so easily agglutinated and consolidated as flesh; though in children, according to *Galen*, by reason of the abundance of their humidity, the lost substance may be repaired, according (as they term it) to the first intention, that is, by restoring of the same kind of substance or matter. But in others, about the fractures, a certain hard substance usually concretes, of that nourishment of the broken bone which abounds, which glues together the fragments thereof, being fitly put together. This substance is then termed a *Callus*, and it is so hardned in time, that the bone thereafter in the broken part is seen to be more firm and hard than it is in any other; therefore that usual saying in Physick is not without reason, That rest is necessary for the uniting of broken bones. For the *Callus* is easily dissolved, if they be moved before their perfect and solid agglutination. The matter of a *Callus* ought to be indifferent and laudable in quantity and quality, even as blood which flows for the regeneration of the lost flesh in wounds. It is fit, that there may be sufficient matter for such a *Callus*, that the part have a laudable temper, otherwise there either will be no *Callus*, or certainly it will grow more slowly. Fractures are far more easily repaired in young bodies than in old: For in these there is plenty of the primigenious and radical moisture, that is laudably holding and glutinous, and in the other there is store of waterish and excrementitious humours. By this you may easily conjecture, that you cannot certainly set down a time necessary for the generating a *Callus*: For in some it happens later, in some sooner; the cause of which variety is also to be referred to the constitution of the Year and Region, the temper and diet of the Patient, and manner of ligation: For, those Patients whose powers are weak, and blood waterish and thin, in these the generation of a *Callus* uses to be more slow: On the contrary, strong powers hasten to agglutinate the bones, if there be plenty of gross and viscous matter; whereby it comes to pass, that meats of grosser nutriment are to be used, and medicines applied which may help forwards the endeavour of Nature, as we shall declare hereafter. When the bones are broken near unto the joynts, the motion afterwards uses to be more difficult, especially if the *Callus*, which is substituted, be somewhat thick and bunching forth. But if, together with the violence and force of the fracture, the joynts shall be broken and bruised, the motion will not only be lost, but the life brought in danger, by reason of the greatness of the Inflammation, which usually happens in such affects, and the excess of pain in a tendinous body. These fractures wherein both the bones of the arm or leg are broken, are more difficult to cure, than those which happen but to one of them: For they are handled and kept in their places with more difficulty, because that which remains whole, serves the other for a rest or stay to which it may lean. Moreover, there is longer time required to substitute a *Callus* to a great bone, than to a little one. Again, these bones which are more rare and spongy, are sooner glued together by the interposition of a *Callus*, than those which are dense and solid. A *Callus* sooner grows in sanguin, than in cholerick bodies: But broken bones cannot be so happily agglutinated, nor restored in any body, but that always some asperity or unequal protuberancy may be seen on that part where the *Callus* is generated: Wherefore the Surgeon ought to make artificial ligations, that the *Callus* may not stand out too far, nor sink down too low. That fracture is least troublesome which is simple; on the contrary, that is more troublesome which is made into splinters; but that is most troublesome and worst of all, which is in small and sharp fragments, because there is a danger of Convulsion by pricking a nerve, or the *Periosteum*. Sometimes the fragment of a broken bone keep themselves in their due place: They also oft-times fly forth thereof, so that one of them gets above another; which when it happens, you may perceive an inequality by the depression of the one part, and the bunching forth of the other, as also pain by the pricking: Besides also, the member is made shorter than it was, and than the sound member on the opposite side is, and more swoln by the contraction of the muscles towards their original. Wherefore when a bone is broken, if you perceive any thing so depressed, presently putting your hand on both sides above and below, stretch forth the bone as forcibly as you can; for otherwise, the muscles and nerves, stretched and contracted, will never of their own accord suffer the bones to be restored to their proper seat of themselves. This extension must be performed in the first days, for afterwards there will happen inflammation: Which being present, it is dangerous to draw the nerves and tendons

Extention must presently be made after the bone is broken.

too violently; for hence would enſue an Impoſthume, Convulſion, Gangrene and Mortification. Therefore *Hippocrates* forbids you to defer ſuch extenſion until the third or fourth day. Fractures are thought dangerous, whoſe fragments are great, and fly out, eſpecially in theſe bones which are filled with marrow on the inſide. When broken or diſlocated bones cannot be reſtored to themſelves and their natural place, the part waſtes for want of nouriſhment; both for that the natural ſite of the veins, arteries and nerves, is perverted, as alſo becauſe the part it ſelf lies immovable, or ſcarce moveable: Whereby it cometh to paſs, that the ſpirits do not freely flow thereto, as neither the nutritive juice cometh thither in ſufficient plenty. When the diſlocated or broken member is troubled with any great inflammation, it is doubtful whether or no a Convulſion will happen, if we attempt to reſtore it, or the parts thereof to their ſeat: Therefore it is better, if it may be done, to defer the reducing thereof ſo long, until the humour which poſſeſſes the part be diſſolved, the tumor abated, and the bitterneſs of pain mitigated.

Sent. 36. ſect. 3. de fract.

In inflammations, the reſtoring of the bone muſt not be attempted.

CHAP. IV.

The general cure of broken and diſlocated Bones.

TO cure a broken and diſlocated bone, is to reſtore it to its former figure and ſite: For the performance whereof, the Surgeon muſt propoſe three things to himſelf: The firſt is, to reſtore the bone to its place: The ſecond is, that he contain or ſtay it being ſo reſtored: The third is, that he hinder the increaſe of malign ſymptoms and accidents; or elſe if they do happen, that then he temper and correct their preſent malignity: Such accidents are pain, inflammation, a feaver, abſceſs, gangrene and ſphacel. For the firſt intention, you may eaſily reſtore a broken or diſlocated bone, if preſently, as ſoon as the miſchance is got, or elſe the ſame day, you endeavour to reſtore it: For the bitterneſs of pain or inflammation, which may trouble the Patient, is not as yet very great; neither is the contraction of the muſcles upwards, as yet very much or ſtubborn: Therefore firſt of all, the Patient with his whole body, but eſpecially with the broken or diſlocated part, as alſo the Surgeon, muſt be in ſome place which hath good and ſufficient light: Then let truſty and skilful attendants be there, good ligatures, and alſo, if need ſo require, good engines. His friends which are preſent, let them ſee and hold their peace, neither ſay nor do any thing which may hinder the work of the Surgeon: Then putting one hand above, that is, towards the center of the body, and the other below, as near as he can to the part affected, let him ſtretch forth the member: For if you lay your hand any diſtance from the part affected, you will hurt the ſound part by too much compreſſion, neither will you much avail your ſelf by ſtretching it at ſuch a diſtance: But if you only endeavour below with your hand or ligature, aſſiſting to make extenſion thereof, it will be dangerous if there be nothing above which may withſtand or hold, leſt that you draw the whole body to you: This being done according as I have delivered, it is fit the Surgeon make a right or ſtrait extenſion of the part affected: For when the bone is either broken or out of joynt, there is contraction of the muſcles towards their original, and conſequently of the bones by them, as it is obſerved by *Galen:* Wherefore it is impoſſible to reſtore the bones to their former ſeat, without the extenſion of the muſcles: But the part being thus extended, the broken bones will ſooner and more eaſily be reſtored to their former ſeat: Which being reſtored, you ſhall preſently with your hand preſs it down, if there be any thing that bunches or ſtands out. And laſtly, you ſhall bind it up, by applying boulſters and ſplints as ſhall be fit. But if the bone be diſlocated or forth of joynt, then preſently after the extenſion thereof, it will be requiſite to bend it ſomewhat about, and ſo to draw it in. The Surgeon is ſometimes forced to uſe engines for this work, eſpecially if the luxation be inveterate, if the broken or luxated bones be great; and that in ſtrong and ruſtick bodies, and ſuch as have large joynts; for that then there is need of greater ſtrength than is in the hand of the Surgeon alone. For, by how much the muſcles of the Patient are the ſtronger, by ſo much will they be contracted more powerfully upwards towards their originals: Yet have a care that you extend them not too violently, leſt by rending and breaking aſunder the muſcles and nerves, you cauſe the forementioned Symptoms, Pain, Convulſion, a Palſie and Gangrene: All which ſooner happen to ſtrong and aged bodies, than to Children, Eunuchs, Women, Youths, and generally all moiſt bodies, for that they are leſs hurt by violent extenſion and pulling, by reaſon of their native and much humidity and ſoftneſs. For thus skins of Leather, moiſtened with any liquor, are eaſily retched, and drawn out as one pleaſeth: But ſuch as are dry and hard, being leſs tractable, will ſooner rend and tear, than ſtretch further out. Therefore the Surgeon ſhall uſe a mean in extending and drawing forth of members, as ſhall be moſt agreeable to the habits of the bodies. You may know the bone is ſet, and the ſetting performed as is fit, if the pain be aſſwaged; to wit, the fibres of the muſcles, and the other parts being reſtored to their former ſite, and all compreſſion, which the bones moved out of their places have made, being taken away; if, to your feeling there be nothing, bunching out, nor rugged, but the ſurface of the membrane remain ſmooth and equal; and laſtly, if the broken or diſlocated member compares with its oppoſite in the compoſure of the joynts, and knees, as the ankles anſwer juſtly and equally in length and thickneſs. For which purpoſe it muſt not ſuffice the Surgeon to view it once, but even as often as he ſhall dreſs it: For it may happen, that the bone which is well ſet, may by ſome chance, as by the Patients unconſiderate turning himſelf in his bed, or, as it were, a convulſive twitching of the members or joynts whilſt he ſleeps, the muſcles of their own accord contracting themſelves towards their originals, that the member may again fall out; and it will give manifeſt ſigns thereof by renewing the pain, by preſſing or pricking the adjacent bodies: Which pain will not ceaſe, before it be reſtored to its place: And hereof the Surgeon

Signs of a bone well ſet.

Cauſes and ſigns of the relapſe of a ſet bone.

ought to have diligent care: For if, whilſt the *Callus* is in growing, one bone ride over another, the bone it ſelf will afterwards be ſo much the ſhorter, and conſequently the whole member; ſo that if this errour ſhall happen in a broken leg, the Patient will halt ever after, to his great grief, and the Surgeons ſhame: Wherefore the Patient ſhall take heed, as much as in him lies, that he ſtir not the broken member, before that the *Callus* be hardned. Such diligent care needs not be had in Diſlocations: For theſe once ſet, and artificially bound up, do not afterwards ſo eaſily fall forth as broken bones. The ſecond ſcope is, that the bones which ſhall be reſtored may be firmly kept in their ſtate and place: That ſhall be done by Bandages; as Ligatures, Boulſters, and other things, whereof hereafter we ſhall make particular mention: Hither tend proper and fit medicines, to wit, applying of Oyl of Roſes with the whites of Eggs, and the like repelling things, and then reſolving medicines, as the preſent neceſſity ſhall require. It will be convenient to moiſten your rowlers and boulſters in Oxycrate for this purpoſe, or elſe in Roſe-vinegar, if the Fracture be ſimple, or with Red-wine; or the liquor warm (in *Galen*'s opinion) if a wound be joyned to the Fracture; and it will be fit to moiſten Fractures often in Summer; for ſo the part is ſtrengthened, the defluxion being repelled, whereby the inflammation and pain are hindered. You muſt deſiſt from humecting and watering the part when the ſymptomes are paſt, leſt you retard the generating of a *Callus*; for which you muſt labour by theſe means which we ſhall hereafter declare. To this purpoſe alſo conduces the reſt and lying of the part in its proper figure and ſite accuſtomed in health, that ſo it may the longer remain in the ſame place unſtirred: Beſides alſo, it is expedient then only to dreſs the part, when it is needful, and with thoſe things which are requiſite, ſhunning as much as may be, inflammation and pain. That figure is thought the beſt, which is the middle; that is, which contains the muſcles in their ſite, which is without pain; ſo that the Patient may long endure it without labour or trouble. All theſe things being performed, the Patient muſt be asked, whether the member be bound up too ſtrait? If he anſwer, No, (unleſs peradventure a little upon the fracture or luxation, for there it is fit it ſhould be more ſtraitly bound) then may you know that the binding is moderate: And this ſame firſt ligation is to be kept in fractures without looſing for three or four days ſpace, unleſs peradventure pain urge you to the contrary. In diſlocations the ſame binding may be kept for ſeven or eight days, unleſs by chance ſome ſymptom may happen; which may force us to open it before that time; for the Surgeon muſt with all his art have a care to prohibit the hapning of evil accidents and ſymptoms, which, how he may bring to paſs, ſhall be declared in the following Chapter.

Ad. ſent. 21. ſect. 1. de fract.
